The fpirit of wine impregnated with the tincture of the farina was next evaporated; as the liquor grew thick toward the end of the evaporation, it fent out a ftrong fmell of *Wax*, and, when wholly evaporated, it left on the fpoon a cake of yellowifh matter, having perfectly the fmell and external appearance of *Wax*. We may learn from this, that the fubftance of *Wax* is in the farina of flowers, and that this menftruum is capable of extracting its finer parts. The quantity of extract remaining from this operation was a fcruple. This carried all the external appearances of *Wax*, and fome of its properties. It was of the fame colour and confiftence with the common yellow *Wax*; its fmell was wholly the fame, and it would fufe or run into a liquid matter at the fire, and might be moulded between the fingers, being as ductile as common *Wax*.

With all thefe properties there was great reafon to fuppofe it to be perfect *Wax*; but this appeared not to be the cafe when it was held a little time in the mouth, for it there broke to pieces, and diffolved in the manner of the common lozenges, which have fugar for their bafis. The evident refult of this experiment was, that the matter of *Wax* was contained in this fubftance, collected on the legs of the bees, and owing its origin to the farina of flowers; but that it was as yet mixed with fome other fubftance, and the fpirit of wine had extracted them both together.

The moft likely extraneous matter to be mixed with the *waxey* fubftance, was fome falt; this was eafily proved to be the cafe by another operation; for if this refiduum was dried to a perfect hardnefs over the fire, it would become fo moift again, on being expofed to the air, that in an hour's time the fingers would ftick to it; this imbibing humidity from the air is fo known a property of falts, and fo uncommon in other things, that there is little room to doubt but that this was the cafe in this refiduum.

It is evident, however, from this experiment, that a part, at leaft, of the matter of which *Wax* is made, is contained in the ftamineous powder, or farina of plants, and that the fpirit of wine extracts this, and with it fome portion of heterogene matters. It is probable, that if we knew the proper diffolvent of *Wax* in its perfect ftate, which is a thing not yet known, we fhould be able, by means of that, to extract the *Wax* pure and alone, either from the ftamina of flowers, or from the matter lodged on the legs of the bees; but that till we are acquainted with fuch a diffolvent, we are not to wonder that we cannot extract pure and perfect *Wax*, either from the farina in its natural ftate on the plant, or when lodged on the legs of the bee.

Laftly, fpirit of wine digefted upon real *Wax*, and the tincture evaporated, does not diffolve the whole fubftance of the *Wax*, but the refiduum of the evaporation is the fame with that from the farina itfelf; a fubftance of the confiftence of butter, of a yellow colour, having the fmell of *Wax*, and fome of its properties, but being foluble in water. *Reaumur*, Hift. Inf. vol. 10. p. 48.

The falt which is extracted from perfect *Wax*, as well as from the farina of plants, by digeftion in fpirits of wine, is of the nature of fugar or honey, being the effential falt of fome peculiar juices of the plant. This is contained in much larger quantity in the virgin *Wax*, of which the firft combs of bees are made, than in fuch common *Wax* as has been melted and run into cakes; this is proved by extracting a tincture from fuch virgin *Wax*, which always has a plainly faccharine or honey-like tafte.

The difficulty in the way of the making *Wax* from the fubftance from which the bees make it, is the poffibility of its being converted into *Wax* within the body of the animal: If this is the cafe, notwithftanding that we perfectly know the matter of which *Wax* is made, we are not to wonder that we are not able to make it, any more than that we are not able to make chyle or blood out of the feveral fubftances ufed by us as food, and out of which we well know that it is made within our bodies.

Crude or rough WAX, called by the French *cire brute*, in natural hiftory, a name given to a fubftance called by the antients *erithace*, *fandarac*, and *ambrofia*.

We feem to have no name for it in Englifh, but may call it after the name of the French, *rough-Wax*.

The Dutch call it the food of the bees, and that perhaps very properly, there appearing many reafons to think that the bees eat it.

It is the yellow fubftance found on the hinder legs of bees in fmall lumps, and is the fubftance of which *Wax* is made by this infect. See the article WAX, *fupra*.

Manner of collecting the crude WAX. If we examine a bee juft entering a flower, which is well opened, and in its perfect ftate, we fhall ufually fee her body very clean and neat; but if we examine her when fhe comes out, fhe is ufually found covered over with a fine duft: It is very eafy to determine that the creature has got this duft from fome part of the flower; and obfervations equally eafy will alfo prove, that this powder is the matter of which the bee makes its *Wax*.

People who have not examined flowers as botanifts have, yet often obferve, that in a tulip or a lilly there are certain filaments which duft over the fingers in touching them. Thefe filaments are by authors called the ftamina or threads of flowers, and they always contain a large quantity of this duft. Tournefort, and many other great writers, have fuppofed this duft to be only a fort of excrement fecreted from the abundant juices of the plant by thefe filaments, which they have fuppofed to be organs deftined only for that purpofe; but later obfervers have allotted a more noble ufe to this duft; they have called it the *farina fœcundans*, and have proved that all the fœcundity of plants is owing to it, the feeds never growing if they are not properly impregnated with the particles of this duft, any more than the eggs of animals will be hatched into young ones, if not impregnated by the male femen. This farina is not to be fuppofed an irregular duft, in the manner of our common powders; but the farina of the fame plant is always compofed of particles of the fame fhape, and that different from the fhape of the globules of the farina of other plants. *Reaumur*, Hift. Inf. vol. 9. p. 371.

It is of this powder or farina that the bees prepare their *Wax*. When one of thefe infects goes into a flower, fhe always fhakes thefe ftamina, and difcharges all their globules or duft upon her body, while fhe is fucking the honey with her trunk. It is on this occafion that the hairs, with which the bee is covered, are of fervice to her. Thefe round globules would all roll off from her fmooth body and legs; but they are entangled in great numbers among this foreft of branched and foliated hairs, and the creature carries them off for her fervice. Thus when the bee comes out of a flower, fhe is always feen to be dufted over with a yellow, a red, or a white powder, according to the colour of the farina of that fpecies of plant. In fome places the bees return to their hives, at certain feafons, fo covered with thefe powders, that the owners have thought they were, at certain times of the year, poffeffed of yellow or white bees.

Some bees carry their duft thus on their body to the hive; others take the pains to clean themfelves firft, by brufhing their bodies, and collecting the whole together into a body, or fmall lump: This is done by means of the fquare brufhes, which make the fourth pieces of the four hinder legs; thefe are befet with tufts of hairs, in the manner of a common brufh ufed for cloaths, and thefe they are able to move to every part of the body. The hairy parts of the anterior pair of legs ferve to brufh the head, and parts about it, as clean as the brufhes on the other legs do the body; and the duft, which is to them a very precious matter, is by this means collected into two parcels or lumps, one of which they place in the triangular bafket, with which nature has furnifhed them on the third joint of the hinder legs. See the article BEE. *Reaumur*, Hift. Inf. vol. 9. p. 374.

This lump on each leg is formed into a fort of round figure, and they fix it down in the cavity of this triangular piece, and the ftrong and large hairs with which all the edges of this piece are furnifhed, very well keep it in till the creature gets to the hive.

The quantity of powder received from a fingle flower, when thus collected into two lumps, feldom forms them fo large as a fmall pin's head; but as the creature inceffantly flies into frefh flowers, the new matter collected from each, and added to the reft, ftill increafes the heap, till, when the bee is ready to return to the hive, each ball often is as large as a pepper-corn, and refembles it in fhape, only that it is fomewhat flatted. Many perfons have obferved the bees thus bufying themfelves, and forming the powder with which they are covered into balls; but the motion of their limbs, on this occafion, is fo fwift, that we can only fee the brufhing, and the effect of it in the balls; but our eye can never trace the manner of the operation. There are fome circumftances alfo in which the bee may be feen to make an immediate collection of *Wax* from the flowers, to the place on the hinder legs, where it is received

received in a lump, without ever going on the body at all. This is very happily obferved in the flowers of the apple and pear-tree in the fpring-feafon.

It is but of a very late time that men have found out that the little buttons on the fummits of the filaments of the flowers of plants contained this powder or farina fæcundans; but the bees feem to have known it from all time; and before thefe little buttons or cafes of the farina burft open, is the time when the bee can furnifh herfelf the moft completely with the farina from them. If the bloffoms of an apple-tree be obferved when juft opened, and the apices or buttons of the ftamina ripe, but not yet burft, a bee that comes into fuch a flower, tries one of thefe apices with her teeth; if fhe finds it is not ripe, fhe goes to another; but if it be, fhe burfts it open with her teeth, and wiping all the duft clean out of it with her fore-leg on this fide, fhe paffes the powder, thus received, to the fecond leg, and thence to the third, where it is immediately lodged in a lump in the proper receptacle on the triangular piece, which makes the third joint of that leg. This being at a feafon of the year when the weather is cold, and the bees not very brifk, their operations are feen better than at other times; but even here it is but imperfectly that they are traced, the motion of the legs, in delivering the treafure from one to another, is too quick to be feen.

There is, however, another occafion in which thefe motions are to be feen much more diftinctly than in any other of thefe operations; this is when the bees are employed, as they fometimes are, in collecting a reddifh glutinous matter inftead of *Wax*: This matter is of the confiftence of a refin while foft; it is pliable, and fticks to whatever it touches, fo that the creature is troubled enough to deliver it from part to part, and the motions by which it performs this are confequently much flower than thofe by which it manages its *Wax*. The method of this procefs is thus: the bee bites off a fmall piece of the refinous matter from the vegetable, with its teeth; it then holds this piece between the teeth, till it has fafhiond it into a fmall round globule; as foon as this is done, the laft joint of the anterior leg, which may be called the foot, receives it from the teeth; this foot is compofed of five joints, and has a power of bending and clofing in the manner of our fingers; this feizes upon the little globule while it is held between the teeth, and with fome difficulty difengages it. It then delivers it to the foot of the fecond leg of the fame fide, which feizes it, and flowly delivers it from its adherences to the foot of the firft leg; when perfectly freed, this places it on the triangular joint of the third leg, and then beats it down into the cavity by repeated ftrokes, at once working it into a proper confiftence, and driving it into the mould, as the labourers ufe the foft clay of which they make bricks. This is doubtlefs the procefs in the depofiting and working the common *Wax* into form; but that being a lefs vifcid and tenacious fubftance, the whole motion is performed too quick to be obferved diftinctly; whereas in this, the tenacity of the fubftance making the parts ftick to it, the motions are flower, and confequently are more eafily feen. *Reaumur*'s Hift. Inf. vol. 9. p. 378.

All the bees do not return loaded in the fame degree with *Wax* to the hive; fome perhaps are better workers than others, and probably fome have the happinefs to meet with flowers that yield more honey than others. When the lump is fmall, it is contained within the verge of the palette, or flat part of the leg; but when it is larger, it hangs over the fides, and entangling among the hairs, forces them outward; but thefe hairs are at the fame time greatly affiftant in retaining it in its place.

When the bee meets with a flower whofe apices are not fo ripe as to burft open on the touch, fhe is obliged to bite every one of them with her teeth, and then collects the matter of the *Wax*, as in the inftance of the apple-bloffoms; but when the apices are fo perfectly ripe as to burft of themfelves on being touched, fhe has nothing to do but to introduce herfelf among them, and then fhaking them thoroughly about, their powder is difcharged all over her body, and is to be brufhed off, and collected into lumps by a more tedious procefs, every particle of it being probably obliged to come into the reach of the feet of the anterior legs, and when worked into lumps in them, to be delivered to the feet of the next pair, and by them depofited on and preffed down into the palette or third joint of the laft pair of legs.

If the bees are obferved when returning to the hive loaded with their lumps of *Wax* on their thighs, thefe lumps on fome will be found to be white, on others yellow, on others red, and on fome greenifh: This is owing to the different colours of the farina, yielded by the different plants they have been at work upon. The manufacture of the bee in moulding this into a lump, has not yet been able to alter the colour of the farina, nor even its figure; for if the lumps be examined by the microfcope, they will all be found to confift of globules of a rounded or oval figure, or of whatever other fhape they had when on the plant. The bees returning to their hives after their morning excurfions in the fpring, are always found to contain in the cells of their palettes large lumps of *Wax*; but thofe which go out in the heat of the day, return with little or none; the reafon of this is, that the humidity of the farina, by means of the dew, makes it eafily formed into a lump or mafs, its particles naturally fticking together; whereas in the heat of the day this powder is too dry to be formed thus into a compact mafs, and therefore cannot be carried home by the bee. *Reaumur*, Hift. Inf. vol. 9. p. 382.

Chemical Analyfis of WAX. Tho' bees-*Wax* be of fo firm and folid a fubftance as we fee, yet it is very remarkable that it contains no earth, but rifes wholly in the fire in the common way of diftillation by the retort, without leaving a refiduum. Another fingular obfervation in this procefs, is, that the more fluid matter there comes over into the receiver, the thinner the remaining matter in the retort becomes, not as might naturally be expected the thicker.

When the fpirit of *Wax* (which is a phlegm with fome acid particles fufpended in it) is all driven over by the fire, the refiduum is a foft fatty fubftance, commonly called the butter of *Wax*; and if this butter be rectified, that is, if more acid and more phlegm be driven from it by the force of fire, the refiduum of this procefs is yet thinner than before, remaining in form of a clear liquor like oil, It appears therefore, on this analyfis, that *Wax* is compofed of two parts, an aqueous fubftance, with fome acid particles blended in it, and an oil; thefe two liquors have, by their union, formed this concrete, and acquired a hardnefs; but in the feparating them from one another, they become fluid again.

The proportion of the ingredients in this fubftance is alfo a very fingular thing, for all the care in the world cannot feparate quite one fourth part of the weight of the *Wax* in form of oil, the remainder then is all phlegm and acid. Mr. Homberg advanced, that oils only became inflammable by means of the acid they contained, and this feems a proof of it; but when we confider that *Wax* all burns away, it is an odd obfervation, though a very certain one, that three fourths of what is burning is water. Mem. Acad. Par. 1708.

To imitate Fruit in WAX. Take the fruit, and bury it half-way in clay; oil its edges, and the extant half of the fruit, then nimbly throw on it tempered alabafter, or plafter of Paris, to a confiderable thicknefs. When this is concreted, it makes the half mould, the fecond half of which may be obtained in the fame way. The two parts of the mould being joined together, a little coloured *Wax*, melted, and brought to a due heat, being poured through a hole made in any convenient part of the mould, and prefently fhook every way therein, will reprefent the original fruit. *Boyle*'s Works abr. vol. 1. p. 136.

WAY (*Cycl.*)—WAY *aftward on*, or *foreward on*, in a fhip, is the fame with her run or rake. See the article RAKE and RUN.

WAYED *Horfe*, in the manege, is one that is already backed, fuppled and broken, and fhews a difpofition to the manege.

WEACHIN, in botany, the name given by the Indians of America to the maiz, or Indian corn, which they cultivated for bread before we knew them.

WEAK (*Cycl.*)—WEAK, or *eafy branch*, in the manege. See the articles BANQUET and BANQUET-*Line*.

WEALD (*Cycl.*)—WEALD, or WALD, in the beginning of names of places, fignifies a fituation near woods; and the woody parts of the counties of Kent and Suffex are called the *Wealds*, though mifprinted *wildes*, in the ftatute 14 Car. 2. c. 6.

The word *Weald* in Saxon fignifying a wood.

WEALREAF, in our old writers, fignifies the robbing of a dead man in his grave. *Leg. Ethelred.* c. 21. *Blount.*

The word comes from the Saxon *Weal*, ftrages, and *reaf*, fpoliatio.

WEASEL, in zoology. See the article MUSTELA.

WEATHER (*Cycl.*)—We have feveral fchemes for keeping journals or diaries of the weather, extant in the Philofophical Tranfactions, the medical Effays of Edinburgh, and in other books. The *Ephemerides Ultrajectinæ* may alfo be confulted.

The inftruments requifite for fuch a journal, are a barometer, thermometer, hygrometer, anemofcope, and ombrometer, which fee in their proper places in the Cyclopædia or Supplement.

WEATHER-*Cord*, is an hygrometer of a very antient invention, and, if properly conftrued, may be ufed with good fuccefs, to fhew the alterations of the atmofphere, with refpect to moifture and drinefs; but as commonly made, * it never rifes or falls fufficiently to point out fuch changes as the curious would be defirous to know. But thefe rifings and fallings may be made very fenfible, by means of a long index, moveable round a center, and pointing to a divided arch. We have a conftruction and figure of an improved *Weather-cord* in the Philofophical Tranfactions. N°. 479. p. 170. fig. 5.

WEATHER-*Quoil*, or *Coile*, in the fea language, is the turning the fhip's head about, fo as to lie that way which her ftern did before, without loofing any fail, but only by bearing up the helm.

WEAVER'*s Alarm*. This contrivance is only a weight faftened to a packthread, which is placed horizontally, fo that in a certain time a candle may burn down to it. Then the flame of the candle fetting fire to the thread, the weight falls, and awakens the fleeping perfon. See Phil. Tranf. N°. 477. Sect. 14. where we have a figure to explain the invention, which got its name from being in frequent ufe among the *Weavers*.

WEEDS (*Cycl.*)—This term is uſed by our huſbandmen to expreſs ſuch plants as come up in their lands, and are different from the crop ſown there.

No plants are uſeleſs in themſelves; but in reſpect to the farmer they are both uſeleſs and hurtful, when they come in this manner, and devour the nouriſhment deſtined for the crop of what was ſown.

All *Weeds* are pernicious; but ſome much more ſo than others: Some are very miſchievous, but eaſily killed; ſome leſs hurtful, but more difficultly rooted out; and ſome have both qualities together. The hardeſt to kill are thoſe which grow readily from ſeed, and have roots, every part of which is qualified for the becoming a ſtout plant in a ſmall time; the worſt are couch-graſs, colts-foot, melilot, fern, and ſome others of the like kind.

Some of theſe pernicious plants only affect the crop by ſtarving, and leſſening its increaſe; but there are others which add to this miſchief, that of ſpoiling what they leave; theſe infect the crop with their own nauſeous ſmell, ſuch as melilot, garlic, and ſome others. It is ſuppoſed by ſome, that *Weeds* ſtarve the ſown plants, by taking up the room they ſhould poſſeſs; but this is an error, and the real way in which they prejudice them, is, the devouring the nouriſhment that they ſhould imbibe.

This is eaſily proved by the following experiment. Let three beds of the ſame ſoil, equal in ſize, and equally prepared, be ſown with the ſame corn; let the firſt of theſe be kept clear from *Weeds*; in the ſecond, let the *Weeds* be ſuffered to grow up among the corn; and in the third, ſtick up a quantity of dead ſticks, greater in bulk than the *Weeds*. It will be found that the produce in the third bed will be equal to that of the firſt, though as much and even more room is taken up by the ſticks, than by the *Weeds* in the ſecond; but the quantity in the ſecond bed will be leſs, in proportion to the *Weeds*, than in any other. The quantity of nouriſhment loſt, is not proportioned to the quantity of the *Weeds* that exhauſt it; for theſe being of different ſpecies, ſome are greatly more miſchievous and devouring than others.

The farmer finds it impoſſible ever wholly to deſtroy the *Weeds* in his lands; and the reaſon ſeems to be, that in many kinds the ſeeds will lie many years in the ground, and ſucceſſively grow, ſome one year, ſome another; ſo that the deſtroying the crop entirely for one year, does not kill them for ſucceeding ones. The ſeed of red poppy will lie twenty years in the ground, in a land all that time occupied by ſaintfoin; and if it be, after that, ploughed for corn, they will all grow, and fill the field.

The ſeeds of theſe plants will never all come up in one year, becauſe they muſt have their exact degrees of depth, moiſture, and covering; the ſeeds which want any of theſe one year, lie to grow up another. The beſt defence the farmer has hitherto found againſt theſe enemies, is to endeavour their deſtruction by a ſummer fallow. This, if the weather be propitious, does make ſome havock among them, but it never deſtroys them entirely. If the ſeeds lie ſo high that the ſummer's heat parches them up, or ſo deep that it cannot reach them, they do not germinate, and are by that means ſaved for another year. And another thing, which ſaves a very great number of them, is their being able to bear the heat and moiſture of a whole year without growing. Wild oats, and many other ſeeds of *Weeds* are of this kind. If you gather theſe when ripe, and ſow them in the moſt careful manner, watering them at times, and taking all the care of them that is neceſſary to the moſt tender plants, they will not grow till the ſpring come twelve-month after they were ſowed, and ſometimes not till the ſpring after that; that is, two years and a half after the time of putting them into the ground. It is plain from this, that no art can deſtroy theſe by fallowing, or other means, in one year.

The common way of *weeding* among the young corn, turns out to very little good; if this is done while the *Weeds* are young, the greateſt part of them are only cut or broken off near the ground; this, inſtead of deſtroying them, gives them new vigour, and they ſhoot up with many heads in the place of one, and draw more nouriſhment than at firſt: if, on the other hand, it is done when they are grown up, the relief comes after the diſeaſe; for by that time they have robbed the corn of all the nouriſhment, or nearly all, they could. Hand-*weeders* alſo frequently do more harm in the corn, by treading it down, than they do good by taking out the *Weeds*. This operation ſometimes coſts the farmer twelve ſhillings an acre, beſide the miſchief done, and yet there remain *Weeds* enough for a crop the next year from ſeeds.

The method of horſe-hoeing is a very excellent way of curing lands of this diſeaſe, ſo long as it is carefully practiſed; one of the greateſt advantages it will bring the farmer, is, that no *Weeds* will grow up but thoſe whoſe ſeeds are brought in the air, and theſe are but very few in compariſon of the other kinds.

WEEDS, in mining, a term uſed by our Engliſh diggers to expreſs any ſort of unprofitable ſubſtance found among the ores of metals. They ſeem to have borrowed the phraſe from the gardeners; and as every thing with them is a *Weed*, except what they have planted, and expect to gather, ſo every thing is a *Weed* with the miners, except the thing they are ſinking for. See the articles DIGGING and MINING.

The principal ſubſtances known in our mines under the names of *Weeds*, are mundic or marcaſite; this is of three ſorts, white, yellow, and green; daze, a kind of glittering talcy ſtone, of the telaugium kind, which endures the fire, and is of various colours and hardneſſes; iron-moulds, or pyritæ; caul, which is browniſh and ſpongy; and gliſter, which is a ſort of talc. Phil. Tranſ. N°. 69.

Hair-WEED. See the article HAIR.

WEEK (*Cycl.*)—WEEK-*Fiſh*, in zoology, a name given by ſome to a very delicate fiſh, caught on the Eaſt Indian ſhores, and called by the Dutch there the *wit viſch*. *Ray*'s Ichthyography, append. p. 6. See the article WIT-*Fiſh*.

WEEVER, in ichthyology, the Engliſh name for the fiſh called by Willughby and other authors, the *draco-marinus*, or ſea-dragon, and the *araneus-marinus*, or ſea-ſpider. Some alſo have called it *trachurus*.

It is properly, according to the Artedian ſyſtem, a ſpecies of the *trachinus*, and is diſtinguiſhed by that author by the name of the *trachinus* without beards, and with the lower jaw longeſt. See the articles DRACO-*Marinus* and TRACHINUS.

It is to be obſerved that Willughby and Geſner have deſcribed what they call two other ſpecies of this fiſh; but theſe are all found, on a cloſe obſervation, to be the ſame fiſh, differing only in reſpect of age and ſize, or other accidental variations, owing to the like natural cauſes.

WEEVIL, in natural hiſtory, the name of a ſmall inſect which does great damage in magazines of corn, by eating into the ſeveral grains, and deſtroying their whole ſubſtance.

This creature is ſomewhat bigger than a large louſe, and is of the ſcarab kind, having two pretty, jointed, tufted horns, and a trunk or piercer, projecting from the forepart of its head: at the end of this trunk, which is very long in proportion to its body, there are a ſort of forceps, or ſharp teeth, with which it gnaws its way into the heart of the grain, either to ſeek its food, or to depoſit its eggs there.

By keeping theſe creatures alive in glaſs tubes, with a few grains of wheat, their copulation and manner of generation have been diſcovered. The female perforates a grain of wheat, and therein depoſits a ſingle egg, or, at the utmoſt, two eggs; and this ſhe does to five or ſix grains every day for ſeveral days together. Theſe eggs, which are not larger than a grain of ſand, in about a week produce as odd a ſort of white maggot, which wriggles its body very much about, but is very little able to move from place to place: this, in about a fortnight, turns to an aurelia, from which is produced the perfect *Weevil*. This deſtructive creature is itſelf very ſubject to be deſtroyed, and when in the egg or aurelia ſtate, is very ſubject to be eaten by mites. *Baker*'s Microſ. p. 221. *Lewenhoeck*.

WEIGHT (*Cycl.*)—In the Philoſophical Tranſactions [a] we have an account of the analogy betwixt Engliſh *Weights* and meaſures by Mr. Barlow. He advances that antiently a cubic foot of water was aſſumed as a general ſtandard for liquids, and weighed 62 pounds and a half. And, in effect, we find [b] the *Weight* of a foot of pump-water to be 62 pounds 8 oz.—[[a] N°. 458. Sect. 1. [b] Phil. Tranſ. N°. 169.]

This cubic foot multiplied by 32, gives two thouſand, the *Weight* of a ton. And hence 8 cubic feet of water made a hogſhead, and four hogſheads a ton, in capacity and denomination, as well as *Weight*.

Dry meaſures were raiſed on the ſame model. A buſhel of wheat, aſſumed as a general ſtandard for all ſorts of grain, alſo weighed 62 pounds and a half. Eight of theſe buſhels made a quarter, and 4 quarters a ton weight. See the article BUSHEL.

Coals were ſold by the chaldron, ſuppoſed to weigh a ton, or 2000 pounds. See the article CHALDRON, *Cycl.*

Hence a ton in *Weight* is the common ſtandard for liquids, wheat, and coals. Had this analogy been kept up, it would have prevented the confuſion now complained of.

It may be reaſonably ſuppoſed that corn and other commodities, both dry and liquid, were firſt ſold by *Weight*, and that meaſures, for convenience, were afterwards introduced, bearing ſome analogy to the weight before uſed.

Mr. Barlow's ſcheme ſhews the reaſon why the word *ton* is applied both to *Weight* and liquid meaſure, *viz.* becauſe the ſame quantity of liquor is a ton both in *Weight* and meaſure. Hence the word *quarter* may alſo be explained. Biſhop Fleetwood [a] gueſſed that it ſignified the fourth part of ſome *Weight*, and not of any meaſure. And it ſeems plainly to ſignify the fourth part of a ton, or 2000 pounds [b].—[[a] Chron. Pret. p. 72. [b] Phil. Tranſ. ibid.]

WEIGHT *of the Human Body*. It is to be obſerved, that the heat and dryneſs of the air both leſſen the *Weight* of the body, and the cold and moiſtneſs of the air both increaſe this *Weight*. See the article MOISTURE *of the Air*.

Much ſleep, much food, and little exerciſe, are the principal things which increaſe the *Weight* of the body, and make animals grow fat. Conſequently, if the weight of the body be too great for good and uninterrupted health, it may be leſſened by diminiſhing ſleep and food, and by increaſing exerciſe.

cife. On the contrary, if the *Weight* of the body be too little for good health, it may be increafed by adding to food and fleep, and by leffening exercife; and the food muft be increafed chiefly by increafing drink and liquid nourifhment. For the difcharges are commonly lefs from drink and liquid nourifhment, than from dry and folid food. Dr. *Bryan Robinfon* of the Food and Difcharge of Hum. Bod. p. 89, 90.

There is but one *Weight* under which a body can enjoy the beft and uninterrupted health, and that *Weight* muft be fuch, that perfpiration and urine may be nearly equal at all feafons of the year; for by this means the body will be uniformly drained of its moifture: the inward parts by urine, and the more fuperficial parts by perfpiration, without any irregular and unnatural difcharges, and its moving *Weight* will continue nearly the fame at all feafons of the year. Dr. Bryan Robinfon thinks this *Weight* may be fettled, by his obfervations in his treatife on the food and difcharges of human bodies.

A quick increafe of *Weight* in human bodies often produces diftempers; the beft way to prevent this increafe is either by fafting or exercife. But amidft a variety of difturbing caufes, nothing fo effectually prevents fuch an increafe of *Weight* as a very exact and regular diet, which may prevent the difcharges from running into irregularities and difproportions to one another. See Dr. *Bryan Robinfon* of the Food and Difcharges of Human Bodies, p. 82. feq.

Men and other animals of extraordinary *Weight*, are often recorded in the writings of the learned. We have lately had two inftances of uncommon bulk and *Weight* in men near Halifax in Yorkfhire. One weighed 35 ftone and fome odd pounds, which is about 500 lb. And his brother weighed 34 ftone odd pounds; between them they make 70 ftone, or 980 pounds. Phil. Tranf. N°. 479. p. 102.

Athletic WEIGHT, in the animal œconomy, that *Weight* of the body under which an animal has the greateft ftrength and activity. Dr. Robinfon thinks this happens when the *Weight* of the heart, and the proportion of the *Weight* of the heart to the *Weight* of the body, are greateft. For the ftrength of an animal is meafured by the ftrength of its mufcles, and the ftrength of the mufcles is meafured by the ftrength of the heart. Alfo the activity of an animal is meafured by the *Weight* of the heart, in proportion to the *Weight* of the body. See Differt. on the Food and Difcharges of Human Bodies. p. 117, 118.

If the *Weight* of the body of an animal be greater than its athletic *Weight*, it may be reduced to that *Weight* by evacuations, dry food, and exercife. Thefe leffen the *Weight* of the body by wafting its fat, and leffening its liver, and they increafe the *Weight* of the heart, by increafing the quantity and motion of the blood; fo that by leffening the *Weight* of the body, and by increafing that of the heart, they will foon reduce the animal to its *athletic Weight*. Thus a game cock, in ten days, is reduced to its *athletic Weight*, and prepared for fighting. If the food which, with the evacuations and exercife, reduced the cock to his *athletic Weight* in ten days, be continued any longer, the cock will lofe his ftrength and activity.

It is known by experience, that a cock cannot ftand above 24 hours at his *athletic Weight*, and that he has even changed for the worfe in 12 hours. When he is at the top of his condition, his head is of a glowing red colour, his neck thick, and his thigh thick and firm; the day after, his complexion is lefs glowing, his neck thinner, and his thigh fofter; and the third day his thigh will be very foft and flaccid. Four game cocks, reduced to their *athletic Weight*, were killed, and found to be very full of blood, with large hearts, large mufcles, and no fat.

It is to be obferved, that the *athletic Weight* of an animal is a very dangerous *Weight*. Fevers and apoplexies are the diforders which commonly happen to animals under or near their *athletic Weights*. Hence, horfes fed upon dry food are much more fubject to fevers and apoplexies, than horfes fed upon grafs. Dr. *Robinfon*, ibid.

WELD, (*Cycl.*) the name by which our farmers commonly call the *luteola*, or dyers weed.

This is a very rich commodity among the dyers, and is the more advantageous to the farmer, as it may be raifed on very poor land, and at a very fmall expence. Moderately fertile land does beft for it; but it will grow upon the moft barren; and if this be but dry and warm, it will require no tillage. The feed may be fown with barley or oats, and only harrowed in with brufh or furze, or rolled down with a wooden roller. It is a very fmall feed, and the greateft difficulty about it is the fowing it even. It is a flow grower; a gallon of feed is fufficient for an acre; and though it makes but little progrefs the firft fummer, it begins to grow after the corn is cut, and the next year yields a good crop.

There is a great nicety required in the time for gathering it; for this fhould be when the ftalk is full ripe, and the feeds not fo ripe as to fall out; it is to be pulled up by the hand, and made up into little bundles to dry. The feed may be either thrafhed out as foon as it is houfed, or in the fpring following; but the plant muft be carefully kept dry.

The feed fells at about ten fhillings the bufhel, and the dyers ufe it for deep lemon colour, and bright yellows. It is more cultivated in Kent than in any other part of England, and it there yields the farmer from forty fhillings to ten pound an acre. *Mortimer's* Hufbandry, p. 165.

WELL (*Cycl.*)—In Scotland they have a *Well*, which Sibbald has mentioned as foretelling ftorms. It is a deep and large *Well* near Edinburgh, and from the noifes heard in it at certain times, is called by the people the *routing Well*. They go to this to liften after the prefages of weather, and it is faid that ftorms are particularly foretold by it; and that noifes are not only heard in it before ftorms happen, but that they are always heard determinately and diftinctly on that fide whence the ftorm will come. *Sibbald's* Prod. Hift. Scot.

In the Philofophical Tranfactions we have an account of a boiling *Well*. See the article SPRING.

WELLE *Corondc, fandy cinnamon*, a name given by the Ceylonefe to a fpecies of cinnamon which feels hard and gritty between the teeth, as if it were full of particles of fand, tho' in reality there is no fand among it.

The bark of this tree comes off very eafily; but it is not fo fit to roll up into quills as the right cinnamon, for it is more rigid and ftubborn, and apt to burft open. It is of a fharp but bitterifh tafte. The roots of all the cinnamon-trees yield more or lefs camphor, but this as fmall a quantity as any of them. Philof. Tranf. N°. 409.

WENDING, at fea, a term for bringing a fhip's head about, and feems only to be a corruption from *winding*. They fay, *how wends the fhip?*

WEPOLON, in zoology, the Ceylonefe name of an Eaft Indian ferpent, of a very long and flender body, and in fome degree refembling a piece of cane.

WERST, or WURST, a Ruffian meafure equal to 3500 Englifh feet. A degree of a great circle of the earth contains about 104 *Werfts* and a half. Phil. Tranf. N°. 445. Sect. 7.

WEST-ASHTON *Water* is a chalybeat water, refembling that of Holt. See Phil. Tranf. N°. 461. Sect. 20.

WESTERWALD *Earth*, a kind of earth mentioned by Agricola, of a whitifh yellow colour, of a like nature to the terra Silefiaca, but preferable to it, as yielding more falt. He tells us that it diffolves filver fo much better than other menftrua, as to render it potable, and parable into a ufeful medicine in cephalic cafes. *Boyle's* Works, vol. 1. p. 501.

WESTING, in navigation, the fame with departure. See the article DEPARTURE, *Cycl.*

WET (*Cycl.*)—WET *Air*. See the article MOISTURE *of the Air*.

WET *Couch*, a term ufed by the maltfters for one of the principal articles of malt-making.

In the making malt, the ufual way is to foak the grain in water two or three days, till it becomes plump and fwelled, and the water is brown; the water is then drained away, and the barley is removed to a floor, where it is thrown into a *wet couch*, that is, an even heap of about two foot thick.

In this heap the barley fpontaneoufly heats, and begins to grow, fhooting out firft the radicle, and, if fuffered to continue growing, foon after the blade; but at the eruption of the radicle, the procefs is to be ftopped fhort, by fpreading the *wet couch* thin over the floor, and turning it once every four or five hours for two days, laying it thicker each time; after this it is thrown into a large heap, and there fuffered to grow hot of itfelf, and afterwards fpread abroad again and cooled, and then thrown upon the kiln to be dried crifp without fcorching. *Shaw's* Lectures, p. 186.

WHALE (*Cycl.*)—The *Whale*-fifhery of the Caroline iflands is the moft eafy and agreeable of that of all other places, and, befide the great profit, affords a pleafant fpectacle to multitudes of people on the fhores.

There are ten or twelve of thefe ifles difpofed in form of a circle, fo that they make a fort of port, in which the fea is perpetually calm and pleafant.

When a *Whale* appears in this gulf, the people all get into their canoes, and rowing toward the fea, keep between the creature and its retreat, and drive him forwards towards the ifles at the bottom of the port. They drive him in this manner before them into the fhallows, where they plunge into the water themfelves, and fome get ropes and chains about him, while others dart him with their fpears. Their agility and addrefs is wonderful in this. The creature can never get away when they have once got him faftened, but is foon killed, and got to the fhore.

The anatomy of the bones of the *Whale* has been fo little underftood, that there have been many very great errors in regard to fuch of them as have been at times found foffile, or buried in the earth among the teeth of elephants, and the remains of teftaceous and other animals. The moft frequent and moft ridiculous of all the wrong opinions about thefe, is their having originally belonged to creatures of the human fpecies; yet many, even among the more intelligent part of the world, have taken them for the remains of giants. The vertebræ of a *Whale* have been miftaken for thofe of a giant, and a part of its fins for a hand, and fo of the reft. While the world, more ready to fpread the marvel, than to inquire into the truth, have made computations of the height of the man to whom bones of that fize muft have belonged, and from their propor-

tion

tion in regard to thofe of the common human fize, have found the giant who poffeffed them muft have been ninety or an hundred foot high; while much lefs pains in comparative anatomy would have taught them, that they never could have belonged to any human body at all. Mem. Acad. Par. 1727.

Toothed WHALE, *Cetus Dentatus*, a name given to a peculiar kind of *Whale*, called by Johnfton, and many other writers, by the too general name of *balæna*.

This is diftinguifhed from the common *Whale* which yields the *Whale*-bone, by having white and ftrong teeth in the lower jaw, which that fifh has not. This is the fpecies of *Whale* from which the fperma ceti was originally taken. It was firft of all difcovered on the coaft of New England, being thrown on the fhore there, and fperma ceti formed by the fun and air out of the oil of its head; but it is far from being peculiar to that place; the northern feas afford it, and it is not unfrequently taken on the weftern coafts of Ireland. One caught there about fifty years fince, meafured feventy-one foot in length, which is nineteen foot more than the length Clufius allows to this fifh.

The fperma ceti originally ufed in medicine was only a part of the oil or liquid fat of this fpecies of *Whale*. This, in its firft confufed appearance, as drawn from the animal, appears of a whitifh colour like milk, and in this ftate is put into large veffels, in which a clear yellowifh oil feparates itfelf to the bottom; the fperma ceti, as it is called, fwims at top in white flakes or fcales; thefe foon after precipitatate themfelves to the bottom of the veffel, where they candy together, and form large lumps of fperma ceti; there requires fome care and trouble to feparate and purify this thoroughly from the ftinking oil that is apt to ftick to it, but the price of the drug very well allows it.

The fat of the body affords the fame fubftance, but it is obtained in larger quantities from that about the head. Several hundred weight of this may be got from one *Whale*: But our common practice at prefent is to make it from the lees and fettlements of common train oil. Philof. Tranf. N°. 227. p. 508.

WHAME, in natural hiftory, the name given by the people of fome parts of England to the burrel-fly or wringle-tail, a fpecies of bee-fly very troublefome to horfes. See the article WRINGLE-*Tail*.

WHEAT (*Cycl.*)—It has been very juftly obferved by the antients, as well as moderns, that *Wheat* will grow in almoft any part of the world, and that, as it is the plant moft neceffary to mankind, fo it is the moft general and the moft fruitful. It grows well not only in the temperate climates, but in the very hot and very cold ones; and when fown in places where it never grew fpontaneoufly, fucceeds as well as where it has been always common.

The fuccefs of our crops of *Wheat* in America plainly prove this: And in Peru and Chili in particular, where thofe countries were very well inhabited, it never was known till the Europeans brought it in, it produces as large crops as in any part of England. *Deflandes*, Trait. Phyf.

When *Wheat* is planted early, lefs feed is required to an acre than when it is planted late, becaufe lefs of it will die; and poor land fhould always be allowed more feed than rich, becaufe a greater number of the plants will perifh on this land than on the other. The leaft quantity of all of feed is neceffary for rich land, that is planted early, for in this cafe very few of the feeds will fail to produce a plant that will live and flourifh. The ufe of the hoe caufes every plant to fend out a great number of ftalks from the fame root, and in thefe, more than in the number of plants, confifts the richnefs of a crop, as the ears on thefe are always largeft and fulleft.

Another thing to be confidered, in order to find the proper quantity of feed to plant, is, that fome *Wheat* of the fame fpecies has its grains twice as large as others: in this cafe a bufhel, containing but half the number of grains that it does in the fmall-grained *Wheat*, one bufhel of the fmall-grained will plant juft as much as two bufhels of this; not the meafure of the feeds, but the number of the grains being the thing to be confidered in regard to the fowing. *Tull's* Horfehoeing Hufbandry.

It is a very natural thing to fuppofe that a large-grained *Wheat* will produce larger and finer plants, and larger grain than a fmall-grained one; but experiments have proved, that there is nothing in this; for the fmalleft-grained *Wheat* produces fully as large plants as the largeft, and thofe with as great ears, and as big feeds; but the young plants appear fmaller and poorer.

Six gallons of middle-fized feed is the ufual quantity drilled upon an acre; but on rich lands, planted early, four gallons will fuffice; becaufe then the *Wheat* will have roots at the top of the ground before winter, and tiller very much, without danger of the worms, and many other accidents, which the late planted *Wheat* is liable to.

If it be drilled too thin, it will be in danger of falling, and if too thick, it may happen to tiller fo late in the fpring, that fome of the ears may be blighted; a medium therefore is beft. The depth to plant it at is from half an inch to three inches; for if planted too deep, there is more danger of its being eaten off by worms between the grain and the blade. A *Wheat*-plant that was not fown early, fends out no root above the grain, before the fpring, and is nourifhed all the winter by a fingle thread, proceeding from the grain up to the furface of the ground: this is the thread of life to the plant during the winter, and the longer that is, the greater danger there is of the worm, that creature much more eafily finding a thread that extends by its length to five or fix inches deep, than one which reaches but one inch; befide, the worms in winter do not inhabit very near the furface of the ground, and therefore they never naturally come in the way of the fhort threads, though the long ones are always in their reach.

It is very neceffary to take care againft the rooks, juft at the time when the *Wheat* is fhooting up. Thefe mifchievous birds perceive it beginning to fprout, before the farmer can fee any thing of it, and are led by the fhoot to pick it up; they muft be carefully kept off the ground for a week or ten days at this feafon; for at the end of that time the blade will be grown up, and the grain fo exhaufted of its flour, that it will be of no value to them, nor will they give themfelves any trouble about ftealing it.

The rooks never moleft fuch *Wheat* as is fown about Michaelmas time; for at this feafon there is fo much grain of the late harveft fcattered about the fields where it has grown, that they find it much more worth their while to pick it up there, than to fearch under ground for it in the fown crops, which therefore efcape till too far grown for this animal. *Tull's* Horfehoeing Hufbandry.

Many experiments have been tried to the great purpofe of multiplying grain, fome of which are commemorated, with an account of their different fuccefs, in the Philofophical Tranfactions. Digby mentions a plant of barley, all rifing from one corn, which, by fteeping in water in which was a fmall quantity of falt-petre, and afterwards being watered every day with the fame water, brought forth two hundred and forty-fix ftalks, and above eighteen thoufand grains: And the laft edition of Cambden mentions a thing very obfervable of this kind, though from another caufe; which is, that the corn fown in a field in Cornwall, where a battle had a little time before been fought in the civil wars, brought forth four or five ears upon every ftalk.

Mr. de da Prince has fairly tried the common and many other methods, which though they have not had fuch immenfe products for their fuccefs as thefe related above, yet may fet the world right as to what they have to expect from the different ingredients generally ufed, and which of them promife moft fairly for fuccefs.

The experiments are thefe: On the 22d of March there were laid to fteep a pea, a barley-corn, a *Wheat*-corn, and an oat-corn, in brimftone-water. Thefe were alfo fteeped in alum-water, in a folution of falt of tartar, in the folution of the caput mo tuum of fal armoniac, in common urine, in a folution of the common nitrum murale or falt of old walls, in a folution of falt-petre in water; and, finally, in the noftoc or ftar-jelly.

When thefe had all ftood fteeping in this manner in their feveral liquors five days and five nights, they were fet in a good foil, in a garden, under a wall, directly facing the fun. They were fet in the morning after a rainy night, and there were fet with them a pea, a *Wheat*-corn, a barley-corn, and an oat-corn, unfteeped, and in the common way. This was on the twenty-feventh of March, and on the tenth of April following, fome of them were come up, others did not appear. Thofe which had been fteeped in the brimftone-water, all came up together. Of thofe fteeped in alum-water, the three grains were fprouted; but the pea, though very much fwelled, had made no attempt to fhoot. Of thofe made in the folution of falt of tartar, the barley and oat were aboveground, and the pea had fprouted a little, and the barley fcarce at all. Thofe fteeped in the folution of the caput mortuum of fal armoniac, in urine, as alfo thofe in the folution of the falt of walls, were all come up. Of thofe fteeped in the folution of falt-petre, the oat and barley were quite up, the others had fprouted a little. Thofe which were fteeped in the noftoc or ftar-jelly, were none of them come up, and fcarce had made any attempt to fprout. The barley and oat fteeped in urine had juft come up; but the *Wheat* and pea had fcarce fo much as fprouted; and finally, thofe which had not been fteeped at all, were all come up as foon, and appeared as vigorous as thefe, except the *Wheat*, which appeared a little lefs forward than the reft.

All thefe fhoots or young plants were fet about a finger deep in the ground, and they had a fine favourable feafon to grow in.

It appears from the whole, that alum-water is particularly bad for peas, tho' it agrees well enough with *Wheat* and barley, and with oats. That falt of tartar does very well with oats and barley, but is hurtful to peas, and to *Wheat*. That falt-petre does not appear to have that virtue which has been fo long given it, of promoting the growth of plants; and in fine, that all thefe fteepings did no vifible fervice to the grain; but that many of them evidently hurt the feveral kinds.

All thefe young plants were digged up, except three of the fhoots of barley; and thefe increafed fo very much, on ftanding

ing in a good foil and afpect, and at the diftance of two foot afunder, that they had fixty, fixty-four, and fixty-feven ftalks, from their fingle grain and root. Each of thefe ftalks had an ear, and, one with another, there were about forty corns in each ear. New fhoots were continually iffuing from the roots; and as the Eaft Indian trees afford leaves, bloffoms, and ripe fruit at the fame time, fo if the fun's heat had continued, there would have been young fhoots, young ears, and ripe ears on the fame plant, at the fame time, all the year round.

It feems very plain, from the whole of thefe experiments, that the multiplying of *Wheat* and other grain is rather to be expected from the fowing it on a good foil, and at a proper diftance, than from any of thefe liquors contrived to fteep the feed-grain in. As moft of the liquors contrived for this purpofe are, however, harmlefs, it will be worth the farmers while to try them at times, and in a regular manner, fowing the different parts of the fame field with fteeped and unfteeped grain, in the fame proportion.

The experiment of the fteeping the grain in the offals of animal fubftances, carries with it evident fuccefs; but we are to remember, that only a third part of the quantity of feed is to be ufed to the fame quantity of ground in that method, as is in the common way; and it is more than poffible that the increafe which attends this method, may be owing to this diftance of the plants, rather than to the good done by the water. Philof. Tranf. N°. 281. p. 1212.

It is evident from experience, that the multiplication of *Wheat*, that is, the quantity of *Wheat* produced from every grain, is very different in different places, and according to various accidents. It has been often attempted to arrive at the art of caufing every grain of *Wheat* to yield its utmoft poffible increafe; and if this could be brought about on eafy terms in the large way, fo as to affect whole fields, it is evident that the advantage would be very confiderable. This has been attempted by Vallemont in feveral different ways, but with moft fuccefs in thefe following: Let there be collected together as large a quantity as may be of the bones, fkins, feathers, and other parts of animals, which are thrown away as refufe, together with the refufe of foods and wearing apparel, fuch as old fhoes, gloves, or whatever elfe of this kind comes in the way, though horns and hoofs of all animals are excellent; and, in fhort, let every thing be collected that abounds with falts: when a large parcel of thefe things is got together, let them be feparated into two or three heaps, according to their different natures; the hardeft kinds into one heap, the fofteft into another, and fo on. Let each of thefe parcels be put into a large wooden veffel, and a fufficient quantity of rain or river-water be poured on them, that they may fwim at liberty in it. When the water has ftood fo long, that it ftinks very much; ftrain it off, and keep it in veffels for ufe. The fofteft bodies will give the water this ftink in five days; the moderately hard ones in feven days; and the hardeft of all in nine days. Thefe laft are to be broken to pieces before they are put into the water. The liquor prepared from thefe is called the *prepared water*.

Let a quantity of plants of any kind, no matter what, be burnt with their flowers and feeds, and let a lixivial falt be made from the afhes in the common way. Then take as many pounds of falt-petre as there are acres of land to be employed, and let each pound be diffolved in twelve quarts of water, and to this folution add a fmall quantity of the lixivial falt of the plant. This liquor the author calls the *univerfal matter of vegetation*. When both the liquors are thus made, mix together an equal quantity of each of them; that is, of the prepared water, and of the univerfal matter; and let the whole quantity be fo much as will ferve thoroughly to wet and foak the quantity of corn that is to be fown; this is to be fo much, that it ftands two fingers breadth above the grain. When the grain and the liquor are thus mixed, the light grains, which will not grow, will fwim at the top, and may be fkimmed off and feparated from the reft. The grain at the bottom of the veffel is to be ftirred up and turned every two hours: in this manner, the grain is to be foaked twelve hours, and after this the water is to be poured off, and the grain dried, by laying on a fieve, or thin fpread on the floor; and after two or three hours it is to be fown in the common way.

The quantity of feed neceffary for an acre of ground, when thus fteeped, is only one third of the quantity commonly ufed, and this will produce infinitely more grain, and is as much as the land can bear. The liquor poured off from the foaking of this quantity of grain, is not to be thrown away, but muft be faved, for it will ferve as well for feveral more parcels as it did for this.

This was tried in the year 1706, which was the year after the book came out, in feveral parts of France, and that with fo much fuccefs, that the author got great reputation, and his book was tranflated into the German, and fome other languages. Whether the method was found afterwards not to fucceed fo well, or whether it was dropped through mere inadvertence, the thing has not been regarded fince that time; but the procefs is at once fo cheap and fo eafy, that it fhould feem extremely worth while to bring it into trial again. *Vallemont.* Curiof. de Vegetat.

There are four ways of augmenting the crops of *Wheat*, not in the number of the plants, but in the ftalks, ears, and grains.

The firft is by increafing the number of ftalks from one, two, or three, to thirty or forty in each plant, in ordinary field land; and the crop is augmented by bringing up all thefe ftalks into ear, which is the fecond way; for if it be diligently obferved, it will be found that not one half of the ftalks of *Wheat* fown in the common way, ever come to ear at all: Nay, if a fquare yard of fown *Wheat* be marked out, and the ftalks thereon numbered in the fpring, it will be found that no lefs than nine parts in ten of them are wanting at the harveft-time.

An experiment of the advantage of this augmentation was made by Mr. Tull in rows of *Wheat* that were equally poor; one of thefe rows was increafed fo much, as to produce more grains than ten of the other, by bringing up more of its ftalks into ears, and alfo by augmenting the ears to a much greater bignefs, which is the third way; for it is very certain that the ears will be much larger or much fmaller, according to the quantity of nourifhment that is given them.

The fourth and laft way of increafing the crops of *Wheat*, is by caufing the grain to be much larger in the ears. This can no way be done fo effectually as by late hoeing, efpecially if it be done juft after the *Wheat* is gone out of the bloffom; by this means the grains will weigh twice as much as thofe produced in the fame fort of *Wheat*, when this late hoeing has been omitted; their number, at the fame time, is the fame in the ear; and as the *Wheat* is fold not by tale, but by meafure, the farmers gain is double in this cafe, the *Wheat* meafuring juft twice as much as it would otherwife have done.

Thus by increafing the number of the ftalks, bringing more of them up into the ear, making the ears larger, and the grains larger, plumper, and fuller in every ear; the method of horfe-hoeing, by which alone this can be effected, makes a larger crop out of the tenth part of the number of plants, than in the common way: but all thefe advantages will be loft by thofe who, though they give into the horfe-hoeing way, yet will not allow the fix foot intervals between the rows; for it is owing to this great fpace of ground alone, that as much nourifhment may be given to the *Wheat* as the farmer pleafes.

In the method by thefe wide intervals, we can raife a larger crop of *Wheat* with lefs labour, lefs feed, no dung, and no fallowing; but not without a competent quantity of earth, which is the cheapeft thing given to corn. The earth of a whole good acre being but about the tenth part of the expence, and of indifferent land but about a twentieth.

The crop enjoys all the earth, for between the laft hoeing and the harveft, there remains nothing but a fpace of empty mould in the middle of the intervals. Farmers do not grudge the price of three or four pounds in the buying and carriage of dung for an acre; but they think themfelves undone if they afford an extraordinary eighteen-pennyworth of earth to the wide intervals of an acre, not confidering that earth is at once the beft and the cheapeft entertainment that can be given to plants; for at five and fixpence rent, which is common to fome land in many parts of the kingdom, the whole earth belonging to each of the rows cofts only fixpence; that is, a penny for a foot broad and fix hundred and fixty foot long, that being the fixty-fixth part of an acre. But the vulgar count this expence of a foot breadth of ground not as they ought, only as part of the rent, but as an eleventh part of their own ufual charges added to the rent.

If the intervals are narrower in deep land, there might be earth enough in them; but there would not be room enough to pulverize it.

The horfe-hoe, well applied, fupplies the ufe of dung and fallow; but it cannot fupply the ufe of the earth, though it can infinitely increafe the virtue of it, where there is any reafonable quantity.

The mean price of *Wheat*, between dear and cheap, is reckoned five fhillings a bufhel; and therefore an acre of land that fhould produce every year eight bufhels, without any expence, would be accounted a very profitable one. Now an acre of land drilled with *Wheat*, and horfe-hoed, will produce fixteen bufhels of *Wheat* eafily, with the expence only of ten or fifteen fhillings, and this is a third part more profitable.

It is commonly computed that the farmer cannot live, if the *Wheat* he fold under five fhillings a bufhel; he muft therefore keep his *Wheat* when it is fold cheaper than that in the markets; and the common method is to keep it in the ftraw, taking care to keep away the mice. The fecureft method of all is to dry the *Wheat* in the grain; but this many are afraid to practife.

Some people, who have known this fecret, have made great profit by buying up the *Wheat*, when under three fhillings a bufhel in the markets, and then preferving it in this manner till a dearer time. The method is to dry it in a malt-kiln, but with no other fuel than *Wheat*-ftraw, never fuffering it to have any ftronger heat than that of the fun. The longeft time the *Wheat* need lie in this heat, is twelve hours; but fometimes four hours is fufficient; according to its dampnefs when bought, and the time it is intended to be kept, it requires a longer or fhorter drying. The only thing that caufes the

the decay of *Wheat*, and gives way to that devouring animal the weevil in it, is its too great dampnefs; this is carried off in this manner, by a heat no greater than that which the fun might have given to the grain. The vegetating power therefore is not deftroyed by this; and the bakers have acknowledged that the flour of this *Wheat* does rather better for the working into bread, than that of frefh *Wheat*.

Though all forts of vegetables may have great benefit from the hoe, becaufe it fupplies them with plenty of food at the time of their greateft need; yet they do not all equally require hoeing; but the plant that lives longeft fhould always have the greateft ftock of nourifhment provided for it, and fhould therefore be moft frequently hoed of any plant. *Wheat* generally lives, or ought to live, longer than any other corn; for if it be not fown before fpring, its grain will be thin, and will have but little flour in it; and when it is fown late in the winter, it is in great danger of being killed by the frofts, while weak and tender.

To prevent thefe inconveniencies, *Wheat* is generally fown in autumn; and by this means, having thrice the time to be maintained that fpring corn hath, it requires a larger fupply of nourifhment, in proportion to that longer time; not that the *Wheat* in its infancy confumes the ftock of food that it afterwards does, but becaufe, during that long interval between winter and the fpring feed-times, moft of the artificial pafture or benefit from former tillage, is loft both in light and ftrong lands.

This is the reafon why all that extraordinary pains in fallowing and dunging of the foil is neceffary for *Wheat*; and yet all this trouble and expence is fo far loft, that if a part of the fame field unfallowed and undunged be fown in April, after good plowing, it will raife as fair a crop in all refpects as the other, only that the flour will be in lefs quantity, by wanting time in the ground for filling the grains.

Poor light land, in the common way of hufbandry, muft be extremely well manured, in order to the maintaining *Wheat* a year, which is the ufual time that it is in it; and if it be fown late, the greater part of it ufually perifhes, not being able to furvive the winter while fo poor, and on fuch land; and if it be fown very early on ftrong land, though rich, well tilled, and dunged, the crop will be worfe than on poor light land fown early. The new method of horfe hoeing gives both to ftrong and to light land all the advantages neceffary, and takes off all the difadvantages of both. By this method the ftrong land may be planted with *Wheat* as early as the light, if plowed dry; and the hoe-plough, if rightly applied, will be able to give it nourifhment equal to that of dung in both forts of land.

The tops of the ridges for the drilling of *Wheat* muft not be left quite fo narrow and fharp as they are for drilling of turneps, *Wheat* being generally to be fowed in treble rows, and the turnep only in fingle ones. In reaping the *Wheat* thus fown, it is to be cut as near to the ground as poffible, and this is eafier done in this than in *Wheat* fown in the common way, becaufe in this drilled method the ftalks all ftand clofe together. When the *Wheat* is cut thus low in the reaping, the ftubble is no great impediment to the preparing the land for the fucceeding crops.

As foon as conveniently may be, after the carrying off a crop of *Wheat*, if the trench in the middle of each wide interval be left deep enough by the laft hoeing, the farmer is to go as near as he can to the ftubble with a common plough, and turn two large furrows into the middle of the intervals, which will make a ridge over the place where the trench was; but if the trench be not deep enough, it is beft to go firft in the middle of it with one furrow, this, with two more taken from the ridges, will be three furrows in each interval; this plowing is to be continued as long as the dry weather lafts, and then the whole is to be finifhed by turning the partitions on which the laft *Wheat* grew up to new ridges, which is ufually done at two great furrows; thefe laft furrows, which complete the ridges, may be plowed in wet weather. By this fort of management, the *Wheat* being planted in rows, at fix foot intervals, the fame piece of ground will produce every year a new crop of *Wheat* in the intervals, without any fallowing or manure, only by means of the fufficiently breaking the furface with plowing and horfe-hoeing.

It is a general rule, that all forts of grain profper beft where they are fown at a time when the ground is fo dry that it is broken to a fort of powder by the plough. *Wheat* alone is an exception to this rule; and the reafon of this is, that as *Wheat* is to endure the feverities of a whole winter, after it is fown, it therefore fucceeds beft by being fown in wetter weather, when the ground is not to be broken fo very fmall, and is preffed down clofe upon the feeds, and covers them better. If *Wheat* were as hardy as rye, and its roots were as hardy and patient of the cold, it might be fown in as dry a feafon as the rye, and would profit as much by it; but, on the contrary, it requires fo much covering, that it is a very good practice of fome farmers to turn on their fheep over very light land, as foon as it is fown with *Wheat*, in order to tread the furface of it hard, and then the cold of winter cannot fo eafily kill or penetrate the roots. And as *Wheat* requires to have the earth lie harder on and about it in the winter, fo it alfo requires more dung, or fomewhat elfe, to diffolve the earth about its roots, after the cold weather is paft, than the rye does, whofe roots were not fo confined by the preffing of the earth about them.

It is another general rule, that all vegetables thrive beft when fown on frefh tilled ground, immediately after it is plowed; but *Wheat* is alfo an exception to this rule, for the beft way for it is to plow the ground when very dry, and then to let it lie even, though it be many weeks till fome rain come to moiften it, and then drill the *Wheat*. The harrows and the drill, in this cafe, will move a fufficient part of the ground, which will ftick together for the defence of the fmall roots during the winter, the reft of the mould lying open, and divided underneath until fpring, to moiften them and nourifh them.

There is a fort of binding fand, which requires not only to be plowed dry, but to be fowed dry alfo, or elfe the *Wheat* will dwindle in the fpring, and fail of being a good crop. What is meant here by dry plowing, is not, however, that the ground fhould be fo dry that the duft fhould fly; but it muft not be fo wet as to ftick together in lumps; neither fhould the ground be drilled when it is as wet as pap: it fuffices that it is moift; only the lighter lands ought to be more moift than the ftrong.

Strong land plowed wet in November, will be harder in the fpring than if plowed dry in Auguft, though it would then have three months longer to lie. *Tull's* Horfe-hoeing Hufbandry.

Buck-Wheat. This is a plant very advantageous to the farmers of England, who have barren lands in poffeffion. It is to be fown in May. One bufhel of feed will fow an acre, and it will grow on any foil. It ripens late in autumn, and, when mowed, it muft lie upon the ground till the ftalks, which are naturally hard, grow foft; it will not fhed the feed in lying, nor will it get any damage by the rain. It yields a very confiderable increafe, and if the land be tolerable, fometimes no lefs than fifty or fixty bufhels from an acre.

It is excellent food for hogs, poultry, and other animals. The flour of it is very white, and, mixed with *Wheat*-flour, is ufed for food by the country people in fome places. The ftraw is good fodder for cattle, and the grain is good to give to horfes among their oats; but it muft be broken in a mill, otherwife it will pafs through them whole.

Buck-Wheat makes a very good lay for *Wheat* or rye, efpecially if not mowed, but plowed in; but the beft way is, juft before it bloffoms, to feed it with cattle, efpecially with milch cows, which it caufes to yield a great deal of milk, and that fuch as yields very good cheefe and butter. It is food for the cattle in the very dryeft time, when all the common grafs in paftures is burnt up; and proves a very great improvement for the land. For this purpofe they fow it thicker than for others, fometimes three or four bufhels on an acre. *Mortimer's* Hufbandry, p. 137.

White-Cone-Wheat, a term ufed by our hufbandmen to exprefs a peculiar kind of *Wheat*, which is very ftrong, and has a large ear.

It is the beft kind for fowing in fields fubject to the blight; for the ftalks of it being, for the moft part, folid or full of pith like a rufh, not hollow like thofe of common *Wheat*; the infects that caufe the blight fiezing on the ftalks of other *Wheat*, does this no injury, even though they fhould attack it; the ftalks of this kind being often found full of the black fpecks, which are always the marks of that infect having been there, and yet the ear full, and the grain good.

This *Wheat* makes very good bread, if the miller does not grind it too fmall, or the baker make his dough too hard, it requiring to be fomewhat larger than other *Wheat*-flour, and fomewhat fofter in the dough. A bufhel of *white-cone-Wheat* will make confiderably more bread than a bufhel of Lammas *Wheat*; but it gives it a fomewhat yellowifh caft. *Tull's* Horfe-hoeing Hufbandry.

Smyrna Wheat, a peculiar kind of *Wheat* that has an extremely large ear, with many leffer or collateral ears coming all round the bottom of the great one.

As this is the largeft of all forts of *Wheat*, fo it will difpenfe with the nourifhment of a garden, without being overfed, and requires more nourifhment than common hufbandry in the large way can give it. In the common way its ears grow not much larger than thofe of our common *Wheat*.

This fort of *Wheat* feems, of all others, the moft proper for the new method of horfe-hoeing hufbandry, as that method feems capable of giving as much nourifhment as the farmer pleafes, by often repeating the hoieng. Next to this, the *white-cone-Wheat* is beft for this fort of hufbandry; then the grey-cone-*Wheat*.

Wheat-*Bird*, a name given by the people of Virginia to a fpecies of bird, which, after the time of the fowing the *Wheat* in that country, made its appearance annually at the feafon of its beginning to ripen, and was never feen there before. See the article *Birds of* Passage.

Wheat-*Ear*, in zoology, the Englifh name of the common œnanthe, called alfo the *white-tail*, and the *fallow-finch*. See Tab. of Birds, N°. 33.

It is fomething larger than the common fparrow; its head and back are of a greyifh colour, with fome admixture of red-

rednefs; and the female has fometimes a confiderable caft of green; the rump is white, whence the bird has its name of the *white-tail*; tho' this is fometimes not the cafe, the rump being of the fame colour with the reft of the back. The belly is whitifh, with a glow of red; the breaft and throat are redder than the belly: And in the male birds the belly is fometimes yellowifh. There is on each fide of the head a long white line running above the eyes, and under them a fhorter of black, which laft is wanting alfo in the female. The wing-feathers are black, except their extremities, which are edged with a reddifh brown, with a caft of whitifh; the tail is very beautifully variegated with black and white. Its beak is black, flender, and ftrait. Its mouth black within, and opening very wide. It feeds on beetles, and other infects, and builds in the deferted burrows of rabbits, &c. They are extremely plentiful in Suffex, and fome other counties of England, after harveft-time, when they are extremely fat, and very much efteemed at table. *Ray*'s Ornithol. p. 168.

WHEEL (*Cycl.*)—WHEEL-*Animal*, a name given by the writers on microfcopical difcoveries, to a fpecies of minute animalcule, which appears in a fort of fheath or cafe, the end of which it faftens to the roots of water-plants, or whatever elfe is in its way. See Tab. of Microfcopical Objects, Clafs 1. This little creature has two feeming *Wheels*, with a great many teeth or notches coming from its head, and turning round, as it were, upon an axis. This little creature, on the leaft touch, draws in its *Wheel* into its body, and its body into the fheath; but as foon as all is quiet, it throws them out, and works them again.

In order to find thefe animalcules, choofe fuch roots of duckweed as are long, and proceed from ftrong old plants, for the young roots feldom afford any; they fhould not be covered with that rough matter which is frequently found about them, nor any way tending to decay, as they will often be.

In the water found remaining in the leaden pipes, or gutters, on the tops of houfes, there are alfo found great numbers of thefe *Wheel-Animals*. Thefe are of a different fpecies from the former; and when the water dries away they contract their bodies into a globular or oval figure, and are then of a reddifh colour, and remain mixed with the dirt, growing together into a lump as hard as clay. This, whenever it is put in water, in half an hour's time difcovers the animals living again, and as brifk as ever; and they have been found to be living in this manner, after the matter had been kept dry twenty months.

It fhould feem from this, that as the water dries up, their pores become fhut in the manner of thofe of fuch animals as remain torpid for the winter; and that when they find water come on again from rain, they then unfold themfelves, and live and feed as long as it lafts. *Baker*'s Microfcope, p. 91.

WHEELER, among brick-makers. See the article BRICK.

WHEEZING, a name given by our farriers to a diftemperature in horfes, in which they draw their breath with difficulty and noife.

The generality of people make this and purfinefs, in horfes, the fame diftemper; but the more judicious always diftinguifh it, as wholly different from that. Purfinefs proceeds always from a ftuffing or oppreffion of the lungs; but this *Wheezing* is only owing to the narrownefs of the paffages between the bones and griftles of the nofe.

The horfes that are moft of all afflicted with this diftemper, do not want wind; for notwithftanding that they *wheeze* exceffively when they are exercifed, yet all the time their flanks are not moved, but keep in the fame condition that they were while the creature ftood ftill. The dealers call thefe fort of horfes *blowers*, and though there is no real harm in the thing, it is a difagreeable quality, and few people will choofe them, that have much fervice for them.

There are fome horfes that have a natural defect in their breathing, which makes it at all times attended with fome difficulty, but not with the *Wheezing* before-mentioned; thefe are called thick-winded horfes.

People who are careful in the buying horfes, will purchafe neither of thefe kinds; but there is this caution to be obferved in regard to this defect, that it often feems to be in horfes where it really is not. When a horfe has been kept a long time in the ftable without exercife, he will at the firft riding be out of breath, and fetch it in a difficult and painful manner, though he be neither a blower nor thick-winded; but all this will go off with a little exercife.

There are fome temporary *Wheezers* and *blowers* among horfes: thefe at times rattle, and make a great noife through their nofes in taking breath; but the complaint goes off and returns. This is only occafioned by a great quantity of phlegm, for their flanks do not redouble with it at the worft of times, nor have they any cough with it; fo that there is no danger of their being purfy.

WHELPS. Nothing is more effential to the having a good pack of hounds, than a proper care of the *Whelps*, and of the parents from which they are to be bred.

The bitches, in particular, fhould be carefully chofen, and fhould be fuch as are the ftrongeft and beft proportioned; they muft alfo have large ribs and flanks.

The beft feafon for the coupling of hounds is in January, February, or March, for then they will litter in a good time of the year, that is, in fpring; fo that they will be fit to enter in due courfe, without lofs of time, or of the feafon; for if bitches litter in winter, it is very difficult to bring up the *Whelps*, the cold killing them if there is not great care taken of them.

The dogs that line the bitches muft not be above five years old; for if they are older than this, the young ones will be dull and heavy. Care fhould be taken to have a proper dog ready the firft time of the bitches going proud; for it is affirmed by many, who fay they have experience for it, that whatever kind of dog lines a bitch the firft time, there will be one puppy at leaft in all her fucceeding litters that will have fome refemblance of him.

The firft litter of puppies that a bitch brings, are never efteemed fo good as the fecond or third. When a bitch has been lined, and grows big with *Whelps*, fhe is not to be fuffered to hunt among the pack, nor to take any other violent exercife; for that would endanger her cafting her *Whelps*; fhe fhould be kept up, and fed well, and a good place fhould be provided for her to litter in.

As foon as fhe has littered, thofe which are intended to be kept fhould be felected out, and the reft immediately drowned. There is great difficulty in choofing the beft at this early time; but the general opinion gives it for thofe which are the lighteft, that they will be the fwifteft and beft as they grow up.

Others take all the *Whelps* away, and having determined what number they will keep, they fettle the choice on thofe which the bitch carries back firft to the place where fhe littered; but all this feems very uncertain.

The *Whelps* muft have good frefh ftraw to lie in, and it muft be often changed. They are to be kept in a place where neither the rain nor fun-fhine can be troublefome to them, and once a week it will be proper to anoint them all over with a little nut-oil, with fome faffron infufed in it. This will prevent the flies from annoying them fo much as they otherwife would, and will kill worms of all kinds. When they are fifteen days old, it is the cuftom to worm them, and a week after one joint of their ftern fhould be twifted off. As foon as they can fee, they fhould have milk given them to lap, and at two months old they muft be weaned, keeping them wholly from the bitch. They muft at this time be well kept, but not too high fed: And it is proper to put fome cummin feed into their food, to keep the wind out of their bellies.

Many let the *Whelps* of their hounds fuck three months, and then fend them away to villages to be bred up till they are ten months old, cautioning thofe people who have the care of them, not to let them eat carrion, nor frequent warrens.

Rye bread is a very common food for young hounds, and is particularly recommended by many, but wrongly, for it foon paffes through them, and gives them very little nourifhment. When they are fed conftantly with this, in the time of their growing up, they always become narrow backed; and this is a great fault in this fort of dog, a broad back being one of the greateft recommendations in a hound. *Wheat* bread is greatly preferable on all accounts for the food of the young hound, giving him ftrength and firmnefs.

At ten months old they are to be taken home, and put into the company of the others, to live as they do: and after a few weeks keeping company with the reft, they are to be coupled, and to go out to hunt. Five or fix days practice will, at this time, do a great deal toward the inftructing them; and, if they are apt to run aftray, or to open unfeafonably, they muft be made to feel the fmart of the whip: This, and the example of the reft, will foon learn them to run and open in a proper and regular manner.

WHELPS, in a fhip, the feamens term for thofe brackets which are fet up on the capftan, clofe under the bars; they give the fweep to it; and are fo contrived, that the cable, winding about them, may not furge fo much as it might otherwife do, if the body of the capftan were quite round and fmooth.

WHERN, in natural hiftory, a name given by fome of our miners to a kind of ftone found in ftrata; but of the hardnefs and finenefs of flint. It is called alfo *chert* and *nicomia*.

WHEWER, a name ufed in fome parts of England for the common wigeon. See the article PENELOPE.

WHEY (*Cycl.*)—In many diforders of the human body, where the ftomach will not bear milk; or when it is not proper, for other reafons, *Whey* may be given with great fuccefs.

We have a differtation of Fred. Hoffman on this fubject. *De faluberrima feri lactis virtute*. Oper. Tom. 6. p. 9. This author recommends a particular kind of ferum or *Whey*, made by evaporating milk to a drynefs, and mixing the refiduum with water. See the article MILK.

There are various methods of making *Whey* vulgarly known. That with oranges is very agreeable, and much recommended by Dr. Cheyne in his *Nat. Meth. of curing Difeafes*.

Alum WHEY, *Serum Aluminofum*, a *Whey* made with alum. Two drams of alum to one pint of cow's milk boiled. See Lond. Difp. It is a good aftringent.

WHINCHAT, in zoology, the Engliſh name of a ſpecies of *œnanthe*, or fallow-finch, called by Aldrovand and ſome other authors, *anthus* and *florus*.

It is of the ſize of the common water-wagtail. Its head, neck and back, are of a reddiſh brown, with regular rows of black ſpots. Each feather has a black ſtreak along its middle, and a browniſh one on each ſide. The belly is whitiſh, with a ſlight tinge of a reddiſh brown. The upper part of the breaſt and the ſides are of a browniſh yellow. Its wing-feathers are brown, with yellowiſh edges. The tail is part black and part white. The beak is ſtrait, ſlender, and black. The male has much of a white variegation on his wings, which the female has not. It lives about ditch banks, and the like places, and feeds on beetles and other inſects.

The colours are very uncertain in this bird, and it often much reſembles the ſtone-chatter; but may always, by an accurate obſerver, be diſtinguiſhed from that bird by the white ſpots in its wings, by the whiteneſs of the under part of its tail, and the white lines on its head. *Ray*'s Ornithol. p. 169.

WHIPLADE, in huſbandry, a term uſed by the farmers in ſome places for a particular ſort of cart, whoſe hinder part is made up of boards, after the manner of a dung-cart, having alſo a head of boards, and ſhambles over the thills; this head being made ſo as either to be taken out or left in. The cart may be indifferently uſed to carry dung or other things; dung when the head is in, and corn, &c. when it is taken out. *Plot*'s Oxfordſhire, p. 262.

WHIRL-*Pool* (*Cycl.*)—Theſe in rivers are very common, from various accidents, and are uſually very trivial, and of little conſequence. In the ſea they are more rare, but more dangerous. Sibbald has related the effects of a very remarkable marine *Whirlpool* among the Orcades, which would prove very dangerous to ſtrangers, though it is of no conſequence to the people who are uſed to it. This is not fixed to any particular place, but appears in various parts of the limits of the ſea among thoſe iſlands. Wherever it appears it is very furious, and boats, &c. would inevitably be drawn in and periſh with it; but the people who navigate them are prepared for it, and always carry an empty veſſel, a log of wood, or large bundle of ſtraw, or ſome ſuch thing, in the boat with them; as ſoon as they perceive the *Whirlpool*, they toſs this within its vortex, keeping themſelves out; this ſubſtance, whatever it be, is immediately received into the center, and carried under water; and as ſoon as this is done, the ſurface of the place where the *Whirlpool* was, becomes ſmooth, and they row over it with ſafety; and in about an hour they ſee the vortex begin again in ſome other place, uſually at about a mile diſtance from the firſt. *Sibbald*'s Prodr. Hiſt. Scot.

WHISTLE *Fiſh*, a name given by the people of Cornwall to a ſpecies of gadus, with only two fins on the back, otherwiſe called *muſtela fluviatilis*. See the articles GADUS and MUSTELA.

WHITE (*Cycl.*)—WHITE-*Face*, or BLAZE, in the manege, is a *white* mark upon a horſe, deſcending from the forehead almoſt to the noſe. It is called in French *chanfrin blanc*. See the article CHANFRIN.

WHITE-*Foot*, in the manege, called in French *Balzane*, is a *white* mark that happens in the feet of a great many horſes, both before and behind, from the fetlock to the coffin. The horſes thus marked are either tramelled, croſs-tramelled, or *white* all four. Some horſemen place an unlucky fatality in the white of the far foot behind. See the articles CHAUSSE *trop haut*, and TRAMELLED.

WHITE-*Hart-Silver*, in our old cuſtoms, a mulct on certain lands in or near the foreſt of *White-hart*, paid yearly into the exchequer, impoſed by King Hen. 3. upon Thomas de la Linde for killing a beautiful *White-hart*, which the King before had ſpared in hunting. *Cambd. Brit.* 150. *Blount*, *Cowel.*

WHITE-*Horſe-Fiſh*, a common Engliſh name for a thorn-back, called by Willughby the *raia aſpera noſtras*, and ſuppoſed by moſt authors to be the *fullonica* of Rondeletius.

It has a long and pointed noſe, and is covered with prickles upon the back. When it is of a yellowiſh colour, its belly is perfectly white, without ſpot or ſtain, whence it has its name. *Willughby*'s Hiſt. Piſc. p. 78.

WHITE *Land*, in agriculture, a tough clayey ſoil, naturally of a ſomewhat whitiſh hue when dry, eſpecially when it has lain ſome time untilled, but becoming blackiſh after rain; this appears of a light greyiſh colour, when turned up by the plough, and ſlides off from the plough-ſhare with eaſe, and with a ſmooth gloſſy ſurface.

It has often a yellowiſh hue with the grey, and is often veined with large parcels of a blue marly earth. *Moreton*'s North. p. 43.

WHITE *Swelling*. We have ſeveral examples of ſucceſsful cures of *White Swellings* of the joints, or tumors from inſpiſſated lymph, by a ſmall ſtream of warm water falling from a height on them.

When the water is impregnated with penetrating medicines, or natural minerals, its virtues are greater. The application of bladders, containing warm water, to the parts affected, is alſo recommended. See *Le Dran*, Obſ. Chirurg. Tom. 2. Obſ. 93, 94.

WHITE-*Tail*, in zoology, an Engliſh name for the common œnanthe, more frequently called the *fallow-finch*, or wheatear. See the article WHEAT-*Ear*.

WHITE-*Throat*, in zoology, the name of a ſmall bird, very common in our gardens and hedges, and ſeeming to have been deſcribed under the name of *ſpipola* by Aldrovandus and ſome others, though moſt approaching to the *ficedula* claſs.

Its beak is black above, and whitiſh below; its feet of a yellowiſh brown; its neck and back are of a browniſh-grey; its head more grey than either, and upper part of the throat *white*, the reſt reddiſh; its breaſt and belly are alſo a little reddiſh; but in the female the breaſt is perfectly white. The edges of the long-wing feathers are ſome whitiſh and others browniſh, and the tail is variegated with black and white, and ſome grey or aſh-colour intermixed. It is extremely common in our gardens and orchards, and feeds on flies, ſpiders, and other inſects. It builds in buſhes, at a ſmall height from the ground, with ſtubble and horſe-hair, and lays five browniſh-green eggs, with black ſpots. *Ray*'s Ornithology, p. 171.

WHITE *upon White*, in the porcelain manufactory, a name given by the Engliſh merchants to a particular China-ware, which is formed of three different *white* ſubſtances, the body being of one, the flowers of another, and the varniſh which covers theſe of a third.

The principal art in the making this ſort of China, is the finding the proper degree of dryneſs in the veſſels for receiving the pencilling or upper coats. It is a fine art, and the principal colour is made of an earth called *hoache*, which is much of the nature of our *ſteatites*. See the articles HOACHE and STEATITES.

WHITES, the popular name of a diſorder incident to women. See the article FLUOR-*Albus*.

WHITENING *of Bones*, for a ſkeleton. See the article BONE.

WHITING, in zoology, the Engliſh name of a common fiſh of the aſellus kind, commonly diſtinguiſhed by the writers in ichthyography by the name of *aſellus mollis*, though by ſome called *aſellus albus* and *merlangus*.

The *Whiting* is diſtinguiſhed from the other ſpecies of the cod kind by theſe characters: It is of a ſmall ſize, ſeldom much exceeding a foot in length, and is thin and ſlender in proportion to its length, particularly about the tail. Its ſcales are very ſmall, and its colour much more pale and whitiſh than in any other fiſh of the cod kind, whence it has its Engliſh name. The belly is white, and the belly-fins behind the tail are ſpotted with ſmall black dots. It has no beard. Its eyes are large, and its upper jaw longer than its under; ſo that its teeth, which are large and crooked, fall over, and are uncovered when the mouth is ſhut; and the inner part of this jaw is armed alſo with very ſmall teeth. Its belly, or rather its breaſt-fins, are nearer the head than in any other ſpecies. It is common in the Engliſh ſeas and elſewhere. *Willughby*'s Hiſt. Piſc. p. 170.

According to the Artedian ſyſtem of ichthyology, the *Whiting* is one of the *gadi*, diſtinguiſhed by that author by the name of the *gadus* with three fins on the back, without beards, with a white body, and with the upper jaw longer than the under. See its deſcription and hiſtory under the article ASELLUS. See alſo the articles GADUS and MERLANGUS.

WHITING-*Pollack*, a fiſh of the cod kind. See the article HUITINGO *Pollachius*.

WHITLOW-*Graſs*, in botany, the Engliſh name of a genus of plants. See the article PARONYCHIA.

WHOLSOME *Ship*, in the ſea language, one that will try, hull, and ride well, without rolling, or labouring in the ſea. A long ſhip that draws much water, may try, hull, and ride well; but if ſhe draws little water, ſhe may try and ride well, but never hull well; and a ſhort ſhip, that draws much water, may hull well, but neither ride nor try well; and ſuch is called an *unwholſome* ſhip.

WICKER *Tree*, a name given by the Engliſh to a tree common in China, and deſcribed by Kircher and others. It is, as it were, a rope twiſted by nature, about an inch thick, and creeps along the earth often for above a hundred paces together, much embarraſſing the way, but ſerving for cables of ſhips, ſeats, hurdles, beds, mats, and various other neceſſary uſes. It endures no vermin, and is much valued for being cool and refreſhing in the hot ſeaſons. *Kircher*'s China illuſt.

WICRANGLE, in zoology, an Engliſh name for the mattageſs, or greater butcher-bird, the *lanius cinereus major* of authors. *Ray*'s Ornithol. p. 53. See the articles LANIUS and MATTAGESS.

WICRANTUM, in natural hiſtory, a name given by the people of the Eaſt-Indies to certain foſſile bodies, of the nature of the pyrites, of the ſize of peas, and formed into variouſly angular figures.

They look black and gloſſy, and much of the nature of blende, or mock lead; but when put into the fire, they ſhew us by their ſmell that they contain ſulphur. They are found in the diamond mines.

The natives firſt powder them; and then mixing them with the juices of certain plants, they dry them, and then calcine them again. Theſe proceſſes they repeat at leaſt ſixty times; but the firſt calcinations are made with a mixture of divers urines, as that of the horſe, the camel, the cow, and the like.

After this tedious preparation, they are given in coughs and colds, and are faid to be a remedy even in confumptions.

WIDE-*eared* in the manege, is applied to a horfe, when the root, or lower part of his ear is placed too low, and the ear itfelf is too large. The French ufe the term *Oreillard* for fuch a horfe.

WIDOW (*Cycl.*)—Mr. Kerfeboom has given us a table, fhewing how long 432 *Widows* lived, and finds, that, at a medium, each lived fourteen years. Phil. Tranf. N°. 468. fect. 3.

Among the antient Greeks, *Widows* had the Care of the eternal fire of *Vefta* committed to them; which charge, among the Romans, could be performed by virgins only, who from their office were called veftals. *Hofm.* Lex. Univ. in voc. *Vidua*. See the article VESTAL, *Cycl.*

King's WIDOW. See the article DOTE.

WIDURIS, in natural hiftory, the name of a ftone found in Java, Malabar, and fome other places, and defcribed by Rumphius. Some fpecies of this are all over of a fine white; others are of a dufky colour, with ftreaks of white; the fimply white ones are femi-pellucid, and look very like the white of an egg. Some alfo have called this the *Hyalops*, or *Achates vitreæ perfpicuitatis*.

WILD *Oat*. See the article OAT.

WILD-*Goofe Chace*. See the article CHACE.

WILDERNESS, (*Cycl.*) in gardening. There is nothing fo great an ornament to a large garden as a *Wildernefs*, when properly contrived, and judicioufly planted.

The *Wildernefs* fhould always be proportioned to the fize of the garden, and fhould never be fituated too near the houfe; becaufe the trees perfpire fo large a quantity of watery vapours, as make the air very unwholfome. The *Wildernefs* fhould never be fo placed as to block up a good profpect; but where the view naturally ends with the verge of the garden, or little more, nothing terminates it fo well as a fine plantation of trees. The fize of the trees fhould be confidered, and tall growing ones fhould be planted in larger places; fmaller, in lefs extenfive; ever-greens alfo fhould be kept by themfelves, and placed moft in fight, not mingled confufedly among the trees which caft their leaves. The walks fhould be large and not numerous; the large walk is beft made ferpentine, and this fhould not be entered upon the grand walks of the garden, but by fome private walk.

It is too common a method to difpofe the trees in *Wildernefſes* in form of regular fquares, triangles, *&c.* but this is faulty; for as nature fhould be ftudied in thefe works of fancy, the moft irregular is the moft pleafing plantation. The walks for the fame reafon are much more pleafing when they run in wild meanders, than when they interfect one another in ftudied and regular angles. The winding walks fhould be made to lead to an open circular piece of grafs, with a ftatue, an obelifk, or a fountain; or, if an opening large enough for a banquetting-houfe be contrived in the middle, it will afford a very pleafing fcene. The trees fhould gradually rife from the fides of the walks and openings, one above another to the middle of the quarters, where the largeft trees fhould ftand, by which means the heads of all the trees will appear in view, but their ftems will not appear in fight.

Not only the growth of trees is to be confidered in the planting of a *Wildernefs*, but their nakedneffes are to be confidered and hid. The larger growing trees are allowed a proportionable diftance, and their ftems hid by honeyfuckles, rofes, fpireas, and other low flowering fhrubs. Thefe may alfo be planted next all the walks and openings; and at the foot of thefe, near the walks, may be fet rows of primrofes, violets, and daffodils, with other the like flowers; behind the firft rank of lower flowering fhrubs fhould be planted thofe of a fomewhat higher ftature, as the *althæa frutices*, the cytifufes and gelderrofes; and behind thefe may be rows of the talleft flowering fhrubs, as the lilacs, laburnums, and the like; and behind thefe, the heads only of the lower growing trees will appear, which fhould be backed gradually with thofe of higher growth, to the center of the quarter; from whence the heads of the trees fhould defcend every way to the walks, or openings.

The grand walks and openings fhould always be laid with turff, and kept well mowed; but, befide thefe, there ought to be fmaller ferpentine walks through the feveral quarters, where perfons may retire for privacy: thefe fhould be left with the bare earth, only kept clear of weeds, and laid fmooth.

Thefe walks fhould be made as winding as poffible, and a few wood-flowers planted along their fides will have a very good effect. The ever-greens fhould be allotted a peculiar part of the *Wildernefs*, and fuch as fronts the houfe; and, in the planting thefe, the fame regard is to be had to their growth, that the talleft trees be planted hindmoft, and their ftems hid by fhorter ones, and fo on, down to the verge: as in the firft row may be planted laurultines, boxes, fpurge laurels, junipers, and favins; behind thefe, laurels, hollies, and arbutuffes; next behind thefe, yews, alaternuffes, phillereys, cypreffes, and Virginian cedars; behind thefe, Norway and filver firs, and the true pine; and finally, behind thefe, the Scotch pine and pinafter. Thefe will have a very beautiful appearance, as their tops will only be feen, and make a fheet of green, which may alfo be very beautifully varied, from the artful admixtures of the feveral fhades of green which the various plants have.

In all thefe plantations, the trees, however, fhould not be fet in formal ftiff rows, but in a loofe variety, proportioned to their manner of growth. *Miller's* Gardener's Dict.

WILDS, a term ufed by our farmers to exprefs that part of a plough by which the whole is drawn forwards.

The *Wilds* are of iron, and are of the form of a gallows, whence they are by fome called the *Gallows* of the plough, but improperly, the gallows of the plough being properly that part formed by the crow-ftaves, and the tranfverfe piece into which they are mortifed at the top.

The *Wilds* confift of two legs, and a tranfverfe top-piece: one of the legs, and the top-piece, are all of one piece of iron, and the other leg, which is loofe, has a hole in the top, into which the end of the tranfverfe piece is received; both thefe legs pafs through the box of the plough, which is that tranfverfe timber through which the fpindles of the wheels run: thefe legs are pinned in behind the box with iron pins: the holes through the box at which thefe legs pafs, are not made at right angles, but flanting upwards, fo that the fore-part of the *Wilds* is higher than the hinder part; were it not for this, the upper part of the crow-ftaves would lean quite back when the plough is drawn.

The ufe of the notches in the *Wilds* is to give the plough a broader or narrower furrow; if the links are moved to the notches on the right-hand, it brings the wheels toward the left, which gives a greater furrow; and, on the contrary, a fmaller furrow is made when the links are moved to the notches on the left. The legs of the *Wilds* fhould be nineteen inches, and their diftance eight inches and a half; they muft be made ftrong, and the links muft be placed in different notches, that the front of the plough may be kept fteady, and the wheels not be drawn one before the other. Thefe links are of iron alfo, and are each fix inches and a half long, and to thefe are faftened the chains of the harnefs, by which the whole plough is drawn along. *Tull's* Hufbandry. See the articles PLOUGH and GALLOWS.

WILLOW, in botany. See the article SALIX.

Our common *Willows*, in the fpring feafon, when they are in flower, produce a quantity of cottony matter, which might be put to fome ufe.

The Chinefe are induftrious enough to collect this cotton as it falls from their *Willows*; and the women and children, among the poorer people, card it, and pick out the feeds, and render it fit for many ufes in the place of cotton.

The poor people, in fome parts of the Indies, make a fort of liquor of the flowers of the *Willow* before they are opened, which intoxicates them very fuddenly; and the dry hufks of the fame tree, remaining after the flowers and feeds are fallen, are wholfome as food, people in times of famine having lived upon them, boiled in water.

The ignorance of the Chinefe in natural hiftory, has occafioned two very ftrange ftories, about the downy or cottony matter of the *Willow*, to be recorded in their books, and firmly believed among them.

The one is, that if this down fall upon the water, it is in one night's time converted into the plant called duck-weed, and if it falls upon any of their fur garments, it becomes a fort of moth, or worm, that eats them to pieces. The common people are fo fully perfuaded of this, that they will never let any garment of this kind he expofed to the air at this time of the year. There is fome probability, that the down of this tree may contain the eggs of certain infects, but then it does not change into them; and thefe can only be the eggs of thofe butterflies which frequent that tree; the confequence of which muft be, that they will produce caterpillars whofe food is the *Willow* leaves, not any other fubftance.

The other error may probably be owing to the water-plant ufually making its firft appearance at the fame feafon when the *Willows* are in flower, fo that it feems produced of them.

A like error we have among the common people of England, in regard to the yellow *rattle*, or *crifta galli lutea*. This plant appears in our meadows juft at the time when the cowflips have done flowering, and is thence vulgarly fuppofed to be the fame plant in a different ftate, or that the cowflip at a certain time changes into this plant.

The wood of the *Willow*, though in itfelf very light and fpongy, is yet of a nature to bear the injuries of wet better than almoft any other kind. It is ufed by the Chinefe on this occafion, in the making their wells, and on all other occafions where wood is to ftand under water, and fucceeds perfectly well. Obferv. fur les Coutumes de l'Afie.

WILLOW-*Galls*, in natural hiftory, the name given by authors to certain protuberances found very frequently on the leaves of the feveral fpecies of *Willow*, which are properly galls, each containing the worm of a fly, and owing its exiftence to that infect.

The galls are ufually of a roundifh or oblong figure, and are equally protuberant on each fide of the leaf: They are of a pale green at firft; but they afterwards become yellowifh, and finally reddifh. The furface of thefe is feldom perfectly even, but ufually has feveral little prominences and cavities in it. When this gall is opened, there is found in it a worm much refembling a caterpillar in figure, having a fmooth an-

 nulated

nulated body, and a hard brown head. This, however, is not a caterpillar, the utmoft number of legs in that genus of animals being found to be fixteen, and this worm having twenty.

It is one of thofe creatures which Reaumur, from their refemblance to the caterpillar kinds, has called falfe or baftard-caterpillars. This creature, when the gall is young, is blue; it afterwards becomes greenifh; and finally, when the gall becomes red, it is white. It is in this ftate that Redi has figured and defcribed the gall, and he therefore naturally defcribes the worm as white. This infect feems to eat in its prifon more voracioufly than any other gall-infect whatever; for while the gall grows in fize, it becomes alfo thinner in every part; fo that the creature, at the proper time, has but little difficulty to get out. *Reaumur's* Hift. Infect. vol. 6. p. 211.

Thefe galls fometimes ftand fingly on the leaves; but more frequently there are three or four on a leaf; not unfrequently there are great numbers, and particularly on the leaves of the ozier: thefe being very narrow, the galls are beautifully arranged on them, ftanding ufually in two rows, one on each fide the middle rib; and thefe fo clofely fet together, that they refemble the beads of a lady's necklace. The inner furface of moft other galls is fmooth, and the animal lodged in a polifhed cavern; but that is not the cafe in thefe galls, the animal eats too faft to eat with fo much regularity; and, in fine, before it arrives at its full growth, it ufually eats its way through the fides of it, and feeds on the fubftance of the leaf in other parts, retiring at pleafure again into its cell. This is a very fingular thing, no other infect of this kind being known to do it. Vallifnieri is the perfon who affirms it of this, and fays, that he has feen the fact.

When the time of the laft change of this infect draws nigh, it leaves the tree, and defcending to the earth, makes its way into it in a proper place, and then becomes a nymph, out of which, at a proper time, iffues a four-winged fly. This is alfo the laft ftate of all the baftard-caterpillars that have yet been traced through their feveral changes.

The obfervation of this change, however, is not fo eafy as that of feveral other fpecies, fince the creature does not undergo it in the gall, but under the earth, and there can be no certainty in expecting the infect out of the ground.

Redi, who was very curious in thefe particulars, could never arrive at the fight of the winged animal. His method of attempting it was by putting a great number of the galls into boxes, and expecting their changes there; but thefe creatures all died for want of the proper nidus for the chryfalis. Vallifnieri fucceeded better, by means of putting a large quantity of a moift friable earth, of the fandy kind, into the boxes with the galls. The confequence of this was, that he foon faw fuch of the infects as were arrived at a ftate proper for their change, creep out of the galls, and bury themfelves in the earth at the bottom of the boxes. On tracing them farther, he found that each of them fpun itfelf a cafe of filk, like the filk-worm's web, under the cover of which it lay in the earth all the winter, and in the fpring following, about the middle of April, it came up in the form of a fmall four-winged fly, of no very fingular beauty. This is alfo obferved of all the other baftard-caterpillars, none of them producing flies of any beauty, though fome of very fingular figures. *Reaumur*, Hift. Inf. vol. 6. p. 213.

The flies which are thus produced in April, copulate almoft as foon as freed from their exuviæ of the chryfalis ftate, and the females foon after lodge their eggs in the leaves of the *Willows*. This is all done before the end of April, and the young ones hatched of thefe eggs, live but a fhort time before they pafs into the chryfalis ftate, and living flies are hatched from thefe in June. It is this brood whofe young ones pafs their chryfalis ftate in the earth, and appear not during the whole winter, till the fpring fun enlivens them again. There are, befide thefe, another kind of galls of the *Willow* leaves, which are of the clafs of thofe, each of which contains feveral cells; in each cell of thefe there is found a fmall white maggot, the offspring of the egg of a two-winged fly, which, after paffing the chryfalis ftate in the earth, alfo comes out in the form of its winged parent. The cells in the galls are different in number in the feveral galls, and are from four or five to twenty: They have no communication with one another, but each worm lives in its own cell.

Befide thefe there is alfo fometimes found in thefe galls a worm of a brownifh white colour, having two hooks in its head, and no legs at all. This has all the appearance of a carnivorous animal, and probably was depofited there in the egg-ftate by its parent, not to feed on the gall, but on its defencelefs inhabitant. This worm finally becomes a fmall bluifh beetle, and is often found alone in the cavity of the gall, often in company with its proper inhabitant, fucking its juices as it feeds on thofe of the plant. There feem to be feveral fpecies of thefe devourers common to thefe galls; fince Vallifnieri obferved, in the boxes where he kept thefe galls to produce the animals from thence, many fpecies of fmall beetles, and feveral diftinct kinds of flies, which were probably the laft ftate of feveral kinds of carnivorous worms, which had preyed upon the proper inhabitant of the galls. *Vallifnieri*, Dialog. des Infect.

WILLOW *Herb*, in botany, the Englifh name of the *lyfimachia*. See the article LYSIMACHIA.

WIMBREL, in zoology, the Englifh name of a bird of the curlew-kind, and known among authors by the name of *arquata minor*, or the leffer curlew, and called in the Venetian markets *taraniola*.

It is very much of the fhape of the common curlew, but is not more than half its fize. Its beak is about three fingers breadth long. Its feet are greenifh, and its wings fpotted with large femicircular fpots; and its general colour is a dufky brown.

WINCRANTUM, in natural hiftory, a name given by the people of the Eaft Indies to a foffile fubftance refembling, in fome degree, the plated lead ores of Europe, but containing very little of that metal; it is properly a fpecies of blende, or mock lead, of a talcy appearance; it is confiderably hard, and is ufualy found in other ftones. It is given in medicine in the Indies as a provocative to venery, being firft calcined and beat to powder.

WIND (*Cycl.*)—*Wind* has been, by many authors, made the bafis of many different difeafes: among others, Dr. Reyn has given it as his opinion, in a treatife on the gout, that flatufes, or *Wind* inclofed between the periofteum and the bone, are the true caufe of that difeafe; and accordingly, that all the method of cure ought to tend to the expelling that *Wind*. He fuppofes this *Wind* to be of a dry, cold, and malignant nature, conveyed by the arteries to the place affected, where forcibly feparating that fenfible membrane the periofteum, and diftending it, the pain muft needs be very great.

He is alfo of opinion, that head-achs, palpitations of the heart, tooth-ach, pleurify, convulfions, colics, and many other difeafes, are originally owing to the fame caufe, and only differ in regard to the place affected, and to the various motions and determinations of the *Wind*. The moveablenefs of the pain in gouty perfons from one part to another, he looks on as a proof of this, and thinks that the curing the gout by burning moxa, or the cotton of the mugwort leaves, upon it, is owing to its giving way to the *Wind* in the part to evaporate itfelf.

That thefe *Winds* are cold, appears from the fhivering fits which generally precede a paroxyfm of the gout, and the fhiverings in the beginnings of fevers, and before all fits of agues, are owing to the fame caufe, is fuppofed by this author a natural conclufion from the former obfervations.

The *Winds*, according to this author and Fienus, are a fort of halituous fpirits, raifed by the improper degree of our native heat, or out of our meat and drink; or, finally, out of an abundance of black choler.

Their differences, he fays, principally proceed from the various ferments producing in us a variety of humours; which acting upon one another, do in their effervefcences create *Winds* of various effects, and denominate difeafes from the places which are the fcenes of their action. It is on this account that the acupunctura, or pricking with long needles, among the Chinefe, is of ufe. The Japonefe, and other neighbouring nations, having no other cure for moft difeafes than the pricking with the needle, and the burning the moxa on the part. *Reyn* de Arthritid.

The hufbandman often fuffers extremely by high *Winds*, in many different refpects. Plantations of trees at a fmall diftance from the barns and houfes, are the beft fafeguard againft their fuffering by *Winds*; but they muft not be planted fo near as that their fall, if it fhould happen, would endanger them. Yews grow very flowly, otherwife they are the beft of all trees for this defenfive plantation. Trees fuffer by *Winds*, being either broken or blown down by them; but this may be in a great meafure prevented by cutting off great part of the heads and branches of them, in places where they ftand moft expofed.

Hops are the moft fubject to be injured by *Winds* of any crop; but this may be in a great meafure prevented by a high pale, or very thick thorn hedge; this will both keep off the fpring *Wind*, which nips the young buds, and be a great fafeguard againft other *Winds* that would tear the plants from their poles. The poles fhould always be very firm in the ground; and the beft fecurity to be added to this, is a row of tall trees all round the ground.

Winds, attended with rain, do vaft injury to the corn, by laying it flat to the ground. The beft method of preventing this, is to keep up good enclofures; and if the accident happens, the corn fhould be cut immediately, for it never grows at all afterwards. It fhould be left on the ground, in this cafe, fome time after the cutting, to harden the grain in the ear. *Mortimer's* Hufbandry, p. 302.

Large WIND, in the fea-language; to fail with a *large Wind*, is the fame as with a *fair Wind*.

Quarter WIND, at fea. See the article QUARTER.

Tropic WINDS. See the article TROPIC.

Side WIND, at fea, that which blows on the fide of the fhip.

WIND, in the manege. A horfe that carries in the *Wind*, is one that toffes his nofe as high as his ears, and does not carry handfomely.

The

The difference between carrying in the *Wind*, and beating upon the hand, is, that a horſe who beats upon the hand, ſhakes his head, and reſiſts the bridle; but he who carries in the *Wind*, puts up his head without ſhaking, and only ſometimes beats upon the hand. The oppoſite to carrying in the *Wind*, is arming and carrying low.

WIND-*Flower*, in botany, the Engliſh name of the *anemone*. See the article ANEMONE.

The proper ſoil and culture of the many varieties of this beautiful flower are theſe: For the ſoil, take a quantity of freſh light ſandy loam, or hazel earth from a common, or dry paſture, not dug above eight or ten inches deep; mix this with a third part its quantity of rotten cow-dung, and lay it up in a heap; turn this over at leaſt once a month, and every time pick out the ſtones, and break the clods. After this mixture has been twelve months made, it will be fit for uſe.

The beds of this earth muſt be prepared in September, and ſhould be made eight inches deep, if it be in a wet ſoil; but if in a dry one, three or four inches will be ſufficient; three weeks after this has been laid in, ſtir it for ſix inches deep with a ſpade, and then with a ſtick draw lines each way of the bed, at four inches diſtance, ſo that the whole may be in ſquares; then make a hole three inches deep in the center of each ſquare, and plant a root in each; and when all are planted, rake the earth of the whole bed ſmooth, ſo as to cover the roots two inches thick. The ſeaſon of planting theſe roots fur forward flowers, is the middle of September, and for the later in October: this is beſt done at a time when there are gentle rains. Some roots ſhould alſo be ſaved to be planted after Chriſtmas, for fear of accidents to the former from very hard weather.

Theſe uſually flower three weeks after thoſe planted in autumn. In the beginning of April the early planted roots will begin to flower, and they will keep in flower near a month, if the weather prove favourable, and they are properly ſhaded with matts, laid over hoops in the greateſt heat of the day: the ſecond, and laſt planted ones, will follow theſe; and, in the whole, there will be at leaſt two months fine flowering.

Toward the latter end of May the firſt planted roots will loſe all their leaves, and they muſt be then taken up and waſhed clean, and laid to dry on mats in the ſhade; after which they are to be put up in paper bags, and hung up till the time of planting them comes on again. The later planted ones are to be taken up alſo as ſoon as their leaves are decayed, and not ſuffered to remain to make new ſhoots; for then it is too late to remove them.

They are propagated two ways, either by dividing the roots, or by ſowing. The roots are to be divided as ſoon as they are taken up out of the ground: they will ſucceed if broken into as many parts as there are eyes or buds in them; but they flower moſt ſtrongly, if not parted too ſmall.

The way, by ſowing, is this: Chooſe firſt ſome good kinds of *Anemones*, plant theſe early, and they will produce ripe ſeed three weeks after the flower firſt blows. This muſt be carefully gathered, and in Auguſt it ſhould be ſowed in pots or tubs, or a very well prepared bed of light earth, rubbing it between the hands with a little dry ſand, to prevent ſeveral of the ſeeds from clinging together, and ſpreading them as even as poſſible all over the bed; after this a light hair bruſh ſhould be drawn many times over the ſurface of the bed, to pull aſunder any lumps of ſeed that may yet have fallen together; obſerving not to bruſh off the ſeed, and as much as poſſible not to bruſh it into heaps. When this is done, ſome light earth, about a quarter of an inch deep, ſhould be ſifted over the bed. If the weather be hot, the bed muſt be at times covered with mats laid hollow, and gently watered.

In about two months after ſowing, the plants will appear, if the ſeaſon has been favourable, and they are to be carefully defended from the hard froſts by proper covering, and from the heat of the ſun afterwards by a moveable reed fence. As the ſpring advances, if the weather be dry, they muſt be gently watered, and when their green leaves decay, there muſt be a quarter of an inch more earth ſifted over them, and the like again at Michaelmas; and the bed muſt be kept clear from weeds, and the following ſpring they will flower. *Miller's* Gardener's Dict.

WIND-*Gall*, a name given by our farriers to a diſtemperature of horſes. In this caſe there are bladders full of a corrupt jelly, which, when let out, is thick, and of the colour of the yolk of an egg.

They vary in ſize, but are more uſually ſmall than large. Their place is about the fetloc-joint, and they grow indifferently on all four legs, and are often ſo painful, eſpecially in the ſummer-ſeaſon, when the weather is hot, and the ground dry and hard, that they make the creature frequently ſtumble, or fall abſolutely down.

The general method of cure is to open the ſwelling about the length of a bean, and to preſs out the jelly: when this is done, they apply a mixture of the oil of bays, and the white of an egg, covering it with tow.

Another method is, after the jelly is all ſqueezed out, to wrap round the part a wet woollen cloath, and then applying a taylor's hot iron, this is to be rubbed over till all the moiſture is carried away; it is then to be daubed all over with pitch, maſtic, and reſin, boiled together, laying tow in plenty over all.

The *Wind-galls* that are ſituated near the ſinews, are much the moſt painful of all, and ſooneſt make the horſe lame.

The general cauſe of *Wind-galls* is ſuppoſed to be extreme work or exerciſe in very hot weather; but it is to be obſerved, that thoſe horſes, which have long joints, will be *Wind-galled* if they work never ſo little. The worſt *Wind-galls* are thoſe of the hinder legs; all the above-mentioned will frequently miſs of ſucceſs in theſe, and nothing but fire will cure them.

WIND-*Hatch*, in mining, a term uſed to expreſs the place at which the ore is taken out of the mines.

The word *hatch* is the general term uſed by the miners to expreſs an opening from the ſurface into the mine, or in the attempting to find a mine.

Thus the word *eſſay-hatches* ſignifies the openings made in ſearch of the trains of ſhoad-ſtones; and the *tin-hatch* in Cornwall is the name of the opening by which they deſcend into a tin-mine.

The word *Wind-hatch* ſeems to be a corruption of *winder-hatch*; for at theſe places they have a *winder* conveying two buckets, the one conſtantly up, the other conſtantly down; the man below fills the bucket that deſcends; and when that which aſcends full is emptied at the mouth of the hatch, the perſon who has the care of that part of the work, delivers it empty to go down again. Phil. Tranſ. N°. 69.

WIND-*Sails*, in a ſhip, are made of the common ſail-cloth, and are uſually between twenty-five and thirty foot long, according to the ſize of the ſhip, and are of the form of a cone ending obtuſely: when they are made uſe of, they are hoiſed by ropes to about two thirds or more of their height, with their baſis diſtended circularly by hoops, and their apex hanging downwards in the hatch-ways of the ſhip; above each of theſe, one of the common ſails is ſo diſpoſed, that the greateſt part of the air, ruſhing againſt it, is directed into the *Wind-ſail*, and conveyed, as through a funnel, into the upper parts of the body of the ſhip. Phil. Tranſ. N°. 463. p. 65.

WIND-*Shock*, a name given by our farmers to a diſtemperature to which fruit-trees, and ſometimes timber-trees, are ſubject.

It is a ſort of bruiſe and ſhiver throughout the whole ſubſtance of the tree; but the bark being often not affected by it, it is not ſeen on the outſide, while the inſide is twiſted round, and greatly injured.

It is by ſome ſuppoſed to be occaſioned by high *Winds*; but others attribute it to lightening. Thoſe trees are moſt uſually affected by it, whoſe boughs grow more out on one ſide than on the other.

The beſt way of preventing this in valuable trees, is to take care, in the plantation, that they are ſheltered well, and to cut them frequently in a regular manner, while young.

The *Winds* not only twiſt trees in this manner; but they often throw them wholly down: in this caſe, the common method is to cut up the tree for firing, or other uſes; but if it be a tree that is worth preſerving, and it be not broken, but only torn up by the roots, it may be proper to raiſe it again by the following method: Let a hole be dug deep enough to receive its roots, in the place where they before were; let the ſtraggling roots be cut off, and ſome of the branches, and part of the head of the tree; then let it be raiſed; and when the torn-up roots are replaced in the earth in their natural ſituation, let them be well covered, and the hole filled up with rammed earth; the tree will, in this caſe, grow as well, and perhaps better, than before. If nature be left to herſelf, and the tree be not very large, the pulling off the roots will raiſe it. *Mortimer's* Huſbandry, vol. 2. p. 79.

WIND-*Thruſh*, in zoology, a name given by ſome to the redwing, and ſuppoſed to be given from their generally firſt appearing with us in windy ſeaſons; but it appears more probably to be derived from the German name *wint-troſſel*, or vine-thruſh, from its doing great miſchief there in the vineyards, by eating and deſtroying the grapes. *Ray's* Ornithology, p. 139. See the article RED-*Wing*.

WIND-*Hover*, in zoology, the name of a ſpecies of hawk, called alſo by ſome the *ſtannel*, but more uſually the *keſtrel*, and known among authors by the names of the *tinnunculus* and *cenchris*. *Ray's* Ornithol. p. 50. See the article TINNUNCULUS.

WIND-*Ward*, (*Cycl.*) in the ſea language, denotes any thing towards that point from whence the wind blows, in reſpect of a ſhip.

WINDAGE *of a Gun* is the difference between the diameter of the bore, and the diameter of the ball.

WINDER-*Meb*, in zoology, the name of a bird of the larus or gull-kind, moderately large, and deſcribed by Aldrovand under the name of *larus major*.

Its head is remarkably large and thick, and is of a mottled colour of white and grey; its breaſt and belly are alſo variegated with the ſame colour, but they are ſomewhat paler. Its beak is thick and ſtrong, of a yellow colour, and very ſharp; and the opening of its mouth very wide. Its wings are variegated with white, grey, and cheſnut-colour; and both theſe

 and

and the tail have much black in them. The feet are webbed and yellow, the claws are fharp, and the hinder toe larger than in moft birds of this kind. *Ray's* Zoology, p. 267.

WINDING-*Tackle*, in a fhip. See the article TACKLE.

WINDOW (*Cycl.*)—Before glafs *Windows* came into ufe, the *Window* cafements were commonly made of a tranfparent ftone called *fpecularis lapis*, and thence called *fpecularia*; and before the *fpecularia*, veds were the only defence they had againft the weather. *Pitifc.* Lex. Antiq. in voc. *Specularia.*

WINDY *Tumors*. See the article *Windy* TUMORS.

WINE (*Cycl.*)—The method of converting white *Wines* into red, fo much practifed by the modern *Wine*-coopers, is this: Put four ounces of turnefole rags into an earthen veffel, and pour upon them a pint of boiling water; cover the veffel clofe, and leave it to cool; ftrain off the liquor, which will be of a fine deep red, inclining to purple. A fmall proportion of this colours a large quantity of *Wine*. This tincture might be either made in brandy, or mixed with it, or elfe made into a fyrup with fugar for keeping. A common way with the *Wine*-coopers is to infufe the rags cold in *Wine* for a night or more, and then wring them out with their hands; but the inconveniency of this method is, that it gives the *Wine* a difagreeable tafte; or, what is commonly called the tafte of the rag; whence the *Wines*, thus coloured, ufually pafs among judges, for preffed *Wines*, which have all this tafte from the canvas rags in which the lees are preffed.

The way of extracting the tincture, as here directed, is not attended with this inconvenience; but it loads the *Wine* with water; and if made into a fyrup, or mixed in brandy, it would load the *Wine* with things not wanted, fince the colour alone is required. Hence the colouring of *Wines* has always its inconveniencies. In thofe countries which do not afford the tinging grape, which affords a blood-red juice, wherewith the *Wines* of France are often ftained, in defect of this, the juice of elder-berries is ufed, and fometimes logwood is ufed at Oporto.

The colour afforded by the method here propofed, gives *Wine* the tinge of the Bourdeaux red, not the Port; whence the foreign coopers are often diftreffed for want of a proper colouring for red *Wines* in bad years. This might perhaps be fupplied by an extract made by boiling ftick-lack in water. The fkins of tinging grapes might alfo be ufed, and the matter of the turnefole procured in a folid form, not imbibed in rags. *Shaw's* Lectures, p. 211.

Any confiderable heat, or even a degree of fimmering, or tepidity, will, by its inteftine and fubtile agitation, that barely difturbs the fine faline and fpirituous parts, which are very fufceptible of heat, thereby disjoin them from the reft, and occafion an alteration in the tafte, tranfparency and durability of the *Wine*, as much as if the fpirit had been drawn off by diftillation, and afterwards poured in again, in which cafe the whole ceafes to be *Wine*, though it is poffible to bring it to *Wine* again, by bringing on a new fermentation.

It is a common accident, and a difeafe in *Wines*, to be kept too hot, and is not eafy to cure when it has been of any long continuance, otherwife it may be cured by introducing a fmall artificial fermentation, that new ranges the parts of the *Wine*, or rather recovers their former texture: but the actual expofing of *Wine* to the fire, or the fun, prefently difpofes it to turn eager; and the making it boiling hot, is one of the quickeft ways of expediting the procefs of making of vinegar.

On the other hand, *Wine* kept in a cool vault, and well fecured from the external air, will preferve its texture entire in all the conftituent parts, and fufficiently ftrong for many years, as appears not only from old *Wines*, but other foreign fermented liquors, particularly thofe of China, prepared from a decoction of rice, which being well clofed down in the veffel, and buried deep under ground, will continue, for a long feries of years, rich, generous, and good, as the hiftories of that country univerfally agree in affuring us.

The fame is to be underftood of vinegar which has once thrown off the fuper-abundant earthy parts, and many of the oily ones which prefided in it while it was *Wine*; whence the faline ones now get the afcendant, and as it were fubdue and prefide over the fpirituous ones. In this ftate it will continue perfect a long time; good and ftrong vinegar, well ftopped down, and placed in a cool place, preferving itfelf unaltered for a long feries of years: but if it be left open, fo that its fine vapour exhales, or its fubtile part be drawn from it, and again poured back; in either cafe it lofes its uniform confiftence, and particularly its durability, and immediately hurries into vapidity and corruption.

If either by fraud or accident a larger portion of water is mixed with *Wine* than is proper for its confiftence, and no way neceffary or effential, this fuperfluous water does not only deprave the tafte, and fpoil the excellence of the *Wine*, but alfo renders it lefs durable; for humidity in general, and much more a fuperfluous aqueous humidity, is the primary and reftlefs inftrument of all the changes that are brought on by fermentation. It may doubtlefs therefore be ufeful, and fometimes abfolutely neceffary, to take away this fuperfluous water from the other part which ftrictly and properly conftitutes the *Wine*. This has been agreed upon on all hands as a thing proper; but the manner of doing it has not been well agreed on; fome have propofed the effecting it by means of heat and evaporation, others by percolation, and others by various other methods, all found unfuccefsful when brought to the trial; but the way propofed by Dr. Shaw from Stahl, is the moft certain and commodious; this is done by a concentration of the *Wine*, not by means of heat, but of cold. *Stahl's* Schediafm. de Concentratione Vini. See the next article.

Condenfing of WINES; a phrafe ufed by Stahl, and fome other writers, to exprefs what is more ufually called the concentrating them, that is, the freeing them from what fuperfluous humidity they contain, and by that means rendering them more rich and noble, freeing them from their taftelefs part, reducing them to a fmaller bulk, and by that means making them fitter for tranfportation, and finally rendering them more durable in their perfect ftate, and much lefs fubject to the various accidents that make them decay.

Various methods have been attempted for the effecting of this, and great objections found in the way of all of them, except the lateft, brought into ufe by *Stahl*, and fince recommended greatly to the world by Dr. Shaw in his chemical effays.

If any kind of *Wine*, but particularly fuch as has never been adulterated, be in a fufficient quantity, as that of a gallon or more, expofed to a fufficient degree of cold in frofty weather, or be put into any place where ice continues all the year, as in our ice-houfes, and there fuffered to freeze, the fuperfluous water that was originally contained in the *Wine*, will be frozen into ice, and will leave the proper and truly effential part of the *Wine* unfrozen, unlefs the degree of cold fhould be very intenfe, or the *Wine* but weak and poor. This is the principle on which Stahl founds his whole fyftem of condenfing *Wines* by cold.

When the froft is moderate, the experiment has no difficulty, becaufe not above a third or a fourth part of the fuperfluous water will be froze in a whole night; but if the cold be very intenfe, the beft way is, at the end of a few hours, when a tolerable quantity of ice is formed, to pour out the remaining fluid liquor, and fet it in another veffel to freeze again by itfelf: this is proper, for two reafons; firft, becaufe the quantity of ice growing large, more of the concentrated *Wine* will be apt to lodge in it than fhould, and it will require a longer time to drain and clear away from the ice. The making the experiment will fufficiently explain this to any body; for, without breaking the ice, the unfrozen part will, barely by inclining the veffel, find its own way out, and drain clear from the watery part, which is now converted into ice; fo that if the draining be perfect, the ice of the moft perfectly red Bourdeaux claret will become nearly as clear and pale as water, and will refolve by heat into an almoft entirely colourlefs phlegm. This is no fmall curiofity attending this experiment, and at the fame time affords a criterion of its exact performance.

If the veffel, that thus by degrees receives the feveral parcels of the condenfed *Wine* be fuffered to ftand in the cold freezing place where the operation is performed, the quantity lying thin in the pouring out, or otherwife, will be very apt to freeze anew; and if it be fet in a warm place, fome of this aqueous part thaws again, and fo weakens the reft. The condenfed *Wine* therefore fhould be emptied in fome place of a moderate degree as to cold or heat, where neither the ice may diffolve, nor the vinous fubftance mixed among it be congealed. But the beft expedient of all is to perform the operation with a large quantity of *Wine*, or that of feveral gallons, where the utmoft exactnefs, or the danger of a trifling wafte, needs not be regarded.

By this method, when properly performed, there firft freezes about one third part of the whole liquor, and this is properly the more purely aqueous part of it, infomuch that when all the vinous fluid is poured off, to be again expofed to a concentration, the ice remaining behind, from this firft freezing, being fet to thaw in a warm place, diffolves into a pure and taftelefs water.

If the *Wine*, now once concentrated, fhould, by a long continuance in the freezing cold, be again congealed to the utmoft (unlefs the cold were very fevere indeed) and then again be drained from its ice, there, foon after this, falls to the bottom of the veffel, a pure white powder or tartar, and even the icy part afterwards depofits alfo a little of the fame fubftance after thawing; and after the ftanding two or three days, there is always more and more of this tartar precipitated, and that conftantly the more in proportion as the *Wine* was more auftere, or lefs adulterated with fugar brandy, or the like, for thefe things contain no tartar.

The ice of the fecond operation on a quantity of *Wine*, differs in nothing from that of the firft, provided only that the *Wine* was poured clear off from it, before the ice is fet to melt, by which means it diffolves into a clear phlegm. This fhews the excellency of the operation, as it lofes not its efficacy upon repetition, but brings away mere water as well at laft as at firft, without robbing the *Wine* of any of its genuine or truly valuable parts. The remaining liquor, which has efcaped being

ing frozen in these two operations, is a real concentrated *Wine*, as appears by its colour, consistence, taste, and smell; for it now has all these properties in a much larger degree, than while it contained so much superfluous moisture of a merely aqueous kind. It therefore becomes a nobler and richer *Wine*, than could any way be procured without such a contrivance. For as, by this means, two thirds of the quantity are taken away in the better sorts of *Wine*, and three fourths in the weaker, what remains must needs possess three or four times the strength and virtues of the same quantity of the crude *Wine*.

This operation, though it be perfect in regard to *Wines*, yet does not succeed so well in regard to the malt liquors. The experiment has been fairly tried by Stahl on a gallon of strong malt drink, and the success was as follows: The ice separated in the first operation, when thawed by heat, resolved into a liquor of the colour and taste of small beer; and the second concentration afforded an ice of much the same kind, which might have passed for ordinary small beer, but for a flashy watery taste that manifestly predominated in it. The liquor unfrozen was but a pint and half by measure, but it was extremely rich and thick, and seemed very strong and spirituous, and perfectly aromatic, or highly flavoured. The consistence was somewhat like that of a thin syrup, and it had a pleasing softness that sheathed the acrimony of the spirit, and covered the bitter taste of the hop.

The mucilaginous nature which is predominant in all malt liquors, occasions a great inaccuracy in this experiment, as not suffering the water to run clear, or be separated from the richer tincture of the malt, nor letting the condensed liquor be obtained clean from the ice; but as the loss occasioned by this is not great, and the liquor is much cheaper than *Wine*, if this should ever come into use in the large way, the thawed liquor of the ice might be used again in a new brewing, and so the loss of that part of the strength which was carried away by the freezing be recovered.

The phlegm of *Wine*, separated by this operation, when it has not succeeded perfectly well, carries off something also of the flavour and taste of the *Wine*; and this need not be supposed all lost, for this liquor alone will, if strong enough, serve excellently to make vinegar, or if not so much impregnated as to do for that purpose, it will serve the vinegar-makers instead of other water, and be of so much advantage in the process, as fully to make up for the quantity of *Wine* lost.

The frozen part, or ice, consists only of the watery part of the *Wine*, and may be thrown away, and the liquid part retains all the strength, and is to be preserved. This will never grow sour, musty, or mouldy afterwards, and may at any time be reduced to *Wine* of the common kind again, by adding to it as much water as will make it up to the quantity that it was before.

Wines in general may by this method be reduced to any degree of vinosity or perfection. Thus, for example, if a *Wine* of a moderate strength have a third part of its water taken away, in form of ice by congelation, the remaining part will thereby be doubled in strength and goodness: for if we allow, in the better sorts of *Wine*, that one third part, which is near the truth, is truly good or vinous, and two third parts are nothing but water, one third part of the good *Wine* being blended among the two third parts of water, of no strength nor value; it follows, that if one of these third parts of water be taken away, and all the *Wine* left, that which was before but one third *Wine*, is now one half *Wine*, no way reduced in its strength, and therefore the whole must be stronger in that proportion.

But if this operation of congelation be carried to the utmost, and be practised on a large quantity of *Wine*, and with a very intense cold, and the ice taken away several times, and the *Wine*, thus freed from a part of its water, again and again exposed, it will be found that good *Wines* will be reduced to one sixth part of their original quantity; and the vintner will easily find out the use of this remaining sixth part, which is a true quintessence of *Wine*, and will be of the utmost benefit, by mixing in small quantities with poor and low-flavoured *Wines*, to meliorate and improve them; and even to convert the low-flavoured and least valuable ones into those very *Wines* from which this condensed part was procured.

Glauber laboured hard at bringing this sort of thing to bear, and attempted it with what he called the quintessence or essential oil of *Wine*; but this, though prepared ever so curiously from the very finest *Wines*, was never found to answer well on the trial, but retained a nidorous and disagreeable flavour, different from that of the *Wine*. Glauber's method, therefore, which was excellent in theory, is by this method of congelation reduced to practice, and that with little trouble, and the greatest advantage.

The benefit and advantage of this method of congelation, if reduced to practice in the large way, in the *Wine* countries, must be evident to every body. Concentrated *Wines*, in this manner, might be sent into foreign countries, instead of *Wine* and water, which is what is usually now sent, the *Wines* they export being loaded, and in danger of being spoiled by three or four times their own quantity of unnecessary, superfluous, and prejudicial water.

The business is, how to perform the operation, for *Wine*-countries being in general hot countries, the business of freezing will not be so easily carried on there as in the cold ones: but this is an objection easily solved by observing, that in most of the *Wine* countries that we are acquainted with, there are hills and mountains, the tops of which are covered with snow all the year round; and all who are acquainted with natural philosophy, very well know, that where there is snow to be had, there will be no difficulty about freezing.

The difficulty rests therefore not in the matter of freezing, but in the reducing the *Wines*, when thus concentrated, to their due and natural state again; for though the addition of water alone does this in a tolerable manner, yet better means may certainly be found on farther trials. The way of using poor *Wines*, and such as in themselves are of little use or value, is always a good one, and is sufficiently advantageous; because what there is in the price of these above water, is made up to the proprietor in the quantity of the final produce; water could only give the same quantity of the *Wine* that there was originally, and before the condensation; but these *Wines* will bear to be mixed in so much larger a quantity, that the produce will warrant the gaining by the practice.

This method is not practicable to advantage in the *Wine* countries alone. Dr. Shaw assures us, that he has himself experimented it here, and with the use of proper freezing mixtures, has reduced *Wines* in England to a much smaller quantity, in proportion to the whole, than in the strongest of Stahl's experiments. It is evident that, by how much the quantity is smaller, by so much it is richer and stronger, provided that the operation has been properly performed. The Doctor assures us, the noble essence or rob, thus prepared, is capable of working almost miracles, by turning water into *Wine*, and the like; but that, in order to its succeeding well, there requires great care in the operator, when the congelation is repeated the last times. *Shaw*'s Chemical Essays. *Stahl*'s Concentrat. Vin.

Diseases of Wines. All *Wines*, malt liquors, and vinegars, which are well made, and perfect in their kind, will grow fine of themselves, barely by standing; so that if they do not thus grow fine in a reasonable time, it is a sign that they labour under some disease; that is, they are too aqueous, too acid, too alkaline, or they tend to putrefaction, or the like. In all these cases, which may properly enough be called the *diseases of Wines*, suitable remedies are required before the *Wines* will grow fine. The most general remedy hitherto known for all the diseases of *Wines*, is a prudent use of tartarized spirit of *Wine*, which not only enriches, but disposes all ordinary *Wines* to grow fine. *Shaw*'s Lectures, p. 209.

Extemporaneous Wine. A hundred weight of good treacle will produce, according to the art of the distiller, from four to seven gallons of pure alcohol; that is, from eight to fourteen gallons of the common-proof melasses spirit. The still-bottoms have many uses. The distillers scald and recover their musty casks with them, and they may be used for all those purposes of cleansing where argol is required. Mr. Boyle's acid spirit of *Wine*, or a spirit very like it, may also be procured from them, and a matter analogous to what Becher calls the *media substantia vini*. This liquor gives a durable *extemporaneous Wine*.

Fining of Wines. See the article Fining.

Low Wines, in the distillery, the term for the spirituous liquor distilled immediately from the fermented matter, and continued running so long, that the last of it was not at all inflammable. This liquor is afterwards rectified to a proof-spirit of the strength of brandy, and thence to a rectified spirit, called *alcohol*, or spirit of *Wine*. *Shaw*'s Lectures, p. 216.

Wine *Lees*. The distillation of *Wine lees* into spirit is conducted very much in the same manner with that of the malt-wash, when distilled with the mealy part in it: The principal difference is on this account, that the oil of the malt being very nauseous and disagreeable, the utmost care is to be used to keep it back in all the processes of primary distillation, and of rectification; whereas, on the other hand, the oil of the *Wine* lees being a very agreeable and pleasant one, as much care as possible is to be taken to bring it over with the spirit. Glauber has written a peculiar treatise on this subject, in which, without touching upon the most advantageous production of all, he has proved the work to be so very profitable, that the whole usually passes for one of his wild flights, rather than a solid business.

The method of distilling a liquid lee for its spirit, is a thing very universally known; but the advantageous thing, on this basis, is the distilling a dry lee pressed and preserved, and the managing the business in such a manner as at first or last to procure and separate all its valuable parts. The solid lee, here mentioned, is that usually sold to the hatters in England, and is the same thing that in France and other *Wine* countries the vinegar-makers dispose of in cakes, after they have pressed out all the *Wine*, and which is afterwards burnt, and makes what Lemery and others call *cineres clavellati*; and the English, *gravelled ashes*, a fixed alkali salt-like pot-ash.

This lee, when to be used for distilling, should be that of the French *Wines*, and either such as is newly pressed, or has been well secured by packing in a close manner in tight casks, with some proper contrivance of dry sand, or the like, to keep its

its external surface from the contact of the air, which is very apt to corrupt or putrify it.

If this lee is intended to be kept many months, it will be very proper to secure it by sprinkling the layers as they are packed up with a little brandy. The expence of this is nothing, for the brandy is recovered again in the operation.

The essential oil of any fermented substance is always found preserved in great quantity in the lee or sediment of the fermented liquor, and in regard to the distilling of these dry *Wine* lees, the great article is the separating this oil to advantage.

In order to this, the solid lee must be set to steep in six or eight times its own weight of water, stirring the whole well together at times; in this manner the liquor will take up all the lighter and better part of the lee, and will become thick and muddy, the coarser part of the cakes, which is of less value, subsiding to the bottom. The thick liquor, without these lumps, is to be put into the common still, and the liquor worked off, as in the common way, by the chemists, to obtain the essential oils of plants. The still must be made hot and dewy before the liquor is put in, and the fire afterwards kept well regulated, otherwise there will be danger of burning; but the better way to secure it is to put some loose sticks at the bottom of the still.

The oil is thus brought over with the liquor, and is to be separated in the common way, by means of a separating pot placed under the nose of the worm; but if this oil is desired to be obtained fine, the pot must be shifted soon, for, after a time, a gross, resinous, and much less agreeable oil, will mix itself with it, and cannot be separated again without great trouble, and a second distillation, and that will not succeed without great care. *Shaw's* Essay on Distillery.

Philosophic Spirit of Wine, in the writings of some chemists and physicians, a phrase that often occurs as the name of a liquid prepared from *Wine*, and endued with very remarkable properties.

It is generally supposed that this was the same sort of liquor which we at this time call by the name of *Spirit of Wine*; but this is a very erroneous opinion, and has led many into errors, about the operations in which it was concerned. It was truly no distilled liquor, but the spirituous parts of *Wine* condensed and concentrated by the freezing of the more aqueous part. See the article *Concentrating of* Wine, supra.

Pricked Wines. An easy method of recovering *pricked Wines* may be learned from the following experiment: Take a bottle of red port that is pricked, add to it half an ounce of tartarized spirit of *Wine*, shake the liquor well together, and set it by for a few days, and it will be found very remarkably altered for the better.

This experiment depends upon the useful doctrine of acids and alkalies. All perfect *Wines* have naturally some acidity, and when this acidity prevails too much, the *Wine* is said to be pricked, which is truly a state of the *Wine*, tending to vinegar: But the introduction of a fine alkaline salt, such as that of tartar, imbibed by spirit of *Wine*, has a direct power of taking off the acidity, and the spirit of *Wine* also contributes to this, as a great preservative in general of *Wines*. If this operation be dexterously performed, pricked *Wines* may be absolutely recovered by it, and remain saleable for some time: And the same method may be used to malt liquors just turned sour. *Shaw's* Lectures, p. 214.

Saffron Wine, *Vinum Crocatum*. See the article Saffron.

Wine-*Spirit*, a term used by our distillers, and which may seem to mean the same thing with the phrase *spirit of Wine*; but they are taken in very different senses in the trade.

Spirit of Wine is the name given to the common malt spirit, when reduced to an alcohol, or totally inflammable state; but the phrase *Wine-spirit* is used to express a very clean and fine spirit, of the ordinary proof strength, and made in England from *Wines* of foreign growth.

The way of producing it is by simple distillation, and it is never rectified any higher than common bubble proof. The several *Wines* of different natures, yield very different proportions of spirit; but, in general, the strongest yield one fourth, the weakest in spirits one eighth part of proof-spirit; that is, they contain from a sixteenth to an eighth part of their quantity of pure alcohol.

Wines that are a little sour, serve not at all the worse for the purposes of the distiller, they rather give a greater vinosity to the produce. This vinosity is a thing of great use in the *Wine-spirit*, whose principal use is to mix with another that is tartarized, or with a malt-spirit, rendered alkaline by the common method of rectification. All the *Wine-spirits* made in England, even those from the French *Wines*, appear very greatly different from the common French brandy; and this has given our distillers a notion that there is some secret art practised in France, for the giving the agreeable flavour to that spirit; but this is without foundation. See the article Spirit.

When we distil Sicilian or Spanish *Wines*, we do not produce Sicilian or Spanish brandies; and the true reason of this is, that the *Wines* which they distil on the spot into brandy, are very different from those which they export as *Wines*.

Those they distil are so poor and thin, that they will not keep many months, nor can possibly bear exportation. If we had in England those poor *Wines* they distil into brandy near Bourdeaux, Cognac, or up the Loire, there is no doubt but the spirit we made from them would be universally allowed to be French brandy. We have proof of this from some of the Scotch distilleries, where they, with no peculiar art, or secret method, procure from some of the poor pricked and damaged *Wines* received there, brandy so nearly resembling that of France, that a good judge will scarce be able to make the distinction. *Wine-spirits* and brandies therefore are the same thing, only with this difference, that the former is the product of a rich *Wine*, and the latter of a poor one; or, at the utmost, they differ only as our two home products, the cyder-spirit and the crab-spirit do.

The *Wine-spirit*, distilled in England, is not easy to be had pure and unmixed at our distillers, nor under a price almost equal to that of French brandy; so that if it ever be required out of the trade, it is as well to use the French brandy, which will, in all cases, serve the same purposes, unless where a high flavour or a copious essential oil are required. All other spirits are carefully divested of their oil in the rectifications; but the *Wine-spirit* is coveted only for its oil, and all that can be obtained is preserved in this, its principal use being to give a flavour to a worse spirit, and to cover the taste of a disagreeable oil in it.

When a cask of *Wine* chances to turn sour in private hands, it is worth while to distil it for the spirit. The lees also, if in any considerable quantity, will yield such a proportion of the same sort of spirit, as to render it worth while; and as the high flavour is not required in this intent, it will be best to draw off the spirit very gently, either by the cold or hot still, and afterwards it may be rectified without any addition, and reduced to the standard strength of proof. It thus makes a very clean and pleasant spirit, though very different from the brandy from the same country whence the *Wine* came. *Shaw's* Essay on Distillery. See the article Spirit.

Wine-*Fly*, in natural history, the name of a small black fly, found in empty *Wine*-casks, and about *Wine*-lees, and called by the Latins, *bibio*.

It is produced of a small red worm, very common in the sediment of *Wine*. See the article Bibio.

The drippings of *Wine* or beer-vessels, the pressings of the *Wine* or cyder-press, the pots in which honey has been kept, and in which a little remains sticking to the sides, and turning sour, all afford vast numbers of a small species of worm or maggot. This is of a white colour, and has two hooks placed near the head; in short, it resembles, in all the parts, the maggot of the common flesh-fly. Multitudes of these small creatures live and move very brisky about in these substances for several weeks together; but at the end of that time, when they have arrived at their full growth, they enter into the nymph state under a covering or case made of their own skin, which dries, and becomes of a brown colour. After eight or nine days in this state, the case is opened by the falling off of a small piece at the end, and the fly makes its way out. The fly is extremely small when its wings are not extended.

It does not exceed the size of the head of a middling pin; it is however very beautiful; the breast and body are yellow, the reticulated eyes are red, and the wings have all the rainbow-colours. The best way of procuring these little flies, which make a very beautiful microscopic object, is to keep the matter, in which the worms are placed, in a glass, covered down with a paper; as soon as the cover is taken off, at the time of their being in the fly-state, they rise up at once in the form of a cloud; enough of them for observation will however remain about the sides of the vessel. When examined, they are found to have all the regular parts of the larger flies; their antennæ are oval and flatted, and their legs, and every other part, are as elegantly perfect, as they are seen to be in the most elegant large fly.

It is not known whether they are oviparous or viviparous; but this is to be observed, that they give us great light into the origin of animalcules in different fluids. These are a species of winged insect, so small as scarce to be visible as they fly, and to these we owe the worms in the four substances before-described, though we know not how or when they deposit them there. These maggots or worms are of the number of those animals, supposed by the vulgar to be produced of corruption. Snce we see in these the evident course of nature in their origin, what prevents but that there may be numbers of flies yet smaller than these, whose eggs may be deposited in the fluids in which we find our microscopic animalcules. *Reaumur's* Hist. Inf. vol. 9. p. 81.

WING, (*Cycl.*)—*Wings*, among the fly-class, afford several subordinate distinctions of the genera of those animals, under the antient general classes.

Several species of flies, while they are in a state of rest, or only walking, shew several regularly distinct manners of carrying their *Wings*. The much greater number, however, carry them in a parallel or plain position. Among those who carry them thus, some have them in form of a sort of oars, their direction being perpendicular to the length of the body, which is not at all covered by them. This is the case in many of the libellæ, and of the tipulæ.

Others carry their *Wings* in this manner, so as that they cover a part of the body, without at all covering one another. Among

Among the two-winged flies, the great blue fleſh-fly, and the common fly about houſes, give us inſtances of this.

The *Wings* of others croſs one another on the body of the creature, and the degrees in which they cover one another, give occaſion to ſeveral other ſub-diſtinctions; for ſome of them over-hang on each ſide the body of the animal, while others croſs one another, in ſuch a manner as not to cover the body of the fly entirely, but leave a rim of it viſible and uncovered on each ſide of them. Some of the flies bred of water-worms have their *Wings* in this manner.

Others have their *Wings* thus diſpoſed, but croſſing one another only in a part of their ſurface, and that at their extremities; ſo that though they there cover the body of the fly, they leave a portion of the anterior part of the body naked.

The *Wings* of other flies not only croſs one another on the body of the animal, but they round themſelves there; theſe are not exactly parallel in their ſituation, but the upper *Wing* is more elevated on the middle of the body than on the ſides.

Some flies have their *Wings* placed upon their backs, and applied againſt one another. Theſe are in a perpendicular poſition; and ſeveral of the ſmaller ſpecies of libellæ, and winged pucerons, are of this ſort; as are alſo the ephemerous, or day-flies.

The *Wings* of other flies are applied obliquely againſt their ſides, and meet above the body by their inner edges; theſe form, by their junction above, a kind of hollow roof, under which the body is placed. The flies produced from the puceron-eater, and the formica-leo, are of this kind. *Reaumur's* Hiſt. Inſ. Tom. 4. p. 136.

Other flies have their *Wings* thus applied to their ſides, and, inſtead of riſing erect, bending themſelves at their meeting upon the creature's back, and forming a flat depreſſed roof over the body. Of this kind are the *Wings* of many of the flies produced from water-worms. Ibid. p. 137.

And finally, there are ſome of the flies which carry their *Wings* in an oblique direction, but have them meeting under their bellies. Theſe are placed exactly contrary to thoſe which form a kind of high roof over the creature's back; and of this kind are the *Wings* of that elegant fly which is produced from the cherry-worm.

The ſtructure of the *Wings* of different flies might alſo furniſh matter of farther diſtinctions. The greater part of them are of a fine ſtructure, and repreſent the fineſt gauſe, and are equally tranſparent, or nearly ſo in all parts. Some flies, however, have *Wings* of a leſs degree of tranſparence, and ſome even opake ones [a]. Others of the four-winged flies have obſcure ſpots alſo diſtributed near their very tranſparent texture; ſuch are the wings of the ſcorpion-fly; and ſome of the two-winged flies have *Wings* partly opake, partly pellucid, the opake ſpots being ſeparated by tranſparent lines [b].—[[a] Ibid. p. 137. [b] Ibid. p. 138.]

Wings *of Butterflies*. The beautiful *Wings* of this genus of inſects, are diſtinguiſhed from thoſe of the fly-kind, by their not being thin and tranſparent, like them, but thicker and opake. This opacity in them is owing only to the duſt which comes off of them, and ſticks to the fingers in handling them, and it is alſo to this duſt that they owe all their beautiful variety of colours. The earlier naturaliſts, for this reaſon, diſtinguiſhed theſe inſects by the appellation of ſuch as had farinaceous *Wings*. *Reaumur's* Hiſt. Inſ. vol. 1. P. 1. p. 282.

The uſe of the microſcope has taught us, that this duſt is not the reſult of ſome other ſubſtance broken into fragments; but every particle of it is a regularly figured body, made for the place and order it has in the covering of the *Wing*.

The ſeveral ſpecies of butterflies, and even the different parts of the ſame *Wing*, afford theſe bodies of different ſhapes and figures. Moſt of the authors who have written of microſcopic objects, have given the figures of the principal varieties of theſe; but no one has given ſo many as Bonani in his Micrographia, in which work the figures of the various kinds take up four quarto plates.

It has been the general cuſtom of authors to call theſe feathers; but they are by Mr. Reaumur, with much greater juſtice, called ſcales. Their ſtructure has no reſemblance to that of feathers, for they are little flat and thin bodies, of more or leſs length, and always having a ſhort pedicle which enters into the ſubſtance of the *Wing*. That part of the ſcale from which this pedicle is propagated, is rounded in moſt caſes, and very frequently the other end is rounded alſo. The whole ſcale therefore in theſe becomes of an oval figure. Others have a little dent in the middle of the end, oppoſite to the pedicle, by which they are made to reſemble the ſhape of a heart at cards, and many of them are not abſolutely flat, but are more or leſs hollowed on the under ſide: And the ends, which are in ſome plain and ſtrait at the edges, are in others indented or jagged, and in ſome cut into ſmall and elegant ſegments.

The indentings of ſome are but few in number, and theſe reſemble the fingers of a hand ſpread open, the body of the ſcale repreſenting the palm; in ſome, theſe fingers terminate in ſharp points, in others they are more obtuſe, and in ſome there are only three of theſe to each ſcale; in others there are as far as eight; ſome are regular triangular blades, and have their baſe very ſhort, in compariſon to the length of the ſides; but this is variouſly cut and indented in all the manners before ſpoken of. In ſome theſe jags at the end ſeem propagated all along the ſcale, and form in it ſo many ridges, elevated above the reſt of the ſurface on the upper ſide, and hollowed on the under. Thoſe which have theſe elongated ridges, have uſually alſo a rib running down the middle through their whole length, as the leaves of plants have, and the pedicle is in theſe ſcales as in the leaves of vegetables, only an elongation of this middle rib.

Beſide theſe, which are the more uſual figures of the feathers or ſcales of the *Wings* of butterflies, there are ſome others extremely different, and which neither Bonani, nor any other author has given the figures of till Reaumur. Theſe have leſs title to the appellation of ſcales than any of the others, and at firſt ſight might ſeem indeed to have none at all. Their pedicle is ſo long and ſlender, that they might be miſtaken for hairs; but that each of them is terminated by a ſmall flat plate, which is ſplit a little way down the middle, and in all reſpects reſembles the ſcales before deſcribed, which adhere to their ſhort pedicles. There are, however, ſome of this laſt kind, which can by no means be called ſcales. What, in thoſe deſcribed above, is a flat plate placed at the end of a very long and ſlender pedicle, is, in theſe, only a diviſion of the extremity of the long capillary pedicle, into four or five parts, which have not breadth enough to entitle them to the name of ſcales. *Reaumur's* Hiſt. Inſ. vol. 1. P. 1. p. 255.

The diſtinction in names in theſe matters, is abſolutely neceſſary, and the calling theſe bodies, uſually termed feathers, ſcales, cannot well be avoided by an accurate obſerver, becauſe there are, in ſome of the butterflies, ſome parts which are covered with real feathers, ſome other parts have only hairs, and ſome others ſcales; all theſe have been called feathers by ſome; but they are ſo different in themſelves, that they well deſerve different denominations. Beſide all theſe, ſome parts of ſome of theſe creatures are beſet with real prickles, and ſometimes even the ſame part, in the ſame animal, is jointly covered with all theſe ſeveral ſorts of inveſtures.

When the *Wing* of a butterfly is viewed by a microſcope, the arrangement of theſe ſeveral bodies in it is ſeen to be extremely beautiful and regular. The ſcales lie as regularly and evenly one over another, as the tiles on a houſe, or the ſcales on the fiſh-kind, every ſeries of them covering a ſmall part of that ſeries which runs below it. The upper and under part of the *Wing* are equally furniſhed with theſe, and there is no ſpecies of this creature, in every *Wing* of which there are not ſeveral figures of theſe ſcales in ſeveral parts: But the greater part of the ſurface, a little diſtant from the edges, has only one ſort in moſt ſpecies. But this kind is different in the ſeveral ſpecies; in ſome we only find the plain oval ones, in others the cordated, and in others thoſe which are divided at the end, in the manner of the fingers of a hand. In other ſpecies the *Wings* make a leſs elegant appearance, though more loaded with theſe ſcales; for the ſeveral ſeries of the beautiful ſorts of ſcales which have been before deſcribed, are in theſe buried under other very thick ſeries of thoſe which have long capillary ſtems, and appear only like ſo many hairs. The extremities of the *Wings* of theſe inſects appear to the naked eye as if bordered with a ſort of fringe; but, when examined by the microſcope, this fringe appears to be compoſed of a number of oblong ſcales, of the nature of thoſe triangular ones before-deſcribed, which have very narrow ends, in proportion to the length of the ſides, and theſe ends are variouſly fingered.

The ſtructure of the *Wing* itſelf, which ſupports theſe ſeveral ſcales, hairs, *&c.* is very worthy our attention. In order to examine this, it is neceſſary to rub off all the duſt or ſcales. We then find that the *Wing* itſelf is framed of ſeveral large and ſtrong ribs, which all take their origin at that part where the *Wing* is fixed to the body, and thence extend themſelves along the ſeveral ſides of the *Wing*. The largeſt and thickeſt of theſe ſurrounds the outer edge of the *Wing*, the largeſt next to this extends itſelf round the interior edge, and the others direct their courſe along the middle of the *Wing*, and then divaricate and become ramified in the manner of the ribs in the leaves of plants. The ſubſtance which connects and fills up the ſpaces between theſe ribs, is of ſo peculiar a nature, that it is not eaſy to find any name to deſign it by, at leaſt there is no ſubſtance that enters the compoſition of the bodies of the larger animals, that is at all analogous to it: It is a white ſubſtance, tranſparent and friable, and ſeems indeed to differ in nothing from that of the large and thick ribs, but in that it is extended into thin plates; but this is ſaying but little toward the determining what it really is, ſince we are as much at a loſs to know by what name to call the ſubſtance they are compoſed of. Malpighi indeed calls them bones; but though they do ſerve in the place of bones, rendering the *Wing* firm and ſtrong, without making it heavy, and are, when cut tranſverſely, found to be hollow; yet, when ſtrictly examined, they do not appear to have any thing of the ſtructure of bones, but appear rather of the ſubſtance of ſcales, or of that ſort of imperfect ſcales, of which the covering of thoſe inſects which we call cruſtaceous is compoſed. *Reaumur's* Hiſt. Inſ. vol. 1. P. 1. p. 259.

Be this ſubſtance however what it will, it admirably ſerves the office nature ſeems to have intended it for, making the *Wings* at once very light and very firm; and the millions of ſmall

and

and flat fcales which cover them, fcarce at all increafe the weight, and yet make an admirable defence for the middle part, where it is extended into thin plates between the ribs. In examining this part more narrowly, we find that it is traverfed in all parts by a number of furrows or lines running from rib to rib, each marked with a vaft number of dufky-coloured points or fpots. Mr. Reaumur compares thefe to the ridges and holes in the common papers on which pins are kept, and obferves, that thefe little dufky fpots are the holes which receive the ftems or pedicles of the feveral feries of fcales. This is diftinctly feen by the microfcope, as the *Wing* is never wholly cleared of the fcales; and the few which remain fingly in their places, always fill up fome of the holes or obfcure points in thefe feveral feries.

The *Wings* of butterflies, thus large, and thus light, are very well able to fuftain them a long time in the air, and thus might be expected to fly better than moft other infects; but many people have obferved the irregular manner in which thefe infects ufually fly, which is not ftrait forward, but up and down, and to one fide and the other: this has been fuppofed owing to fome imperfection of the *Wings*; but, in reality, it is their great perfection that enables the creature to do this, and this manner of flying is abfolutely neceffary to the preferving their life, as birds of many kinds are continually after them while they are on the *Wing*; and it is a pleafant fight to obferve, in what manner this fort of dodging motion in the butterfly difappoints the bird that flies ftrait at it, and often preferves it fafely for a long way together.

All the beautiful variety of colours, which we fee on the *Wings* of thefe infects, is owing to the fcales and feathers. The fubftance of the *Wing* is tranfparent, and of one uniform and dufky-whitifh colour; this however is wholly hid by the fcales planted on it, and is like the earth in a meadow, covered with a profufion of flowers of various forts and colours. Certain parts of the *Wings* of fome fpecies have only blue fcales, other parts only purple, and others only yellow, and fo on, in the different fpecies of different colours, a fine deep black and a pearly white being two very common colours in them, and capable of producing a fine variety in the fhadowing: And as thefe arrangements of coloured fcales are difpofed with a beautiful regularity, they give us all the appearances of clouded veins and eyes that we fee. *Reaumur's* Hift. Inf. vol. 1. P. 1. p. 260.

WINGS *of Gnats*. Thefe are of a very curious ftructure, and well worthy the ufe of the microfcope, to fee them diftinctly.

It is well known, that on touching the *Wings* of butterflies, a coloured powder is left on the fingers, which, though to the naked eye it appear a mere fhapelefs duft, yet when examined by the microfcope, it is found to be very regularly figured beautiful bodies, in form of feathers and fcales: Thefe are of various figures, and all of them very elegant. The generality of flies have nothing of this kind; but the clofe examination of the *Wings* of the gnat will fhew, that they are not wholly deftitute of them; they are much more fparingly beftowed indeed upon the gnat than on the butterfly; but then they are arranged with great regularity. *Reaumur's* Hift. Inf. vol. 4. p. 577.

The *Wings* of the gnat, like thofe of moft other infects, are of a cartilaginous fubftance; friable, and tranfparent as a flake of talc, and the circumference, and many parts of the inner ftructure of the *Wing* are ftrengthened by flender but firm ribs, which are divaricated into feveral ramifications. Thefe appear to us to be mere ftrait fibres; but they are probably hollow, and perform the office of veffels, for carrying the fluids or air neceffary to the fupport of the *Wing*, as well as to ftrengthen it. In the *Wings* of butterflies there are fimilar ribs, but they are there all hid by the fcales; but it is not fo in the gnat, for in its *Wings*, as in thofe of the other flies, thefe ribs feem naked.

The affiftance of the microfcope fhews, however, that they are not abfolutely fo in the *Wings* of gnats; but thefe nerves or ribs, with their feveral ramifications, look like fo many ftalks of a plant covered with fmall oblong leaves. The feveral fcales that are attached to thefe ribs, make acute angles with them, and are directed toward the end of the *Wing*.

The number of thefe fcales is very fmall in comparifon with that of the butterfly-clafs; but they make a flighter and more elegant ornament. There are fome fpecies which have the intermediate fpaces of the *Wing* adorned alfo with thefe fcales; but they are in thefe but thinly fcattered. The intermediate fpaces of the *Wings*, when they have no fcales, are finely wrought and pointed, and the innner edge of the *Wings* is always bordered with a row of fcales in form of a fringe, which, in fome fpecies, is compofed of fcales all of the fame equal fize, and in others is made up of many of very various lengths; and the exterior edge of the *Wing*, which is furrounded by a rib much thicker and ftronger than the interior, is not fringed with a feries of fcales, but is befet, at certain diftances, with a fort of long prickles. Ibid. p. 578.

The ordinary fhape of the fcales of the gnats *Wings*, is that of an oblong battledoor, one end of which is broader, and the other more pointed. The narrower end is that from which goes the ftalk by which it adheres to the rib. The other end is fometimes more, fometimes lefs round, and is fometimes a little hollowed in the middle. Some of thefe fcales are much longer in proportion to their breadth than others, and fome of them have their extremity formed into an open crefcent. All have a number of fine lines running longitudinally through the whole fcale. Ibid. p. 579.

Goofe-WING, at fea. See the article GOOSE-*Wing*.

WINTER (*Cycl.*)—WINTER-*Heyning*, in our ftatutes, a feafon between the eleventh day of November, and the three-and twentieth of April, which is excepted from the liberty of commoning in the foreft of Dean, &c. Stat. 20 Car. 2. c. 3. *Blount*.

WINTERANUS *Cortex*, in botany, a name given to the wild cinnamon-tree, the characters of which are thefe: The trunk is about the thicknefs of one's thigh, rifing to about twenty or thirty foot high, having many branches and twigs hanging downwards, making a very comely top. The bark confifts of two parts, *viz.* outward and inward. The outward bark is thin as a milled fhilling, of a whitifh-afh or grey colour, with fome white fpots here and there on it, and feveral fhallow furrows of a darker colour, running varioufly through it, and making it rough; its tafte is aromatic. The inward bark is much thicker than cinnamon, being equal in thicknefs to a milled crown-piece, fmooth, of a whiter colour than the outward, of a much more biting and aromatic tafte, fomething like that of cloves, and not glutinous like cinnamon, but dry and crumbling between the teeth. The leaves come out near the ends of the twigs, without any order, ftanding on inch-long foot-ftalks; they are each of them two inches long, and one inch broad near the end where broadeft, and roundifh, being narrow at the beginning, and thence increafing in breadth to near its end, of a yellowifh green colour, fhining and fmooth, without any inciffures about its edges, and fomewhat refembling the leaves of bay or *laurocerafus*. The ends of the twigs are branched into bunches of flowers, ftanding fomething like umbels, each of which has a foot-ftalk, on the top of which is a calyx made up of fome foliola, within which ftand five fcarlet or purple petala, and within them is a large ftylus. To thefe follow fo many cauliculated berries, of the bignefs of a large pea, roundifh, green, and containing within a mucilaginous pale green, thin pulp, four black fhining feeds, or acini, of an irregular figure.

All the parts of this tree, when frefh, are very hot, aromatic, and biting to the tafte, which is fo troublefome as fometimes to need a remedy from fair water. It grows in the low-land, or Savanna-woods in Jamaica, Antigua, and the other Caribbee Iflands.

The bark of this tree is what is chiefly in ufe, both in the plantations of the Englifh between the tropics, in the Weft Indies, and in Europe, and is, without any difficulty, cured by only cutting off the bark, and letting it dry in the fhade.

The people of the Weft Indies ufe it inftead of all other fpices, being thought very good to confume the immoderate humidities of the ftomach, help digeftion, expel wind, &c.

It is likewife, as well there as in Europe, thought a very good remedy againft the fcurvy, and to cleanfe and invigorate the blood, being, among the apothecaries and druggifts of London, ufed for thofe purpofes under this name, though differing from the true *Cortex Winteranus*, as may appear from the defcriptions of both; but may very well fupply its place. Phil. Tranf. N°. 192. See the article CORTEX, *Cycl.*

WIOCHIST, among the Indian natives of Virginia, is their prieft, who is alfo generally their phyfician; and is the perfon in the greateft honour amongft them, next to their king, or great war captain. Phil. Tranf. N°. 454. Sect. 1.

WIRE (*Cycl.*)—Iron *Wire* is made from fmall bars of iron, which are called *ofleom iron*, which are firft drawn out to a greater length, and to about the thicknefs of ones little finger, at a furnace, with a hammer gently moved by water. Thefe thinner pieces are bored round, and put into a furnace to aneal for twelve hours. A pretty ftrong fire is ufed in this operation.

After this they are laid under water for three or four months, the longer the better; then they are delivered to the workmen, called *rippers*, who draw them into *Wire* through two or three holes. After this they aneal them again for fix hours, and water them a fecond time for about a week, and they are then delivered again to the rippers, who draw them into *Wire* of the thicknefs of a large packthread. They are then anealed a third time, and then watered for a week longer, and delivered to the fmall *Wire*-drawers, called *overhoufe-men*.

In the mill where this work is performed, there are feveral barrels hooped with iron, which have two hooks on their upper fides, on each whereof hang two links, which ftand acrofs, and are faftened to the two ends of the tongs, which catch hold of the *Wire*, and draw it through the hole. The axis on which the barrel moves does not run through the center, but is placed on one fide, which is that on which the hooks are placed; and underneath there is faftened to the barrel a fpoke of wood, which they call a *fwingle*, which is drawn back a good way by the cogs in the axis of the wheel, and draws back the barrel, which falls to again by its own weight. The tongs hanging on the hooks of the barrel are by the workmen faftened to the end of the *Wire*, and by the force of the wheel, the

the hooks being pulled back, draw the *Wire* through the holes.

The plate in which the holes are is iron on the outfide, and fteel on the infide; and the *Wire* is anointed with train oil, to make it run the eafier. *Ray*'s Englifh Words, p. 133.

WIRES *of Afteriæ*, in natural hiftory, a name given by authors to a fort of extraneous foffil belonging to the Afteriæ, and being a fort of branches from the body of that column. See the article ASTERIA.

WIRE *of Lapland*. The favage inhabitants of Lapland have a fort of fhining flender fubftance in ufe among them on feveral occafions, which is much of the thicknefs and appearance of our filver *Wire*, and is therefore called by thofe who do not examine its ftructure or fubftance, *Lapland wire*.

The people of this miferable country find many ufes in every thing nature has afforded them, and, among the reft, that fpecies of ftag called the rein-deer, which is the moft frequent animal among them, is not only ferviceable in furnifhing them with meat, cloaths, houfes, and the means of carriage and travelling; but its bones make many of their moft neceffary utenfils; and the finews, which are all carefully feparated in the eating, are, by the women, after foaking in water, and beating, fpun into a fort of thread, which is of admirable finenefs and ftrength, when wrought to the fmalleft filaments; but when larger, is very ftrong, and fit for the purpofes of ftrength and force. Their *Wire*, as it is called, is made of the fineft of thefe threads, covered with tin. The women do this bufinefs, and the way they take is to melt a piece of tin, and placing at the edge of it a horn with a hole through it, they draw thefe finewy threads, covered with the tin, through the hole, which prevents their coming out too thick covered. This drawing is performed with their teeth, and there is a fmall piece of bone placed at the top of the hole, where the *Wire* is made flat, fo that we always find it rounded on all fides but one, where it is flat.

This *Wire* they ufe in embroidering their cloaths as we do with gold and filver; and they often fell it to ftrangers, under the notion of its having certain magical virtues. *Scheffer*, Hift. Lapland.

WIT-*Fifh*, in zoology, a name given by the Dutch in the Eaft Indies to a fifh common on thofe coafts, and feeming to be of the tænia kind. It is of the fize of our common whiting. Its back is ftrait and even, and its belly prominent. Its fnout is pointed fomewhat upwards, and its tail forked. It has one fingle fpine or prickle on its back, and has a long belly-fin reaching from the head to near the tail. Its whole body is ftriated, and it has two long filaments or beards hanging from its fnout, and is a very fine and delicate fifh. *Ray*'s Ichthyography, Append. p. 6.

WIT-*Fifh* is alfo the name given by the Dutch to an Eaft Indian fifh, of the herring kind, caught in great plenty near the fhores in many places, and called by Mr. Ray, *albula-Indica*. *Ray*'s Ichthyogr. Append. p. 3. See the article ALBULA-*Indica*.

WITCHES *Butter*, a name given by the common people of England to a fort of tremella growing on the bark of old trees, in form of a corrugated membrane. See the article TREMELLA.

WITCH-*Craft* (*Cycl.*)—The old laws made in England and Scotland againft conjuration and *Witch-craft* are repealed by a late ftatute, and no perfon is to be profecuted for any fuch crime, 9 Geo. 2. c. 5. Sect. 1, 2, & 3.

But pretenders to *Witch-craft*, or to tell fortunes, or to any crafty or occult fcience to difcover ftolen goods, may be imprifoned for a year, put in the pillory, and bound over to their good behaviour. Ibid. Sect. 4.

WITHERS, (*Cycl.*) that part of a horfe where the mane ends, being joined to and ending at the tip of the fhoulder-blades.

Thefe parts fhould be well raifed and pretty ftrong, for this is a fign of ftrength and goodnefs in the horfe. They keep the faddle from coming forward upon the horfes fhoulders and neck, which immediately galls and fpoils him. A hurt in this part is very difficult to cure, and, for this reafon, they fhould be lean rather than flefhy, as they are then lefs fubject to be bruifed and hurt by the faddle.

When there are fores on the *Withers*, the caufe muft be looked to, in order to determine a proper cure, and prevent a return. If the hurt be caufed by the largenefs of the faddle-bands, provided that it be not too great, it may eafily be cured by the following remedy: Take the whites of fix eggs, beat them with a piece of alum as big as an egg for a quarter of an hour, or till the whole is reduced to a thick fcum or froth; let the fwelling be rubbed well with this mixture, and then covered over with more of the froth; this is to be left to dry on, and the application is to be repeated every ten or twelve hours; notwithftanding that the heat and fwelling remains, this, by degrees, will take place, though not at firft.

If the hurt be great, recourfe muft be had to bleeding; and this may be repeated after two days, if the fwelling and inflammation continue.

If a tumour, with great inflammation, follow a bruife with the faddle-bows, the part affected is to be rubbed with lime-water, and covered with a lamb's fkin, the woolly part next the back: after the wafhing, the ointment, well known among our farriers by the name of the *Duke's ointment*, is to be applied; and if the tumour inclines to fuppurate, the ointment muft be wafhed off with a mixture of vinegar and water warmed, mixed with a handful of falt to every quart of it: an ointment is then to be made of half a pound of populeon, and a quarter of a pound of black foap, and as much honey: thefe are to be thinned with a large glafs of fpirit of wine, and the part is to be well rubbed with fome of this three or four times a day, covering it afterwards with a lamb's-fkin. Some ufe, inftead of this ointment, a pultice made of powder of cummin-feed, linfeed-oil, and pigeons-dung, which does as well.

WITHERS *of the Bow of a Saddle*, in the manege. See the article BOW.

WITHER-*Band*, in the manege, a band or piece of iron laid underneath a faddle, about four fingers above the withers of the horfe, to keep tight the two pieces of wood that form the bow.

WITHER-*Wrung*, in the manege. A horfe is faid to be *Wither-wrung*, when he has got a hurt in the *Withers*; which fort of hurts are very hard to cure. See the article WITHERS, *fupra*.

WITTENA-*Gemot* (*Cycl.*)—In the Saxon times this was the chief court of the kingdom, where all matters, both civil and criminal, and thofe relating to the revenue, were determined. In civil and criminal matters, it was a court, in the firft inftance only, for facts arifing in the county where it fat; but it heard and determined caufes from all other counties, by way of appeal. *Lambard*, Archaionom. 57, 239, 245. Mirror, c. 5. Sect. 1.

To this court were fummoned the earls of each county, and the lords of each leet, as alfo the reprefentatives of towns, who were chofen by their burgeffes. *Lambard*, Archaionom. 239.

WITWALL, a common Englifh name for the great fpotted wood-pecker, the *picus varius major* of authors. See the article PICUS.

WOAD, *Ifatis*, in botany. See the article ISATIS.

This ufeful plant makes a very confiderable article in trade, and is in many parts of the kingdom propagated to very great advantage.

It requires a dry and warm foil, which fhould have lain quiet for fome time before. The land it is fown on muft be laid very even, and all the clods and large ftones taken away. It is to be fown in the latter end of July, foon after the feed is ripe. It will come up in Auguft, and muft then be houghed, leaving the plants about ten or twelve inches afunder, that they may be ftrong, and produce the larger leaves. It is never fown more than two years upon the fame land, becaufe it robs it greatly. It is ripe for the cutting at different feafons, according to the drynefs or moifture of the weather; but when the leaf is full grown, and of a fine green colour, it is known to be fit for ufe, and is to be cut immediately, left it fhould turn pale by ftanding.

Good *Woad* will yield five or fix crops in a plentiful year, and very feldom gives lefs than three or four. The two crops firft cut are always the beft, and thefe are not to be mixed among the after-cuttings.

An acre of ground ufually yields, one year with another, about a ton, which fells, according to its goodnefs, for from fix pounds to thirty. *Miller*'s Gardeners Dict.

According to Mortimer, the proper foil for this ufeful plant is a warm and rich land, and the longer it has lain unploughed the better, for the *Woad* requires a great deal of nourifhment. It will do very well on fandy and gravelly foils, if they are of a good depth, and have rich mould among them.

When land is too rank for corn, nothing can prepare it for this crop better than *Woad*, abating the too great fertility of it. The land where it is to be fowed muft be laid very level, and the clods all broken. The time of fowing it is from the beginning to the middle of February. It muft be kept conftantly weeded; but if it come up ftrong, it will need the lefs trouble of this kind, as it will kill the weeds of itfelf. The plant muft be gathered when the leaves are fully grown, and have not yet loft their colour. What grows in winter is of no ufe as *Woad* for the dyers, but it is an excellent food for fheep. If the ground be dry, it muft be watered for a day or two before the feed is fown, otherwife it does not fucceed well.

It is remarkable of *Woad*, that it requires a peculiarity of climate to bring it to its perfection, and make it fit for the dyers ufe; and that in many places where it feems to grow vigoroufly, it yet never ripens this juice, which is its only value, to any degree of colour.

The French cultivate this herb in as large quantities as we do in England, and have tried in many provinces; but they find it fail in feveral of them. In upper Languedoc it arrives at a very great degree of perfection, and its leaves are very large and fucculent, and furnifh a blue colour, very ufeful in dying ftuffs of all kinds; but in Normandy, where there is much land proper to cultivate it on, it has been often tried with all the advantages of manure and hufbandry; but the want of a fufficient degree of heat will not fuffer it to arrive at perfection. Its leaves, tho' as large as thofe of the Languedoc *Woad*, are never fo thick or fucculent, and the colour they afford is fmall

ſmall in quantity, and of a duſky-browniſh hue, that renders it little regarded. Trait. Phyl. de *Deſlandes*.

Though *Woad* gives a blue dye, yet it is uſed to prepare cloth for green and many other colours, when they are deſigned to be permanent, and not to fade. *Boyle*'s Works abr. vol. I. p. 169.

Beſide the plant properly ſignified by the name *Woad*, which dyes a blue colour, we have two others known in our Engliſh herbals under this name, as alſo that of *wold* or *weld*. Theſe are both called by the common people *dyer's weed*, and are the *luteola* and the *geniſta tinctoria*.

The antients confounded all theſe three plants alſo under the ſame names. Paulus Ægineta ſeems to make them all the ſame plant; and Neophytus, ſpeaking of the *iſatis*, or our *Woad*, properly ſo called, ſays, that it was called by the Latins, *lutum*. This *lutum* has been by ſome underſtood to mean the *luteola*, and by others the *geniſta tinctoria*; but the latter opinion only is right, for it is deſcribed to us by the antients as having leaves like the *linum*, or flax, and flowers like the broom.

WOLF, *Lupus*, in zoology. See the article LUPUS.

WOLF, in the hiſtory of inſects, the name of a ſmall white worm or maggot, which infeſts granaries, and does very great damage there.

It is in this ſtate of the worm that it does the miſchief; but this is not its perfect form, for it is afterwards transformed into a ſmall moth, with white wings ſpotted with black.

This little maggot has ſix legs, and as it creeps along, there iſſues from its mouth an extremely fine thread or web, by which it faſtens itſelf to every thing it touches, ſo that it cannot fall. Its mouth is furniſhed with a pair of reddiſh forceps, or biting inſtruments, by means of which it gnaws its way not only into wheat and other grain, but perforates even beams of wood, boxes, books, and every thing it meets with.

Toward the end of ſummer this pernicious inſect may be ſeen crawling up the walls of corn-chambers, infeſted with them, in great numbers; they are then ſearching a proper place where they may abide in ſafety during their aurelia-ſtate; for when the time of their undergoing this change approaches, they forſake their food, and the little cells they had formed of hollowed grains of corn clotted together, by means of the web coming from their mouths. They now wander about till they find ſome wood, or other ſubſtance, to their mind, into which they gnaw holes with their phangs, capable of concealing them; and there enveloping themſelves in a covering of their own ſpinning, they ſoon become a dark coloured ſort of aurelia. They remain in this ſtate all the winter; but in April or May they come forth in their moth-ſhape, and are then ſeen in vaſt numbers taking ſhort flights, and creeping up the walls. In this ſtate they eat nothing; but they ſoon copulate and lay eggs, which are in the ſhape of a hen's egg, but no larger than a grain of ſand. Each female lays ſixty or ſeventy eggs, which ſhe depoſits in the little wrinkles of the grains of corn, where in about ſixteen days they hatch, and the minute maggots immediately perforate the grain, and eat out all its ſubſtance, and with the threads which come from their mouths cement other grains to it, which they, in the ſame manner, ſcoop out and deſtroy.

The watchful obſerver has two opportunities of deſtroying theſe devourers from among his corn. One is, when they forſake their food, and aſcend the walls, which they will ſometimes almoſt cover. The other, when they appear in the moth-ſtate. At both theſe times they may be cruſhed to death againſt the walls in great numbers, by clapping ſacks upon them: but they may be exterminated more effectually by cloſing up all the windows and doors, and burning brimſtone on a pan of charcoal, letting the room be full of the fumes of it for twenty-four hours. This certainly deſtroys the animals, and does no ſort of injury to the grain, not communicating the ſlighteſt ſcent to it. *Baker*'s Microſcope, p. 222.

WOLF-*Fly*. See the article LUPUS.

WOLF-*Spider*. See the article LUPUS.

WOLF-*Net*, a term uſed by the ſportſmen for a kind of net uſed in fiſhing, which takes great numbers, and has its name from the deſtruction it cauſes.

It is uſed both in rivers and ponds, and is of the nature of the rattle, excepting only the wanting the four *Wings*. The trunk or coffer conſiſts of ſeven feet, beſide the two gullets. It is ſupported by hoops, and is to be placed in ſome part where there is an abundance of ſedges, ruſhes, and water-graſs. There is to be a place made for the net here, by the uſe of a paring-knife, cutting away all the weeds and other matter, for the ſpace that will contain it; and when the net is placed, there are to be two allies cut or cleared in the ſame manner, one on each ſide of the net, that the fiſh may be invited into them, and by them into the net. There muſt be ſome ſtones or leaden weights uſed to ſink the net, and a long pole faſtened to the upper part of the mouth of it, by means of which, when it is well filled with fiſh, it may be lifted up and taken to the ſhore.

WOLF-*Tooth*, a term uſed by our dealers in horſes to expreſs an inconvenience that creature is ſubject to, in regard to its teeth.

There are uſually two of theſe *Wolves*-teeth, which are ſmall, and grow in the upper jaw, next to the great grinding teeth: theſe are ſo tender and painful, that the horſe cannot chew its meat, but is forced to let a great part of it fall out of his mouth, or to ſwallow it half chewed.

The remedy, in this caſe, is to tie up the horſe's head to ſome part of the rafter, and open his mouth with a cord, then with an inſtrument like a carpenter's gouge, and a mallet, the teeth that are thus troubleſome are to be knocked out, and the holes filled up with ſalt.

If the upper-jaw teeth hang over thoſe of the under jaw, and by that means cut the mouth, the ſame inſtrument is to be uſed, and the teeth are to be pared ſhorter by little and little. When they are ſufficiently pared down, they muſt be filed ſmooth, and the mouth waſhed with vinegar and ſalt, and the whole complaint will be thus removed.

WOLF'*s-Grapes*. See the article LYCOSTAPHYLÆ.

WOLF'*s-Peach*. See the article LYCOPERSICON.

WOMB (*Cycl.*)—It is the opinion of Boyle, that as in the earth, which is the frutful *Womb* of all the ſeeds of plants, ſo in the *Wombs* of all animals, while in a fit and proper ſtate for conception, there muſt concur three things; a benign heat to cheriſh, a due fermentation to agitate and dilate, and a due proportion of moiſture, ready to enter with eaſe into the pores opened by the fermentation.

To theſe qualities is owing, in all probability, the menſtrual diſcharge of women, the blood being agitated and rarified, in a part deſtined to theſe offices, for the uſe of an included fœtus; and when that is not there, this fluid ſwells, and opens the veſſels, ſo as to burſt out into a profluvium. It is remarkable that the *Womb* in the human, and one more ſpecies of animal beſide, that is, the monkey, diſcharges this blood regularly; all other animals, at the time of the effervеſcence in that part, which is at intervals of longer periods, diſcharging only a ſmall quantity of an aqueous matter, as is ſeen in mares, cows, *&c.* It is obſerved by the medical writers, that there is an evident conſent of many parts of the body with the *Womb*, that is, ſeveral parts which are always affected with it, and owe their being affected to ſome diſorder in that part, which it propagates and continues to them.

The antients had an opinion of ſympathy on this occaſion; but ſuch obſcure and unmeaning ſolutions are now thrown aſide; and we find that this joint affection of the ſeveral parts to the *Womb*, is owing only to the vicinity of the parts, or the communication and ſtructure of the veſſels, by which the vitiated liquors of the body being conveyed from one part to another, may there excite the ſame or different affections: but becauſe this way of ſympathiſing by veſſels has many conſiderable and unobvious varieties, theſe muſt be examined at large, in order to a perfect underſtanding of the effects they produce. The diverſity and various uſes of the veſſels in the bodies of the perfecter animals muſt be underſtood; and the neceſſity of motion and ſenſe depending from the brain, the animal ſpirits, and the ſyſtem of the nerves, conſidered: the nature and office of theſe being well underſtood, it will appear plainly, that they, being thus diſperſed through the whole body, cannot but produce a conſent of parts through the whole; but that this will be moſt ſenſible where the connections are greateſt, and leaſt ſo where leaſt. *Boyle*'s Diſſertationes Medicæ.

The *Womb* has been generally ſuppoſed ſo extremely tender a part, that the leaſt ſcratch or injury offered it, muſt cauſe an inflammation, of which death itſelf would be the conſequence. But the Paris academy affords, in their memoirs, an inſtance ſomething very different from this. A waſher-woman, of a robuſt habit of body, and about thirty years old, who was then ſix or ſeven months gone with child, accidentally fell down upon a ſtake of an old pale, which wounded her to two or three fingers breadth, and a conſiderable depth, a little below the navel: from that time ſhe never felt the child ſtir; but eight days after, ſhe voided, by the vagina, a large quantity of putrid blood, and this continued eight or ten days.

The external wound was healed in the common way, and the woman went to her uſual work, and continued well to her nine months end; ſhe now expected delivery, but no pains came on, and ſhe thus continued to the fifteenth month without much uneaſineſs; but then ſhe perceived a tumor to ariſe in that part of the belly where ſhe had been hurt. This, in fine, opened of itſelf, and after diſcharging a laudable matter for forty days, at the end of that time it healed up.

In the twenty-ſeventh month this tumor returned again, and became then much larger than before; in three days it became vehemently enraged, and, on opening it, there was diſcharged a quart of ſtinking matter, which greatly relieved her; after three more days dreſſing, there began to appear ſome bones, and, in fine, day by day ſome were diſcharged, till, on the whole, the compleat ſkeleton of a fœtus of between ſix and ſeven months was diſcharged.

In this caſe, there is no doubt but that the *Womb* itſelf was pierced through by the point of the ſtake, at the time of the fall, and the fœtus killed by the wound, and afterwards becoming putrid in the matrix, its parts were diſcharged one by one through the wound in that organ.

This ſeems wholly contradictory to that great tenderneſs ſuppoſed

pofed in the uterus; and fhews that, as no part is by anatomifts allowed more delicate, fo there is fcarce any cafe in which nature and good conftitution cannot make a cure.

It is to be obferved alfo, in regard to this woman, that in the fourteenth month after her fall, fhe found herfelf again with child; but this ended in a mifcarriage.

Several bundles of mufcular fibres enter the ftructure of the *Womb*. Ruyfch mentions an orbicular mufcle at its fundus; which, Mr. Monro fays, he has alfo feen. Vide Med. Eff. Edinb. vol. 2. p. 128. and *Ruyfch*, Epiftolæ de mufcul. in fund. Uteri.

The human uterus has numerous orifices of veffels opening into its cavities, to pour out liquors there.

Towards the fundus of the *Womb* efpecially, thefe orifices are found to be the extremities of canals that come out from larger cavities, lodged within the fubftance of the *Womb*. Thefe cavities are commonly called finufes. See the article SINUSES *of the Womb*.

It is a queftion among anatomifts and phyfiologifts, whence the cavity in the *Womb* is formed, which in the laft months contains the infant, the greateft part of the waters, and all the fecundines, except the placentia? As to which, the curious may confult the learned Dr. *Thomas Simpfon*'s Differtation in the Medic. Eff. Edinb. vol. 4. art. 13.

WOMEN (*Cycl.*)—*Lying-in* WOMEN. See the articles LYING-*In*, DELIVERY, LOCHIA, and MOLA.

Pregnant WOMEN. See the articles PREGNANCY and GRAVIDITAS.

WOOD (*Cycl.*)—The ftructure and organization of *Wood* is a fubject on which many have employed their thoughts; but perhaps none with greater fuccefs than the celebrated Monfieur Buffon, of the Royal Academy of Sciences at Paris.

This gentleman obferves that the organization of *Wood* is yet unknown in all its parts; and that though the world is greatly indebted to the obfervations of Grew, Malpighi, and Hales, yet, when he entered on the fubject, he found there was much more unknown than known, and determined to obferve, from its firft ftate, the growth of trees, and the formation of their woody part.

The feed of a tree, fuppofe an acorn, if put into the earth in the fpring feafon, produces, after a few weeks, a tender fhoot, of an herbaceous ftructure, which enlarges, extends itfelf, and hardens by degrees, and in the firft year's growth, has in it a flender filament of a *woody* fubftance. At the extremity of this young tree there is a little button formed, which opens the next year into leaves, and from which there is propagated a fecond fhoot, in all refpects like that of the firft year, except that it is more vigorous, grows fafter, and hardens much more confiderably. This is alfo terminated by a button like that of the precedent year, and in this is contained the fhoot of the third year; and in this manner is the growth of the tree carried on, till it has acquired its whole height.

Each of thefe buttons is a fort of feed, which contains the fhoot of the fucceeding year, juft as the feed itfelf did that of the firft: and the growth of a tree in height is carried on therefore by a feries of annual productions, exactly like one another, and the full-grown tree is, though perhaps a hundred foot high, compofed only of a number of fhort trees, joined end to end, the longeft of which is not above two foot in length. Thefe little trees of the feveral years never at all alter their height or length, or even their thicknefs; they remain even in a tree of a hundred years old, of their original length and diameter, and fuffer no change, but in becoming harder. This then is the manner in which trees grow in height; how they grow in thicknefs is next to be inquired into.

The button, which makes the fummit of the tree of the firft year, draws it nourifhment through the very fubftance of that little tree; but the principal tubes or veffels which ferve to convey the fap, are placed between the bark and the *woody* filament.

The action of this fap in moving, dilates and enlarges thefe veffels, while the button, in raifing itfelf up in growth, elongates them; the fap alfo, in continually paffing them, leaves behind it certain fixed parts, which augment the folidity. Thus the fecond year's little tree contains in its middle a *woody* filament in form of an elongated cone, which is the production of the *Wood* of a former year, and a *woody* bed for it, which is alfo of a conic fhape, and which furrounds the firft filament, and reaches beyond it in length; and this is the production of the fecond year. The third bed forms itfelf altogether like the fecond, and all the fucceeding ones are formed by the fame law, and in the fame order, and envelope one another in a continued fucceffion or feries, fo that a large tree is compofed of a number of *woody* cones, which enfold, cover, and envelop one another, as the tree increafes in thicknefs.

When the tree comes to be cut down, one eafily counts, in a tranfverfe fection of the trunk, the number of thefe cones, the fections of which make fo many concentric circles; and the age of the tree is known by the number of thefe circles, for they are diftinctly feparate from one another; in a vigorous and well-grown oak, thefe lines are each of a fixth of an inch or more in thicknefs, and the fubftance of thefe lines or circles is very hard and firm, but the fubftance of the *Wood*, which lies between, and unites thefe to each other, is much lefs fo. This intermediate matter is always the weak part of the *Wood*, and its ftructure and organization is perfectly different from that of the *woody* cones, and depends entirely on the manner in which thofe cones are united to one another. This is thus explained:

The veffels, which are longitudinally difpofed in the *Wood*, and convey the nourifhment to the button, not only are extended and hardened by the action of the fap in motion, and by the firm particles it depofits; but they are ever attempting alfo an extenfion of another kind; they are ramified all along as they go, and break into numberlefs extremely minute filaments, which iffue from them like fo many branches; thefe, on the one part, are deftined to the production of the bark of the tree; and on the other, are connected to the *Wood* of the preceding year, and form between the two *woody* beds a fort of fpungy reticular work, which, when cut tranfverfely, even to a great thicknefs, fhews numberlefs little cavities and holes, refembling a fort of lace-work. The *woody* beds are therefore united to one another by a fort of net-work; this net-work, however, does not occupy nearly the fpace of the *woody* circles which it feparated, and is ufually indeed but about a fixth part of their thicknefs. This thicknefs is much the fame in all the trees of the fame fpecies, whereas the *woody* beds vary in them very confiderably in thicknefs; in the oak they are found from a fixth to a four and twentieth part of an inch in thicknefs.

By this eafy expofition of the texture of *Wood*, it is eafy to difcover that the longitudinal coherence of the particles of it muft needs be vaftly greater than the tranfverfe: one fees alfo that, in little pieces of *Wood*, as in a bar of an inch thicknefs, if there are fourteen or fifteen of thefe *woody* beds, there will alfo be thirteen or fourteen of thefe intermediate fpaces; and confequently it will be much weaker than if there were but five or fix of thefe *woody* beds in it, and confequently but four or five of thefe intermediate fpaces.

It may alfo be obferved, that in thofe little bars of *Wood* there are two or three of the *woody* beds wounded, which is often the cafe; the ftrength of the bar muft be thence greatly impaired: but the greateft fault thefe fmall pieces of *Wood* are fubject to, is the different difpofition of thefe beds in the different parts of the fame tree; and this difference is fo great, that the force or ftrength of a large beam of any *Wood*, cannot be computed by proportion, from that of a fmall piece of the fame *Wood*; which, were it poffible, would make calculations of this kind extremely eafy. The ingenious author of this paper has from hence calculated the force and ftrength of timber ufed in building. Memoirs Acad. Par. 1740. See the article TIMBER.

All kinds of *Wood* are to be preferved from the worm, and from many other occafions of decay, by oily fubftances, particularly the effential oils of vegetables. Oil of fpike is excellent, and oil of juniper, turpentine, or any other of this kind, will ferve the purpofe; thefe will preferve tables, inftruments, &c. from being eaten to pieces by thefe vermin, and linfeed oil will ferve, in many cafes, to the fame purpofe; probably nut-oil will do alfo, and this is a fweeter oil, and a better varnifh for *Wood*. *Mortimer*'s Hufbandy, vol. 2. p. 105. See the article TIMBER.

Some of the Weft-Indian trees afford a fort of timber which, if it would anfwer in point of fize, would have great advantages over any of the European *Wood* in fhip-building for the merchant-fervice, no worm ever touching this timber. The acajou, or tree which produces the cafhew-nut, is of this kind; and there is a tree of Jamaica, known by the name of the *white-wood*, which has exactly the fame property, and fo have many other of their trees. Phil. Tranf. N°. 36.

To feafon *Wood* expeditioufly for fea-fervice, it has been ufual to bake it in ovens. *Boyle*'s Works abr. vol. 1. p. 135.

The art of moulding *Wood* is mentioned by Mr. Boyle [b] as a defideratum in the art of carving. He fays, he had been credibly informed of its having been practifed at the Hague; and fufpects that it might have been performed by fome menftruum that foftens the *Wood*, and afterwards allows it to harden again, in the manner that tortoife-fhell is moulded. Or, perhaps, by reducing the *Wood* into a powder, and then uniting it into a mafs with ftrong but thin glue. And he adds, that, having mixed faw-duft with a fine glue made of ifing-glafs [c], flightly ftraining out what was fuperfluous through a piece of linnen, the remainder formed into a ball and dried, became fo hard as to rebound when thrown againft the floor.—[[b] Works abridged, vol. 1. p. 130. [c] See the article GLUE.]

The people who work much in *Wood*, and that about fmall works, find a very furprifing difference in it, according to the different feafons at which the tree was cut down, and that not regularly the fame in regard to all fpecies, but different in regard to each. The button-mould-makers find that the *Wood* of the pear-tree, cut in fummer, works tougheft; holly, on the contrary, works tougheft when cut in winter; box is mellow eft when it has been cut in fummer, but hardeft when cut about Eafter; hawthorn works mellow when cut about October, and the fervice is always tough if cut in fummer. *Merret*'s Notes on Neri, p. 263.

It is a very well known quality of metals, to be longer and larger when

when hot, and fhorter and fmaller when cold: A thoufand experiments prove this, and the books of experimental philofophy have fufficiently expatiated upon it; on the contrary, it is found to be the property of *Wood*, that it is longeft in cold weather and fhorteft in hot; this change is owing to the remains of the fap yet in the *Wood*, which being condenfed by cold is enlarged in its furface, as all liquors are when frozen into ice; and fhrinks into a lefs fpace or bulk again, when liquated by heat.

It follows from this, that all *Wood* muft change its furface more or lefs, according as it contains more or lefs fap, and this may be made a teft of great ufe for the determining what kinds of *Wood* have moft, and what leaft fap. This would be a very valuable piece of knowledge, fince there are many ufes for which that fort of *Wood* muft always ferve beft, which has the fmalleft quantity of fap remaining in it. See the article HYGROSCOPE, *Cycl.* and *Suppl.*

Thus, in the great article of preferving of flour, no barrels are at prefent ufed, but thofe of feafoned dry oak; the whole advantage of this *Wood* is, that it contains lefs fap than others; for the fap in the *Wood* makes the flour damp, and it then becomes rancid, and breeds worms. So that if any other *Wood* can by this means be found out to contain lefs fap when dried in the common way than oak does, it will be fo much the better for this purpofe; or if a cheaper *Wood* fhould be found only to contain as little fap as the oak, it would do as well, and the price of oak would be faved in thefe veffels.

A proper way of trying when the fap was fufficiently exhaled out of trees, might alfo be found by this experiment, and much benefit would accrue from it; for our fhips, when made of timber not fufficiently dried, prove injurious to the healths of the people on board; and it has been remarked both by the French and ourfelves, that many more men in general die in the firft voyage of a new fhip, than in the fame time in an old one; and indeed the firft fix months are ufually obferved in this cafe to be moft fatal. The exhalation of the fap from the *Wood* of the veffel, is certainly the occafion of this, and if it could be contrived to have this fap properly exhaled before the timber was ufed, it would not only prevent this mortality among the men, but the veffel itfelf would be the founder, and the better for it. *Deflands*, Trait. de Phyf.

Wood ufed for fuel is required of various kinds, in regard to the various works to be performed by it.

Neri every where commends oak for the *Wood* to be burnt in the glafs-houfes, as the propereft *Wood* for making a ftrong and durable fire with a good flame.

Imperato, on the contrary, commends afh on the fame occafion; becaufe, as he fays, it gives a fubftantial, rather than a great flame: And Camerarius defervedly commends juniper *Wood*, as affording a lafting ftrong and fweet fire, could plenty of it be had. Among the antients, Pliny commends light dry *Wood*; and Plutarch, the tamerifk in particular, for making the glafs-houfe fires; but glafs-making requires fo great a fire, as cannot be eafily made from fuch *Wood*. Nor can afh be proper, becaufe though it gives a good fire, it foon decays. *Merret*'s Notes on Neri, p. 275.

Foffile WOOD. *Foffile Wood*, or whole trees or parts of them, are very frequently found buried in the earth, and that in different ftrata; fometimes in ftone, but more ufually in earth; and fometimes in fmall pieces loofe among gravel. Thefe, according to the time they have lain in the earth, or the matter they have lain among and in the way of, are found differently altered from their original ftate; fome of them having fuffered very little change, and others being fo highly impregnated with cryftalline, fparry, pyritical, or other extraneous matter, as to appear mere maffes of ftone or lumps of the common matter of the pyrites, *&c.* of the dimenfions, and more or lefs of the internal figure of the vegetable bodies into the pores of which they have made their way.

The *foffile Wood*, which we find at this day, may, according to thefe differences, be arranged into three kinds: 1. The lefs altered. 2. The pyritical. And, 3. the petrified.

Of the trees or parts of them lefs altered from their original ftate, the greateft ftore is found in digging to fmall depths in bogs, and among what is called peat or turf-earth, a fubftance ufed in many parts of the kingdom for fuel. In digging among this, ufually very near the furface, they find immenfe quantities of vegetable matter buried, and that of various kinds: In fome places there are whole trees fcarce altered, except in colour; the oaks in particular, being ufually turned to a jetty black; the pines and firs, which are alfo very frequent, are lefs altered, and are as inflammable as ever, and often contain between the bark and wood a plain refin. Large parts of trees have alfo been not unfrequently met with unaltered in beds of another kind, and at much greater depths, as in the ftrata of clay and loam, among gravel, and fometimes even in folid ftone. *Hill*'s Hift. of Foff. p. 638.

Befide thefe harder parts of trees, there are frequently found alfo in the peat-earth vaft quantities of the leaves and fruits and catkins of the hazel, and the like trees; thefe are ufually intermixed among the fedge and roots of grafs, and are fcarce at all altered from their ufual texture. The moft common of thefe are hazel nuts; but there are frequently found alfo the twigs and leaves of the white poplar; and a little deeper ufually there lies a cracked and fhattered *Wood*, the crevices of which are full of a bituminous black matter; and among this the ftones of plumbs and other ftone-fruits are fometimes found, but that more rarely.

In places where the fir and pine kinds are buried, the fmaller twigs, and the cones or fruit are frequently met with near the furface, the bodies of the trees being lodged deeper. The oaks are in many places fo found, that the *Wood* is little inferior in hardnefs to that cut out of the moft folid frefh tree. The foffile trees in our peat-earth and moors are often found entire, with their roots remaining fixed to them; but more frequently the bodies of the trees are broken off near the roots, and that and the tops of the branches with the fruit, which are often feparated alfo, are found at fmall diftances in the fame moor: Many of the larger branches are alfo found fevered from thefe trees, and lying at fome diftance; when the roots are torn up and lie in irregular directions, the extremities of thefe are alfo broken off. But very frequently the roots of trees remain in their natural pofition, and their larger roots and tap-root run ftrait down into the clay, or other folid ftratum which is the bottom of the bog; the ftump remaining above the furface, and the tree lying horizontally at a fmall diftance, buried at a greater or fmaller depth.

It is idle to imagine, that thefe have been thus buried either at the creation, or, as many are fond of believing, at the univerfal deluge: at the firft of thefe times the ftrata muft have been formed before trees were yet in being, and the peat *Wood* is fo far from being of antediluvian date, that much of it is well known to have been growing within thefe three hundred years, in the very places where it is now found buried.

In this ftate, that is little altered from their original condition, it is, that the fruits, and larger parts of trees are ufually found; what we find of them more altered, are fometimes large and long, fometimes fmaller and fhorter branches of trees; fometimes fmall fragments of branches, and more frequently fmall fhapelefs pieces of *Wood*. The larger and longer branches are ufually found bedded in the ftrata of ftone, and are more or lefs altered into the nature of the ftratum they lie in: The fhorter and fmaller branches are found in vaft variety in the ftrata of blue clay, ufed for making tiles in the neighbourhood of London; thefe are prodigioufly plentiful in all the clay-pits of this kind, and ufually carry the whole external refemblance of what they once were, but nothing of the inner ftructure; their pores being wholly filled, and undiftinguifhably clofed by the matter of the common vitriolic pyrites, fo as to appear mere fimple maffes of that matter. Thefe fall to pieces, on being long expofed to a moifture, and are fo pregnant in vitriol that they are what are principally ufed for making the green vitriol or copperas, at Deptford, and other places.

The irregular maffes or fragments of *Wood*, are principally of oak, and are moft ufually found among gravel; though fometimes in other ftrata. Thefe are varioufly altered by the infinuation of cryftalline and ftony particles, and make a very beautiful figure when cut and polifhed, as they ufually keep the regular grain of the *Wood*, and fhew exactly the feveral circles which mark the different years growth. Thefe, according to the different matter which has filled their pores, affume various colours, and the appearance of the various foffils that have impregnated them; fome are perfectly white, and but moderately hard; others of a brownifh black, or perfectly black, and much harder; others of a reddifh black, others yellowifh, and others greyifh, and fome of a ferrugineous colour. They are of different weights alfo and hardneffes, according to the nature and quantity of the ftony particles they contain: Of thefe fome pieces have been found with every pore filled with pure pellucid cryftal; and others in large maffes part of which is wholly petrified and feems mere ftone, while the reft is crumbly and is unaltered *Wood*.

That this alteration is made in *Wood* even at this time, is alfo abundantly proved by the inftances of *Wood* being put into the hollows of mines, as props and fupports to the roofs, which is found after a number of years as truly petrified as that which is dug up from the natural ftrata of the earth. In the pieces of petrified *Wood* found in Germany, there are frequently veins of fpar or of pure cryftal, fometimes of earthy fubftances, and often of the matter of the common pebbles: Thefe fragments of *Wood* fometimes have the appearance of parts of branches of trees in their natural ftate; but more frequently they refemble pieces of broken boards; thefe are ufually capable of a high and elegant polifh.

Many fubftances, it is certain, have been preferved in the cabinets of collectors, under the title of petrified *Wood*, which have very little right to that name. But where the whole outer figure of the *Wood*, the exact lineaments of the bark, or the fibrofe and fiftular texture of the ftriæ, and the veftiges

vestiges of the utriculi and tracheæ or air-vessels are yet remaining, and the several circles yet visible, which denoted the several years growth of the tree, none can deny such substances to be real *fossile Wood*. *Hill's* Hist. of Foss. p. 639. See the article *Fossile* PLANTS.

One of the most singular instances we have of the matter in which *fossile Wood* may be preserved, is in Razynski's history of Poland; he tells us, that when one of the kings of Poland went to visit the great salt-mines in that kingdom, the superintendant of the works shewed him by way of curiosity a vast mass of the hardest kind of the salt, in which was buried a piece of an arm of a tree; the salt was broken with proper instruments, and the *Wood* taken out; it proved to be beech, with the texture so plainly remaining that it was easily known, but its pores all filled with the matter of the salt in which it lay. It was of the thickness of the bone of a man's arm, and was as perfect and entire as when growing on the tree. It is the only instance we have of *Wood* preserved in this manner; and it would be well if we could by any means ascertain the time when it was deposited there. *Razynski's* Hist. of Poland.

Another remarkable instance of the change wrought on *Wood* by lying under the earth, is that of its having been found as it were converted into iron; that is, that the *Wood* has been as thoroughly impregnated with the particles of iron, as that which we usually call petrified *Wood* is with the particles of stone.

Mr. Liebknecht, professor of the mathematics at Giessen, was the first who ever observed this singular process of nature in the fossile world: He found in a mine, where there were many iron ores, a piece of ash-*Wood*, easily discoverable to be such by the course of its fibres; the cortical part or bark of which was petrified or turned into stone, as we usually express it in the common way, and its inner substance plainly turned into absolute iron. This part of the substance was of the colour of iron, and took a like polish; it gave the same sound with a piece of iron when struck, and bore the strokes of a hammer in the same manner without breaking.

Its specific gravity was also greater than that of any ore of iron. All these circumstances gave great probability of its being absolute iron, but there were others which gave absolute certainty of that. A piece of this and a piece of a rich iron ore were beaten to pieces separately, and washed in several waters; the iron ore was at first evidently lighter, and fouled the water, but the iron in the *Wood* sunk at once without throwing off any adventitious matter. After several washings, however, the ore being cleared of its earth, *&c.* became heavier than the iron of the *Wood*.

After roasting both in the fire, the iron in the *Wood* made a violent ebullition with oil of vitriol, and sent up a thick vapour; but the ore made very little ebullition, and sent up scarce any vapour. This is the more wonderful, as the finding native iron even in the richest pieces, is very uncommon; nor does it amount to certainty, from all these experiments, that this substance was really perfect iron. The author observes, that after melting with salt of tartar it was attracted by the magnet. Act. Erudit. Ann. 1710. See the article *Bog*-WOOD, *infra*.

Jamaica WOOD. See the article BRAZIL, *Cycl.*

Petrified WOOD, the opinions of the judicious part of the world have been very different in regard to the bodies preserved in the cabinets of the curious, under the name of *petrified Wood*; some affirming these bodies to have been only pebbles, or flints accidentally formed in this shape, and with veins resembling those of *Wood*; and others affirming, with equal warmth, that they have been really *Wood*, into which stony matter has been brought by water.

Many good arguments have been produced on both sides the question, but Mr. De la Hire has attempted to bring the dispute to a certain conclusion, by means of some peculiarly happy specimens, which were of the palm-tree petrified, found in the deserts of Africa: these on comparing them with pieces of the palm-tree cut out of the recent *Wood*, appeared to have every where the beautiful and regular veins of that *Wood*, and left no room to doubt, but that they certainly had been once the vegetating *Wood* of that tree, though now converted into hard stone; the petrified pieces were perfect stone, in all its qualities; they had its hardness, its sound when struck upon, and were, as many other stones are, opake in some places, and transparent in others; they were found on weighing them to be often of the specific gravity of recent pieces of the palm *Wood*, of the same dimensions. One of these pieces was two foot long, and four or five inches broad; this was part of the trunk of the tree stripped of its bark; in this all the fibres ran longitudinally, and wholly resembled those of the recent *Wood*; a certain portion of them being forked at their ends, as they are in the *Wood*; the fibres were all hollow, even in the stone as in the *Wood*, and the interstitial matter which had joined them together in the tree, appeared in the stone to have formed a very strong sort of cement, approaching to flint. The cavities in the once woody fibres appearing very large, Mr. De la Hire gave the following account of that phænomenon: He observed, that long soft and massy bodies, in drying, very often had their internal parts all drawn toward the circumference, and consequently from the center; and that the consequence of this often was, that when the body was perfectly dried, there appeared a more or less regular variety in the middle, in form of an empty pipe or canal. The smaller branches of many trees, he observes, usually dry so, and sometimes their larger arms and trunks; and this especially when the *Wood* has been of a softer nature; this he imagines to have been the case in the trunk of this palm-tree, and that its several fibres, being all long and soft, might in drying have had their several parts recede in this manner from the center to the circumference, so as to have at length formed every one of them a sort of long tube or pipe, and that if this happened to them while woody, it could not but be regularly preserved in them in their petrified state.

The other specimen was of the bottom of the trunk with a part of the roots: this was not only composed like the former of longitudinal fibres perfectly analogous to those of the recent *Wood*, but from its under part there grew several roots of the thickness of a finger, and three inches or more in length: these, which were covered with a thin bark, and had within them several fibres of an inconceivable fineness; composed the body of each root, as the longitudinal fibres of larger diameters had the *Wood* of the trunk and within these there was contained a firm substance of the nature of the heart in the roots of trees, which had within it a yet different substance resembling the pith of the inner part of the small roots of this tree. This being all exactly the state of the small recent roots of the palm-tree, it does not seem at all to be supposed that nature, though she might have imitated barely the longitudinal fibres of a plain piece of *Wood*, accidentally in stone, should imitate all the several parts of which these last roots are composed, all so different in themselves, and all disposed in such exact and nice order. The very colours of the several parts of these roots were different in the stone, some kind of stony matter having probably been fitter to enter the pores of the one part, and some other kind of the other. The several fine fibres which compose the body of each root being of a black glossy stone, of the nature of the common black flint; and the internal part or pith being supplied by a white and more soft stone. The pith having in drying observed the same law as was before mentioned, in regard to the fibres of the *Wood*, had become hollow like them in the drying, and consequently this white stone appears hollow, and in form of a tube or pipe in many places. The comparison of this petrifaction in this manner, with the recent *Wood* of the same tree, left not the least room to doubt of its true origin.

Father Duchat also, an author of unquestioned credit, affirms from his own personal knowledge, that in the kingdom of Ava there is a river, whose waters petrify recent *Wood* into flint; and that he has often seen trees standing in it, whose bottom part so far as covered with the water, has been true flint, while all above was mere dry *Wood*, and fit for firing. Mem. Acad. Par. 1692.

Shining WOOD. There are a great many things in which a piece of rotten *Wood* that shines in the dark, agrees with a burning coal; and there are also many things, in which they differ. They agree in these particulars: 1. They are both of them proper and true luminaries, having light residing in them, and are not like looking-glasses or white bodies, which are only luminous according to the quantity of light which falls upon them from other bodies, and which they reflect. 2. Both shining *Wood* and burning coals require the presence of the air to keep them shining, and both require also an air of a considerable density; and both having been deprived of their shining quality by the pumping out of the air, will recover it again on the admitting fresh air to them. 3. Both of them will easily be quenched by putting them into water, and many other liquors. And 4. As a live coal will not be extinguished by any coldness of the air, neither will the *shining Wood* be deprived of its light on any additional coldness in that element. Philos. Trans. Nº. 32.

These are the things in which they agree; those they differ in are the following: 1. A burning coal is easily put out by compression, the treading on it and squeezing it together readily divesting it of its light; on the other hand, compression or crushing of any kind seems not to have any effect upon the *shining Wood*; its bruised parts shining as brightly as its entire ones. If a piece of this *shining Wood* be squeezed between two glasses, this experiment will be most fairly tried; and in this case, though the contexture of the whole be evidently broken, and the parts separated, the light is as strong in them as while the piece was entire. 2. A burning coal extinguished by the drawing out the air, will, after a few minutes be irrecoverable, on the admission of air in any manner; but, on the contrary, the *shining Wood*, when thus extinguished and kept extinct for half an hour, will be immediately re-kindled on admitting the air to it. 3. A live coal included in a small glass, will continue

tinue shining but a few minutes; but a piece of *shining Wood*, in the same circumstances, will continue bright for several days. 4. The coal, while it burns, sends forth smoke and other exhalations; the rotten *Wood* sends out none, and consequently a coal all the while that it is shining wastes itself at a great rate; but the rotten *Wood* does not waste itself at all. And, finally, the burning coal is actually and vehemently hot; the rotten *Wood*, though it shines, is not so much as warm. Phil. Transf. N°. 32.

The light that is observed to proceed from rotten *Wood* under some particular circumstances, is found by experiment to require air to feed and keep it up: on putting a piece of this *shining Wood* into an exhausted receiver, the light soon goes wholly off, and the *Wood* remains as dark as a piece of a common stick; but immediately on letting in the air again the light is re-kindled, and a sudden flash of lightening seems to illuminate the *Wood*, and it continues bright as before.

In experiments of this kind, the effect of the air-pump is often much more strongly perceived a minute or two after it is worked, than during the time of the pumping; and that very degree of exhaustion which leaves these luminous bodies some light at first, will by degrees destroy it; thus, if the pumping be stopped soon after the light begins to grow faint, and the body examined to find its changes afterwards, it will be seen to grow every minute more and more faint, till it wholly disappears.

The light of shining flesh and fish when putrified, is wholly of the same nature with that of rotten *Wood*, as to its dependance on the air for its splendor; and in the same manner loses its light in the exhausted receiver, and regains it on the admission of the air into it again, in the same sudden manner. Phil. Transf. N°. 31.

Bog-Wood, or *Subterraneous* Wood, a name given by the inhabitants of many parts of this kingdom to such *Wood* as is found buried in the earth in boggy places, and which is found hard and strong at this time. See the article *Fossile* Wood, *supra*.

We have in the Philosophical Transactions an account of vast quantities of this sort of *Wood* found under ground in Hatfield chace. Infinite millions of the roots and bodies of trees are found there; they are of all growths, and are mostly such trees as are the growth of our own soil, such as oaks, firs, birch, beech, yew, holly, willow, ash, and the like. The roots of all these trees stand in their natural positions as when growing, and stand as thick together as they could grow in a forest. The bodies are usually broken off, and laid all along just by them.

The large trees are usually found fallen in a north-east direction, and the smaller ones lying always; the fir-tree or pitch-tree is more common than any other kind, and is found sometimes of twenty, thirty, and thirty-five yards long, and so found and firm that many of them have been sold to make masts for ships. Oaks have been found of the same length, though wanting some yards of their natural tops; these have been sold at ten or fifteen pounds apiece, and are as black as ebony, and very sound and lasting in whatever service they are put to. The ash-trees do not preserve their firmness in this manner, many of them are so soft that the workman's spade cuts through them; and when exposed to the air, they usually fall to pieces; but the willows, though a much softer wood than the ashes, preserve their texture, and are found very strong and firm. In some of the fir-trees it is very observable, that they have shot out side-branches after they were fallen, which have grown into large trees. Many of these fossile trees appear plainly to have been burnt; the fir-trees are particularly very common in this state; and of these some are burnt quite through, and others only on one side. Some of these also have been found with the plain marks of human work upon them; many with their branches chopt off, and their trunks cut into two or three pieces. Some squared, and others in part cleft, and the *wooden* wedges used in cleaving them are still found remaining in the cracks. Stones are found in some of them in the place of wooden wedges, but in none iron ones. The heads of axes are also sometimes found, they are of a strange form, and somewhat represent the sacrificing axes of the antients. These are found at such depths, that it is impossible they should have ever been lodged there since the time of this place's being a forest; nor ever could have been found, but by means of the ground's being drained by a late invention. The general opinion as to these trees is, that they were buried in this manner at the time of the universal deluge; but they are plainly of later origin, as fossils. The coins of some of the Roman emperors having been found buried under them. Phil. Transf. N°. 275. p. 983.

The earth of bogs is not the only soil that preserves these trees; for in the low parts of Lincolnshire between the towns of Burningham and Brumley, there are several large hills composed only of loose sand, and as this blows away there are continually discovered whole trees, or parts of trees, and particularly the roots and stumps of firs, and some other kinds, all with the marks of the ax upon them, and looking as fresh as if done but yesterday. Under these hills and in the bogs before-mentioned, not only the *Wood* of the fir-tree, but its cones are found in immense number; many bushels being often laid in a heap together. In cutting a drain for a river of a considerable depth, there were found at the very bottom several parcels of cut *Wood*, in poles, beams, and the like; the head of an ax was also found somewhat resembling the antient battle-ax, and a coin of the Roman emperor Vespasian; but what was yet more remarkable, was, that what they were now sunk to seemed to be the original surface, the ground not being loose like all above it, but found and firm, and lying in ridges and furrows, with the evident marks of having formerly been ploughed. So that all the bog-earth above seems plainly to have been added since; and that the fossile *Wood*, supposed of antediluvian origin, is but of the time of the antient Romans, or less than that.

All the bogs in this kingdom afford in like manner fossile-trees; and not only those, but other places, have at all times accidentally discovered them. Giraldus Cambrensis tells us, that so long since as in king Henry the second's time, the sands on the shores of Pembrokeshire were driven off by peculiar storms and tempests, and that deep under those sands there were then discovered great numbers of the roots and bodies of trees in their natural postures; and many of these had the strokes of the ax upon them, the marks at that time remaining as plain as when first made. Some of these resembled ebony; and many other such trees were discovered at Neugall in the same county, in the year 1590. Cambden tells us of such *Wood* found in the bogs in Somersetshire, Cheshire, Lancashire, Westmoreland, Yorkshire, Staffordshire, and Lincolnshire; and since his time, many other counties have been found to be as fruitful in it. Dr. Plot mentions them in many parts of his history of Staffordshire, and by their standing in their natural postures, as to the roots at least; and prudently concludes, that they certainly once grew there, and were not brought from elsewhere.

Dr. Leigh, in his history of Lancashire, gives an account of the same sort of trees found in the draining the boggy lands at Martin-Meer; and prudently determines them not to have been of the antient date many pretend, in referring them to the deluge.

He observes, that they are plainly of no older date than the time of the savage inhabitants of England, about the time of the Roman conquests; for in this place, beside the roots and bodies of trees and their fruit, there were found eight canoes, or small boats, such as the wild inhabitants used at that time. And in another moor, in the same county, a brass kettle, with a small mill-stone, and some beads of wrought amber. In the same place were also found several human bodies whole and entire, at least to outward appearance, and the whole head of a hippopotamus or river-horse. This is perhaps the hardest thing to be accounted for of the whole set, as to its coming there. The boggy places in Anglesea and the isle of Man, are all full of buried trees of the same kind; and the bogs of Ireland abound no less with them.

England, and its adjacent islands, are not the only places where this buried *Wood* is found; for Verstegan tells us, that the moors in the Netherlands abound with them; they all lie North-east, as ours do. Helmont also mentions the Peel there, a morass of eight or nine miles broad, which is full of them. The French naturalists tell us of fossile trees also, in their country; and in Swisserland and Savoy; but all in the low-grounds.

Ramazzini tells us, that in the territories of Modena, which are now a dry and fruitful country, yet in the time of the Cæsars were only a great lake, there are found at the depth of thirty, forty, and even fifty foot, the soil of a low marshy country, with sedges, water-grass, and other marsh-weeds; and under this there lie the trunks of trees, and their roots stand near them in a natural posture as when growing. Many old coins of the Roman emperors are also found there; as also several busts, wrought marble, and squared stones, evidently shewing the work of such tools as the Romans have been known to use. Some of the trees in these places stand upright. Phil. Transf. N°. 275. p. 986.

Gilding on Wood. See the article Gilding *on Wood*.

Wood-*Coppices*. In the first raising of *Coppices* two things are to be considered; first, the nature of the soil, that such trees may be planted in it as will thrive well there; and secondly, the uses that the *Wood* is intended to be sold for, that such kinds may be planted as will be most proper for those uses.

If the principal vent for *Wood* be for the fire, the best trees for *Fire-wood* must be planted, such as the oak, beech, hornbeam or other hard woods. These are the most profitable for felling as *Fire-wood*, and one or more of these will grow in any soil.

If there be a demand in the country where the *Coppice* is to be planted for hoops and hop-poles, then the ash, the chesnut, the oak, alder and hazel, are to be planted.

According to the profits of the *Underwood*, the thicknefs of the ftandard-trees are to be regulated, for as they ftand more or lefs thick, they more or lefs injure the *Underwood*. It is alfo to be confidered at what growth the *Underwood* is to be fold. The taller and larger the *Underwood* of a coppice in general is, the more profitable will it be for firing, and all other ufes, and the ftandards will be the better for its being left to grow to a proper height, for their bodies will be always, unlefs very great accidents occur, carried up ftrait as far as they are fhaded by the coppice-*Wood*.

A deep foil makes the fhrubs as well as trees grow more vigoroufly than any other, and they will be fooner fit for cutting in fuch places. The perfon who owns thefe *Woods* muft contrive to cut down only a certain quantity of them every year, and regulate this fo that he may have a conftant fucceffion of a like quantity; that part of the *Wood*, which was firft felled, may be grown up to its fize for felling again by that time the laft is cut. This is, in different places, to be calculated to all the various numbers between eight years and twenty or thirty.

The cutting *Wood* feldom yields the more and the better timber; but the cutting it oftener has greater advantages, in that it makes it grow thicker, and gives the feedlings time to come up. If many timber-trees grow in the coppice, and are to be cut down, they and the *Underwood* fhould be felled together, cutting off the ftumps as clofe to the ground as may be, in the trees, and in the fhrubs and *Underwood* the ftumps fhould be left about half a foot high, and cut flanting and very fmooth.

Sawing is the beft method of felling timber-trees; but it fometimes kills the root; and if this is obferved to be the cafe in the coppice, no new fhoots arifing from the root, then it is proper to ftub up the root, that it may not unneceffarily encumber the ground, that the other young plants may have the benefit of it.

In the firft raifing of coppices from feed, the ground muft be prepared by good tillage, as much as if it were intended for corn. The feeds of the feveral trees are to be fown in February, and if the foil be fhallow, the ground fhould be plowed into great ridges: this will make the foil lie the thicker upon the top of each ridge, by which means the roots will have more depth to run to for nourifhment, and in a few years the furrows will be filled up to the level of the reft with the dead leaves, and thefe, as they rot at the bottom, will make a kind of foil, through which the young roots will fpread, and be conducted from one ridge to another, and fo the whole ground will be occupied by them. If the coppice be to be raifed on the fide of a hill, plow the ridges crofs-way of the defcent of the hill, that the water may be detained among them, and not fuffered to run off, as it otherwife would, by the furrows; but if it happen that the ground be over-wet, which is more rarely the cafe, then the contrary method is to be obferved, and the furrows plowed deep and ftrait downwards, that all the water may be carried off by them, as by fo many trenches or drains.

Some fow a crop of corn along with the feeds of the *Underwood*, for the advantage of the firft year; but as the feafon of fowing the feeds of the trees, is too late for the fowing the corn, it feldom turns to much advantage. It is better to fow the trees alone, and keep them well weeded the two firft years; after which they are ftrong enough to take care of themfelves againft fuch enemies.

In very barren ground, where the young trees can hardly ftand the heat in fummer, it is proper, after fowing them, to fcatter a quantity of furze-feed over the land; the furze will grow quick, and over-top the trees at firft, but it will ferve as a guard to them at this time, defending them from injuries, and keeping the ground moift about their roots. In a few years the trees will grow up beyond thefe bufhes, and they will then foon deftroy them by their dropping.

In the raifing of coppices, the neareft diftance for the plantations ought to be five foot for the *Underwood*; but as to what number, and fcantlings of timber are to be left on each acre, the ftatutes in this cafe direct; but it is an ordinary coppice, which will not afford three or four firfts, fourteen feconds, twelve thirds, and eight wavers, according to which proportion the fizes of young trees in coppices are to fucceed one another. In coppice or *Underwood* felled at twenty-four years growth, there are to be left twelve ftore-oaks upon every acre, or, in defect of them, the fame number of elms, beech, or afh; thefe are to be ftrait-bodied trees, and are to be left till they are ten inches in diameter, at a yard from the ground; but it is better for the owner to have a much greater number of timber-trees, efpecially in places where *Underwood* is cheap; and as to the felling, it is always neceffary to begin regularly with one fide, that the carriages, neceffary to the taking off the *Wood*, may come on without injury to the reft: and in large *Woods*, a cart-way fhould always be left in the middle, quite through the *Wood*. The timber of the *Underwood* may be cut from the month of October to February; but the laft month is greatly the beft, in places where there is but a fmall quantity to be felled, and it can all be got down before the fpring is too much advanced. All the *Wood* fhould be carried out by midfummer, and made up by April at the lateft; for when the rows and brufh lie longer than this unmade up, and unbound, many of the fhoots and feedlings are fpoiled by them. It is always worth the owners while to inclofe the coppice well the winter before felling, to keep out the cattle, which would elfe greatly damage the fupply from the feedlings and young fhoots.

New-weaned calves are the leaft prejudicial to newly-cut *Woods* of any creatures, and may be put in where there is much grafs; the next in harmlefsnefs to thefe are young colts, which, at about a year old, may be put in to feed in the fame manner; but about May they muft all be put out.

If the *Woods* happen to be cropped by cattle, it is beft to cut them up, and they will make new fhoots; for that which has been bitten by the cattle, will not grow for feveral years in any degree.

If coppice-*Woods* are too thin, this is to be remedied by laying down the longeft and fmalleft fhoots of thofe fhrubs or trees which are the moft advantageous, in the place, or of fuch as are neareft the bare place; thefe will each fend forth a great number of fuckers, and the whole *Wood* will be thickened as much as defired in a very little time. *Mortimer's* Hufbandry, vol. 2. p. 64.

WOOD-*Caterpillars*, in natural hiftory, the name of a genus of caterpillars which does not live in the manner of others on leaves of trees or plants, or open to our obfervation, but is, as it were, buried alive under the bark, in the trunk and branches, and in the roots of trees, and fometimes in the body of fruits.

Thefe are eafily diftinguifhed from thofe worms and maggots which are found in roots and fruits, and owe their origin to flies of another kind; but they are fubject to be confounded with another fort of animals, called by Mr. Reaumur, *falfe* or *baftard caterpillars*, which carry a great refemblance in their figure to the real caterpillars, but which have more legs than any of the true ones have, and are finally transformed into four-winged flies, which are not true butterflies.

The butterflies, which are the parents of thofe caterpillars which live immured in trees or fruits, lay their eggs on the furface, and the young caterpillars, when hatched, eat their way in; and doubtlefs inftinct directs the parent to depofit its eggs only on fuch fubftances as will fupply a proper nutriment to the young. It is no wonder that we do not find, on the outfide of a fruit, the hole by which this creature has made its way in; it enters while fo fmall, that the orifice that admits it is fcarce vifible, and this probably afterwards clofes up.

What appears fomewhat furprifing, however, in this, is, that there ufually is only one caterpillar in a fruit, which is large enough to afford food to a large number; and if there are fometimes found two creatures within, one is ufually a caterpillar, the other a worm of fome other kind. The whole occafion of which is, that the operation of penetrating into the fruit, is fo difficult to the young animal, that it feldom fucceeds in it; and though the butterfly depofits many eggs on each fruit, and thefe all hatch, yet it is only here and there one on a fruit that can find the way into it.

Thefe creatures, when once lodged in their prifon, have nothing to do but to eat up the fubftances which inclofe them, leaving the outer hard fhell unhurt, which ftill ferves as a cafe for them; this is a very frequent cafe in the grains of corn, where the farinaceous fubftance ferves as aliment, and the hard outer fkin becomes a firm hollow cafe afterwards for the animal. The farinaceous fubftance in this cafe ufually proves enough for the animal in its caterpillar ftate; but if it does not, the creature has recourfe to a very fingular expedient; it eats again its own excrements, and finds its now ftronger ftomach able to feparate nourifhment from that very matter, which had before paffed off from its weaker ftomach undigefted.

Of thefe fpecies of caterpillars, fome go out of their prifon in order to change into their chryfalis, and thence into their butterfly-ftate; but the greater number remain there, and pafs through all their changes within.

The little caterpillar, which has eaten all the farinaceous fubftance of a grain of barley, and is to remain in the fhell to change into a chryfalis, covers over the whole inner cavity of the feed with a web of her own filk, and then feparates it by a divifion, made of the fame matter, into two cells of different fizes; the longeft of thefe is for itfelf in the chryfalis-ftate, and the fmaller for its excrements, which it takes great care to keep out of its own habitation: when it enters into the butterfly-ftate, it makes its way out of the prifon through a round hole, which is made through the rind of the grain, and is, till that time, ftopped with a nice valve.

This is a precaution the caterpillar takes while it is growing, that it may not die a prifoner when it arrives at its winged-ftate, in which it has no inftruments for making its way out.

It is always the deftruction of a grain of corn to have one of thefe creatures in it; and it fares not much better with the larger fruits: in thefe, though the caterpillar eats only a fmall part of the fruit, yet it deftroys the organization of the whole, and frequently fo entirely fpoils the courfe of its growth, that it falls off the tree.

Thefe caterpillars, like all the other kinds, have certain flefh-eating worms, whofe parents are of the fly-kind, for their terrible enemies and deftroyers; and it is not unfrequent, on opening one of thefe fpoiled fruits, inftead of the expected caterpillar,

terpillar, to find a fly juft ready to come out; this has been produced from the chryfalis of a worm, which had before found its way into the fruit, and eat up the caterpillar, which was the original poffeffor of the place. Memoirs Acad. Scienc. 1736.

Wood-*Cock*, in zoology. See the article Scolopax.

This is a bird of paffage, and comes into England about the middle of October, and goes away again in March.

During their ftay with us, they ramble about from place to place, never remaining above eight or ten days together in the fame *Wood* or meadow. They feldom or never fly in the day-time, unlefs difturbed by men, or by fome beaft. In whatever places they are put up, they always fly to the thickeft *Wood* that lies near, and there hide themfelves under the fturdieft and thickeft trees, where they remain all day fearching for earthworms, and other food, under the fallen leaves.

When night comes, they go out of the *Woods*, and generally refort to watery places, where they may wafh their bills, fouled with the taking their prey, and thrufting into the earth; here they remain all the night, and if there is tolerable fhelter, they ftay alfo all the day under it; but when there wants this, they fly away to the *Woods* in the morning. In their flight, they choofe the fhadieft places, and will coaft it away to a great diftance in fearch of the higheft *Woods* to retire to, that they may be the better fecured, and the more defended from the annoyance of the *Wind*. While they travel under fhelter, they always fly low; but when they come to any glade to crofs, they mount to a confiderable height; but as foon as they have paffed this, they fink again.

They hate flying high, and they are afraid to fly among trees, becaufe, like the hare, they fee but very badly ftrait before them; and it is owing to this imperfection in their fight, that they are fo eafily taken in nets fpread in their places of refort.

The draw-net, in countries which are very *woody*, is extremely profitable in this fport, it being no uncommon thing to take ten or a dozen *Wood-cocks* at a time in it.

The method of ufing it to advantage is this: There muft be chofen a proper place in fome thick *Wood*, where thefe birds are found to refort, and a place muft be cleared for them, and for the net. Suppofing the *Wood* about three hundred paces long, in this cafe, toward the middle there muft be cut a walk through it eight fathoms wide: near the end of this, two oppofite trees are to be pitched upon, proper to fupport the two fides of the net; the boughs of thefe are to be all cleared away, and the nets faftened by logs and pullies.

When the net is thus placed, the fportfman muft provide fome covert in which he may ftand concealed. This is eafily made by half a dozen boughs of trees with their leaves on; and the fportfman, when he has ftuck thefe down in the ground, and interwoven their boughs together, may either ftand behind it, or fit down on a bundle of dry fern, or any other fuch matter.

At three or four foot diftance from this ftand, toward the net, there is to be a ftrong ftake faftened into the ground, and on this the lines of the net are to be faftened when it is drawn up. When there comes a *Woodcock*, the net is to be let down as foon as ever he is taken, to entangle him the more, for, otherwife, in the ftruggling he may chance to make his efcape. The fportfman is then to run up, and break a wing, and crufh his head. The net is then to be refitted again as quick as poffible, for when one is caught, there is great reafon to fufpect that many more are coming the fame way, which will be all loft if the fportfman is flow at his work.

If a hare, or any other creature worth the taking, come along the walk, the net is not to be immediately let down upon it, for in that cafe it would certainly ftart back, or run forwards, and in either cafe would probably make its efcape: the net is to be drawn up five or fix foot, that he may pafs quietly under it without fufpicion: as foon as he is gone by, the fportfman is to make a great fhout, and let go the net; the creature will, on this noife, ftart back, and will thus be certainly taken in the net.

There are, in many places, great thoroughfares through fome open piece of ground, by which *Woodcocks* pafs in great numbers from one *Wood* to another. If there be in thefe two trees, naturally planted, fo as to fuftain the nets, they are by all means to be ufed; but if not, the fportfman will find it worth his while to be at the expence of planting two trees deep in the earth, at proper diftances, that they may ftand all weathers. Nets fpread between thefe, are the moft fatal of all others to thefe birds, for all that inhabit either one or the other of the *Woods* come this way at times, without fufpicion of any danger or difturbance. See the article Draw-*Net*.

There is another method of taking thefe birds in high *Woods*, with thofe nets called *hays*, of the nature of the rabbets-hays, only with fmaller mefhes. The *Woodcocks* are to be driven into thefe, and there fhould always be at leaft two or three of them planted together. When the fportfman has provided himfelf with nets, he is to take five or fix perfons into the *Wood* with him. The proper *Woods* for this purpofe are thofe of feven or eight years growth; and the people are to go into fome part of them, near the middle. The nets or hays are to be placed in the fame manner as they are for taking of rabbets, but two or three joining together at the end, and hanging over flopewife that way which the *Wood-cocks* are intended to be driven.

The nets being thus fixed, let the company go to the end of the *Wood*, placing themfelves at about ten rods diftance from one another; they muft all have fticks in their hands, and they are to move forward flowly toward the nets, making a noife by ftriking the fticks againft the trees and branches, and by holloeing with their voices; in this manner they are to move up to the net; and the *Wood-cocks* in that part of the *Wood* will all be terrified before them, but will not take wing, but run along upon the ground, and thus be driven along like a drove of beafts, fo that when the company come up, they will find almoft all of them in the net. When that part of the *Wood* is thus drove, the nets are to be turned the other way, and placed flopewife in the contrary direction, and the company retiring to the other end of the *Wood*, are to drive the *Wood-cocks* that are in that part with the fame noife, till they have fent them into the nets in the fame manner.

Thus all the *Wood-cocks* in the *Wood* may be taken with very little trouble, and this may be done equally at any time of the day.

Another way of taking this bird is by means of noofes or fprings. See the article Noose.

The *Wood-cock* and the fnipe are both eafily taken alfo with bird-lime, when their places of refort are known, but they are not fo eafily found as many other birds.

The cuftom of the *Woodcock* is ufually to be upon the banks under hedges, and by the fides of ditches toward the fun; and and they will fuffer the fportfman to come nearer them in the day-time after a moon-fhiny night, than after a dark one. The reafon of which is, that having fed well by moon-light, they are only fit for reft in the day following; but when the night has been dark, they are feeking food all day long.

The fnipes naturally lie by the fides of rivers, when the plafhes and ponds are frozen, and they always lie with their heads up or down the ftream, never tranfverfely.

In order to take either of thefe birds by bird-lime, the fportfman muft be provided with a large number of fmall and fmooth twigs, neatly and evenly covered with good bird-lime. Thefe muft be placed floping, fome one way, fome another, and the whole place about where they refort muft be covered with them. The fportfman then muft conceal himfelf very carefully, that the fight of him may not frighten away the game.

Wood-*Cock-Shell*, a name given by the Englifh naturalifts to a peculiar kind of the purpura. It is called in French, *becaffe*. See the article Becasse.

Wood-*Land*, in agriculture, a term ufed by the farmers of many counties of England, for a fort of foil, from its conftant humidity and dark colour, refembling the foil in *Woods*, which, of whatever nature it originally is, will always be made to appear thus from the continual dropping of trees, and the want of a free air and fun, together with the fall of leaves, deftroyed and wafhed to pieces by the wet.

This foil in the open countries has a confiderable quantity of clay in it, and holds the water a long time that once falls upon it: in wet weather it fticks firmly to the plough-fhare, and in dry is very apt to crack. In uncultivated places it ufually produces rufhes and rufh-grafs. A moift and dripping year is extremely detrimental to this fort of land. *Moreton's* North. p. 38.

Wood-*Lark*, in ornithology. See the article Alauda.

This is one of the fweeteft of our finging-birds, and is indeed very little inferior to the nightingale, when in good health, for we are not to judge by fuch as are made feeble by improper food, or want of cleanlinefs in their cages.

It is one of the tendereft birds we have, and yet it breeds the fooneft of any that we know of. They principally frequent gravelly grounds, and the fides of hills, that are expofed full to the fun, and if there be any ftumps of oaks in thefe places, they always refort to them. The females couple with the males in the beginning of February, at which time, and never before, they part with their laft year's brood; immediately after coupling, they betake themfelves to building their neft.

They generally build in lay, or grounds, where the grafs is rank, and is grown brown. The principal material they ufe is dry grafs, and they always choofe fome place fheltered by a good tuft for their neft, to defend themfelves from the cold winds, which are very fevere at that feafon. They feed their young principally with a fmall red worm; but it is very difficult to find this kind, to feed a neft of them under our care, and they will not do well without it; fo that they fcarce ever come to any thing this way.

The young branchers are taken in June, July, and Auguft. After this they may be taken in large numbers at the latter end of September, which is their general flight-feafon, and then from the beginning of January to the beginning of February, at which time they get together to couple for breeding. Thofe that are taken in the fummer-months, are ufually taken in nets, by the help of a hawk.

The fportfman is to go out in a dewy morning, and fixing on fome hill, he is to go to that fide of it which faces the rifing

rising sun, for this place they are sure to frequent. He is to take out a hawk and a small net at the end of a stick; when he espies a bird he is to shew the hawk, on which it will squat down, and on his approaching nearer and making the hawk flutter over the place the bird will only lie so much the closer, so that he may go up and lay the net over it, and thus take it without hurting it.

The best *Wood-larks* that are kept in cages have been caught in this manner. A better way of taking numbers of them is to prepare a net made in the same manner as the common net for taking partridges, only with the meshes much smaller; three or four persons are to go out with this, and one of them is to take out a hawk, which serves in the same manner for the larks as the setting-dog does for the partridges.

Where-ever a flock of these larks is seen together, as is very common, the whole flight keeping with the female till the next coupling season, the hawk is to be shewn, and on his hovering, they will all lie still, and the net may be easily drawn so compleatly over them, that not one can escape. The best time for taking this bird for the cage, is in July, or the preceding or following month; those that are put into the cage at this time sing presently, but their song time is not lasting, for they soon fall to moulting, in which state many die; but if they get over it, they commonly prove very healthful afterwards, and become very tame and familiar, and sing sweetly. Those which are taken in the latter end of September, are generally very strong and sprightly; but they do not sing till after Christmas. Those taken in January and February finally prove the best of all; they generally begin singing in two or three days, or at the utmost in a week after they are taken.

The method of keeping them in health in the cage, is this, there must be two pans of food, the one containing meat, the other oatmeal and hempseed. A very good food is the following; boil an egg very hard to the crumb of a halfpenny loaf, and as much hempseed; let the egg be chopped very small, and the hempseed bruised in a mortar; when these are mixed, the bread is to be crumbled in among the rest, and the whole is to be rolled together with a common rolling-pin, and kept for use.

There must be some fine small gravel strewed at the bottom of the cage, and renewed at farthest once in a week. This will prevent his feet from getting hurt by being clogged with the dung; and his basking in this will keep him also from growing lousy, after which few come to good. There must be a perch in the cage, and it must be either lined with green bays, or made of fine matting, which the lark is very fond of.

When the bird is first taken, some meat must be strewed upon the sand in the bottom of the cage, for the bird will be sometimes almost famished before he finds the meat in the pan.

The cock-bird of this kind is known from the hen by the loudness and length of his call, by his tallness as he walks about the cage, and by his doubling his notes in the evening, as if he was going with his mate to roost. A better rule than all others, however, is his singing strong; for the hen *Wood-lark* sings but very weakly.

Both the cock and hen of this kind are tender, and subject to many disorders; the principal of these are cramps, giddiness of the head, and breeding lice. Cleanliness is the best cure for the first and the last of these complaints, but we know of no cure for the other. A good strong bird however, will often last very well five or six years, and often improve all the time.

Wood-*Louse*. See the article Millepedes.

Wood-*Mite*, in natural history, the name of a little animal frequently made the subject of microscopical observations, and by some called the *Wood-louse*; though that less properly, as there is another larger animal generally known by that name.

The *Wood-mite* is in shape and colour very like a louse, and is frequently found running very nimbly, but always by starts and jumps, on old books and rotten wood. The eyes of this creature are of a fine gold colour, and can be thrust out or drawn in at pleasure; and when examined by the microscope the peristaltic motion of the guts is seen very distinctly, and beautifully; and what is more wonderful, there is observed a very distinct and regular motion in the brain.

This probably is the same animal with the pediculus pulsatorius, described by Mr. Derham, as one of the death-watches. *Baker*'s Microscope, p. 185.

Wood-*Pecker*, in zoology, the English name of a species of *Picus*. See the article Picus.

Wood-*Pucerons*, in natural history, a name given by Mr. Reaumur, to a small species of insect of the puceron kind, of a greyish colour, and distinguished by its two hollow horns on the hinder part of its body.

These animals very much resemble, both in shape and size, the pucerons of the alder; but as those live always on the surface of the stalk, these make their way deep into the wood of a tree.

Mr. Reaumur found large quantities of these lodged at a considerable depth in the wood of some elms, after they were cut down; the passages by which they had made their way in, were not to be found; but they were lodged in large and long holes, of the diameter of a goose-quil, and running many inches along the tree in a longitudinal direction.

All the pucerons found in these places, appear to be females, and none have wings; they all have vast numbers of young ones of different degrees of maturity within them, and these may be forced out by pressing their bodies. *Reaumur*'s Hist. Inf. V. 6. p. 61.

Wood-*Ruffe*, in botany. See the article Asperula.

Wood-*Sorrel*, in botany, the name of a small plant, common in our woods, and having the same sharp sour taste with sorrel; but agreeing with that plant in no other particulars. See the articles Oxys, and Sorrel.

Wood-*Spite*, in zoology, an English name given by many to the common green *Wood-pecker*, the *picus viridis* of authors. See the article Picus.

WOOFF, (*Cycl.*) a name given in some parts of England to the sea-wolf, or *lupus piscis*, called by Gesner *anarrhicas*. *Willughby*'s Hist. Pisc. p. 130. See the article Lupus *Marinus*.

WOOL (*Cycl.*)—Wool-*Balls*, in natural history, masses of *Wool* compacted into firm and hard balls, and found in the stomachs of sheep, as the hair-balls are in oxen and other animals.

These are doubtless formed in the same manner as those hair-balls, of the outer covering of the animal, but they are much more uncommon; they are found in numbers, three, four or five in the stomach of the same animal.

Their outside has commonly much of the appearance of a puff-ball, and is usually either in part or wholly covered with a very thin and soft blackish smooth skin; the inner substance is entirely *Wool*, but that wrought together as closely as the hatter does his furs in the making them into hats.

They are usually soft, smooth, and somewhat elastic, of a pale buff-colour, very light, and of irregular figures rather cubic than globular, and seldom of any great size, an inch in diameter being their common standard. *Moreton*'s Northampt. p. 451.

WOOLLY-*Pashnum*, in natural history, a name given by the East-Indians to a species of native red arsenic, or orpiment, found in that part of the world.

It is of a paler colour than the red orpiment of Germany. *Woodw.* Cat. Foss. V. 2. p. 23.

WORK (*Cycl.*)—Work, in the manege. To *work* a horse, is to exercise him at pace, trot, or gallop, and ride him at the manege.

To *work* a horse upon volts, or head and haunches in or between two heels, is to passage him, or make him go side-ways upon two parallel lines.

WORMS (*Cycl.*) in the Linnæan system of nature, a class of animals, whose distinguishing character is, that they have the muscles of their body in one part affixed to a solid basis. *Linnæi* Syst. Nat. p. 33.

Worms, in husbandry, are very prejudicial to corn-fields, eating up the roots of the young corn, and destroying great quantities of the crop.

Sea-salt is the best of all things for the destroying them. Sea-water is proper to sprinkle on the land where it can be had; where the salt-springs are, their water does as well; and where neither are at hand, a little common or bay salt melted in water does as well.

Soot will destroy them in some lands, but it is not to be depended upon, for it does not always succeed. Some farmers strew on their lands a mixture of chalk and lime; and others trust wholly to their winter fallowing to do it, if this is done in a wet season, when they come up to the surface of the ground, and some nails with sharp heads be driven into the bottom of the plough.

If they are troublesome in gardens, the refuse brine of salted meat will serve the purpose, or some wallnut leaves steeped in a cistern of water for a fortnight or three weeks, will give it such a bitterness that it will be a certain poison to them.

A decoction of wood-ashes, sprinkled on the ground, will answer the same purpose; and any particular plant may be secured both from worms and snails by strewing a mixture of lime and ashes about its roots. It is a general caution among the farmers to sow their corn as shallow as they can, where the field is very subject to worms. *Mortimer*'s Husbandry, p. 328.

Generation of Worms. See the article Generation.

Aquatic Worms. Of these there are some which transform themselves into flies, but which depart much from the manner in which the generality of the fly-worms effect this change.

These are of the third class of fly *Worms*, and have an invariable head, and have no teeth or hooks meeting one another. They are usually found in ponds, or in waters that have but a slow current. Their head is small, long, and scaly;

ſcaly; their body long, and ſomewhat flatted, and is compoſed of eleven rings; the laſt of which is leſs flatted, and longer than any of the reſt, and in one ſpecies of theſe *Worms* is as long as five or ſix of the other rings, though it is not ſo in others. *Reaumur*'s Hiſt. Inf. Vol. 4. pag. 310.

The firſt ring in theſe *Worms* is of a ſomewhat ſmaller diameter than the ſecond; this is of a ſmaller than the ſucceeding one; and the three laſt, or next the tail, are of a ſmaller diameter, but more length than the others. The ſkin of this *Worm* is conſiderably tough and ſtrong, though not cruſtaceous but pliable and flexile like a piece of parchment; and at the commiſſure of the rings, the anterior has a ſort of appendix which falls over that it joins to.

They ſomething differ from one another in colour, ſome are of a greeniſh brown, others of a clearer brown, and others of the greener kind are veined with brown, and of the browner with yellow; they have no legs, but have ſome cruſtaceous hooks in their places under their belly, and theſe ſo ſmall as not to be diſtinguiſhable unleſs carefully looked for, and then only at the junctions of the three laſt rings. Ibid. p. 311.

As one finds theſe *Worms* in the ſame ſtate and ſame readineſs to undergo their metamorphoſis, ſome only of ſeven or eight lines long, and others of three inches, there can be no doubt but theſe are of different ſpecies. Theſe are ſeldom extended to their full length in the water, nor have they much power of contracting themſelves, or making one ring enter into another; but they can bend their bodies upward and downward at the junctions of all the rings.

This is of the kind of *Worms* which have no teeth, properly ſo called, but many of its ſpecies have a conſiderable number of fleſhy hooks. Others have but a few, and beſide theſe they have a ſort of beards. The end of this beard is larger than any other part; and the inſect throws them out from the under part of its head, and draws them in again at pleaſure, with great ſwiftneſs; and when they are out, it moves them backward and forward with great ſwiftneſs: The ends of theſe examined by the microſcope, ſhew themſelves to be covered with cluſters of hairs. Ibid. p. 112.

There are in this ſpecies two ſpots, a little browner and more poliſhed than the reſt of the ſkin, placed one on each ſide the head, which have ſomewhat the appearance of eyes, at leaſt the creature does not appear to have any if theſe are not ſo. Ibid. p. 313.

At the extremity of the head there is a little fleſhy protuberance, which is probably either a mouth, or ſucker, by which it takes in its nouriſhment.

Notwithſtanding that this is naturally an aquatic animal, it is however neceſſary to its life, that it ſhould breathe. For this purpoſe, the laſt ring of the body of theſe *Worms* is open at the end, and ſerves them in the place of the poſterior ſtigmata, in others of the *Fly-worms*. The extremity of this ring is frequently to be ſeen on the ſurface of the water; and about it there is always ſeen a ſort of funnel made of a vaſt number of hairs that grow there, and diverge on this occaſion into this form.

Each of the hairs that forms this ſort of funnel, is itſelf a ſort of beard, furniſhed with numbers of ſhort hairs on each ſide; and the uſe of the whole is to prevent the water from getting in at the aperture made to admit the air. If any doubt could be had of the creature's reſpiring by this means, it would be extremely eaſily cleared by a ſimple and eaſy diſſection of the creature, ſeparating its belly from its back; for one then diſcovers two large veſſels running the whole length of the body, and filling up a great part of its ſpace; theſe are the two great tracheæ; they are inſerted near the head, where probably the anterior ſtigmata are placed, and running through the body join and are inſerted again at the tail. Ibid. p. 314.

It is ſtrange, that a creature like this, an inhabitant of the water, ſhould be deſtined in its ſucceeding ſtate to be an inhabitant of the air; but it is evidently ſo, this *Worm* transforming itſelf into a two-winged fly. When one knew however that this was to be the caſe, one would naturally imagine that ſome long-bodied fly of the libella kind, or ſome other ſuch ſhould be the laſt change of our long *Worm*; but, on the contrary, the production is a very ſhort-bodied fly; nor is this at all more wonderful than the caſe of thoſe libellæ, ſome of the longeſt bodied of which are immediately before their egreſs into that ſtate in the form of very ſhort *Worms*. Ibid. p. 317.

What is farther a great ſingularity in this creature, is that when it changes into the fly, and at any time before that ſtate, it undergoes no change in its exterior form, nor can the time of the change be at all foreſeen; and what is yet more ſingular, the creature when it has undergone its change, and is no more living but in the ſtate of a ſhell to the encloſed fly, is no way diſtinguiſhable by the eye from the living *Worms*, nor can be diſcovered but by the touch. The difference then indeed is eaſily perceived, as the living *Worms* are ſoft and flexile, theſe ſtiff and rigid, and incapable of moving themſelves. It is no uncommon thing for the laſt ring of the body to be turned up, and make an angle with the reſt, even in this ſtate; and often the ninth ring in the ſame ſtate makes an angle with the eighth, but in a contrary direction to the other. The *Worm* while living frequently makes alſo theſe angles, but then it changes them as it pleaſes; whereas, in this ſtate, they are become immoveable. Ibid. p. 318.

When therefore we find, among a number of theſe *Worms*, ſome that are ſtiff and rigid, we may determine that theſe have loſt their original form, and that their ſkin now only ſerves them as a ſhell for their transformation. When this is the caſe, there is no inſect which ſo ſoon accompliſhes its changes. Theſe *Worms* frequently within five or ſix days from the time of their firſt becoming ſtiff and rigid, are transformed into flies.

The nymphs of this fly takes up only a ſmall part of the ſhell made by the ſkin of the *Worm*, all the laſt rings, and part of the firſt remaining empty, the middle ones only being occupied by the nymph. It is not impoſſible, however, but that theſe vacant ſpaces may have their uſe, and may be neceſſary to give paſſage to the air, without which the embryo fly would periſh. Ibid. p. 319

Worms, called *Aſcarides*. The name *Aſcarides* is given by Mr. Reaumur, to a ſort of ſmall *Worms* or maggots, bred from the eggs of winged animals; which bury themſelves between the membranes of the leaves of plants, and there eat away the parenchymatous ſubſtance.

Theſe are a very minute ſpecies of animals, and the ſmall ſpace of the inſide of a leaf allotted for the place of their reſidence, is to them a vaſt extent of country; and they eat it away at various times, and in different manners; ſome eat very ſlowly, and only burrow themſelves a way in contorted holes or cells; theſe he calls *foſſores parvi*: Others eat more variouſly, devouring all that lies before and round about them, and not burrowing in different directions; theſe laſt are called *foſſores magni*.

Theſe differ greatly one from another, and indeed are the *Worms* of different animals; ſome afterwards changing into ſmall butterflies, others into ſmall flies of the common kind; but the manner of life is the ſame in all. The butterflies whoſe eggs produce theſe, are extremely beautiful, glittering with a multitude of gaudy colours, and with ſilver and gold among the reſt; but they are too minute to ſhew their beauties to the naked eye. Thoſe of the *Aſcarides*, which do not in fine become butterflies, are two-winged flies, or ſmall beetles, in their ultimate ſtate. As ſmall as theſe *Aſcarides* in general are, they do not fail to ſhew the proper characters, by which they may be reduced to regular claſſes: Thoſe which have had their origin from the eggs of butterflies, are truly and properly caterpillars in miniature; the others are maggots, from flies; and if from beetles, they are hexapode *Worms*. Of the little caterpillars, ſome have ſixteen feet, ſome only fourteen; and ſome of them are perfectly ſmooth and equal all over the body; others have a number of rings or annular diviſions, like the larger caterpillars, their ſeveral changes for the arriving at the fly-ſtate are the ſame with thoſe of the common ſilk *Worm*, and other ſpecies of large caterpillars.

The ovula of the parent butterfly are depoſited ſingly, only one being placed on a leaf; for the little caterpillar is of the nature of the ſolitary, not the gregarious animals. Theſe eggs are ſo ſmall, as to be ſcarce viſible, except to an obſerver ſo accurate as Mr. Reaumur; but he not only diſcovered them lying upon the leaves of plants, but traced them to the time of their hatching; and obſerved this curious particular, that the caterpillar never enjoys the light or free air, but as ſoon as ever it is hatched eats its way through the integument of the leaf; and, under the cover of its ſhell, buries itſelf among the parenchymatous matter, whence it never comes out again till it arrives at the fly ſtate.

The *Worms* which are hatched of the eggs of flies, make their way as ſpeedily into the ſubſtance of the leaf; but with this difference in the manner of doing it, that as the caterpillar eats its way through with its teeth, the *Worm* ſtrikes its head forcibly againſt it ſeveral times, and by repeated blows at length breaks a hole in it, large enough to admit its little body; and then feeds on the parenchyma of the leaf, in the ſame manner with the caterpillar. Theſe finally change into their chryſalis ſtate, within the covert of the membrane of the leaf.

The laſt kind of *Aſcarides* which are to become beetles, make their way into the ſubſtance of the leaf in the ſame manner; and when they have fed their deſtined time upon its parenchyma and juices, they ſometimes change in the covering of the membrane, and ſometimes come out of their holes and chooſe the ſurface of the leaf for the ſcene of this great cataſtrophe. *Reaumur*'s Hiſt. Inf. Tom. 1.

Bee-Worm, the name given by naturaliſts to the ſmall white *Worm*, found in the cells of the honey-comb, and afterwards changing into a bee, in the manner of the white maggots, found in meat, &c. which, after a certain change, into a ſtate of reſt, become transformed into flies, like thoſe to which their eggs owe their origin.

To trace these *Worms* of the bee to their origin, we are to observe that the female bee lays an egg at the bottom of each cell, and that this is not simply dropped into this place, but that the bee fixes it to a certain part; that is, either to the base of the cell, or to one of the angles, by its smaller end. The egg is of an oblong figure, and is larger at one end than at the other; it is covered with a thin flexible membrane instead of a shell, so that it may be bent double, and will, on taking off the force, return to its own shape again. *Reaumur*, Hist. Inf. vol. 10. p. 239.

These eggs appear perfectly smooth and glossy to the naked eye; but when viewed with powerful glasses, there is a scaly structure observed in them; though Mr. Reaumur suspects that this is not on the outside, but is seen through the transparent covering, and is, in reality, the structure of the *Worm* within.

Though it be the regular course of nature, that only one egg should be deposited in each cell, yet there are sometimes found two, three, or even four, in one place: the occasion of this usually is a female bee's being engaged in a small swarm, in which the working bees cannot erect combs fast enough, so that as she is under a necessity of depositing her eggs from day to day, she is compelled to put them two or three together: these, however, seldom come to any thing, such small swarms usually dispersing after a while, the female seeking admittance into some other hive, in which she may lay at her leisure. When the bees work in the common way, and the female is so pressed to deposit her eggs, that she cannot stay the necessary time, she often, in this case, places two or three eggs in a cell; but as the number of cells every day increases, the hive is not deserted on this occasion; but the swarm continues in it, and the female continues her laying as the workers make the cells; as it is impossible, however, for two or three *Worms* to live in one cell, the worm, when at full growth, and when in the nymph-state, entirely filling up the whole cavity, the bees foresee the event, and take care to remove the supernumerary eggs out of the cells, leaving only one in each. *Reaumur's* Hist. Insect. vol. 10. p. 244.

It has been a common opinion among authors, that after the eggs of the bees are thus deposited in the cells, they are set upon, in order to be hatched in the manner of those of birds. The generality of writers have given this office of sitting to the drones or male bees; but others, who have observed the swarms more narrowly, and found that there are no drones in the hives, except for about three months of the year, and that the eggs remain in the cells at times when they are not there, have declared, that the common working-bees do this necessary office; nay, some, who have written expresly on this subject, have gone so far as to give directions what should be done with such bees as were found sitting on the eggs, when the swarms were removed from one hive to another.

Mr. Maraldi, who could not give into this opinion of the bees sitting on the eggs, yet was for giving them some office in regard to their hatching, and consequently observes that the bees got on the tops of the cells which contains the eggs, and there fluttering their wings with great rapidity, excite a heat which occasions the young ones to be hatched. This, however, is not less erroneous than the other; for a strict observation always shews that the cells in which the eggs are, are wholly left and abandoned by the bees, and they never go near them, except when their road lies by them on their other necessary occasions. It is very probable indeed that the heat of the hive is a great agent in the hatching of the eggs; but the single bees never attempt to add to this, in regard to any particular cell, and without this the heat within is often equal to that of the eggs sat upon by a hen, and sometimes superior to it.

The eggs are hatched about three days after the bee deposits them, and all their changes are afterwards so swift, that it is necessary to watch them very attentively, in order to see them. In almost two days after the hatching, the *Worm* is found grown to so large a size, that it is scarce to be believed the same animal. The whole period of the life and changes of the *Worm* is contained in about seventeen days; for if a cell be observed in which an egg is just laid, and the same cell be examined twenty days afterwards, the young bee will be found just ready to appear out of the nymph of the *Worm*, and take its flight from the cell. The labouring season of the bees, in this respect, is when they are newly hived, and their industry, and the efforts of it at that time, are scarce credible.

Mr. Reaumur observed the whole process in a swarm which he put into a new hive on the twenty-fifth of May. They all immediately began to work upon their combs, and on the twenty-seventh, which was only two days after, there were a vast number of cells erected, in each of which the female, or queen, had deposited an egg; and on the seventeenth of June, these cells all furnished the hive with a new swarm, each producing its bee.

From the time that the *Worm* is hatched out of the egg, to its passing into the nymph-state, it always remains at the bottom of the cell, and lies rolled up in form of a ring, its head coming very near the tail. In this manner it lies very comfortably, there being under it a sort of bed of a soft and glutinous white matter, which prevents the hard matter of the cell from pressing against it. This matter has also another use yet more materially necessary to the animal, as it serves for its food.

The common working bees are destined to take care of the young brood, and the care they take to keep them supplied is surprising. The *Worm* is a feeble animal, not able to go out of its cell in search of food, nor is it by any means proper that it should, as the combs would be destroyed by the continual passing of a number of such creatures. When the bees are observed by means of a glass-hive, it is easily seen in what manner they prevent the necessity of this all the time that the *Worms* are alive in the cells: their chief business is their support, and there are numbers of them every moment seen plunging their heads into the cells, and depositing there a supply of this matter, which serves for the nourishment of the young brood. It is a pleasing sight to observe how carefully they come one after another to the same cell, till there is a sufficient quantity in it, and, after this, how others that come in on the same service, looking into that cell, and, finding it supplied, pass over it to others which want their help. *Reaumur's* Hist. Inf. vol. 10. p. 246.

When we see the bee in this employment, after plunging its head into the cell, remain in that posture some time before it draws it out again; it is easily conceived, that it is there disgorging what we find afterwards left in the cell. It is to be observed, that some have supposed this white matter which surrounds the *Worms* to be their excrements, not their food; but there are many reasons against this opinion. The *Worms* of winged insects in this state void little or no excrement; and if this matter of the bees cells was the excrement of the *Worms*, it must necessarily follow that it must be found in smallest quantity when the *Worm* was first hatched, and daily increasing afterwards; but just the contrary of this is the case, for the quantity of it is greatest of all while the *Worm* is very young, and there is none of it found by that time when the creature is full grown, and is ready to pass into the nymph-state.

Swammerdam, and other curious inquirers into the œconomy of bees, have wondered where the creatures produced this liquid substance, which is of a whitish colour, of the thickness of cream, and of an insipid taste like flour and water. Some have supposed it the extravasated juices of trees and plants, collected by the bees for this use; but it is much more probable, that it is the matter of the common food of these animals. The honey and rough wax which, after having passed their digestion, is reduced to a substance of this kind, analogous to the milk of animals, is in this state voided by the mouth by these animals, for the support of their young, while in a condition in which they cannot help themselves.

The bees seem yet farther careful of their offspring, and take the pains to bring them up by degrees from more insipid to less insipid food; for as they are to live on honey in their fly-state, they are to be by degrees brought to this diet while *Worms*. This will be found to be the case, on examining the cells in which they live at their different stages. In the first stage, or while the *Worms* are very young, the matter of their nourishment is found perfectly insipid, as before observed; but as they advance in growth, if it be tasted at different times, it becomes more and more sweet; and, in fine, what is brought for the nourishment of the *Worm*, when nearly arrived at the time of its change into the nymph-state, is little different from honey.

The bees therefore seem able to give this matter what sort of preparation they please, and it is evidently different at these different times, not only in taste but colour. At first it is white, but it afterwards becomes transparent and colourless, and after this greenish or yellowish, very often resembling in colour diluted honey. *Reaumur's* Hist. Inf. vol. 10. p. 247.

The *Worm* has no legs, as indeed it has no need of any, its whole life, in that state, being destined to be spent in that cell where it is first hatched: it is not easy to get one of them out of the cell without hurting it; but when it is carefully taken out, and laid on a paper, it is found to have no power of crawling, but only gives signs of life by turning its head a little about. There is very little difference in the growth; its colour only changes from a somewhat bluish-white, which it is at first, to a purer white, and the incisures between the rings become less deep, and in fine, almost wholly disappear when the creature is at its full growth.

The head of this *Worm* is somewhat harder than the rest of the body, and is of a regular figure, being flatted, and composed like the head of the caterpillar, of two lips, the under one divided into three parts, and the upper one being furnished with two hard substances in form of teeth, though much less solid and strong than those of the caterpillar, as this creature has nothing to do with solid food. In the full grown *Worms* there is always seen a yellow line or streak running directly along the middle of the back. This seems to be a streak on the surface of the skin, but it is, in reality, no other than the great canal of the intestines, which is easily seen through the transparent skin, as it is full of a yellowish matter, very much resembling honey.

Under the belly of this creature there is an appearance of certain

tain folds more white than the reft; thefe are difpofed parallel one to another, and all run in a tranfverfe direction. It is natural to fuppofe that thefe are the folds at which the *Worm* has a power of bending itfelf; but, when examined ftrictly, this does not appear to be the cafe, for they are found to be in reality fo many round veffels of a bright filvery whitenefs, placed under the fkin, and vifible through it, on account of that fuperior whitenefs. They may be eafily raifed with the point of a needle, and taken out of the body, and they are then found to be of the fame ftructure with the tracheæ of all other animals of this fmall kind; namely, they are extremely fine and fmall cartilaginous filaments, hollow within, and rolled into a clofe fpiral wreath.

The ftigmata of this *Worm* are eafily diftinguifhed, though they are extremely fmall. If one of the tranfverfe tracheæ of the belly be traced to its extremity at each end, it will be found to terminate at each in a ftigma. Thus all the reft of them may be found out, and they will be found to lie in a regular line along each fide, running along the two great tracheæ, which pafs longitudinally from the head to the tail on each fide of the *Worm*. From thefe there part fome fhort but thick tracheæ, which pafs toward the back, and there become divided into many branches; and on the under part of the body, near the head, there may be diftinguifhed feveral others beautifully undulated, which pafs from fide to fide, though not in a regular manner. The anus of the *Worm* is placed in the laft ring of the body, and is very fmall; it is deftined to give paffage but to a very fmall quantity of excrements. *Reaumur*, Hift. Inf. vol. 10. p. 257.

If the progrefs of the growth of the *Worm* be examined, it will be found that two days after the egg is laid it is hatched, and in fix days more it arrives at its full growth. When it is firft hatched it rolls itfelf up into a fort of circle, which is then however fo fmall, that it does not reach quite round the cell, and leaves a confiderable fpace within its center: this, however is foon filled up by the growth of the creature; as it becomes longer, its head is brought to meet the tail, and is forced beyond it as far as the laft ring but one of the body: in this time the body alfo fwells fo much in thicknefs, that there can no more be any fpace left in the center of the ring, nor any room for the head to be thruft farther forwards; as the *Worm* has much of its growth yet to come in this uncomfortable fituation, it naturally happens that the body lofes its round fhape, and becomes flatted, and in this manner rifes up fo high in the cell, as almoft to fill it up: when the cell is examined in this ftate, it feems to contain two *Worms* rolled up, and laid in it, one upon another, fince it is hard to conceive the body of one fo fafhioned as to fill it in this manner: when the *Worm* is however taken out, its fhape plainly fhews how it has filled it, and in what manner it has conformed itfelf to the place of its abode: when at liberty, it foon recovers the natural rounded fhape of its body.

It is very plain, that the *Worm* muft be very little at eafe in this fituation, and that it will be neceffary for it to change it, in order to its own neceffary transformations. When therefore the time of its firft change approaches, it ceafes to eat, and begins to unrol the circle its body makes, and to lay itfelf at its length in the cell. When this happens, the bees become fenfible that it has no occafion to eat any longer, and therefore they bring it no more food; but nature only requiring for this change a ftate of reft, and the exclufion of the external air, they perform their laft office to it in what might appear a very ftrange operation, if it were not known to be neceffary to the *Worm* in this ftate; this is the faftening up the top of the cell with a covering or lid of wax, fo that the *Worm* now finds itfelf fhut clofe up in a fort of box, hermetically fealed. The manner in which the bees make this covering, is by beginning a circle within the mouth of the cell with new wax, and fucceeding this by feveral others, each within the laft, till they leave only a vacant point in the center, which they fill with a lump of the fame wax, fo that the cover is compofed of a great number of concentric circles.

When this cover is finifhed, the *Worm* compleatly extends itfelf at length within, and as it is now to pafs into the ftate of a nymph, and the outer integument of that will be too thin and tender to bear the immediate contact of the wax of which the cell is compofed, it begins a new work, which is the fpinning a fort of filk in the manner of the filk-worm; with this it forms a web, completely covering all its parts, and in this fafe cafe it becomes a nymph. The web of filk which the *Worm* fpins, on this occafion is extremely fine, and is by degrees carried all round the cell, fo as to line it regularly throughout in the manner of a linnen hanging. This is not only applied thus clofely to the fides and bottom of the cell, but in the fame manner to the lid or top; and thefe are eafily feen on breaking open a cell which enclofes a nymph; for when the wax of one fide of the cell is broke, the *Worm* is then only feen through a thin and tranfparent reddifh web, which is this lining of the cell, and is found to be very flexile, yet very tough. The time when this is beft of all feen, is, however, when the combs of an old hive are broken; for, in this cafe, the webs within the cells which have been deftined to the raifing of young ones, are fo thick that they will not break; but may be eafily examined and pulled to pieces, and they are then found to be made of a great number of crufts, one within another. *Reaumur*, Hift. Inf. vol. 10. p. 261.

It is not to be fuppofed that one *Worm* could have formed thefe complex webs, as they are neither neceffary to it, nor to be fafhioned in the time that animal has to work in. It is very certain that one of thefe cells deftined to the breeding up of the young offspring, is not only allotted to one *Worm*, but to feveral fucceffively; and each of thefe having in its turn fpun its web, by this means the whole web is found compofed of fo many crufts or doubles, or is, in reality, a collection of fo many webs as there have been *Worms*.

As foon as ever one of thefe nymphs iffues out of the cell, in the bee-ftate, the working bees clean out the cell, and render it perfectly fit for the office of educating another young one; and as foon as that is done, the female bee lays another egg in it, and fo on; fo that almoft as long as the comb lafts, every three weeks there is a new *Worm* to inhabit it, and a new web fpun, and added to the former number. By feparating the crufts of one of thefe complex webs one from another, it becomes eafy to reckon how many bees have been hatched in each. The feveral crufts are fo very thin, that there may be a great number of them applied one over another, before they will fenfibly fill up or ftraiten the cavity within the cell, and, in other refpects, the cell is the better for it, every coat of this matter adding a lining to it, which is at leaft as ftrong as the fides of the cell.

The web that this *Worm* fpins is remarkably fine and delicate. Its threads are of a fmalnefs fcarce conceivable, and its workmanfhip worthy the materials; for they are wove in fo compact a manner, that it is not eafy to fee the ftructure; infomuch that Mr. Maraldi, a very accurate obferver of the bees in other refpects, fuppofes this lining of the cell to be formed of the fkin of the *Worm*, thrown off at its entering into the nymph-ftate. He is a little embarraffed to conceive in what manner the fkin becomes fo regularly and nicely applied to all the angles of the cell; but a clofer obfervation fhews the truth; for if the cells be opened when newly covered by the bees, the *Worm* within will be found to be yet in its own form, and will be detected in the act of fpinning its web; or if glaffes be called in to our affiftance afterwards, the web, whofe ftructure is imperceptible to the naked eye, will be feen to be compofed of fine threads regularly woven together like thofe of other fpinning animals.

The female bees are treated with a peculiar diftinction, even in this ftate of the *Worm*, as well as afterwards. We fee that the common cells ferve fucceffively to the hatching of feveral of the common *Worms*, and bringing them to perfection in the bee-ftate; but this is not the cafe in the females, each cell only ferves to raife one bee of this kind, and is never found covered within with any more than one web or filky lining. Indeed the bees always deftroy thefe royal cells as foon as ever the bee is hatched from them, or, at the moft they only leave the bottoms of them, to ferve as the bafe of other cells; and this indeed is wholly neceffary, in order to their carrying on their common work, and enlarging their combs. *Reaumur*, Hift. Inf. vol. 10. p. 263.

The fucceffive hatching of feveral bees in the fame common cell, is of great ufe to it, as the web left by every one within it, greatly ftrenghens the cell; but this is by no means neceffary, in regard to the royal cells, or thofe deftined to the producing the female bees, as the fides of thofe are always made fo thick, that they can require no additional ftrengthening.

When the common *Worm* of the bee has arrived at its growth, the labouring bees bring it no more food, fo that it eats up the whole of what remains, and the cell becomes dry and clean. It then extends itfelf at full length under the cover of the lid of the cell, and by giving itfelf feveral motions, it caufes the fkin of its back to fplit open with a fmall longitudinal fiffure. The internal motion of the creature foon enlarges this flit, and at length the body of the nymph appears in the fiffure, and by degrees makes its way compleatly out. The fkin left behind is then only a dry membrane, and this nymph is to be looked on as the animal: this is an oblong body of a delicate ftructure, but without any power of motion.

In this, if nicely examined, there may, however, be difcovered all the parts of the future bee, and it feems indeed no other than the perfect bee, with its limbs as yet all foft and tender, and concealed under a thin membrane, till they acquire a due ftrength and firmnefs. The rings of the back may be eafily traced on the back of the nymph, and when its belly is examined, the legs and horns, or antennæ, and the trunk, are all diftinctly feen extended lengthwife, and the wings are folded in fmall knobs, which are afterwards to be unfolded in a wonderful manner.

The drones, or male bees, which the common working bees fo unmercifully maffacre and deftroy in the month of July, or thereabouts, are not lefs taken care of in their worm-ftate, than thofe of the common kind. The *Worms* of thefe drones do not differ in any particular from thofe of the common working kind, except that they are larger, and are placed in larger cells.

The bees bring food to thefe *Worms* in the fame manner as to the others, and when the time of their change into the nymph-ftate approaches, they as regularly and carefully cover their cells

cells with a wax lid. It sometimes happens, that the *Worms* of these drones are lodged in cells no larger than those in which the *Worms* of the common bees are placed. The bees who have the care of the young brood always are able to distinguish these however, and when they come to make the cover of the cell they always give them room by making it of a different form; they do not extend a flat crust over the mouth of the cell in this case, but raise a hollowed and elevated covering. The cells of the drones are easily distinguished from the rest, by this; and a whole side of a comb is by this means often found to be the lodging of the drones only.

The eggs out of which the male bees are to be hatched, differ in nothing from the others, except that they are a little larger; and the bees produced of the *Worms* hatched from them, are proportionably larger, as are also the *Worms* themselves when at their full growth. It sometimes happens, however, that the male bees are no larger than the others; several hives having been found with the males of this small kind. It sometimes happens that the female bee is obliged to deposit two, three, or even four eggs in one cell, through a scarcity of cells at the time when it is necessary for her to lay; but as these can never grow to their full size in a third or fourth part of the room they should have, Mr. Reaumur is of opinion, that this is the cause of the smallness of these male bees; and that in whatever hives they are found, the eggs have been left three or four in a cell.

The love that the working bees have for the young *Worms* hatched in the combs of their own hives appears very great, and their care of them the most perfect in all their stages that could be conceived; but this love and tenderness does not extend to the young ones of another hive. Mr. Reaumur tried the experiment, by putting into one of his glass hives part of the comb from another hive, in which there were some eggs and some young *Worms*; but while the bees of this hive were perfectly careful of their own young, they were cruel in the greatest degree to these, tearing them out of their cells, and carrying them out of the hive, there leaving them to perish. *Reaumur's* Hist. Inf. V. 10. p. 267.

There are certain circumstances also, under which the bees are not less cruel, even to their own young: If it happen that a comb break, and a piece of it fall to the bottom of the hive, the bees immediately gather about this fallen piece, and kill all the *Worms* that are in the cells of it, in the same manner as they did the strangers, carrying them out of the hive. It should seem, that the creatures knew, that the want of the necessary heat which is found in the center of the hive would be the occasion of the death of these *Worms* before they could arrive at the bee state, and that in mercy to the creatures themselves they at once put a period to a life, that could only be miserable, and prevented a great deal of unnecessary trouble to themselves, in feeding a number of creatures which never could come to perfection. It sometimes happens also, that the bees kill and carry out of the hive the bodies of many of the *Worms*, while the combs all remain in their place, and no accident has happened to them. There are however very plain reasons which may justify this cruelty, so very different from the general care and tenderness they have for them. One of these may be, the necessity of making a provision for themselves against the winter.

If the fœcundity of the female bee continue so long, and be so great, that all the cells are filled with young ones, at a time when many of them must of necessity be filled with honey, for the sustenance and support of the hive in winter, it will be found absolutely necessary that many of the cells must be cleared of the *Worms*, in order to their being filled with the honey. The preservation of the republic being the first of all cares, this cruelty will be found justifiable, rather than by a foolish tenderness all should be left to perish with hunger. This slaughter is plainly very often owing to this cause, as it is seen to be made at such time as the winter is coming on; and when there is present a season admirably adapted to provide a supply for it, by affording great opportunities of collecting a great deal of honey in a little time.

There is also another occasion, on which a massacre of this kind may be justified on the principles of reason. If a female prove very prolific, and by any accident do not lay any eggs for the producing another female, or the egg or eggs of this kind which she does lay do not come to good, the young brood in this case cannot answer the general purpose of nature in their production, that is the forming a new swarm and taking care of a new offspring; and in this case, as they would live to no purpose, it is not wrong in the bees who have the care of the young to destroy all these, and make room by that means for a new brood born with happier circumstances.

It is very possible also, that the *Worms* may be liable to certain disorders, which we can have no knowledge of; but in consequence of which they could only produce very feeble and useless bees: in this case, which the bees who have the care of the young may easily perceive, it would be no improper method in them to destroy in the *Worm*-state what they foresaw would be of no use to the commonwealth in the bee-state. *Reaumur's* Hist. Inf. V. 10. p. 273.

Though the common bees refuse the care of such young ones as are taken out of other hives, and put into theirs, their rules however are not so strict as to the breeding no other young but those of their own hive; for it has been found by experiments, that if all the bees of two hives be forced to make a change, and each swarm to enter into the hive belonging to the other, they will in this case take as much care of the young *Worms* they find in the combs, as they would have done of their own.

If the common bees take all this care of the *Worms* which are to become working bees like themselves, and even of those which are to become drones which after a time they are to destroy, there is no wonder that they take greater pains to secure and bring up those *Worms* which are to become female bees; of which they are so very watchful and observant, that they feed these *Worms* with the utmost care; and when they have brought them up to that state when they are to eat no longer but are to pass their last change into the chrysalis or nymph-state, they close up the aperture of the cell with a lid of wax; in the making of which, they are not less prodigal of that choice and precious substance the wax, than they had before been in the constructing the cell. It takes as much wax to make one of the cells in which these females are to be brought up, as to make an hundred and fifty of the common cells; this may be found by weighing them against one another, and the cover or lid of the cell put on at the time of the transformation of the *Worm* bears the same proportion to the covers of the other cells. Every thing that regards these creatures is managed with profusion: In the common cells there is never found a drop of that liquid matter destined for the food of the *Worm*, when it is arrived to the nymph state, the bees never furnishing it with a drop more than is absolutely necessary; but they give so profusely to the *Worm* that is to become a female bee, that when it is changed into the nymph-state there is usually found in the cell with it a quantity of this food equal to its own bulk.

This food seems also more nicely prepared, than that which is intended for the nourishment of the other worms; for if it be tasted, it is found very sweet and luscious, but attempered with a sharpness like that of vinegar, and with a warmth like that of pepper, or some other spice.

It might be supposed from this food always found in the cell with the royal or female nymph, that the creature in that state took in nourishment; but this is not the case, the nymph of the female bee can no more eat than any of the others; but this mass of food is of no injury to it in that state, as it does not fill up the whole cell as the others do, but has a great deal of room, and there is always a void space between it and the mass of food. *Reaumur's* Hist. Inf. V. 10. p. 278.

The progress of the young bee from its *Worm*-state, is this: When the cover is fitted to the cell, the nymph makes its way out of the back of the skin of the *Worm*; it is at first perfectly white, but by degrees its eyes acquire a reddish colour, and afterwards the several parts of the body become more and more brown; by degrees they all acquire their due strength and solidity; and when that is done, the bee appears out of its case, by bursting the thin membrane that covered it. The next office then, is the getting out of the close cell, which is a prison to it; in order to render this easy, the head of the bee is always fixed by the position of the nymph just under the center of the lid or cover of the cell.

The first business of the new-hatched bee is therefore with its teeth to eat a way through this covering; this it does by slow degrees, first forcing a small aperture, and afterwards by degrees enlarging that to a proper size to let its head, and in fine its whole body, appear. This is, in favourable circumstances, that is when the day is favourable and the young bee vigorous and strong, the work of about three hours; but at other times, it is half a day's work; and in some cases is never perfected at all, the creature dying by that time it has made an aperture large enough to get its head out at, and perishing with the head out and the body within the cell.

Swammerdam supposed, that the bees which placed the covers upon the cells, took them off again at a proper time; but this is not at all consonant to reason and experience, since, were it so, we could never find bees dead in the position just described. But Swammerdam living before the invention of glass-hives, could only guess at what we can now see distinctly performed under our eyes.

As soon as the head and the fore-pair of legs are out, the disengaging the rest of the body is very easy, as these legs being fixed on the outside of the cell have sufficient force to pull up the rest.

When

When the creature is completely out, it ſtands on the ſurface of the comb near the cell out of which it is come, and its parts, which are yet very ſoft and moiſt, become hardened and dried by degrees.

While it ſtands thus, the reſt of the bees which are about the ſpot gather round it, and give evident marks of joy at its being produced; they ſtroke and make much of it, and often offer it honey out of their own mouths. While it ſtands in the midſt of theſe careſſes, its wings by degrees unfold themſelves, while ſome of the bees are thus welcoming the new inhabitant, others immediately ſet themſelves about clearing away the matters left in the cell, and fitting it for the reception of a new inhabitant.

The bee produced out of it, has neceſſarily left behind it two exuviæ; the ſkin of the *Worm* when it transformed itſelf into the nymph ſtate; and finally that of the nymph, out of which it is juſt come in form of a bee.

One of the working bees immediately enters this cell, head foremoſt, and taking up one of theſe exuviæ carries it out of the hive, and the moment ſhe has left the cell another enters it, and in the ſame manner carries out the other exuviæ; after her there enter ſeveral others, which carry out the fragments of wax that had fallen in while the *Worm* was gnawing its cover to pieces; and others, finally, put it perfectly in order, and render it fit for the reception of a new egg, which the female bee ſoon depoſits in it; inſomuch that Mr. Maraldi ſays, he has ſeen five bees produced in the ſame cell, in the ſpace of three months.

The young bees are eaſily diſtinguiſhed from the others, by their colour; they are grey, inſtead of the yellowiſh brown of the common bees. The reaſon of this is, that their body is black, and the hairs that grow upon it are white, from the mixture of which ſeen together reſults a grey; but this colour forms itſelf into a browniſh yellow by degrees, the rings of the body becoming by degrees more brown, and the hairs more and more yellow. The bee is no ſooner produced from the nymph, than it knows the whole buſineſs of its future life; it immediately goes out, and gathers wax and honey for the common ſtores. At the time that one bee hatches in this manner, as many others are alſo hatched as there were eggs depoſited by the female in the ſame day; this is often many hundreds: So that a few days of this kind render the hive too full of inhabitants, and the new-born brood are forced to go out in form of a ſwarm to find ſome other habitation, where they may employ themſelves in the ſame manner with thoſe to which they owed their origin. *Reaumur*'s Hiſt. Inſ. V. 10. p. 280. See the article SWARM.

Canker-WORM. See the article SCARABÆUS.

Churr-WORM. See the article GRYLLOTALPA.

Connough, or *Connaught*-WORM, in natural hiſtory, a name given by the common people of Ireland, to a kind of caterpillar found in many parts of that kingdom; and, from its ugly aſpect, reputed to be poiſonous.

It is ſaid to be the only poiſonous creature of that kingdom, and many miſchievous effects are attributed to its ſting, and to its poiſonous quality, when eaten by cattle.

As to the firſt of theſe opinions, it is evidently erroneous; the creature having no power to ſting at all. The other is not ſo eaſily proved falſe, but is much to be ſuſpected. The reaſons on which it is founded, are theſe: The cattle in Ireland are ſubject to a very terrible diſeaſe, which is moſt frequent in Autumn; about the time when theſe animals are in the greateſt plenty.

It is moſt frequent alſo among thoſe cattle which feed in low and marſhy grounds, where this creature lives and feeds; cows and hogs which feed in theſe places, are the only creatures ſubject to the diſtemper, and this is imputed to the cows eating by large mouthfuls, becauſe ſhe chews the cud a ſecond time; and the hogs feeding ſo foul and greedily, as to eat things which other creatures refuſe. Finally, the great cauſe of the aſſigning this diſeaſe to this creature is, that the *Worm* only appears in great numbers about once in ſeven years; and in theſe, and theſe years only it is, that the diſtemper among the cattle is common.

The ſymptoms by which this diſeaſe is diſtinguiſhed from all others, are, a great ſwelling of the head, and a falling down of the anus; the gut often hanging out to the length of ſix or ſeven inches. The common cure among the more intelligent people is a ſtrong decoction of the plant called bearſfoot, or great black hellebore, with ſome rue and garlic given with butter and beer; this is found to have great ſucceſs with the cows. The hogs are cured only by mixing reddle, or the common red ochre powdered, with buttermilk, and making them eat a large quantity of it.

The Iriſh peaſants have recourſe to many idle remedies; but theſe are found often of real ſervice. The caterpillar, ſuppoſed to occaſion this diſeaſe, feeds on the common ragwort, and is larger than moſt other creatures of this kind, being of the length and thickneſs of a man's finger; it is marked with two large ſpots behind the head, which are ſuppoſed by the vulgar to be the eyes, but are only round variegations, of the nature of thoſe common on other caterpillars; and what they take to be a ſting in the tail, is no other than a horn in that part; which is not peculiar to this caterpillar, but found on many others. That the common people are deceived in regard to the external parts of this creature, is evident; but experiments are required yet to prove, whether or not they are ſo, in regard to its poiſonous quality.

One trial is remarked by Mr. Molyneux to have been made on a dog, who eating the ſkin of only one of the creatures was found dead about three days after; another dog, which eat the juices expreſſed from that ſkin, received no hurt. The inſect is deſcribed in Liſter's edition, under the name of the elephant caterpillar. Phil. Tranſ. N°. 168. p. 880.

Flower-root-WORM. See the article FLOWER.

Fly-WORMS, in natural hiſtory, the *Worm* or maggot produced of the egg of a fly, and afterwards to be transformed into one.

Theſe *Worms* are to the fly, what the caterpillar is to the butterfly it produces. The cuſtom of the world has appropriated the term caterpillar to that one ſpecies of the flying inſects firſt ſtate; but we have unfortunately no term of diſtinction yet eſtabliſhed for any of the firſt ſtate of any of the other flying inſects, the creature produced by the egg of the fly ſcarce being indeterminately called *Worm*. Till more expreſſive names ſhall be invented for theſe, it may not be improper to diſtinguiſh thoſe of the different claſſes by the additional name of the inſect they are to be changed into, and to call that which is to become a beetle, the *Scarab-worm*, that which is to be hereafter a fly, the *Fly-worm*; and ſo of the reſt. *Reaumur*'s Hiſt. Inſ. V. 4. p. 161.

Thoſe which are to be hereafter winged creatures of the fly-claſs, are extremely different one from another in form and figure, and may very properly be arranged into ſeveral claſſes.

The moſt remarkable and ſtriking differences between the claſſes of theſe creatures, are thoſe of the form and ſhape of their heads. Many of them have heads which it is not eaſy to diſtinguiſh to be ſuch, as they carry no one mark of the head of an animal viſibly about them. We are accuſtomed to ſee in other animals a conſtant and regular form of the head, which is no way alterable during the life of the animal; but among theſe *Fly-worms* there are many, whoſe heads are variable at the pleaſure of the creature; and which at times are ſeen to be more or leſs long, more or leſs thick, more or leſs flat, more or leſs ſhortened at pleaſure by the animal, and eaſily bent and turned about in any direction.

The heads of theſe creatures are not only fleſhy, but compoſed of a very ſoft and flexible fleſh; as theſe creatures have no ſhell, it may occur to ſome to think they have no brain; but this would be a greater wonder than all the reſt. Be it as it will, the naturaliſt need make no heſitation to pronounce that the head of an animal, which is the anterior extremity of the creature, and is furniſhed with neceſſary organs for taking in the food, and conveying it into the body. Ibid. p. 162.

Though there are among the *Fly-worms* many whoſe heads are of this variable conſtruction, there are alſo others whoſe heads are hard, like thoſe of other animals; and which, like thoſe, always retain the ſame regular figure.

This grand diſtinction among theſe *Worms* may furniſh us with the firſt general arrangement of them, which may be into thoſe which have a variable, and thoſe which have an unchangeable head. Ibid. p. 163.

If we after this attend to the number, arrangement, diſpoſition, ſtructure, and form of the other parts of theſe little animals, we ſhall find ample matter for a ſufficient number of ſubordinate diſtinctions, which will alſo prove very extenſive.

Some *Worms* of this kind we ſhall find, which have not the leaſt appearance of legs; others we ſhall find, that have legs, but theſe merely membranous ones; others which have them merely ſcaly, or ſhelly; and others, which, like the caterpillars, have legs of two kinds, ſome ſhelly, and others membranous; but which have always more of the latter kind than the caterpillars have.

Other ſub-diſtinctions there will alſo be found, in the variable and unchangeable heads of divers of theſe *Worms*; and the whole form of the body in others will be found to be totally different. Some of them have a power of altering the figures of their bodies at pleaſure, being able to lengthen or ſhorten them, or to make them thicker or thinner at pleaſure. Some can alſo at the ſame time inflate, as it were, and ſwell out ſome particular parts of their body, while they make other parts thin and flat. And others have their body ſo rigid, as to be wholly incapable of theſe changes, and indeed of bending or turning otherwiſe than all together.

The external coat of ſome of them is alſo very thin, tender and membranous; whereas that of others is ſtrong, firm and ſcaly, or cruſtaceous. And finally, the different ſpecies themſelves will afford us ſufficient ultimate diſtinctions, by the poſition, number and figure of their organs of reſpiration. *Reaumur*'s Hiſt. Inſ. V. 4. p. 163.

*Genera of Fly-*Worms. The diſpoſition of the ſtigmata, or air-holes, at which the tracheæ of theſe animals terminate, will help us to the occaſions of ſeveral diſtinctions of genera among the *fly-Worms* of variable heads.

The *Worm* of the common fleſh-fly has in its ſtigmata ſix apertures, three in each, of an oblong figure, and reſembling button-holes; but, inſtead of theſe, the *Worms* of many other flies have them in the ſame part of their bodies, but have, inſtead of the three button-holes, only one ſmall eminence, reſembling a little button in each: Others have them cylindric and hollow, and ſtanding out from the hinder part of their bodies in form of horns. Some genera have only two of theſe horns, and others have three: The two in ſome are placed to a conſiderable diſtance from one another, and in others they are in a manner joined together. Some alſo carry theſe pipes or horns in an elevated poſition, others having them placed flat on their bodies; and beſide theſe varieties in the number, form, and ſituations of the ſtigmata, ſome diſtinctions of genera may be drawn from the parts which ſurround them, and are deſtined by nature for their defence.

The number, diſpoſition, and figure of the hooks, which ſerve theſe creatures in the place of teeth, may alſo ſerve for matter of diſtinction, as may alſo the differences of their legs. *Reaumur*, Hiſt. Inſ. vol. 4. p. 173.

The common *Worm* of the fleſh fly has two hooks, placed at a diſtance, in a parallel direction, and a dart between them. Others have theſe hooks, but have no dart; others have theſe hooks of very different ſize one from the other, and placed one over the other; others have only one ſingle hook; and others there are, which have nothing of this kind at all, or, at leaſt, which we can never make to ſhew any. Ibid.

The figure of the body in others, will alſo give matter of diſtinction. The hinder part of ſome is, as it were, cut off, and repreſents the truncated end of a cylinder. Some there are of a much ſhorter body than others; ſome have their anterior part as thick as the poſterior: ſome are more flat, and others more round. Ibid. p. 174.

Notwithſtanding that the *fly-Worms* of the firſt claſs have, properly ſpeaking, no legs, yet ſeveral of them are able, at pleaſure, to inflate themſelves, and to ſend out from the under part of the rings of their body, in that ſtate, certain membranaceous portions analogous to, and ſupplying the place of legs, and much variety is to be obſerved in the placing of theſe. Some have them arranged orderly as legs, two and two, one on each ſide of each ring; others have a ſingle range of them all along their belly, in a row down the middle. Each of theſe is ſometimes furcated or divided into two; and others have the under part of their bodies, at or near the junction of the rings, furniſhed with a ſort of hooks, very ſhort and fine, and commonly of a red colour; theſe are of great uſe to the creature in laying hold of the ſurface on which it moves itſelf. Ibid.

The differences of ſize and colour in theſe creatures, may alſo be made the baſis of farther diſtinctions; among other things, the nature and quality of the ſkins of the different kinds may alſo be conſidered, ſome being thin and tranſparent, others thick, rigid, and opake; ſome alſo being ſmooth, others rough and wrinkled, others adorned with long hairs, and finally others, as it were, armed with prickles.

Theſe are the marks and characters of the genera of the firſt claſs. Thoſe of the ſecond, which have variable heads, and differ from the former in that they have legs like thoſe of the caterpillar-claſs, have frequently a ſort of thorns or hooks faſtened to them, and though the head of the *Worms* of this claſs is truly of a variable figure, and is fleſhy, the mouth is ever ſo viſible in all its changes, that the head is eaſily known to be ſuch.

Another very obvious character there alſo is of the generality of the *Worms* of this claſs, which is, that they have a long fleſhy tail, which they can lengthen or ſhorten as their occaſions require; the reſemblance of this to the tail of a rat may probably give this genus the name of the *rat-tailed Worms*.

This tail is the principal organ of reſpiration in theſe *Worms*; its end is always open, and ſupplies the office of the ſtigmata of the other genera. Ibid.

The *fly-Worms* of the third claſs, which have their heads of a conſtant and invariable figure, and, like thoſe of other animals, have no moveable jaws, or any thing analogous to that organization; but ſuch of them as have any teeth or hooks, have all a power of drawing them into their heads on occaſion, and only throw them out when they would uſe them.

The *Worms* of this claſs have pointed heads, or ſuch as ſeem truncated, or with the end of the rays part cut off, they have no ſhelly or ſcaly legs. Theſe are a very numerous family both in the terreſtrial and aquatic kingdom, and all, as far as is hitherto known, furniſh two-winged flies.

The firſt genus of theſe may be eſtabliſhed of the ſcaly ſpecies, which have, as it were, ſcaly rings, and are rigid, and not incapable of flexion, though wholly ſo of contraction or dilatation; theſe *Worms* can turn about nimbly enough, but cannot at all lengthen or ſhorten their bodies, and thence may be properly enough called the *ſerpentine genus*.

The former genus are naturally inhabitants of the earth; thoſe of the waters give us a ſecond genus. Theſe have a merely membranaceous ſkin, and always an oblong head, and their poſterior extremity is terminated by a ſort of pipe, open at the end for reſpiration. The bodies of theſe are round, or approaching to that figure. Ibid. p. 178.

Another genus may well be eſtabliſhed of the *Worms* with heads like the former, but with flatter bodies. There are two ſpecies of this frequently found, the one in cow-dung, the other in the agarics of the ſycamore, and other trees. Theſe have their organs of reſpiration, like the reſt, in the hinder part of their bodies, and they might in many be miſtaken for the arms of the creature, by thoſe not converſant among the creatures of this claſs.

A fourth genus may be eſtabliſhed of the *Worms* of long and rounded bodies, which are ſmaller at each end than in the middle; theſe may be called the *tipulæ-Worms*, becauſe they all are transformed into flies of that claſs. The head of theſe *Worms* is ſcaly, and ſmall in proportion to the ſize of their body, and their ſtigmata are placed in the hinder part of their bodies, and ſurrounded with a fleſhy appendix. Ibid. p. 179.

There is another genus of *Worms* which transform themſelves into tipulæ, and perhaps merit a ſeparate claſs, rather than a ſubordinate genus. Theſe are altogether red, and of a bright lively colour: they have near their head two ſhort legs, which reſemble two ſtumps of arms; but the thing that, above all others, characteriſes theſe, is, that they have, near their hinder extremity, and on the under part of their bodies, four long fleſhy ſtrings, which having ſome reſemblance to the polype-fiſh, may well enough give theſe the name of the *polype-Worm*. Theſe have alſo, at the hinder part of their bodies, two cylindric pipes, which have much of the appearance of organs of reſpiration. Ibid. p. 180.

A ſixth genus may alſo be eſtabliſhed of the *water-Worms*, which are transformed into gnats. Theſe reſpire like the reſt, by means of the hinder extremity of their body, which is an open pipe; they have alſo, beſide this, another pipe, deſtined to give paſſage to the excrements, and placed under their body. Ibid.

A ſeventh genus may be eſtabliſhed of thoſe long *Worms*, reſembling the *Worms* of the tipulæ, and having a ſmall ſcaly head: Theſe live in the earth, and in cow-dung, and are covered with hairs, which give them much the appearance of caterpillars. Theſe have two ſtigmata placed in their hinder part, ſurrounded with fleſhy appendages.

An eighth genus may be eſtabliſhed of the long, white, and ſhining, but not ſcaly *Worms*, frequently found in and among muſhrooms. Theſe have their ſtigmata not placed behind, as the reſt of the *fly-Worms* have; but, like thoſe of the caterpillars, in every ring of their body.

The *Worms* of the fifth claſs, which uſually produce four-winged flies, have heads of a conſtant and invariable figure, and have two teeth, or two moveable jaws, always open and expoſed, and which are placed near the middle of the aperture of the mouth; they have no ſcaly legs. Ibid.

The ſtigmata of theſe *Worms* are placed on their ſides, and never on the hinder parts of their bodies. The flies produced from theſe are of very numerous genera, the bees, waſps, ichneumons, gall-flies, *&c.* are all of this ſort. Ibid. p. 182.

The ſixth claſs of theſe *Worms* is that of the hexapode, or ſix-legged kind, which are transformed into ſome ſpecies of the libellæ. Theſe have no mouth, but inſtead of one, have, in a manner, two, if the openings through which their aliments paſs, may be ſo called. Theſe are at the top of their antennæ, which are placed in the fore-part of their head.

The *fly-Worms* of this ſingular claſs, are but very few in number. The formica-leo, in the ſtate in which it is known by that name, is one, and the puceron-eaters are ſo many others. Ibid. p. 183.

The ſeventh claſs is of the *Worms* which have bodies long like the caterpillar-claſs, and have ſix legs; but their ſingular character is, that they have two other ſhort legs, or properly two hooks of a particular kind, placed near their hinder part, and aſſiſting them in fixing themſelves, and moving. The water-*Worms*, which make themſelves caſes of different materials, and are afterwards transformed into papilionaceous flies, are of this claſs.

Several ſmall green and yellow *Worms*, which feed on the apricock and pear-tree, and fold up the leaves of thoſe trees, tho' they much reſemble caterpillars, are alſo truly and properly of this claſs.

The eighth claſs is of thoſe *Worms* called *falſe* or *baſtard caterpillars*, becauſe the figure of their body might make them be miſtaken for caterpillars, rather than known for *fly-Worms*, by leſs curious obſervers.

Theſe have ſix cruſtaceous legs, as the caterpillars; but they have a greater number of the membranaceous ones than thoſe inſects; they have ſcarce ever leſs than ten, and often fourteen. Theſe alſo are not edged round with hooks, as thoſe of the caterpillars are; and they differ from the true caterpillars in this alſo, that their head is more round, and has only two eyes, one on each ſide; whereas the caterpillars have on each ſide five or ſix, diſpoſed in form of an arch. Ibid. p. 185.

All this claſs of *Worms*, ſo far as is yet known, change into four-winged flies; the females of which are armed with a ſaw behind. The number of the membranaceous legs being dif-

 ferent

ferent in different ſpecies of the falſe caterpillars, will very properly furniſh matter for the ſubordinate diſtinctions of the genera.

A firſt genus may be very properly eſtabliſhed of thoſe which have no more than eighteen legs in all; that is, ſix cruſtaceous, and twelve membranaceous.

A ſecond may be of thoſe which have in all twenty legs; and a third thoſe which have twenty-two legs.

The ſpecies may be ſufficiently diſtinguiſhed by their colours, and by their attitudes, which are very different in the different ſpecies, and very conſtant in the ſame: Some of them always carry the hinder part of their body elevated, others are continually rolled together; and finally, others always extended.

The greater part of the falſe caterpillars are ſmooth; but there are, however, ſome which have a very ſingular ſort of thorns, arranged with great ſymmetry.

It might perhaps not be improper to arrange the thorny ones into a diſtinct claſs, which, according to the figure and order of the thorns might be again ſubdivided into ſeveral genera. Ibid. p. 186.

Meal-Worm. There are two very different inſects found in our meal or flour; the one is ſo ſmall, that it is only to be ſeen by the microſcope; all that the naked eye can diſcover of it is, that ſomething is alive in the place, from the whole ſubſtance of the flour being in motion. See the article Flour.

The other *meal-Worm* is larger, and more frequently offers itſelf to our obſervation; it conſiſts of eleven rings, and has three pairs of legs. The mouth of this *Worm* is made into a kind of forceps, and from this ariſe, on each ſide, a great number of ſmall ſpinulæ; theſe ſerve inſtead of teeth, and the animal feeds by means of them. They are found ſometimes very ſoft and tender, ſometimes hard and firm, and at other ſeaſons they are very briſk and lively; at others they have ſcarce any life in them.

The moſt remarkable thing in regard to theſe *Worms*, is, that they are always exactly of the colour of the flour which they live among. Ray has obſerved, that the white flour breeds white ones; the coarſer flour breeds larger and greyer ones; and that flour which has the bran among it, breeds brown ones, of the ſame colour with itſelf. This is a proviſion of nature for the ſafety of the animal, ſince were it of a colour different from that of the flour, it muſt be eaſily diſcovered among it, and would be picked out and thrown away. The caterpillar tribe are thus preſerved, by being of the colour of the leaves they feed on; their green, uſually ſuiting itſelf exactly to that of the tree or plant. *Deſlandes*, Trait. Phyſ.

Worms *of the Sea*. The ſea-*Worms* are of the number of thoſe animals, which with the oyſter, and ſeveral other ſhell-fiſh, furniſh us an inſtance of animals which remain all their lives fixed in the manner of plants to one ſpot, whence there is no probability of their moving themſelves.

Theſe *Worms* are included in a ſort of caſes or pipes, and may be divided into two claſſes, according to the nature of thoſe caſes. In the one ſpecies theſe are only made of grains of ſand, fragments of ſhells, and the like, faſtened together by a viſcous humour; and in the other they are compoſed of a true ſhelly matter.

Thoſe *Worms* which have ſhelly caſes, are fixed ſometimes to the ſand at the bottom of the ſea, ſometimes to ſtones, or ſea plants, and ſometimes to the ſhells of other fiſhes; their ſhells are rounded, and, in ſome degree, conic, as they always gradually grow wider from their point or apex to the mouth; as to the reſt their ſhape is different in almoſt every individual, forming divers irregular curves, and often reſembling the ſhapes into which a common earth-*Worm* curls and twiſts itſelf in its various motions.

In order to know how theſe ſhells become ſo exactly faſtened to the bodies on which we find them, it will be neceſſary to conſider the manner in which they are formed.

The creature, when juſt produced, is covered with a ſhell; but this ſhell no longer covers its whole body; as it grows, a new ſhell is formed over this, from the condenſation of its own juices, and this fixes it down as it grows to the body, be that what it will, on which it is formed; and as the *Worm*, in its growth, twiſts itſelf variouſly about, it will be fixed down in that poſture by the new-formed ſhell which covers it, and which adheres as well to the body on which the *Worm* lies, as to the old ſhell.

The marine-*Worms* of the other kind, which are not regular ſhells, but whoſe caſes are made up of fragments of different bodies, and of grains of ſand, live in the ſame manner with the others, their whole lives in the ſame hole. Theſe creatures bury themſelves in the ſand of the ſea, as the common earth-*Worms* do in the earth; and the glutinous matter which eſcapes continually from their pores, not being either ſufficient in quantity, or of a nature to harden into a perfect ſhell of itſelf, yet ſerves to faſten together the ſeveral ſmall bodies that come into contact with it all about the body of the creature; and ſerve as a ſort of mortar to cement together a multitude of little ſtones, &c. and of this connected maſs to form a coarſe ſort of covering for the animal, which defends it from the common injuries.

The force of this viſcous or glutinous humour flowing from the bodies of theſe *Worms*, is very evidently ſeen in places inhabited by them, when left dry by the ebbing of the tide; the ſurface of the ſands, in theſe places, appears rough and ragged in a very ſingular manner. The pipes in which theſe *Worms* are lodged, are uſually placed in great numbers near one another, and their ends all ſtand out about an eighth of an inch above the ſurface of the ſand; and the reaſon of this is, that the whole ſand-bank was, when covered with the water, of a level with the mouths of theſe pipes; the ſea, in its receſs, has carried off about an eighth of an inch of the ſurface of the ſand with it; but though it has done this every where, where the ſand was looſe and free, it has not been able to do it where it was glued together by the viſcous juices of this animal, but has left ſuch part of it ſtanding out in form of pipes or caſes to the animal.

The ſtrength of this glue is alſo ſeen in the common accident of the ſeas waſhing off a piece of a ſand-bank, in which they dwell; in this caſe the fragment is found at ſome diſtance, with the interſticial ſand every where waſhed deep away from the ſurface, but with the caſes of the *Worms* remaining prominent, and being perfect and unhurt at full length, with all their convolutions.

Sometimes alſo theſe pipes or caſes are found perfectly detached from all ſandy matter, and lying looſe on the bottom of the ſea; in this caſe the glutinous juice, cementing the outer ſurface, being much weaker than that which keeps together the more internal part, much of the ſuperficial coat is often worn away; nay, ſometimes the caſes are not thicker than a piece of writing-paper, yet ſtill preſerving their whole figure. The internal ſurface of theſe pipes is always perfectly ſmooth, even, and poliſhed, which is wonderful, as they are compoſed of ſuch rugged particles as, one would think, could not eaſily furniſh a ſmooth ſurface; but doubtleſs the mucous or viſcous humour of the animal fills up the interſtices between the particles, and, by degrees, hardens ſo far as to make one even ſurface with their prominent ends.

The *Worm* which inhabits theſe caſes is of a very ſingular figure; it is about an inch long, and of the thickneſs of a large wheat ſtraw; its head is of a very odd ſtructure; it is rounded and flat, and is much broader than any other part of the body. At certain times the extremity of the head is of this round figure, and is divided into three parts; that in the middle is of an oval figure, and hollow; the next to this is a circular zone or band which ſurrounds this oval part; and the third part is another circular zone, extended behind this laſt; on both theſe zones there are a great number of lines marked, which ſeem a ſort of rays, running from the center to the circumference.

Though this is at ſome times the figure of the head; yet at others it is of a very different form, reſembling a creſcent or a horſe-ſhoe; for there is a certain part in the middle of the head, which the creature can open when it pleaſes.

A little below the head, it has three oblong ſlender bodies, which ſerve as oars on each ſide; its body approaches to a conic figure, and is terminated by a long tail; all along the body there are placed, at different diſtances, little fleſhy protuberances ſhaped like hooks, which bend toward the tail.

Theſe are placed in three ranges, and ſeem intended to ſerve the creature in the place of legs or arms, when it has a mind to move upward or downward in the ſhell.

When we conſider the effects of this glutinous juice iſſuing from the body of this animal, in faſtening together any looſe ſubſtances it meets with, ſo as to form a caſe for it, it may be eaſily ſuppoſed that the adheſion of the *balani-marini*, and other the like ſhells, which remain all their lives fixed to ſome one ſpot, is performed in the ſame manner. Mem. Acad. Par. 1711.

Water-Worms. There is a ſingular ſpecies of theſe creatures, which is found to be capable of reproduction or multiplication from cuttings, in the manner of the polype.

The diſcovery Mr. Trembley made of this ſtrange property in the polype, gave occaſion to the trying the experiment in regard to ſome other inſects. *Worms* were the moſt natural object of theſe experiments; and though they failed in many ſpecies, they yet ſucceeded in ſome, and proved, that nature has not given that amazing property of re-production of its moſt eſſential parts, to one only ſpecies of animals.

Mr. Bonet tried the experiment on a very nimble kind of *water-Worm*, by cutting it in two in the middle, and the ſucceſs perfectly anſwered the expectation; for the two pieces continued alive and vigorous, and in a little time became two complete *Worms*. The ſtructure of theſe *Worms*, though it appear ſimple to the naked eye, is very worthy the examina-

tion

tion of the microſcope, and when viewed with this aſſiſtance there are diſcovered in it parts extremely deſerving our attention. Phil. Tranſ. N°. 469. p. 470.

They are of a reddiſh brown colour, and of about two or three inches in length; their thickneſs is that of a common wire; they are compoſed of a ſeries of membranous rings, which continually decreaſe in thickneſs as they approach the extremities. Each of theſe rings has on its under part four, five, or ſix whitiſh ſpines, ſupplying the place of legs; and the clearneſs of the ſkin gives a happy opportunity of ſeeing the muſcular ſtructure of the body, every ring being compoſed of a great number of annular or circular muſcles, placed cloſe by one another.

The head is of no determinate figure, but the creature ſtretches or contracts it in length and breadth at pleaſure; and ſometimes it ſhews two ſmall round elevations, placed one on each ſide the head, which might be very eaſily taken for eyes; the extremity terminates in a point, that the creature may be the more eaſily able to pierce into the mud. The mouth is placed in that part where the head is largeſt, between the two elevations before-mentioned; this is terminated by two brown ſtrokes, and is of the figure of a creſcent. But when the mouth is opened, it appears an aperture of a circular figure, and is ſurrounded by a thick and ſtrong muſcle. This muſcle is of great ſervice to the animal alſo in its progreſſive motion, as it lays firmly hold of any ſmooth ſubſtance, and the animal is then able by means of its annular muſcles to draw up its whole body to that place: At the other extremity of the body, there is an oblong opening which ſerves as an anus.

There is nothing, however, more remarkable in this creature, than the great artery. This veſſel in caterpillars, and in many other inſects, runs all along the back; and is, by Malpighi, called a chain of hearts: But in this *Worm* it is folded in different degrees, in the different parts; and is in a manner only a long ſeries of folds, or doublings from one end to the other. Through theſe crooked paſſages there creeps along a liquor analogous to blood, and every moment a drop of it may be traced running up from the tail, and loſing itſelf in the brain; and it is eaſy to trace this moſt part of its way, by reaſon of the contraction and dilatation of the rings which follow one another ſucceſſively as it paſſes. Phil. Tranſ. N°. 469. p. 471.

It ſeems indeed that every portion of this artery, contained in the compaſs of one of the rings, is a true heart, which puſhes on to the next heart that drop of liquor which it had juſt before received from the preceding one; and the continual repetition of the ſyſtoles and diaſtoles in ſuch a ſucceſſive train of hearts, is an object that may be viewed a long time with pleaſure. It is beſt of all perceived in the middle of the body, where both the rings and the hearts are largeſt, and conſequently the motions moſt eaſily diſcernible. About the fifth or ſixth ring from the head this artery or chain of hearts becomes a ſmall and delicate filament, and from thence to the head diminiſhes in thickneſs, till it is wholly loſt near the mouth; but what is very obſervable, is the ſwiftneſs with which the blood is driven on in this part. Toward the tail the artery is alſo ſmall, and the alternate motion of the ſeveral portions of it confound themſelves together, ſo that the regular contractions and dilatations are not ſeen here, but only a ſort of undulatory motion of certain clouds of a fluid as it were ſucceſſively rolling one over another, but this with great regularity.

Under every junction of the rings there are to be ſeen ſmall veſſels dividing themſelves into numerous ramifications, all theſe ſeem to be branches propagated from the principal artery.

All along, and immediately under this artery, is extended the channel of the inteſtines; this would not be very viſible in itſelf, but the terreſtrial matter with which it is filled, uſually makes it eaſily diſtinguiſhable: This is furniſhed like the inteſtines of larger animals with different orders of muſcular fibres, which ſerve to protrude the remainder of the food; and this operation is alſo by means of the great tranſparency of the creature's ſkin, eaſily ſeen as it paſſes within the body.

It appears very evidently, from the contents of the ſtomach, and bowels of this animal, that it receives earth or mud into its body, and has its nouriſhment from it. Together with this earth it alſo ſometimes neceſſarily receives ſome bubbles of air; and as the air in the body of fiſhes ſerves them very greatly in raiſing and ſinking their bodies at pleaſure, ſo in the bodies of theſe *Worms* the air is not without its effect, but this is generally too powerful for the creature.

The bubbles of air are eaſily diſcerned in the body of the creature, and when they are in any great quantity they bring up the animal againſt its will, and all its ſtrength will not ſerve to carry it to the bottom; but it floats on the ſurface, till it has diſcharged a part of this troubleſome matter. This appears no eaſy thing for the creature to do, but there is often a great ſtruggle ſeen within its body, as it lies upon the ſurface of the water; the bubbles being driven toward the anus, and again forcing their way up to the head ſeveral times together.

Upon theſe *Worms* Mr. Bonet tried the experiment of cutting, in the manner of the operation on the polype, with ſucceſs. He divided one of them into two halves, and putting the ſeparated pieces into a glaſs of water; that half which had the head on it moved about, and ſeemed in all reſpects as well as before; but what was much more remarkable was, that the other half which had no head moved about and reſted occaſionally, and ſeemed to perform all its operations in the ſame manner as if it had one. It is obſerved of the pieces into which an eel is cut, or the tail of a ſerpent or lizzard, that they all move about a long time afterward; but their motion may always be ſeen to be irregular and convulſive; on the contrary, the motion of this part of the *Worm* ſeemed as regular as ever, and it made its way with tolerable ſwiftneſs, and that in a voluntary manner; the principle of life and motion ſeeming not to have been deſtroyed in it. If it met with any obſtacle in its way, it would ſtop and turn; and if ſet in the ſunſhine, it was plainly affected by the heat, and became more vigorous and moved more briſkly; and if a piece of ſtick was brought near it while it lay quiet, it would immediately ſtart and make its way as faſt as it could from it. Phil. Tranſ. N°. 469. p. 474.

On the third day ſome weeds and mud being added to the water, the half which had the head immediately plunged itſelf into the mud, but the other half only hid itſelf among the weeds; and at the cut end of this there was at this time very diſtinctly ſeen a tubercle, which looked like the knot of a branch of a tree; and at the end of a week each end was become perfect, and the two halves were two abſolutely perfect *Worms*. The new head of the one, and the new tail of the other, were perfectly the ſame with the old ones; and the ſtomach, the grand artery, and other parts had prolonged themſelves in a neceſſary manner.

After this experiment, the ſame obſerver cut other *Worms* of this ſpecies into four, eight, and as far as fourteen pieces; and moſt of theſe in a few days got new heads and tails, and became perfect animals. The ſeaſon of the year in which theſe experiments are made is of great conſequence, in regard to their ſucceſs; for in ſummer very few of the pieces fail of becoming perfect animals, even though one *Worm* be cut into near thirty pieces; but in winter many fail. Ibid. p. 475.

The ſecond or third day after the cutting produces the new heads and tails in ſummer, and in winter it is often ten or twelve days before they appear: The head always ſhews itſelf firſt, and lengthens itſelf continually for the firſt or ſecond week after its firſt appearance, and then it ceaſes to grow, having by that time arrived at a ninth part of an inch or thereabouts; this however is not, properly ſpeaking, the length of the head alone, but compriſes the rudiments of five or ſix rings which are annexed to it.

The tail does not begin to grow ſo ſoon as the head, nor does it ſtop its growth ſo ſoon, but continues increaſing in length from day to day for a long time; and in a few weeks the pieces of the middle part of a *Worm*, which were not originally above a ſixth part of an inch in length, will become perfect *Worms* of two inches.

Some of the pieces of the ſame *Worm* will grow longer and faſter than others; and, in general, the ſmalleſt or ſhorteſt pieces of the *Worm* do not grow ſo quick as the longer ones.

The ſeveral pieces cut from different parts of the ſame *Worm* alſo make a very different progreſs in their growth; but, in general it appears, that thoſe pieces which were cut off near the tail grow more ſlowly than thoſe from any other part. The laſt fragment, or that which contains the tail of the animal, grows the moſt ſlowly of all; and the head-end, which might be expected to grow as remarkably quick as this does ſlowly, does indeed exceed many of the parts in this particular, but is not always the very quickeſt of all.

There are ſeveral neceſſary circumſtances to be obſerved, in the progreſs of theſe operations; the moſt neceſſary of all is, the allowing the creatures food; as it appears plainly that they feed on mud, there ſhould always be a proper quantity of this added to the water in which the pieces are preſerved, for otherwiſe thoſe which ſeem to promiſe the faireſt for becoming perfect *Worms*, will often very ſoon periſh, merely for want of nouriſhment to ſubſiſt on, before they can grow to perfection.

Dr. Hales, in his vegetable ſtatics, relates a curious experiment, by which it is proved, that the bones of animals when they are oſſified to a certain degree, do not grow any longer, except at their extremities; and the caſe is the ſame, in regard to theſe *Worms*; for the old piece, which is the middle of the animal never lengthens itſelf, but the addition of new rings to each end make the increaſe of length in the *Worm*.

In all theſe pieces the liquor, which ſerves as blood to the animal, is found circulating from the tail-part towards the head, in the uſual way; and by this motion of the blood it is,

it is always eafy to know, even in the fmalleft pieces, which is the head and which the tail-end, and the new head and tail are always feen to come regularly from the proper ends. Phil. Tranf. N°. 469. p. 479.

Generation of WORMS. See the article GENERATION.

WORMS, in phyfiology. Many effects have been by the ignorant attributed to *Worms*, in which they have had no fhare; and many things called *Worms*, have no right to that name.

We to this day vulgarly call the little black prominent fpots in people's faces, *Worms*; but they are not fo, nor any thing living. We owe the true knowledge of thefe to the fagacious Mr. Lewenhoek, who, examining them by the microfcope after taken out of the face, found them only to be bundles of hairs or imperfect hairs in fmall portions enveloped in thin films; in fome, the fragments of hairs are evident, being ftrong and rigid; in others, they feem foft and pulpy.

Thefe *Worms*, as they are called, ufually appear as black fpecks, fometimes lying even with the reft of the furface of the fkin, fometimes rifing above it; the hairs in each of thefe are from twenty to forty, in number. Their roots ufually lie irregularly, one deeper than another; but their extremities ufually are even. The deeper the *Worms* lie, the more difficult they are to be got out, and the fewer hairs they contain; fo that they are beft obferved when taken from near the furface of the fkin, and when taken from people who have the blackeft hair, as they are moft diftinctly difcernible in thefe, from their ftrength and the difference of colour between them and their inveftient membranes.

It may always be known alfo when there are hairs in one of thefe *Worms* fit to be examined, for if there are, the *Worm* is rigid, and comes out ftrait; but if not, it comes out bent.

The make and conformation of thefe *Worms*, as they are called, is probably in this manner. When the root of a hair being deep in the fkin fupplies fo much nourifhment as to make the hair grow out and appear on the face, the upper part of the hair by rubbing, or fome other violence, comes to be broken off, the lower part of the trunk of it ftill remaining in the fkin, the nourifhment afterwards fupplied to this part for hairs does not tend to lengthen out the broken one, the fummit of that being ftill liable to the fame continual accidents; but new ones are propagated by its fide, which being alfo broke off when they come to the furface, new ones are again formed and grow to the fame length, till from the bafis of what nature intended for one hair we fee thirty or forty; but this is probably not foon effected, but is the bufinefs of feveral years, in all which time the clufter of hairs is fuppofed to be an animal, and the *Worm* is faid to be growing. The hairs growing on all parts of the body are fharp-pointed at their natural ends, but thofe fhort ones which make up thefe *Worms* are always blunt at the end.

WORMS, in medicine. There are a great variety of medicines given for deftroying the *Worms*, which breed in human bodies; but as they are of very different kinds, there is great caution required in felecting fuch as are moft proper for each peculiar cafe.

Acids, in general, are efteemed good in thefe cafes; and lemon-juice, vinegar, and other vegetable acids, fuch as pomgranate and currant-juice, and the like, are given; and fometimes the mineral ones, as the fpirit of vitriol, fulphur, and the like. All thefe are properly given when there is a preternatural heat, and feverifh difpofition; for they not only allay the heat, but refift putrefaction.

Bitters in general are alfo reckoned among the medicines good againft *Worms*; of this kind are wormwood, fmall centaury, rue, and the like; and to thefe are to be added the purging bitters, fuch as rhubarb, aloes, and coloquintida. Thefe medicines do not act merely as bitters; for it is well known, that many infects will endure the bittereft fubftances unhurt, and *Worms* will breed in the gall bladder; but they correct and alter the crude and vifcid matter in the inteftines by which thefe animals are nourifhed, and by ftimulating the fibres of the inteftines they often difcharge the noxious matter, and *Worms* themfelves with it. They alfo correct the inactivity of the bile, which in children and perfons of moift habits is the general caufe of the breeding and living of thefe infects.

Oily medicines of all kinds are by fome greatly extolled in cafes of *Worms*; and there feems this reafon for it, that all infects are deftroyed by being put into oil, and that flies and many other fmall animals, which, after feeming dead, on the being immerfed in other liquors, would come to life again, on being expofed to the folar rays, never revived again after being drowned in oil. To this it is to be added, that very good effects always follow the giving oils, in cafes of the greateft torment from *Worms*. It is not to be fuppofed however, that the oil acts by covering and drowning the *Worms*, fince to this purpofe there muft be as much fwallowed as would fill the whole inteftinal canal; but this cannot be. Oils therefore plainly act in this cafe on the fymptoms, not on the caufe; and relax the fpafmodically contracted coats of the inteftines, and as it were defend and line them with a fort of mucilage, in fuch a manner that the more acrid purging medicines neceffary to the utter deftruction of the animals themfelves, may be given with more fafety. Thus it is a very good method to give a child over night half an ounce or more of oil of fweet almonds, and in the morning following a brifk purge of the refin of jalap, mercurius dulcis, or any thing elfe of this kind.

Saline fubftances in general are alfo greatly celebrated by many in cafes of *Worms*, and they are indeed capable of acting in a double capacity againft them, at once deftroying the tender ftructure of many of them, and vellicating the inteftines fo as to promote the difcharging them. The common bitter purging falts, as the glaubers falt, and the natural falt contained in the purging waters of different places, which is indeed glaubers falt alfo in its origin as well as qualities, are the beft of all others for this purpofe; if the natural waters are drank, it fhould be in confiderable quantities; and if the factitious falt be taken, it fhould be diffolved in large portions of water.

Many people who live on the fea-coafts give their children fea-water, for the fame purpofe; and fome ufe the broth of recent oyfters with pepper and other fpices, and lemon-juice. Salts of the vitriolic kind have alfo long been celebrated as remedies for *Worms*; and the common falt of fteel, as alfo the Pyrmont waters, which are highly impregnated with particles of that metal, are found very ufeful in all cafes of this kind.

But if any diforder admits of fpecific remedies we might expect that this malady would; for thefe purpofes many extol fome of the gums, as affa-fœtida, galbanum, and myrrh, and the leaves of fome plants, as wormwood and tanfey. Onions and garlick are alfo greatly commended; and bitter almonds and wormfeed, have long been famous. All thefe are found peculiarly deftructive of *Worms*, and no method of cure fucceeds well in which one or other of thefe has not a fhare.

Among the minerals, we find alfo one remedy greater than all thefe, that is quickfilver; this has been given in many various forms, and found more or lefs fuccefsful in all. Water, in which crude quickfilver had been boiled, was firft given by Helmont, and that with great fuccefs; after this Meiboom infufed crude mercury in rhenifh wine, and found this more effectual than the former. But the moft fuccefsful method feems the giving proper dofes of mercurius dulcis, with fome purging medicines, as the refin of jalap.

Æthiops mineral, which is a mixture of quickfilver and fulphur, is found alfo of great ufe; and quickfilver rubbed to a mixture with fugar-candy, is preferred by Hoffman to all the other preparations. After a cure by thefe means, the patient fhould be prevented from a relapfe, by abftaining for a time from flefh and fifh; and, after this, from milk and cheefe. Acrid purgatives, or hot remedies are never to be given, where there is any febrile heat; and when there is caufe to fufpect that the duodenum is full of an acrid bile, then mercurials are to be avoided; as are all the draftic purges; for thefe medicines, in thefe circumftances, often bring on inflammations of the bowels.

Before the expelling the *Worms* from the fmall inteftines, it is proper to give glyfters of milk and honey, to allure all the worms together to that part. In cafes of the afcarides lodged in the inteftines, glyfters of milk with tanfey, garlick, and fcordium boiled in it, have great effects; and glyfters of brine, or falt and water with aloes added to it, are alfo found of great benefit; as thefe troublefome *Worms* are ufually lodged in the rectum, thefe glyfters take immediate effect.

It is proper alfo to give a vomit during the courfe of cure, to diflodge fuch *Worms* as may have got into the inteftinum cæcum, fince purging medicines cannot reach them while they remain there. External applications alfo of bulls gall, aloes, and coloquintida, are of fervice laid in form of a cataplafm to the belly. *Hoffman*. Oper. T. 4.

Tin is often recommended as a good remedy againft *Worms*, particularly of the flat kind. Dr. Alfton, in the Med. Eff. Edinb. Vol. 5. Art. 7. directs an ounce and an half of the powder of pewter-metal to be mixed in half a Scotch mutchin, or about half a pint Englifh meafure of treacle, for children; but to grown perfons, he gives two ounces of the powder of pure tin, put through the fineft hair-fieve, and mixed with eight ounces of treacle. As to the adminiftration of this medicine, the original receipt directs half of it to be taken the Friday before the change of the moon; the day after, half of the remainder; and the reft on Sunday. On the monday a purge is to be taken. The doctor thinks there is probably nothing in the particularities of the day; but fays, the medicine fucceeds well in feveral fpecies of *Worms*.

The Memoirs of the French Academy give a very remarkable account of an obftinate pain caufed by a *Worm*, in a place where few perfon, would have fufpected fuch an animal for the caufe of it.

A woman of thirty-fix years old, who had not in any part of her life been fubject to the head-ach in any particular degree,

gree, found at this time a very violent and intolerable pain feize her on the lower part of her forehead toward the right fide, and very near the top of the nofe. This held her a long time, and in the fpace of two years extended itfelf to the temples on the fame fide. It now became continual alfo, whereas before it had had intermiffions, and grew more and more violent; fo that, in fine, it was attended with convulfions, and with a great difordering of the patient's fenfes during its more terrible agonies.

Many medicines were tried, but all in vain; and after four years fpent in fruitlefs attempts for a cure, fhe left off all medicines, and only kept to a regular courfe of life, and to the taking much fnuff; from which fhe ufually found eafe. One morning, after taking fome fnuff, fhe fneezed violently, and threw out of her nofe a *Worm* wrapped up in a mafs of a pituitous matter, tinged with a little blood. She was frighted at the fight, but fhe found herfelf cured in a moment. The noftril on that fide bled a little for two or three days, and in that time her reafon which had been much difturbed, became perfectly calm and fettled as before.

The fize of this *Worm* was very extraordinary; it was thin, its utmoft breadth or thicknefs not being fo much as half a quarter of an inch: It ufually curled itfelf into feveral bendings; for it was difcharged alive, and feemingly hearty, and in this ftate was ufually about two inches long; but when it extended its body to its full length, it was not lefs than fix inches. It was fomething thicker in the middle than at either end, and was of a clear deep brown; its back was rounded or convex, and its belly flat; and it was covered all over, except on the head, with large and regular fcales; thefe were evenly difpofed, and from between thefe there grew on each fide fifty-fix legs; thefe were as fine as a hair, and about one twelfth of an inch long.

The creature feemed therefore of the centipes kind, and in examining the head there were eafily difcovered the two eyes, two horns, and a pair of forceps made up of four arms; and the tail was armed with two points, longer, thicker and fharper pointed than the legs. After examination it was put into an empty phial, where it remained alive eighteen hours; at the end of which time they poured fome fpirit upon it to preferve it, and it lived and crauled about in this two hours.

The feat of the pain fhews very plainly, that the *Worm* muft have lived in the cavity of the frontal finus. This finus is about two inches long, and three quarters of an inch broad, and therefore might very well contain a *Worm* of this fort in a bended pofture; and this feemed to have been accuftomed to that pofture, by its naturally bending and folding itfelf up, when at its liberty. There is between this finus and the noftril naturally a fmall hole, by which they communicate and by which the finus admits the air at every infpiration; and it is not impoffible, but that a ftrong fnuffing in the air at fome time might have carried into this finus with it the egg in which this little animal was inclofed.

It is poffible indeed, that the egg might be lodged here by the round of circulation, but this feems much lefs probable; and it feems very certain that, however it got in, it was by this paffage that it finally got out: It is true, that the cavity is naturally too fmall to have given fo large a creature paffage, but it is eafy to conceive that the creature might have gnawed it larger.

It is plain, that the egg when once received into the frontal finus, muft find there every requifite for its coming to perfection; warmth and humidity, there was very fufficient; and when the creature was hatched, the juices excreted there might ferve it abundantly for nourifhment, infomuch that it plainly grew much larger than it would have done if hatched on the earth in the common way, and lived a longer time than its fellows on earth ufually do, a life of four years free from accidents, and finely cherifhed.

This was its ftate; but what, alas! muft have been that of the patient? The membrane of the finus being continually wounded by the forceps; the points at the tail, and no lefs than an hundred and twelve legs probably almoft always in motion; every particular fibre of this membrane muft have had its wound, and the complaint could not but grow worfe as the creature increafed in fize, and as it was irritated by the frequent ufe of the fnuff; tobacco being a fmell hateful to almoft all animals.

From the fymptoms of this patient, it will be eafy to know any like accident that may hereafter happen, in which cafe it would be adviseable to ufe fnuff or tobacco in any fhape; to take internally fuch medicines as are known to deftroy *Worms*, and to fnuff ftrongly up the nofe fuch acrid and acid liquors as the patient could bear, and as might incommode the animal. Oil is a perfectly innocent medicine to us, yet is deftructive of moft animals; this therefore fnuffed up alone, might work a cure; but if all thefe means fail, it would be very eafy and very fafe for a furgeon to make an incifion into the part, and remove the noxious infect. Mem. Acad. Par. 1708.

We have accounts in the Acta Leipfienfia, of *Worms* not only voided by urine, but let out of the veins in blood-letting; but there want more teftimonies of fuch marvellous things to procure them a general belief.

WORM, in gunnery, is a fcrew of iron to be fixed on the end of a hammer, to pull out the wad of a firelock, carabine, or piftol; it is the fame with *wad-hook*, only the one is more proper for fmall fire-arms, and the other for cannon.

WORM-*Seed-green*, a name given by authors to a feed of the fantonicum kind, little known among us, but called by the generality of authors *chouan*.

WORM-*Tincture*, in chemiftry, a name given by many to a medicine prepared by Hoffman, from earth-*Worms*; and in many parts of Germany efteemed one of the greateft medicines in the world, though lefs known in other places.

The preparation is this: the *Worms* are to be collected in the fpring or fummer months, and the larger fort are the beft. They are to be carefully dried, and reduced to a fine powder; this powder is to be mixed up into the confiftence of a pultice, with oil of tartar per deliquium, and this is to ftand twenty-four hours; then fpirit of wine is to be poured on it, fo as to reach three fingers breadth above it, and a dram of faffron and half a dram of caftor, are to be added, and the whole is to ftand three days in infufion, and after this be filtred off for ufe Some add a fmall quantity of opium to the tincture, but as it is often wanted in cafes where opium is not proper, it is better to keep it feparate thus made; and when there is occafion to have it opiated, to add as many drops of laudanum as is judged neceffary.

The oil of tartar in this cafe penetrates the very innermoft ftructure of the *Worms*, and is a means of the extracting fuch a tincture from them, as no art could otherwife contrive to make; and the medicine becomes, according to Hoffman, much more an anodyne, from the admixture of the falt of tartar in the tincture.

When it is intended to be made with opium, it is always proper to add alfo fome of the hound's-tongue-root, which is found as an anodyne to emulate the virtues of opium.

This tincture, which ever way prepared, is excellent in abating the pains of difeafes, that do not admit a cure. The fits of the gout are rendered eafier by every dofe of it; and even in cancers, the pain is quieted in a wonderful manner by it, and life rendered much more fupportable. *Hoffman's* Act. Labarator. Chym.

WORM-*wood*, *Abfynthium*, in botany, the name of a genus of plants, the characters of which are thefe: The flowers are fmall, but of the flofculous kind, being compofed of feveral flofcules divided into many fegments at the edges, and ftanding upon the embryo-feeds, and contained in a fcaly cup. The embryos ripen finally into feeds, not winged with down.

The fpecies of *Wormwood*, enumerated by Mr. Tournefort, are thefe: 1. The broad-leaved tree *Wormwood*. 2. The Pontic *Wormwood*, or the Roman *Wormwood* of Diofcorides. 3. The mountain-Pontic *Wormwood*. 4. The Cretic *Wormwood*, of a pleafing fmell. 5. The fine-leaved hoary Pontic *Wormwood*. 6. The Pontic *Wormwood*, with purple ftalks, and finely divided leaves, green underneath. 7. The Auftrian fine-leaved Pontic *Wormwood*. 8. The procumbent or creeping Pontic *Wormwood*. 9. The infipid tafted *Wormwood*, refembling the common kind. 10. The fea *Wormwood*, with lavender leaves. 11. The fea *Wormwood*, with the upper leaves divided into fegments. 12. The German fea *Wormwood*. 13. The Dutch fea *Wormwood*. 14. The broad-leaved fea *Wormwood*, of an agreeable fmell. 15. The French fea *Wormwood*. 16. The French wormfeed *Wormwood*. 17. The white mountain *Wormwood*. 18. The hoary Alpine *Wormwood*. 19. The dwarf white Alpine *Wormwood*. 20. The annual corymbiferous *Wormwood*. 21. The long-flowered Spanifh white *Wormwood*. 22. The Spanifh fea *Wormwood*, with a rounder flower, and with the fmell of wormfeed. 23. The fweet-fmelling *Wormwood*, with an elegant fpike of flowers. 24. The African-tree *Wormwood*, with hoary vermiculated leaves. *Tournef.* Inft. Botan. p. 457.

The common *Wormwood* is one of the fineft medicines we know, as a ftomachic and hepatic. It greatly ftrengthens the ftomach, opens obftructions of the liver or fpleen, promotes an appetite, and deftroys worms.

The leaves and tops before the plant is in flower, are the parts of it moft ufed; they are to be dried and given in powder, or in a light infufion. Their virtues in the jaundice and dropfy, are very great. They are alfo given by fome in putrid fevers. Many naufeous infects are deftroyed, or driven away by the fmell of this plant; and it is no uncommon practice among the good women in the country, to preferve their cloaths from moths, by laying bundles of dried *Wormwood* among them.

The Roman and fea *Wormwood* have much the fame virtues with the common kind; but they are lefs naufeous to the tafte, and therefore are generally ufed inftead of it. The true Roman *Wormwood* is very fcarce among us. What we buy under its name, is ufually *abfynthium feriphium*, or common fea *Wormwood*.

Our brewers have fome of them a method of ufing *Wormwood* inftead of the hops, to give the bitter tafte to their malt-liquors, and to preferve them: It is found to anfwer the latter purpofe very well; but the tafte is fo difagreeable,

that

that it is much complained of. The reason of this is, that the people who use it do not understand the time of gathering it.

All plants are fullest of juice while in the shoot, but fullest of virtue when they have their seeds on them. This is the case with *Wormwood*, as well as a thousand others; and though it in the feeding-time produces much more flavour than when younger, yet it is without that nauseous bitter of the crude juice, which gives us the distaste to the plant.

Some people have found the proper way of managing *Wormwood*, and have given a flavour with it to their malt-liquors, even preferable in the opinion of all palates to that given in the common way by hops.

The method is this: The plant is to be gathered when fully ripe and the seeds upon it, and in this state hung up in small bunches to dry. When thoroughly dried, a certain quantity of good strong malt-liquor is to be impregnated with it, to the utmost strength that it can possibly give it. This is to be set by for use, to add to all the rest.

When the hops should in the common way be added to the beer, this liquor is to be added in a proper quantity, making the taste the judge when there is enough of it.

By this means just what degree of bitter is required may be given to the liquor, and the bitter of this common plant thus managed, is as perfectly agreeable as that of any vegetable in the world.

The *Wormwood* for this purpose should have its seeds carefully preserved in the drying, and it is best if not used till the year after it was gathered. Phil. Transf. N°. 124.

Many people who have been fond of the virtues of *Wormwood*, but disgusted at its nauseous bitter taste, have attempted the divesting it of its taste, and yet preserving its qualities; but it being as a bitter that this plant acts in many cases, it is an evidently absurd scheme to take away that quality on which its virtues depend, in order to the rendering them less disagreeable to the palate.

The essential salt of *Wormwood* is afforded in great quantity, and possesses in many respects the virtues of the plant; this is a form in which it were to be wished, that not only this, but many other medicinal plants were more often given.

Wormwood shares with all other bitters the virtues of an abstersive deobstruent, and is in some degree purgative as all bitters are. *Wormwood* is one of those plants which the chemists have generally chosen for their processes of the resuscitation of plants from their ashes; and though the pretended principles of this art are false, yet there have been some of the artists so cunning to form representations of this plant, that have deceived and puzzled the greatest unbelievers, though they have not convinced them. Phil. Transf. N°. 74.

WORMS *Wood-fly*, in natural history, a very small black fly, found on the stalks of the common *Wormwood* in June and July.

WORRALL, in zoology, an animal of the lizzard kind, of about four feet long and eight inches broad, with a forked tongue, which it puts out like a serpent, but without teeth. It is a harmless animal, and feeds only on large flies, and the smaller species of lizzards. It is found in Ægypt only during the hottest months, and principally frequents the grottos and caverns in the mountains on the west of the Nile, where it sleeps during the winter season.

It is said to be greatly affected by music; but experiment shews this to be an erroneous opinion. *Pocock*'s Ægypt. Vol. I. p. 208.

WOUGHS, in mines, are the walls or sides sometimes of hard stone, and sometimes soft; when soft, the miners say they are rotten: These are the bounds of an entry. Betwixt them all sorts of earth, stones, and ore lie; or, as philosophers say, grow. *Houghton*'s compl. Miner, in the Explan. of the Terms.

WOUND (*Cycl.*)—There is nothing will give a truer light into the nature and consequence of a deep *Wound*, than a due consideration of what natural actions of the body are impeded thereby. For instance, in *Wounds* of the breast, when the patient draws his breath with shortness and difficulty, and is at the same time attended with an hæmoptysis and hiccough, we may rationally conjecture that the lungs, or the diaphragm are wounded; so in *Wounds* of the abdomen, when chyle is voided, it is a plain indication that the stomach, small guts, or lacteals, are wounded: When excrements pass by the *Wound*, the great guts are wounded. In the same manner, bilious blood shews the liver or gall-bladder to be divided: If urine passes by the *Wound*, the urinary bladder or else the ureters are wounded; but bloody urine denotes a blow on the kidneys, or a *Wound* of the bladder. But when there are large profusions of blood this way, it is a sign that some of the larger blood-vessels are wounded: Vomiting of blood, declares the stomach to be the injured organ: Violent pains, attended with convulsive twitches, shew that a nerve is wounded, or else that some foreign substance is left in the *Wound*. Whenever the senses are disordered after a *Wound* received on the head, a concussion of the brain is much to be feared. Difficulty of breathing, pains in the breast, and hiccoughing, are symptoms of a *Wound* in the diaphragm. It is of bad consequence for a *Wound* to be attended with a large tumour; but it is of the last consequence if it is attended with no degree of tumour at all; the first is an indication of great inflammation; the last of mortification; some degree of tumour is always therefore best in *Wounds*.

WOUNDS *naturally, and necessarily mortal.* We properly style those *Wounds* mortal which are not to be remedied by all the art and industry of man. Thus *Wounds* are of this kind which are attended with so violent an hæmorrhage, as to produce instant death: of this sort are reckoned *Wounds* that penetrate the cavities of the heart, and all those *Wounds* of the viscera, where the large blood-vessels are opened; such are large *Wounds* of the lungs, liver, spleen, kidneys, stomach, intestines, mesentery, pancreas, uterus; of the aorta, of the iliac, cœliac, renal, mesenteric, and carotid arteries, especially if they are wounded near their origin; of the subclavian also, or vertebral; of the vena cava, the iliac vein, the internal jugular, vertebral; renal, mesenteric of the vena porta, and of the larger veins that lie deep in the body, because their situation will not admit of proper applications to restrain the flux of blood. Heister therefore reckons, very justly, these among the *Wounds* that are absolutely incurable, since they are not remediable either by astringents, ligature, or fire.

Those *Wounds* also are not less mortal than the former, which obstruct, or entirely cut off the passage of the animal spirits to the heart; such are *Wounds* of the cerebellum, of the medulla oblongata, and some violent strokes of the brain itself. There is reason to appreheud very great danger, when the small veins or arteries, which are contained in the cranium, are injured; for the blood flowing from them into the internal sinuses of the brain, either produces too great a pressure upon those very tender parts of the brain, and so obstructs the course of the blood and spirits; or else, being corrupted, it putrifies the brain itself, if it cannot be evacuated by the assistance of the trepan, which is the case when this accident happens at the lower part of the cranium, or in the sinuses of the brain; nor is there less danger where the nerves, which tend to the heart, are wounded, or entirely divided; for, after this, it is impossible for the heart to continue its motion.

To this class are to be referred also all *Wounds* which entirely deprive the animal of the faculty of breathing: there is therefore great danger where the aspera arteria is intirely divided; for where it is only divided in part, it may be healed again by the assistance of an expert surgeon: to this place also belong violent shocks of the bronchia, mediastinum, and diaphragm, especially the tendinous part of it.

Those *Wounds* also which interrupt the course of the chyle to the heart, are no less incurable than the former; such are *Wounds* of the stomach, intestines, receptacle of the chyle, thoracic duct, and larger lacteals; to which may be also added *Wounds* of the œsophagus, if they are large; though death is not so sudden an attendant on these *Wounds*; but, for want of nourishment, the persons afflicted by them are weakened by degrees, and at length die consumptive.

In this account those *Wounds* also are not to be omitted, which are inflicted upon membranous parts, that are situated in the abdomen, and contain some secreted fluid, as on the bladder, either of the bile or urine, the stomach, intestines, receptacle of chyle, and lacteal vessels. The fluids contained in these parts, when once they are let loose into the cavity of the abdomen, cannot be properly discharged, and therefore easily corrode the internal parts of the body; and the membranes that contained them are generally so fine, that they will not admit of agglutination, especially since no medicine from without can be applied. A few indeed have recovered after slight *Wounds* in these parts; but since the number of these instances is but few, and the cure in them has been accidental, and not performed by the surgeon's art, these may very justly be added to the list of mortal *Wounds*.

WOUNDS *mortal by Neglect.* Many *Wounds* there are which, though the experienced surgeon could remedy, yet prove fatal, if neglected, or left to nature: Of this number are those which produce instant death, unless relieved by present assistance; such are *Wounds* of the larger external blood-vessels, which might be remedied by ligature, by the application of astringent medicines, or the actual cautery. Of this kind are *Wounds* of the brachial, or crural artery, unless they are too near the trunk of the body; *Wounds* in the large arteries of the cubit, or tibia; of the branches of the external carotid, or temporal artery; to these also may be added *Wounds* of the jugular and other veins, situated upon the external parts of the body; but in these cases no help can be given, unless the surgeon be brought before there has been a vast profusion of blood. *Heist.* Surg. p. 30.

WOUNDS *mortal by Accident.* *Wounds* are properly said to become mortal by accident, where the patient's death, from them, is occasioned either by the ill conduct of the patient himself, or by the neglect or ignorance of his surgeon, the *Wound* itself being of the number of those deemed curable by the judicious practiser. Under this head are to be reckoned those *Wounds* which the surgeon has neglected to cleanse sufficiently, though he had it in his power to do it; as when some foreign body, which might easily have been extracted, is

is left in the *Wound* by the careleſſneſs of the ſurgeon, and produces inflammations, hæmorrhages, convulſions, and finally death itſelf. So in *Wounds* of the thorax and abdomen; if the ſurgeon does not uſe his utmoſt diligence to evacuate the grumous blood, it will corrupt there, and by drawing the neighbouring parts into conſent, will expoſe the patient to death: great care muſt therefore be taken that the lips of the *Wound* do not cloſe, till the blood, which is collected in the cavity of the body, be all evacuated, if poſſible, which will be perceived by the difficulty of breathing, and other bad ſymptoms going off; but if any of the larger internal veſſels are wounded, then all attempts to diſcharge the blood are vain; for the violence of the hæmorrhage takes off the patient.

Wounds are alſo to be accounted mortal by accident, which are treated or ſearched in too rough a manner by the ſurgeon; for if *Wounds* are handled roughly which are full of nervous parts, or of large blood-veſſels, there is great danger of bringing on hæmorrhages, convulſions, inflammations, gangrenes, and finally death itſelf.

The caſe is alſo the ſame in external *Wounds*, which are ſlight of themſelves, but under which the patient is loſt by the inflammation which is brought on, and increaſed by the ſurgeon's injudicious treatment; or when any one is taken off by the violence of the hæmorrhage, from a *Wound* of the hand or foot; for, in this caſe, the ſurgeon might eaſily have ſtopped the blood, by the application of proper remedies, or by ligature: Or, when the patient is guilty of any intemperance, either in eating or drinking; or of any exceſs of paſſion; of expoſing himſelf to the cold air, or of uſing violent exerciſe; for by theſe means *Wounds*, more eſpecially thoſe of the head, by being liable to freſh hæmorrhages, and other dangerous accidents, frequently become mortal, nowithſtanding that they naturally would not prove ſo, and that though the ſurgeon uſes his utmoſt care and ſkill.

Among theſe alſo are to be accounted thoſe *Wounds* of the head, where the patient is loſt by the vaſt quantity of blood, which is extravaſated in the cavity of the cranium, and is confined there; but where he might have been relieved, if the trepan had been applied in time; for though *Wounds* of this kind generally prove incurable, yet as there is, at leaſt, a poſſibility of ſaving a perſon in theſe circumſtances, by the uſe of the trepan, this may properly be reckoned among the doubtful caſes, and not deemed abſolutely mortal: And laſtly, a bad habit of body frequently prevents the cure of *Wounds*, which would admit of an eaſy cure in a healthful ſubject; ſo we frequently ſee the ſlighteſt puncture in the hand or foot of an hydropical, conſumptive, or ſcorbutic perſon, ſhall produce a gangrene, and prove mortal, though the ſurgeon ſpares no care nor application to prevent it. *Heiſter*'s Surg. p. 29, 31.

Cure of ſlight Wounds. This is generally performed with great eaſe, by applying to the part a ſmall portion of ſcraped lint, well ſaturated with ſpirit of wine, oil of turpentine, or St. John's wort, liniment of Arcæus, or balſam of capivi, Gilead, or Peru, and ſecuring the dreſſing with a plaſter; this dreſſing ſhould be renewed once in a day or two, and the lips of the *Wound* will preſently agglutinate. *Heiſter*, p. 34.

Wounds *dangerous, how to be healed.* *Wounds* of this kind are firſt to be cleanſed from the extravaſated blood, ſordes, &c. In the next place, if a bullet, the point of a ſword, or any part of the cloathing, a piece of glaſs, or any other foreign body, remains in the *Wound*, it is to be removed either with the fingers, or a pair of forceps, or other proper inſtruments. The hæmorrhage is to be ſtopped at the firſt dreſſing; the divided parts are to be brought as near to each other as poſſible, and their ſituation ſhould be ſo maintained, that the cicatrix which is left may appear even.

Where there are no extraneous bodies to be removed, the grumous blood is to be wiped away with a ſoft ſpunge, or a parcel of fine lint wrung out of hot wine or brandy; and when this is done, the next ſtep is to ſtop the hæmorrhage; but before the ſurgeon attempts the removal of extraneous bodies, it behoves him well to conſider whether it be more proper to do it inſtantly, or to wait a more convenient time; for if the patient is become extremely faint, from the loſs of blood he has already ſuſtained, it will be neceſſary, in this caſe, to ſtop the hæmorrhage, and then, in ſome meaſure, to endeavour to revive him by moderate draughts of warm broths, whitewine whey, or ſome cordial medicine; for if theſe precautions are neglected, the patient may not unlikely die in the operation: So alſo where you have reaſon to fear, that in the extracting the broken point of a ſword, or other weapon, you are in danger of wounding a large blood-veſſel or nerve, it will be better to wait a little, either till the patient is ſomewhat come to himſelf, or till the *Wound* is enlarged by ſuppuration. *Heiſter*'s Surg. p. 35.

Gun-Shot-Wounds. See the article Gun-*Shot*.

Wounds *of the Neck.* See the article Neck.

Wounds *of the Eyes.* See the article Eye.

Loſs of Subſtance in Wounds. When this happens in *Wounds*, they will not unite either by the help of plaſters, or the ſuture, or by any other method, till filled up with new fleſh. To bring on this, lint dipped in oil, or ſpread over with ſome vulnerary balſam or ointment, and applied to the bottom of the *Wound*, is very ſerviceable, covering with a plaſter compreſs, and the proper bandages; and this dreſſing is to be repeated daily. There ought to be a balſamic and emollient quality in theſe ſarcotic medicines, that they may not only reſiſt putrefaction, but may alſo ſoften the new fleſh; ſo that it may eaſily receive additions from the blood, and ſuffer itſelf to be elongated. *Heiſter*'s Surg. p. 41.

Wounds *in Horſes.* The moſt terrible *Wounds* theſe creatures are ſubject to, are thoſe got in the field of battle. The farriers that attend camps have a coarſe way of curing theſe; but it is a very expeditious and effectual one.

If the bullet be within reach, they take it out with a pair of forceps; but if it lie too deep to be come at, they leave it behind, and dreſs up the *Wound* in the ſame manner as if it were not there.

They firſt drop in ſome varniſh from the end of a feather, and when the bottom is thus wetted with it, they dip a pledget of tow in the ſame varniſh, which they put into the *Wound*, and then cover the whole with the following charge: Take a quarter of a pound of powder of bole armenic, half a pound of linſeed oil, and three eggs, ſhells and all; add to theſe four ounces of beanflour, a quart of vinegar, and five ounces of turpentine; this is all to be mixed over the fire, and the *Wound* covered with it. This application is to be continued four or five days, then the tent put into the *Wound* is to be dipped in a mixture of turpentine and hogs-lard; by this means a laudable matter will be diſcharged, inſtead of the thin ſharp water that was at firſt. Then the cure is to be compleated by dreſſing it with an ointment made of turpentine, firſt well waſhed, and then diſſolved in yolks of eggs, and a little ſaffron added to it.

This is the practice in deep *Wounds* that do not go through the part; but in caſes where the bullet has gone quite through, they take a few weavers linnen thrumbs, made very knotty; theſe they make up into a kind of link, and dipping it in varniſh, they draw it through the *Wound*, leaving the ends hanging out at each ſide; by means of theſe they move the link or ſkain three or four times a day, always wetting the new part that is to be drawn into the *Wound* with freſh varniſh. They put on a charge of the bole armenic, &c. as before deſcribed, on each ſide of the wounded part, and continue this as long as the *Wound* diſcharges thin watery matter, or the ſides continue ſwelled. After this they dreſs it with the ointment of turpentine, yolks of eggs, and ſaffron, till it is perfectly cured.

The other methods are the dreſſing the *Wound* with an ointment made of wax, turpentine, and lard, and covering it with linnen rags wetted with cream; or the dreſſing, with a mixture of yolks of egg, honey, and ſaffron, and covering it up with cream and baum-leaves beaten together.

When the *Wound* is ſo dangerous as to require the aſſiſtance of internal medicines, they give the following pills: Take aſafœtida, bay-berries, and native cinnabar, of each a pound; beat up the whole into a maſs with brandy, and roll it into pills of fourteen drams weight each. Theſe are to be laid in a ſhady place to dry, after which they will keep ever ſo long without any damage. The horſe is to take two of theſe every other day, or, if neceſſary, every day, till he has taken eight or ten of them, and he is to ſtand bridled two hours before and after the taking them.

When the *Wound* ſeems at a ſtand; not appearing foul, and yet not gathering new fleſh, there muſt be recourſe had to the following powder, whoſe effect in bringing new fleſh is wonderful: Take dragon's blood and bole-armenic, of each two ounces; maſtic, olibanum, and ſarcocolla, of each three drams; aloes, round birth-wort, and common iris-root, of each one dram and a half; make the whole into a fine powder. This is ſometimes uſed dry, ſprinkling it on the *Wound*; but ſometimes it is mixed with turpentine, ſometimes with juice of wormwood, and ſometimes with honey of roſes, and either way does very well.

When the *Wound* grows foul, and requires a detergent to cleanſe it, the common liquor for this purpoſe is a phagedenic water, which they make of lime-water, and ſublimate in this manner:

Take two pounds and a half of newly made and unſlacked lime, put it into a pewter veſſel, and pour on it five quarts of boiling water. When the bubbling is over, let it ſtand to reſt two or three days, ſtirring it often with a ſtick; then pour it clear off after a due time for the lime to ſettle, and filter it through ſome whited brown paper, made for the lining of funnels, on this occaſion. To a quart of the clear lime-water, thus prepared, add eight ounces of ſpirit of wine, and one ounce of ſpirit of vitriol; when theſe are well mixed, by ſhaking them together; then add an ounce of corroſive ſublimate in fine powder; mix all well together, and keep the whole in a bottle, to be uſed for the cleanſing theſe foul *Wounds*, and on any other occaſions, where there may be a detergent of this powerful kind neceſſary. It will keep good many years.

If this water will not thoroughly cleanſe the *Wound*, but there ſtill will remain a quantity of foul matter in it, and there is danger of a gangrene, they add to it as much arſenic, in fine powder, as there was of the corroſive ſublimate; that is, at the rate of an ounce to a quart and half a pint.

Theſe

These are all the medicines that the farrier need carry with him on account of *Wounds*; and they are all such as may be prepared at home, and will continue good so long as he has occasion to keep them, or much longer; and what is left of one year will serve for others.

When the necessary applications are thus settled, it may not be improper to add the general rules by which they conduct themselves in the cure.

1. The *Wound* must be probed at first, but very gently, and afterwards as gently and as seldom as may be, for the horses flesh is the most easy of all others to be contused in wounded parts, and to fall into a gangrene from the hurt. 2. The *Wound* must be kept continually as clean as possible, and free from proud flesh. 3. The necessary revulsion must always be made by bleeding, as soon as the *Wound* is dressed the first time; this prevents inflammation, and a great many other bad accidents. 4. If the *Wound* be in such a place, that the horse can get at it with his tongue to lick it, great care must be taken to prevent his doing so, as it will greatly retard the cure. 5. The farrier is never to proceed to suppuration in any case in which the humours can be either dissolved or repelled, and especially in parts that are full of sinews and ligaments, or that are near the bones. 6. If a *Wound* be accompanied with a great contusion, or if it be of a round or circular figure, incisions are often necessary about its edges, and sometimes the application of caustics. 7. The *Wound* must be always carefully covered, for the access of the air retards the cure. 8. The callous lips of a *Wound* must always be cut to the quick, before these can be united together. These may serve for general rules, that hold good in all cases; and to these may be added some that are principally applicable to peculiar circumstances of the *Wounds*.

Wounds of the breast are to be cured with tents and folds of soft linnen laid over them, steeped in the following mixture: Take verdegrease, vitriol, and alum, of each one ounce; vinegar eight ounces, honey a pound; let all these be boiled together till they become red. *Wounds* in the belly can only be cured by sowing up the peritonæum with strong woollen thread, not silk, leaving the extremities without the skin. The skin is to be sowed together with a strong hempen thread waxed, joining the lips of the *Wound* together, by this means, in form of a buckle. This is to be covered with the common ointment for *Wounds*; and if an inflammation comes on, chalk dissolved in vinegar is to be added.

If the *Wound* be such that the guts come out at it, the horse may still be recovered, if proper caution be used: the guts are to be immediately returned into their place; but they must not in this be touched with the hand, but with a sponge dipped in warm water. And, in order to the making them more readily get into their places, it is proper to make the creature vomit, by thrusting down his throat a feather dipped in oil. If the *Wound* through which they fell is not big enough to return them easily by, it must be enlarged by cutting; but if the guts are found to be bruised or wounded, it is in vain to attempt any thing, for death must follow.

There is also a certainty of death when, after a *Wound* of any kind in the belly, the horse voids blood at the fundament.

When a horse is wounded near the groin, he easily falls into convulsions; in this case he is to be kept from drinking as much as possible: he is also to be covered well up, and kept quiet, and to have green things given him to eat. *Wounds* on the knees are very difficult of cure, because the part is in motion almost continually, and there is very little flesh to work upon. When the *Wounds* are but slight, and in the muscular parts of the body, a mixture of honey and tallow, boiled together, will often prove a cure; when the *Wound* is more considerable, turpentine melted in a little common oil, and applied hot, is the general remedy. If a wound happen between the shoe and the hoof, care must be taken that no foreign matter be left in it, and it must be dressed with any of the ointments that have verdegrease in them; and a charge of bruised elder-leaves is very proper to be applied over all. If the *Wound* be deep and narrow, it must be enlarged at the orifice, and turpentine and wax, melted in lard, must be poured into it. The same rule of opening the orifice holds good in all deep and narrow *Wounds*.

If a nerve happens to be cut, it must be closed, and a defensative must be applied, to prevent a concourse of humours to the part; a fomentation made of oil, wine, and honey, mixed together, is also very proper, wherever a nerve is hurt, and a pultice may be applied over all, made of marshmallow-roots boiled soft, with bread and milk.

If the horse happens to be wounded by a piece of wood, bone, or any other hard substance, part of which remains in the *Wound*, this must be carefully taken out, whatever pain it may cost the creature to do it, and the *Wound* must then be dressed with the common *Wound*-ointments. In this, or any other case of a fresh *Wound*, the washing it with oil of turpentine, is an excellent method of preventing ill consequences.

WRASSE, in zoology, the name of a fish called by authors, *turdus vulgaris*, and by some *tinca-marina*, the sea-tench.

It very much resembles the common fresh-water tench in figure, and is covered with large scales. Its usual size is about five or six inches in length. Its colour is very variable; red, yellow, and brownish, being very frequently mixed in the scales; and it has five or six longitudinal lines, alternately of a pale yellow, an olive-colour, and a dusky red. Its nose is long, and bent upwards, and it has thick and fleshy lips extended over the jaws. Its mouth is small, and its teeth not very sharp; its tail is not forked. The membraoes of the fins and tail are variegated with red and blue spots, and the anterior rays of the back-fin are prickly. It is caught in plenty on the English shores, and is sold among the poorer sort of people in Wales and Cornwall; but is not esteemed a very delicate fish. *Willughby*'s Hist. Pisc. p. 320.

WRECK (*Cycl.*)—*Wreck*, in metallurgy, a vessel in which the third washing is given to the ores of metals.

In Cornwall, when the tin ore has been twice washed, they take the head tin, or that part of the tin ore that lies uppermost, out of the buddle, and throwing it into this vessel, they pour water on it, and work it about with wooden rakes, till it is cleared from whatever other extraneous matter there may still have remained mixed with it, and is, after this, fit for the blowing-house to be run into metal. *Ray*'s English Words, p. 122.

WREN. See the article JENNY-*Wren*.

Crested WREN. See the article REGULUS *Cristatus*.

WRINGLE-*Tail*, a name given by the people of several parts of England, to the *curvicauda*, a species of bee-fly, very much resembling the bee in shape, but having only two wings and no sting.

It is very troublesome to horses, but does not suck their blood, but only lays its eggs in their skins; it is called in other counties the *whame* and the *barrel-fly*.

WRIST (*Cycl.*)—The *carpus* or *wrist* consists of eight small, unequal, and irregular bones, all of which, taken together, represent a sort of grotto, of an irregular quadrangular figure, and connected principally with the basis of the radius.

Considered in this manner, the whole connection of them has two sides and four edges: One of the sides is convex and external, the other concave and internal. The convexity of the outside is pretty regular and even; but the concavity of the inside has four eminencies, one at each corner. One of the four edges touches the fore-arm, and is as it were the head of the carpus; another of the edges touches the metacarpus, and may be called the basis; the third is toward the point of the radius, and the fourth toward the point of the ulna; the first of these latter two may be called the small edge, the latter the larger.

The bones of the carpus are divided into four rows, the first of which lies next the fore-arm, the second next the metacarpus; each row consists of four bones; but the fourth of the first row lies in a manner out of its rank. Each bone has several cartilaginous surfaces for their mutual articulations, and, in some of them, for their articulations with the radius, and bones of the metacarpus and thumb.

It is to no purpose to distinguish the three ordinary dimensions in any of these bones, except one; but in most of them we may consider six sides, one external, turned towards the convex surface of the carpus; one internal toward the concave surface; one toward the fore-arm, which may properly be called the brachial side; one toward the fingers, to be called the digital side; one toward the point of the radius, or the radial side, and one toward the point of the ulna, or the cubical side.

Of these sides some are bony, others are cartilaginous or articular; these last I call sides, the others surfaces, as being portions of the carpus's surface in its natural situation: to distinguish these bones from each other, they have been called the first, second, third, and fourth, bones, of the first or second row, beginning to count from the radius or thumb. But Lycerus has been at the pains of giving a particular name to each of them.

He calls the first of the first row the *os scaphoides*, the second the *os lunare*, the third the *os cuneiforme*, the fourth the *os pisiforme*; the first bone of the second row the *os trapezium*, the second *os trapezoides*, the third *os magnum*, and the fourth *os unciforme*; all which see in their proper places. *Winslow*'s Anatomy, p. 82.

The bones of the carpus are articulated with one another by arthrodia; but the first row forms a sort of ginglymus with the second; because the head of the os magnum may turn in the cotyloide cavity of the first row, while the two first bones of the second row slide upon the digital side of the os scaphoides, and the os unciforme in the same manner on the os cuneiforme.

When all these bones are in their natural situation, a transverse depression is formed in the convex side of the carpus, by which the two rows are distinguished. This depression appears most between the os scaphoides, and the three last bones of the second row, and looks like a fold, by which the second row is thrown back upon the first. The four eminencies on the concave side of the carpus, are for the insertion of a strong transverse ligament. The inner substance of all these bones is spongy, and their sufaces are not very compact. *Winslow*'s Anatomy, p. 85.

Wrist *Fractured.* The bones of the *Wrist* are very seldom subject to fracture, on account of their smallness. And when they are fractured, there is but little hopes of a cure; for the ligaments and tendons are here so numerous, and the bones so very small, that it is scarce possible to reduce them to their places, or to make them grow together again.

On this account the joint of the hand generally becomes stiff and immoveable after these accidents, or else abscesses, suppurations, fistulæ, and caries of the bones follow them; and these, on account of the softness of the bones, and the difficulty of discharging the matter, are seldom remedied, but by amputating the hand. What can be done, however, toward the curing a fracture in this part, is this; the assistant must lay hold of the hand above the *Wrist* and below it, and extend them as far as is necessary in opposite directions; the surgeon is, while this is doing, to replace the bones with his fingers, and when they are all replaced, to bind the hand up with a proper bandage. *Heister.* Surg. p. 129.

Wrist, in the manege. The bridle *Wrist*, is that of the cavalier's left hand. A horseman's *Wrist* and his elbow should be equally raised, and the *Wrist* should be two or three fingers above the pummel of the saddle. To ride a horse from hand to hand, *i. e.* to change hands upon one tread, you need only to turn your *Wrist* to that side you would have the horse to turn to, without advancing your hand. But if your horse stops, you must make use of both your legs. See the article Hand and Leg.

WRIT (*Cycl.*)—Writ *of Inquiry of Damages*, a judicial *Writ* that issues out to the sheriff upon a judgment by default, in action of the case, covenant, trespass, trover, &c. commanding him to summon a jury to enquire what damages the plaintiff hath sustained, *occasione præmissorum*; and when this is returned with the inquisition, the rule for judgment is given upon it; and if nothing be said to the contrary, judgment is thereupon entered. 2 Lill. Abr. 721.

WRITING, (*Cycl.*)—To *write* without blacking the fingers: Prepare the paper with a fine powder, made of three parts of calcined copperas, two of galls, and one of gum arabic, those being fresh mixed, rub them with a hare's foot into the pores of the paper; and then *write* with fair water, and the black letters will immediately appear. *Boyle*'s Works abr. Vol. 1. p. 114, 115.

To make new *Writing* appear old, moisten it with oil of tartar per deliquium, more or less diluted with water, as you desire the ink to appear more or less decayed. *Boyle*, ib. p. 115.

We may *write* without ink, or its materials: For this purpose, take a fine powder of calcined hartshorn, of clean tobacco-pipes, or rather of mutton-bones burnt to a perfect whiteness, and rub it upon the paper, and then *write* with a silver bodkin, or the like. Ibid.

The discharging of ink out of parchment, paper, &c. is commonly done by aqua fortis diluted sufficiently with water, that it may not destroy the paper. The like may be done with oil, or spirit of vitriol diluted. The juice of lemons, or strong vinegar, will take ink out of linnen more safely, as the mineral acids are apt to destroy the linnen, unless great care be used in diluting them.

We may *write* on iron with corrosive sublimate wetted with common water: For this purpose, the parts of metal we would preserve untouched should be covered with wax, and that taken off in the proper places, to make way for the corroding substance. *Boyle*'s Works abr. Vol. 1. p. 528.

The like may be practised by means of aqua fortis.

Mr. Boyle mentions a method he had of copying a whole page of *Writing* at once. But we do not find his description of it any where. See Works abr. Vol. 1. p. 136.

The same author informs us of a method of imitating *Writing*, on copper-plates. The copy to be engraved is to be wrote with a peculiar kind of ink, and the copper-plate being moderately warmed, is rubbed over with a white varnish, and suffered to cool; then the paper being gently moistened, that it may readily communicate its ink, the *Writing* is applied to the prepared surface of the plate, and passed through a rolling-press; by which means the ink adhering to the varnish, leaves the letters very conspicuous. And hence it is easy with a needle to trace the strokes, through the varnish upon the plate, which being afterwards cleaned, the letters are finished with the graver, and the work printed off in a rolling-press, as common cuts.

Mr. Boyle does not mention what the varnish nor ink, used by the artificer from whom he received this method, was; but he tells us, that he himself used the purer sort of virgin-wax, for a varnish; and for his ink he took fine Frankfort black carefully ground, with water, till it obtained the consistence of common ink; but no gum was added, lest it should hinder the ink from coming off. He also observes, that *written* characters may be taken off without the help of a press, by laying the moistened paper smooth upon the varnished copper, and rubbing it on hard with a convex piece of glass. Ibid.

WRONG-*Lands*, in our old writers, seem to denote trees that will never prove timber; such as *wrong* the ground they grow in. Kitch. 169. *Cowel.*

WRY-*Necked*, a term applied to persons affected with a distortion of the neck, and consequently of the head also; which is pulled more to one side than the other.

This is a deformity usually brought into the world with people; but sometimes it is occasioned by accidents afterwards. When it is from the birth, there is very little reason to imagine it curable, because the vertebræ of the neck are rendered crooked by that posture, while the bones are in a soft and pliable state.

There are however, in the writings of surgeons, some instances of this disorder, even in these circumstances, being cured after twelve, sixteen, or eighteen years.

When this disorder comes on adults, it is occasioned generally either by the contraction of the skin from a burn on one side, or from a strong spasmodic contraction of one of the mastoide muscles; which will at length become shorter and indurated, by continuing in that posture; or it may proceed from a relaxation of one or more of those muscles, in consequence of which the neck will be contracted by the stronger antagonist muscle on the opposite side; or lastly, it may proceed from a preternatural ligament drawing down the head. And when either of these is the occasion of the disorder, there is hopes of a cure; especially if the subject be young, and the disorder not of long standing.

If this disorder be recent, and caused by a defluxion of humours, evacuating medicines with mild sudorifics, and heat, may be of service. But when it arises from a contraction of the skin or muscles by burning, the repeated use of oils, ointments, and fomentations, may relax so far as to make a cure. A proper firm bandage must be applied to pull the head toward the natural posture, and a steel collar may be contrived by which the patient shall be suspended very frequently till the neck recover its proper position. But when all these fail, the manual assistance of the surgeon is to be called in. If the skin is contracted by a burn, it must be carefully incided transversely in several places, and the incisions dressed so as to keep them open and dilated, and the head pulled to its proper position by a bandage, till the new flesh filling up these incisions gives room for the head to stand even. But if the *Wry-neck* proceeds from a contraction of one of the mastoide muscles, or from some ligament, they are to be divided by a transverse incision in their lower part, near the clavicle or sternum. *Heister*'s Surgery, V. 2. p. 4. *Tulpius*, V. 4. c. 58.

Wry-*Neck*, in zoology, the English name of a bird, known in Latin by the names *torquilla* and *jynx*. *Ray*'s Ornithol. p. 95. See the article Jynx.

WURST, a Russian measure. See the article Werst.

WYCH-*House* (*Cycl.*)—In the places where there are salt-springs, and salt-works are carried on at them, the work-house where the salt is made is always called the *Wych-house*; and hence we may naturally conclude, that *Wych* was an old British word for salt, which is the more probable in that all the towns in which salt is made end in *Wych*; as *Namptwych*, *Droitwych*, *Middlewych*, &c. *Ray*'s English Words, p. 175.

X.

X.

X. We often meet with the Greek letters X and P joined in this manner ☧, on antient medals. The first we find are on some large brass coins of the Ptolemies, kings of Ægypt, where it was placed on a civil account.

Some writers have taken it for a date, and others for the initial letters of a proper name; but as no reasons are assigned for either of those conjectures, Mr. Ward rather supposes it an abbreviation of the word ΧΡΗΜΑ, *money*, impressed on those pieces, to denote their currency as money; which might be thought proper, as they have not the heads of kings stamped upon them, like their silver and gold coins; but always that of a Jupiter on the front, and an eagle perched on a thunderbolt on the reverse.

This character ☧ was afterwards applied to a very different purpose by Constantine the Great, who made use of it to denote XPICTOC, both in his coins and military ensigns; wherein he was followed not only by some succeeding emperors, but also by private persons, who out of devotion put it on their lamps and other utensils.

It afterwards came to be used merely as a critical note, to point out remarkable passages in manuscripts; and then it stood for the initials of XPHCIMON, *useful*; as we learn from Isidore, Orig. Lib. 1. cap. 20. See Philos. Trans. N°. 474. §. 1.

XAMDELLILAH, an Arabian term, used as a grace or thanksgiving after meat.

The greatest men of that nation will often call in the meanest, even the beggars, to eat with them; who, as soon as they have done, always rise and pronounce this word, which signifies God be praised. *Pocock's* Egypt. p. 183.

XAMI, a name given by some of the old writers to the *ceration* of the Greeks, or carob-tree.

The Arabians use this name, and express by it the same tree which we call by this name: They mention another kind of charnub, which is, their general name for the ceration; this other kind was an astringent, and wholly different from any thing which we know under that name.

It is possible they might mean by it the acacia, which is also a tree that bears pods, and is of an astringent quality.

XANTHICA, Ξανθικα, in antiquity, a Macedonian festival, so called because it was observed in the month Xanthus, at which time the whole royal family with the army were purified. See the article Lustration.

After which the army was divided into two parts, one of which being set in array against the other, there followed a short rencounter, in imitation of a fight. *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 417.

XANTHIUM, in botany, the name of a genus of plants; the characters of which are these: The flower is of the flosculous kind, being composed of a number of floscules, each having one stamen. The seeds are produced on other parts of the plant, and finally become oblong and usually prickly fruits, divided into two cells, and containing each several oblong seeds.

The species of *Xanthium*, enumerated by Mr. Tournefort, are these: 1. The common *Xanthium*, called the smaller burdock. 2. The greater Canada *Xanthium*, with fruit armed with crooked prickles. 3. The jagged-leaved Portugal *Xanthium*, with fruit armed with very strong prickles. *Tourn.* Inst. p. 139.

The roots of this plant are of a bitter and acrid taste, and are recommended as of great service in scrophulous cases, taken in decoction. Matthiolus gives great praises to the root dried and powdered, and given in mixture with rhubarb for the leprosy. *Matthiol.* in Dioscor.

XANTHON, a name given by some of the antients, to a species of marble of a yellowish green colour, much used in ornamenting the inner parts of houses; and from its equal hardness with the Tænarian marble, and the equal high polish it was capable of, supposed by the workmen to be of the same species.

The word *Xanthon* is of very dubious meaning, but is supposed as the name of this marble to have expressed a green colour, as this was otherwise called *marmor herbosum*. See the articles Taenarium, and Herbosum *Marmor*.

XANTHURUS *Indicus*, in zoology, the name of a fish, called by the Dutch *Geel-staerdt*.

It is of the size and shape of the bream; its jaws are armed with strait and very sharp teeth, which stand almost strait out; its back is yellow, and its tail very strongly tinged with that colour; its belly is of a bluish white; its head brown, and its fins of a fine red. It is caught with hooks among the rocks on the shores of the East-Indies; and is a very wholesome and well-tasted fish. *Ray's* Ichthyograph. Append. p. 2.

XANTHUS, in the natural history of the antients, the name of an iron ore of the hæmatites or blood-stone kind, and usually accounted a species of it, and called by others *elatites*.

It was of a pale yellowish white, or the colour of the French pale yellow ochre, used by our painters; but like all other ferrugineous bodies it became red by burning.

Theophrastus gives us expresly the etymology of the name, observing that it was called so from its colour; the Dorians calling a yellowish white ξανθος, *Xanthus*. *Hill's* Theoph. p. 97.

XANXUS, in zoology, a name given by some authors to a large species of sea-shell, somewhat like that with which the tritons of old were painted. It is found in great abundance near Ceylon, and is used there in medicine as an alkali and absorbent, in the same cases in which we give the testaceous powders.

XATHOS, in ichthyology, a name given by Appian, to the fish, called by the generality of authors the *erythrinus*, or *rubellio*. See the article Erythrinus.

It is of the sparus kind, and is described by Artedi under the name of the silver-eyed, red-bodied *sparus*.

XEL, in the materia medica of the antients, a name given to the fruit *sel*. See the article Sel.

XENEXTON, a word used by Paracelsus, to express a sort of amulet to be worn about the neck, to preserve people from infection in the plague.

XENINEPHIDEI, a word used to express a sort of imaginary spirits, mentioned by the adepts, as delighting to discover the occult qualities of bodies to men.

XENISMI, Ξενισμοι, in antiquity, sacrifices offered at the Athenian festival *Anacæa*. *Potter*, T. 1. p. 366. See the article Anacæa.

XENOPAROCHUS, among the Romans, an officer who provided embassadors with all kind of necessaries, at the public expence. *Pitisc.* Lex. Antiq. in voc.

XERANTHEMUM, in botany, the name of a genus of plants, the characters of which are these: The flower is radiated; its disk is composed of flosculcs standing upon the embryoseeds; but the outer circle is composed of plane flat petals, which are not affixed to embryos, but are contained in the same cup with the floscules which make up the disk. The embryos finally ripen into seeds, which are furnished with a foliaceous head.

The species of *Xeranthemum*, enumerated by Mr. Tournefort, are these: 1. The *Xeranthemum*, with large single purple flowers. 2. The *Xeranthemum*, with large double purple flowers. 3. The *Xeranthemum*, with single white flowers. 4. The double white-flowered *Xeranthemum*. 5. The single flowered *Xeranthemum*, with flowers mixed of white and red. 6. The double-flowered *Xeranthemum*, with flowers mixed of a dusky red and white. 7. The white-flowered hoary *Xeranthemum*. 8. The *Xeranthemum*, with small single purple flowers. 9. The *Xeranthemum*, with small single pale purple flowers. *Tourn.* Inst. p. 499.

We have several species of this plant cultivated in our gardens, and known in English by the name of *everlasting flowers*; a name common to all the species of this plant, and of the amaranthoides.

These flowers are of so dry and durable a structure, that if gathered just when they are ripe, they will last many years in perfection, and appear as fresh as while growing; they are also capable of several tinges, and hence are often seen of fine blues and greens, colours not natural to them.

They are all propagated by sowing their seeds in August, in a warm border, observing to water and shade them till they are come up, if the weather proves over dry. When the young plants are two inches high, they should be removed to another warm border under the shelter of a wall, and there planted at five inches distance from each other. They will here stand the winter very well, and in spring will be ready to grow up for flowering without any farther transplanting; they are only to be kept clear of weeds, and in June they will flower; the flowers should be gathered in July for drying, and some of the finest should be suffered to stand for seed; for the plants perish as soon as they have perfected their seeds, and must be renewed by sowing every year. *Miller's* Gardener's Dict.

XERASIA, in medicine, the name of a disease, a species of alopecia, in which the hair falls off through a dryness of the part, and want of due nourishment.

XEROMYRON,

XEROMYRON, a word uſed by the antients to expreſs what they do at other times call in expreſs words a dry ointment. It was a compoſition of warm and aromatic drugs, or of other things fit for external uſe, but without the fatty ingredients, by which they were uſually reduced into the form of ointments.

XEROPHAGY, ξηροφαγία, among the antients, the feeding only on dry victuals, which was the practice of the Athletæ. *Pitiſc.* in voc. *ſaginatio.* See ATHLETA.

XEROTRIBIA, a term uſed by authors to expreſs a dry friction, a rubbing of ſome affected part with the hand or otherwiſe, to recall the warmth and circulation.

XIFINUS, a name given by ſome writers to the ſaphire.

XIMENIA, in botany, the name of a genus of plants deſcribed by Plumier, the characters of which are theſe: The cup is a ſmall three-leav'd perianthium; the leaves of it are cordated, and fall with the flower; the flower is monopetalous, of a bell ſhape, and divided into three ſegments, which ſtand erect, and are oblong, ſomewhat convoluted and obtuſe at the ends. The germen of the piſtil is ſmall, and of an oval figure. The fruit is an oval drupa containing only one cell, in which is an oval nut. *Plum.* p. 21. *Linnæi* Gen. Plant. p. 521.

XINKÆPPETHIJA, in botany, a name given by ſome authors to that ſpecies of the jujube tree, on the branches of which the gum lacca of the ſhops is uſually found. *Herm.* Muſ. Zeyl. p. 40.

XIPHIAS, (*Cycl.*) in the Linnæan ſyſtem of zoology, the name of a genus of fiſhes of the general order of the acanthopterygii or prickly-finned kind.

The characters of this genus are, that the membrane of the gills has eight bones, and the point or extremity of the noſe or ſnout of the fiſh, is ſhaped like a ſword, and that it has no belly fins. *Linnæi* Syſt. Nat. p. 54.

According to the Artedian ſyſtem of ichthyology, the characters of this genus of fiſhes are theſe: The branchioſtege membrane on each ſide contains about eight bones, the ſnout is extended into a very long and depreſſed point, imitating the figure of a ſword, and of a bony ſubſtance; the body is oblong and roundiſh, the back fin is ſmall, and is very low in the middle; there are no belly fins at all. The air bladder in this fiſh is remarkably long, and the anus very near the tail. *Artedi* Gen. Piſc. p. 24.

The *Swordfiſh* is ſo remarkable for the ſhape of its ſnout, which is extended in form of a ſword, that it has been called by all nations by a name expreſſive of that character. Its common name *Xiphias* is from the Greek ξιφὸς, a ſword, and it is called *gladius* in Latin, and in Engliſh the *Swordfiſh*.

It grows to a very conſiderable ſize, ſo as ſometimes to weigh an hundred pounds. It is of a long and rounded body, largeſt near the head, and tapering by degrees toward the tail; its ſkin is conſiderably rough, its back black, and its belly of a ſilvery white; its mouth is of a moderate ſize, and has no teeth; its ſnout runs out into the figure of a ſword in the upper jaw, the under is much ſhorter, and terminates in a very ſharp point; it has one only fin on the back, running almoſt the whole length of it; its tail is very remarkably forked; it has only one pair of fins at the gills, having none on the belly. It is common in the Mediterranean, and ſome other ſeas, and is eſteemed by many a very delicate fiſh for the table. The Manner of fiſhing for it is the ſame at this time, that the old writers have deſcribed it to be in theirs, by the harping-iron. *Willughby*'s Hiſt. Piſc. p. 161.

XIPHION, in botany, the name of a genus of plants, the characters of which are theſe: The flower is liliaceous, conſiſting only of one petal, and much reſembling the iris flower. The piſtil is in the manner of the iris alſo, ornamented with three petals, and the cup becomes a fruit of the ſhape of that of the iris; but the root wholly differs from that of the iris, being bulbous, and compoſed of a number of coats.

The ſpecies of *Xiphion* enumerated by Mr. Tournefort are theſe: 1. The broad-leav'd blue-flower'd ſweet-ſcented ſtalkleſs *Xiphion*. 2. The broad-leav'd ſtalkleſs *Xiphion*, with purple ſweet-ſcented flowers. 3. The broad-leav'd ſtalkleſs *Xiphion*, with ſweet-ſcented milk-white flowers. 4. The white-flower'd *Xiphion*, with blue edges. 5. The Perſian early *Xiphion*, with variegated flowers. 6. The porcelain *Xiphion*. 7. The lavender *Xiphion*. 8. The lavender *Xiphion*, with blue changeable flowers. 9. The purple-flower'd changeable lavender *Xiphion*. 10. The broad-leav'd blue-flower'd *Xiphion*, with ſtalks. 11. The cauliferous broad-leav'd *Xiphion*, with blackiſh purple flowers. 12. The cauliferous broad-leav'd *Xiphion*, with blue flowers variegated with purple, or with violet-colour'd lines. 13. The broad-leav'd cauliferous *Xiphion*, with greyiſh flowers ſtreak'd with violet colour. 14. The broad-leav'd cauliferous white-flower'd *Xiphion*. 15. The *Xiphion* with large ſpotted leaves, and purple flowers. 16. The violet-flower'd *Xiphion*, with large ſpotted leaves. 17. The broad-ſpotted leav'd *Xiphion*, with blackiſh purple flowers, white at the top. 18. The broad and ſpotted leav'd *Xiphion*, with ſnow-white flowers. 19. The narrow-leav'd *Xiphion*, with variegated flowers. 20. The narrow-leav'd *Xiphion*, with three-colour'd flowers. 21. The greater yellow *Xiphion*, with ſcentleſs flowers. 22. The great *Xiphion*, with a pale yellow flower. 23. The great yellow *Xiphion*, with mixt flowers. 24. The many-flower'd changeable colour'd *Xiphion*. 25. The leſſer *Xiphion*, with yellow-ſcented flowers. 26. The large tall *Xiphion*, with changeable yellow flowers. 27. The great but low *Xiphion*, with yellow changeable flowers. 28. The tall narrow-leav'd changeable flower'd *Xiphion*. 29. The low changeable *Xiphion*, with ſmaller flowers. 30. The middle-ſiz'd changeable flower'd yellow *Xiphion*. 31. The narrow-leav'd *Xiphion*, with blue ſweet-ſcented flowers. 32. The narrow-leav'd *Xiphion*, with variegated purpliſh blue flowers. 33. The leſſer blue-flower'd *Xiphion*. 34. The violet blue-flowered *Xiphion*. 35. The narrow-leav'd *Xiphion*, with violet-blue flowers. 36. The narrow-leav'd *Xiphion*, with flowers of a mix'd blue. 37. The white-flower'd narrow-leav'd *Xiphion*. 38. The American *Xiphion*, with blackiſh-yellow flowers. *Tourn.* Inſt. p. 362, ſeq.

We have ſeveral ſpecies of this beautiful plant cultivated in our gardens, where they are called *bulbous Iris's*; and beſides theſe, a vaſt number of varieties or new flowers, as the floriſts call them, are frequently raiſed by thoſe who propagate them from ſeeds. The culture of theſe being the ſame with that of ſeveral other plants of the ſame ſort, which are much valued for their flowers, it may not be amiſs to give it at large.

There ſhould be great care to ſave the ſeeds of the fineſt and ſtrongeſt flowers, and in September ſome ſhallow pans or boxes muſt be placed with holes at their bottom to let out the moiſture, and then filled with light and fine earth. On this the ſeeds muſt be ſown pretty thick, and as evenly as may be; half an inch of the ſame earth muſt be ſifted on theſe, and the boxes muſt then be ſet where they may have the morning ſun; and if the weather proves very dry, they muſt be gently watered at times. They muſt remain in this ſituation till October, and then muſt be removed to a place where they may have the benefit of the ſun as great a part of the day as may be; here they muſt ſtand the winter, keeping the boxes very carefully clear from weeds.

In the ſpring the young plants will appear, and they ſhould then be removed to their firſt ſituation, where they may have only the morning ſun; and if the weather be dry, they muſt be watered at times. In June their leaves will decay, and they muſt then have half an inch of freſh earth ſifted over them, and be left in their ſituation till October, when they muſt be removed to the ſame place as before for the winter.

In the ſpring the leaves will appear again, and when they are again periſhed, the earth muſt be taken out of the boxes, and ſifted to ſeparate the roots, which muſt then be planted at three inches diſtance on a bed of the ſame light earth; they muſt be buried three inches deep, and in the ſpring following muſt have about half an inch of freſh earth ſifted over them; the leaves will this year appear and decay as before; and the following year, in June, they will moſt of them flower, when the fineſt flowers ſhould be marked, that their roots may be taken particular care of. The following year the remainder, which did not flower at firſt, will produce their flowers; ſuch of theſe as are finer than the reſt, ſhould be marked in the ſame manner, and the roots of theſe choice kinds be preſerved with particular care. Whatever fine or new flower is thus raiſed from ſeed, may be afterwards propagated by off-ſets from the roots, which being planted out, will flower the ſecond year, and often produce even finer flowers than the mother root.

The roots of theſe flowers ſhould be taken out of the earth only every other year; this ſhould be done juſt when the leaves are decayed, and they ſhould not be kept out of the earth above a fortnight.

The earth in which theſe flowers thrive beſt, is a light ſandy loam; and if it be taken up with the turf and the graſs rotted among it before it is uſed, it will be ſo much the better. They do not delight in a rich dunged ſoil, nor ſhould they be placed where they are too much expoſed to the ſun; for beſides that the flowers ſoon fade in theſe places, the roots are alſo always found to decay; but in an eaſt border, where they may have the ſun till eleven o'clock, and where the ground is not too moiſt nor over dry, they will ſtand a long time in flower, and thrive extremely well. *Miller*'s Gard. Dict.

XIR, a word uſed by the chemiſts to expreſs mercury.

XISINUM, a word uſed by ſome of the chemical writers to expreſs vinegar.

XOCHIOCOTZO, in botany, a name uſed by ſome authors for the tree which produces the liquid amber, and is called the ſweet gum by the inhabitants of the Weſt-Indies. *Hernandez*, p. 96.

XOCHITENACATL, in zoology, a name given by ſome to the toucan, or American great beaked magpy. *Ray*'s Ornithology. See the article TOUCAN.

XOCHITENACATL *Alia*, in zoology, the name of a bird deſcribed by Nieremberg of the nature of the toucan or Braſilian magpy.

It is of the ſize of a pigeon, its beak is large and thick, and is black and pointed; its wings and tail are variegated with black and white; it has a large black mark reaching from its back to the breaſt; the anterior part of the wings is yellow, the

reſt of its body of a pale colour, and the legs and feet brown. It always is found among the ſweet-flowering trees, and is not uncommon in many parts of South America. *Ray's* Ornithol. p. 298.

XOCOXOCHITL, the Indian name of the clove-berry-tree, or the *caſſia-caryophyllata*, the bark of which is uſed in medicine. *De Laet*. p. 277.

XOMOTL, in zoology, the name of an American bird, of which the Indians are very fond, making a part of their garments of its feathers.

Nieremberg has given this ſhort account of it. It is a web-footed fowl; its back and the upper part of its wings are black; and its breaſt is brown. When it is angry, it raiſes up the feathers of its head in form of a creſt. *Ray's* Ornithol. p. 305.

XOXOUHQUITICPATLI, an American name of a ſtone of the jaſper kind, and of a beautiful green; but uſually pale, and ſometimes with a mixture of grey, and variegated in ſeveral places with ſpots of a deeper green.

It is found among the ſeveral kinds of *lapis nephriticus*, with which that country abounds, and moſt of which the Indians celebrate for their virtues againſt diſeaſes: they are not however acquainted with any medicinal virtues of this ſpecies.

XUCAHA, or XUCAAHI, in botany, the name of a plant much famed for its virtues among the antient Arabians, but unknown at this time.

It was called alſo *amgaila*, and by the Greeks, *leucacantha* and *acantha arabica*, and by many other of the names of the gum-arabic-tree. The uſe of theſe ſynonymous terms has led ſome to ſuppoſe that the gum-arabic-tree, and the *Xucaha* or *amgaila*, which is another of the Arabian names of that plant, were the ſame thing; but this is a great error.

The plant *Xucaha* had a root compoſed of ſeveral knobs, or ſeparate pieces, which when ſeparated and dried, became of a yellowiſh colour, a very light and ſpongy ſubſtance, and of an agreeable aromatic ſmell, but bitter taſte. The antients compared theſe to the cyperus-roots in ſhape, and uſed them as cordials and ſtomachics.

They called the prepared roots *bunk*, and the ſimilitude of this name in ſound with the word *buna*, the fruit of the Ægyptian tree *bon*, that is, coffee, have led ſome to ſuppoſe that it was our coffee which they called by theſe names of *bunk* and *xucaha*; but theſe are all idle conjectures, and the *bunk* being a root, and the coffee a fruit, is ſufficient alone to overthrow this opinion, were there none of the many other reaſons againſt it.

XYLAGIUM, a name given by ſome authors to the lignum ſanctum or guaiacum.

XYLOCARACTA, or XYLOCARACTE, in the materia medica, a name by which ſome authors have called the carob, or ſiliqua dulcis, the ſweet pipe-tree. *Ger.* Emac. Ind. 2.

This was called by ſome of the Greek writers *xyloceraton*, the tree bearing pods, and from a corruption of this name the other has been formed.

XYLOCARPASUM, in natural hiſtory, a name given by ſome authors to a poiſonous kind of wood.

It was the wood of that tree whoſe gum was called *carpaſum* and *apocarpaſum*. This was a much more terrible poiſon than the wood, and as it very much reſembled myrrh in colour, and came from the ſame country from whence the myrrh came, it was often found mixed with it, and many people loſt their lives by taking it.

XYLOCASIA, a term uſed by ſome modern writers on the materia medica, to expreſs what we call *caſſia lignea*, a bark ſomewhat reſembling cinnamon, but leſs aromatic, and of a mucilaginous taſte.

The antients, however, did not mean exactly what we do by this term *caſſia lignea*; they ſometimes pealed off the bark of this tree, and kept it ſeparate; and in this caſe they called it κασία Σύριγξ, a term we have applied to a very different ſenſe, *caſſia fiſtula* with us ſignifying the fruit of the pudding pipe-tree; and when they cut the bark with the wood of the young branches, they then called it *xylocaſia* or *caſſia lignea*.

XYLOCOCCUM, in the materia medica, a name given by ſome of the later Greek writers to the carob-tree, or *ſiliqua dulcis*.

This is alſo called *xyloceraton* by Ægineta, and by ſome of the latin writers of the barbarous ages, *xylocaracte*, a word plainly formed of the others.

XYLOCOLLA, a word uſed by ſome of the antient writers to expreſs what was more uſually called *taurocolla*, glue made of the ears and genitals of a bull.

XYLOCOPIA, Ξυλοκοπία, among the Greeks, a puniſhment with a cudgel. See the article FUSTIGATIO.

XYLOGLYCON, in botany, a name given to the carob, or ſiliqua dulcis, by ſome of the old Greek writers.

The word expreſſes a ſweet, or ſweet-fruited tree, and was ſufficiently expreſſive of the thing; but it was afterwards degraded into a Latin name, ſcarce intelligible, *ſililicon*; this Iſidore writes *ſilicon*, and ſuppoſes to be a falſe ſpelling of the word *ſiliqua*; but it is evidently formed of the word *Xyloglycon*.

Iſidore ſays, the acacia of the ſhops is the juice of the fruit of this tree; but this is an error formed on the expoſitions of the Arabians; they call by the common name *charnub* both the carob-tree and the acacia-tree; and what they have ſaid of the latter he has given to the former.

XYLOIDES, or HYLODES, in botany, a term uſed by many of the antient writers to diſtinguiſh thoſe plants which had woody ſtalks, though they never grew up to any conſiderable ſize; ſuch as the garden-thyme, marjoram, and the like.

XYLON, the *cotton-tree*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the bell-ſhape, very wide at the mouth, and divided into many ſegments. From its bottom there ariſes a pyramidal tube, uſually loaded with ſtamina; and from the bottom of the cup there ariſes a piſtil, which is infixed in the manner of a nail both to the hinder part of the flower, and to the tube. This ripens into a roundiſh fruit, divided into four or more cells, opening at the top, and containing numerous ſeeds wrapped up in a ſtringy white ſubſtance, which is called *cotton*.

The ſpecies of this genus, enumerated by Mr. Tournefort, are theſe: 1. The tree or woody-*Cotton*, with a ſmooth ſtalk, and a blackiſh purple flower. 2. The woody *Cotton*, with yellow flowers. 3. The woody *Cotton* with prickly ſtalks. 4. The herbaceous *Cotton*. 5. The American *Cotton*, with a long pointed fruit: And 6. The fineſt American *Cotton*, with green ſeeds. *Tourn.* Inſt. p. 101.

There are ſeveral varieties, and not a few diſtinct ſpecies of this plant, propagated in the gardens of the curious with us.

The moſt common ſpecies, which is the *Xylon herbaceum*, or herby *Cotton*, is cultivated very plentifully in Candia, Lemnos, Cyprus, Malta, Sicily, Naples, and alſo between Jeruſalem and Damaſcus, from whence the *Cotton* is annually brought in large quantities to us in the northern parts of Europe. It is ſown on plowed lands in ſpring, and is cut down as our corn in harveſt-time, being an annual plant.

The *Cotton* is a woolly or downy ſubſtance, which incloſes the ſeed, and which is contained in a brown huſk or ſeed-veſſel. It is from this plant that moſt of the *Cotton* we uſe is produced, the difference of the ſeveral ſorts of it being owing to the different ſoil and climates it has grown in, and the different culture it has received.

The *Cotton* in the wooll, as it is uſually called, is what we have from Cyprus. Damaſcus *Cotton* is called *Cotton* in the yarn; and the Jeruſalem *Cottons*, which are called *bazaes*, are the fineſt kinds of all.

All the kinds of *Cotton* plants are propagated with us from ſeeds, which muſt be ſown on a hot bed early in the ſpring; and when the young plants are come up, they ſhould be tranſplanted each into a ſeparate pot of light earth, which is to be plunged into a moderate hot bed of tanners bark, obſerving to water and ſhade them till they have taken root; after this they ſhould be watered at times, and have as much air as the ſeaſon will permit. As they enlarge in ſize, they muſt be ſhifted into larger pots; but they muſt be kept in the ſtove, where the herbaceous kinds will annually flower in autumn; but they will ſeldom bring their pods to any perfection. *Miller's* Gard. Dict.

XYLON, Ξύλον, among the Athenians, a puniſhment inflicted by putting the offender into the ſtocks. See the articles PODOCACE and PUNISHMENT.

XYLOSTEON, in botany, a name by which ſome authors have called the ſmall red-berried double-fruited *chameceraſus*.

XYLOSTEUM, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is placed on a cup, and always diſpoſed two on each pedicle: it is tubular in ſhape, and divided into ſeveral ſegments at the edge. The cup finally becomes a fruit, compoſed of two berries, which are ſoft, and contain a roundiſh but flatted ſeed. See Tab. 1. of Botany, Claſs 20.

There is only one known ſpecies of this genus, which is the Pyreenan *Xyloſteum*. *Tourn.* Inſt. p. 609.

XYLOSTROTON, among the antients, an appellation given to moſaic or chequered work. *Pitiſc.* Lex. Ant. in voc.

XYMPATHESIS, a word uſed by ſome of the old medical writers for ſympathy.

XYNERESIS, a word uſed by Hippocrates and others of the antients, to expreſs a firm coheſion or connection of any two things: ſome uſe it to expreſs that firm ſhutting together or clenching the teeth, which happens in convulſions.

XYPHION, in botany, a name uſed by ſome authors for the gladiolus or corn-flag, a plant kept in our gardens for the beauty of its flower. *J. Bauhin.* vol. 2. p. 701.

XYRIS, in the Linnæan ſyſtem of botany, the name of a genus of plants, whoſe characters are, that the flower-cup is a ſort of roundiſh ſpike, made up of roundiſh, hollowed, imbricated ſcales, which divide the flowers; the huſk is ſmall and bivalve, each of the valves being compreſſed, arched, and in the ſhape of a little boat; they are alſo acute, and naturally incline toward one another. The flower conſiſts of three petals, which are large, flat, expanded, with notched edges, and narrow ends, of the length of the cup they are immerſed in. The ſtamina are three ſlender filaments, which are ſhorter than the flower. The antheræ are oblong and erect. The germen of the piſtil is roundiſh; the ſtyle is ſingle and thread-like, and the ſtigma divided into three parts. The fruit is a roundiſh capſule,

capsule, contained within the cup, with three cells and three valves. The seeds are very numerous, and extremely small. *Linnæi* Gen. Plantarum. p. 11.

XYSTICI, among the antients, a designation given to the Athletæ, because they performed their exercises in the *Xystus*. See the article XYSTUS, *Cycl.*

Y.

YARD (*Cycl.*)—YARD-*fallen*, a term used among our farriers to express a malady to which horses are sometimes subject, which is the hanging down of the penis from its sheath between the legs, the creature not being able to draw it up again.

This is caused by weakness of the peculiar muscles, which should act in the drawing up; and proceeds sometimes from a violent slip or strain; sometimes from a blow on the back, and sometimes from extreme weariness in long journeys.

The method of curing this, is first to wash it with oil of roses, after this with warm white-wine, and finally, to anoint it with a mixture of oil of roses and honey: it is then to be returned into its place, and kept from falling down again by a little canvas bolster. It is to be thus dressed once in twenty-four hours, till the cure is perfected.

There are some other distemperatures to which this part is subject, in a horse, as the being foul at the end, so that the creature voids his urine in the sheath; in this case the method of cure is to draw out the penis, and cleanse the end of it from any foulness that may be found there; then it is to be washed with butter and white-wine vinegar melted together: sometimes there is a discharge of a yellow stinking matter from the penis: this is peculiar to stone-horses, and principally affects them after the time of their covering of mares.

This running is attended with a swelling of the penis, and with a pain in voiding the urine; the creature also finds a difficulty in drawing up the penis into the sheath. The method of cure is, to dissolve in a pint of white-wine an ounce of roach-alum by boiling, and four or five times a day this is to be used, injecting it up into the *Yard* with a syringe blood-warm. This will prove a certain cure.

YARIN, a word used by some of the chemical writers to express the flos æris.

YARN (*Cycl.*)—*Spun* YARN, on board a ship. See the article SPUN, *Cycl.*

YGROPISSOS, in the materia medica, a word used by some writers to express tar.

YARROW, in botany. See the article MILLEFOLIUM.

YARWHELP, or YARWIP, an English name used in some places for the *godwit*, the *ægocephalus* of authors. See the article ÆGOCEPHALUS.

YAWS (*Cycl.*)—This is a distemper epidemical, or rather endemical to Guinea, and the hotter climates in Africa, seldom failing to attack each individual one time or other of their lives, but most commonly in childhood or youth: It makes its first appearance in little spots on the cuticle, level with the skin, no larger than the point of a pin, which increase daily, and become protuberant like pimples: soon after the cuticle frets off, and then, instead of pus or ichor in this small tumour, white sloughs or sordes are only found, under which is a small fungus growing out of the cuticle, increasing gradually to different magnitudes, some less than the smallest wood-strawberry, some as big as a raspberry, and others even exceeding in bigness the largest mulberries, which they very much resemble. While they are coming to this height, the black hair, which grows out of the part now covered with the *Yaws*, changes gradually white.

It is impossible to calculate the exact time which this distemper requires, to go through these different stages. Some negroes, who were in good plight, and had full nourishment, in a month after discovering the white spots, have had several *Yaws* as big as a mulberry; and in other negroes, that were low in flesh, and had but a poor scanty diet, in three months time none of the *Yaws* have exceeded a common strawberry.

The *Yaws* appear on all the parts of the body; but the most and biggest are generally on the groins, about the privities and anus, in the arm-pits and face. When they are very large, they are few in number; and when they are many in number, they are small in size. All this time the patient is in good health, does not lose his appetite, and seems to have no other uneasiness than what the nastiness of the sores occasion; for they are not painful, except touched too roughly. This is the natural appearance of the distemper, when left to itself, and in this state it will continue a long time without any sensible evacuation.

The *Yaws* do not prove often dangerous, if the cure is undertaken skilfully at a proper time, and the patient has not undergone any course of physic for them before; but if the patient has been once salivated, or taken any quantity of mercury, and the skin once cleared, and they appear again, they are always very difficult, and often impossible, to cure. Medic. Ess. vol. 5. art. 76.

The chief part of the cure is by gentle salivation with calomel, in small doses, that it may neither vomit nor purge. The patient's drink is the decoction of guaiacum and sassafras, fermented with melasses. See Medic. Ess. ibid. or the Abridg. vol. 2. p. 305.

Sometimes one large *Yaw*, high-knobbed, red and moist, called the *master-Yaw*, remains after the rest are fallen off, and the salivation is over. And to subdue this, some have thought new salivations necessary; but it requires only to be destroyed by a gentle caustic, or mild escharotic, as equal parts of red precipitate and burnt alum.

The salivation should not be begun befor the *Yaws* are at the height, which is discovered by their being at a stand, neither increasing in size or number. Their coming to the height should be accelerated by proper medicines. If the patient be salivated before this time, the distemper will return soon after the salivation. Ibid. p. 304.

YAYAUHQUITOTOTL, in zoology, the name of an Indian bird, described by Nieremberg, remarkable for having two feathers of its tail much longer than tho rest, and naked for a great way; but at the end ornamented with black and blue hairs. The bird is of the size of the starling, and is beautifully variegated with green, blue, yellow, and grey.

Mr. Ray is of opinion, that this is the bird described by Marggrave under the name *guaira guainumbi*. *Ray's* Ornithol. app. vol. 298. See the article GUAIRA-*Guainumbi*.

YDRINUS, or HYDRINUS, a name given by some to the *ophites*, or serpent-stone.

YEAR (*Cycl.*)—YEAR is also a word used by some of the chemical writers to express any product of their operations, which may serve as a medicine, whether internally or externally.

YEAST. Common ale-*Yeast* may be kept fresh and fit for use several months, by the following method: Put a quantity of it into a close canvas bag, and gently squeeze out the moisture in a screw-press, till the remaining matter be as firm and stiff as clay.

In this state it may be close packed up in a tight cask, for securing of it from the air; and will keep fresh, sound, and fit for use for a long time.

This is a secret that might be of great use to the brewers and distillers here, who, though they employ very large quantities of *Yeast*, seem to know no method of preserving it, or raising nurseries of it; for want of which they sustain a very considerable loss; whereas the brewers in Flanders make a very great advantage of supplying the malt-distillers of Holland with *Yeast*, which is rendered lasting, and fit for carriage, by this easy expedient. *Shaw's* Lectures, p. 195.

YELION, a word used by some of the barbarous writers to express glass.

YELLOW (*Cycl.*)—Mr. Boyle tells us a most beautiful *Yellow* may be procured by taking good quick-silver, and three or four times its weight of oil of vitriol, drawing off, in a glass retort, the saline menstruum from the metalline liquor, till there remains a dry snow-white calx at the bottom: On pouring a large quantity of fair water on this, the colour changes to an excellent light *yellow*.

He says he fears this colour is too costly to be used by painters, and he does not know how it would agree with every pigment, especially oil-colours. Works abr. vol. 2. p. 91.

The Chinese are famous for their *Yellows* in dying, which never change with washing. They make this dye of the flowers of the acacia, in a manner in which we might use several of our own productions to great advantage.

It is thus: They gather the flowers before they are perfectly ripe, and dry them in an earthen vessel over a gentle heat, till they crisp up in the manner of tea-leaves; they then add to them the ripe seeds of the same tree in different proportions; and then boiling them in river-water with alum, they give the *Yellow* in any degree that they please.

They have three kinds of *Yellow*, which they distinguish by the names of *Ngo-hoang*, *King-hoang*, and *hoang* alone.

The first of these is the brightest *Yellow*; to dye five or six ells of silk of this colour, they use a pound of the flowers of the acacia, about two ounces of the seeds, and four ounces of alum.

The *King-hoang* is a somewhat deeper *Yellow*; to dye this, they use the same ingredient in the same proportion as in the former case; and when the silk is dry from the dipping in this, they give it a second dipping in a slight tincture of Brasil-wood, this brings it to the fine strong *Yellow* we see.

The *hoang* or pale *Yellow*, is made of the same ingredients as the first, only instead of four ounces of alum they put in but three ounces: River-water is found to be greatly preferable to any other, for the extracting these colours; but even in that there is great difference, some doing the business much better than others.

The Chinese are so expert in judging on this occasion, that they can tell by the taste of water whether it will or will not do; and if it taste faint, they know it is faulty; but they dip the pieces twice into it instead of once, and then the colour succeeds well.

The flowers of the acacia, when they have been prepared by roasting in this manner, may be kept all the year round, and employed in dying as occasion requires, only there is to be longer boiling for the dryed flowers than the fresh ones; and it is always found, that the fresh flowers give the brightest colour. Observ. sur les Coutum. de l'Asie, p. 254.

YELLOW *Flower-de-luce*, in botany. See the article IRIS *Palustris*.

YELLOW-*Hammer*, in zoology, the name of a very common English bird, called by authors *emberiza lutea*; and by some *hortulanus*, by others *luteus*, and by others *chloreus*.

It is a little larger than the chaffinch, and is very beautifully variegated with a greenish or greyish brown and a fine bright yellow.

There is beside this another kind, which is much smaller and of a browner colour on the back; this is called by some authors *zivolo*. *Ray*'s Ornithol. p. 196. See the article ZIVOLO.

YELLOWNESS *of Infants*. See the article INFANT.

YELLOWS, a name given by farriers to the jaundice in horses. See the article JAUNDICE.

YERK, in the manege. See the article YERKING, *Cycl.*

YETTUS, in natural history, a name given by the writers of the middle ages, to a species of marble, of a deep red; which was used by some as a touch-stone.

YEVA *Charrum*, in natural history, a name given by the people of the East-Indies to a kind of litharge; which is very common in that part of the world, and is said to be made partly from lead and partly from zink.

It is less heavy than our yellow litharge, and of a paler colour. It is used as a caustic in all the occasions of surgery there.

YEW, *Taxus*, in botany, the English name of a genus of plants. See the article TAXUS.

YEW is also a term used by the salt-workers of Limington, and some other parts of England, to express the first rising of a skum upon the brine in boiling.

In the places where they use this term, they add no clarifying mixtures to the brine, for it ferments in the cisterns, and all its foulness sinks to the bottom, in form of a thin mud; they admit only the clear liquor into the pan, and boil this briskly till it *yews*, that is, till a thin skin of salt appears upon its surface; they then damp the fire, and carefully skim off this film, and clear only the scratch or calcarious earth, which separates to the bottom.

They do not collect this into scratch-pans, as at many of the other works, but they rake it up to one side of the pan, and take it out; they there add a piece of butter, and continue the fire moderately strong till the salt is granulated. They keep a brisker fire on this occasion at Limington, than in most of the other works; so that they will work three pans in twenty-four hours. See the article SALT.

YIELD, or SLACK *the Hand*, in the manege, is to slack the bridle, and give the horse head. See the article SLACK.

YIN, a word used by some of the chemical writers, to express verdigrease.

YOKE (*Cycl.*)—YOKE, in the sea-language. See the article SEA-*Yoke*, *Cycl.*

YOMO, a word used by some of the chemical writers to express verdigrease.

YOS, a word used by some of the chemical writers to express verdigrease.

YOUNG *Animals*. It is commonly thought that the flesh of *young* animals is sooner digested, than the flesh of the same kind of animals arrived at full growth; and Dr. Cheyne is also of this opinion. But Dr. Bryan Robinson shews this to be a mistake, in some instances; and alledges, that veal and lamb are not so soon digested, as beef and mutton. He mentions the case of a man, who took a vomit every second night for some months, who observed, that when he had taken chicken for dinner, he always threw it up undigested; but never threw up any of his food undigested, when he dined on beef and mutton.

YOUTH. The renovation of *Youth* has been much sought after by chemical adepts; and many of them pretended to various secrets, for this purpose: But unluckily, the death of the pretenders proved a sufficient refutation of their doctrine. Paracelsus talks of the mighty things he could do with his *ens primum*; and even Mr. Boyle tells us some strange things about the *ens primum* of balm. *Boyle*'s Works abr. Vol. I. p. 75. but Mr. Boyle gives these wonderful stories on the credit of a French chemist, and not on his own. See the article ENS *Primum*, *Cycl.*

YOUTH, *Juventus*, in the Pagan theology, a goddess worshipped among the Romans, who, together with the gods Mars and Terminus, kept her place in the capitol along with Jupiter, when the other deities were turned out. Whence the Romans drew a lucky omen for the durableness of their empire. Mem. Acad. Inscrip. Vol. I. p. 71. *seq.*

This state of life was, by the antients, compared to Autumn. In which sense, Horace speaking of one approaching to Puberty, says,

Jam tibi lividos
Distinguet Autumnus racemos,
Purpureo varius colore.

The moderns, on the contrary, when they speak of one in the autumn of his age, mean one that is upon the decline; and choose rather to use the comparison of the spring, to denote *Youth*.

YS, in ichthyology, a name given by Athæneus, and some other of the Greek writers, to the fish called *Mus* and *Sus* by others. It is the capriscus of later writers. See the article GOAT-*Fish*.

YSAMBRA, a word used by some as a name for hellebore, and by others to express a species of poison prepared in Spain, of which hellebore is an ingredient.

YSOPUS, a term used by some, to express the chemical art of separation.

YSPAR, a name by which some of the chemical writers call iron.

YTIC, in natural history, the name of a species of duck, common in the Philippine-islands, and in China.

It is of the size of our tame duck, and is that species which the Chinese hatch from the egg by heat, as the Ægyptians do chickens.

YTZAIMPATLI, in the materia medica, a name given by some to the cevadilla, or *hordeum causticum*, the caustic Indian barley. *Hernand.* p. 307.

YUCCA, or MANIHOT, in botany, the name of the Indian corn. See the article MANIHOT.

We have three or four species of this plant preserved in the gardens of the curious; and the common kind, when grown strong and hardy, will endure the cold of our climate in the open air, and produce its flowers with us.

All the species may be propagated either from seeds sent from abroad, or from off-sets or heads taken from the old plants, in the manner of the aloe. When they are to be raised from seeds, these are to be sown in a pot of light fresh earth, which being plunged into a moderate hot bed the young plants will appear in five or six weeks; and when they are two or three inches high they are to be removed, each into a separate pot, which is to be plunged again into the same hot bed, where they are to be watered and shaded, and to have air given them, as the season and the heat of the bed will permit. In July they must be hardened by degrees to the open air, into which they must be removed soon after to harden them against winter. They must be placed in a defended situation, and remain abroad till October, when they are to be removed into the green-house, and placed among the hardier sorts of aloes. They are here to be treated exactly as those plants; and when they are grown sufficiently strong, they may be removed into common borders, where they will remain through our winters, and flower very beautifully.

When they are to be raised from the off-sets, these must be laid in a dry place for a week or ten days before they are planted, that the wound where they where taken off from the old plant may heal; else, like the other succulent plants, they are apt to rot in the earth, and miscarry. *Miller*'s Gardener's Dict.

YUCCA-*Bread*, or CASSADA-*Bread*, a sort of bread made in many parts of the West-Indies, and eaten there; and sometimes brought over as a curiosity to us.

It is made of the root of this plant, known among the botanists by the name of *manihot*. This grows to five or six feet high, the stalk is woody and full of knots, and has a large pith in it; the leaves are digitated or divided into a number of segments, like so many fingers; the flowers are composed of one leaf, and are as large as our narcissus, and are succeeded by a fruit of the size of a hazel-nut.

The root is very large and thick, and of a dark colour without, but very white within. It grows wild, common enough in ſome places; but it is generally cultivated for uſe, ſetting it in large furrows. Its juice is poiſonous, though the dry powder of the root is perfectly innocent and wholeſome; but there is a kind of it which may be eaten raw, and which is now getting into uſe; inſtead of the other, which is a ſpeedy poiſon, if eaten with its juice.

The manner of making the bread from theſe roots, is this; they peel them, raſp them, and putting them into bags ſqueeze out the juice; they then dry the remaining matter over the fire, and when it is ſufficiently dreſſed, they make it into cakes, which being dried either in the ſun, or by artificial heat, are the *Caſſada-bread*; which is very nouriſhing, and will keep without moulding, as well as biſcuit.

The uſe of it is apt to contract the throat, if eaten dry, and ſometimes brings on a danger of choaking; the beſt method is to moiſten it in broth, or otherwiſe. before it is eaten, or elſe to have a bottle of water at hand to waſh down every mouthful.

The juice expreſſed in preparing this root for bread, will kill any animal that drinks it crude; but it may be boiled over the fire till a great part is evaporated, and the remainder if it be far evaporated will be ſweet, and ſerve in the place of honey; if leſs evaporated, and ſet by to ferment, it will make a very good and wholeſome vinegar. The juice of the roucou is ſaid to be a counter-poiſon for the juice of *Yucca*. *Lemery*. Dict. des Drog.

The thicker cakes of *Yucca-bread* are called caſſavi, or caſſada, and are eaten by the poorer ſort. The thinner are called *ſciam*, and are eaten by the rich. *Grew's* Muſæum, p. 371.

YXIR, a word uſed by ſome of the old chemiſts, to expreſs any thing good in medicine.

YZQUANHTH, in zoology, the Indian name for a bird deſcribed by Nieremberg, and called the creſted eagle. See the article AQUILA *Criſtata*.

YZQUIEPATL, in zoology, the name of an American animal of the fox-kind, and much reſembling a common fox when young.

It is a low animal, its body long, and its legs ſhort. Its noſe is ſharp, its ears ſmall, and its body very thick, covered with hair, particularly about the tail, which is long, and covered with the ſame ſort of hair with the reſt of the body, which is black and white. Its claws are very ſharp; it lives in the caves and in the hollows of rocks, where it breeds, and brings up its offspring. It feeds on worms, beetles, and other inſects, and ſmall animals: When purſued, it breaks wind backward with an inſupportable ſtench.

Its whole body is, indeed, of a very ill ſmell; and its urine and dung are ſo horribly ſtinking, that we have no ſtench that can compare with them. It is a mild and harmleſs animal; but when provoked, its only power of hurting is by violently diſcharging its excrements, which it will throw to ſix or eight foot diſtance, and which ſtain people's cloaths with indelible yellow ſpots, and leave a horrible ſtink which remains a long time on them.

The creature in many reſpects reſembles the rackoon, but differs in its offenſive ſmell, and in this remarkable manner of diſcharging its excrements.

Hernandez mentions two other ſpecies of it; the one variegated with numerous white ſtreaks, but this is called by no diſtinct name among the inhabitants; the other they name the *conepatl*, this has only one longitudinal ſtreak on each ſide the back, which run into the tail. *Ray's* Syn. Quad. p. 184.

Z.

Z. This letter formerly ſtood as a mark for ſeveral ſorts of weights. Sometimes it ſignified an ounce and half, and very frequently it ſtood for half an ounce; ſometimes for the eighth part of an ounce, that is a dram Troy-weight; and it has in earlier times been uſed to expreſs the third part of an ounce, or eight ſcruples.

ZZ, theſe letters were uſed by ſome of the antient phyſicians, to expreſs myrrh. At preſent they are often uſed to ſignify *zinziber*, or ginger.

ZAARA, a word uſed by the Arabian phyſicians, to expreſs the *vigilia morboſa*, or continual watchings of perſons in many illneſſes.

ZACINTHA, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the ſemifloſcular kind, the ſemifloſcules are placed on the embryo-fruit, and are all contained in a general ſcaly cup. This cup finally becomes a ſtriated head, compoſed of ſeveral capſules, each of which contains one ſeed winged with down.

There is only one known ſpecies of this plant, which is what has uſually been called by authors *chicorium verrucoſum*, the wart gum-ſuccory. *Tourn.* Inſt. p. 476.

ZACYNTHUS, an epithet uſed by the antients to a liquid bitumen, from the iſland Zant.

ZADURA, in the materia medica of the antients, a name given to a foreign root, which was round and ſmooth, and of the colour of ginger.

It was at that time imported from the Indies, and greatly eſteemed in peſtilential caſes.

ZAFFABEN, a word uſed by ſome of the chemical writers, to expreſs putty.

ZAFFER, or ZAFFRE, in chemiſtry, the name of a blue ſubſtance, of the hardneſs and form of a ſtone; and generally ſuppoſed to be a native foſſil.

It is in reality, however, a preparation of cobalt; the calx of that mineral being mixed with powdered flints and wetted with water to bring it into this form. *Hill's* Hiſt. of Foſſ. p. 625. See the article COBALT.

To prepare this for uſe in the glaſs-trade, put it in groſs pieces into earthen pans, and let it ſtand half a day in the furnace; then put it into an iron ladle to be heated red hot in the furnace; take it out while thus hot, and ſprinkle it with ſtrong vinegar; and when cold, grind it on a porphyry to an impalpable powder, then throw this into water in glazed earthen pans; and when it has been well ſtirred about, let it ſettle, and pour off the water: Repeat this waſhing often, and the foulneſs of the *Zaffre* will be thus wholly ſeparated: Dry the powder and keep it for uſe.

ZAFFRAMEN, a word uſed by ſome medical writers, to expreſs ſaffron.

ZAFFRAN, a word uſed often in authors to expreſs ſaffron, but ſometimes as the name of other things of a yellow colour; thus ochre was called by this name.

ZAFRANIA, in colours, a term uſed by the Greeks, to expreſs the yellow of ſaffron. The barbarous writers of the after-ages tranſlated it into the Latin *crocietas*, or ſaffron-colour.

The later Greek writers only uſe it, and they have taken it literally from the Arabians Aviſenna and Serapio. This was a term uſed by them to expreſs the colour of the fine bole-armenic of Galen, which they tell us ſtained paper to a fine and beautiful gold colour.

ZAGI. See the article ZEGI.

ZAGU, in the materia medica, the name given by ſome authors to the ſago-tree, the *todda pauna*, or *palma fructu pruniforme*. *Jonſ.* Dendr. p. 144.

ZAHIA, a word uſed by the Arabian phyſicians, to expreſs a ſort of dyſentery, in which there was a very large diſcharge of blood from the rectum, attended with an evident ſenſation of abraſion, or pain in the bowels.

ZAIBAC, one of the many names by which the antient chemiſts have called mercury.

ZAIDIR, a name by which ſome of the chemical writers have called verdigreaſe, or the ruſt of copper; and others, the metal itſelf; and ſome braſs.

ZAIN, in the manege. A horſe is called in French *Zain*, that is of a dark colour, neither grey nor white, and without any white ſpot or mark upon him.

ZAMECH, a name given by ſome writers to the lapis lazuli.

ZAMPOGNA, in the Italian muſic, is uſed to denote any inſtrument that ſounds like a flute; and particularly a bagpipe, being an aſſemblage of divers pipes of different ſizes. It is alſo taken for a common flute.

ZANNA, the name of a medicinal earth, deſcribed by Oribaſius; he ſays, it is found in Armenia, in that part which borders on Cappadocia; and that it is very drying and of a pale colour, and eaſily diſunited by water, falling into a fine powder like lime.

It is called by the natives *Zarina*, and the mountain from which it is taken is near the city Baganona. It is of a drying and aſtringent nature.

ZANNICHELLIA, in botany, a name given by Micheli, to a genus of plants, called by others *algoides*, *aponogeton*, and *gramine folia*.

The characters are theſe: It produces diſtinct male and female flowers, which always ſtand very near one another. The male flower has neither cups nor petals, but conſiſts only of one erect ſtamen or filament, which is conſiderably long,

leaves, and is terminated by an oval anthera. The female flower has a bellied perianthium compofed of one leaf divided into two at the end. There are no petals. The piftil has feveral corniculated germina, with as many fimple ftyles with plain ftigmata of an oval figure. The feeds follow thefe, and are as many in number as there were horns or germina; they are oblong, pointed at each end, and gibbous on one fide, and are covered with a fkin or rind. *Linnæi* Gen. Pl. p. 444. *Vaillant*, A. G. 1719. *Ponteder* Anth. *Dillen*. Gen. p. 169.

ZANONIA, in botany, the name of a genus of plants, the characters of which are thefe: It produces feparate male and female flowers; in the male flower the cup is a perianthium, compofed of three leaves of an oval figure, expanding every way, and fhorter than the flower. The flower is monopetalous, but divided into five fegments, and has an open mouth. The fegments are jagged, and are equal in fize, and bend backwards. The ftamina are five filaments of the length of the cup, ftanding open at their ends, and terminated by fimple apices. The female flowers grow on feparate plants, and have the cup and flower the fame as in the male, only that the cup ftands upon the germen of the piftil. This germen is oblong, and from it are propagated three reflex conic ftyles. The ftigmata are bifid and curled; the fruit is a long and very large berry, truncated at the end, and very fmall at the hafe. It contains three cells, and has a curled future near the apex; the feeds are two; they are of an oblong figure, and flat *Linnæi* Gen. Pl. p. 477. H. Malab. vol. 8. p. 47. 49.

ZANTHENES, in natural hiftory, a name given by the antients to a foffile fubftance found in Media. Pliny quotes Democritus for faying, that if rubbed in palm wine and faffron, it became as foft as wax, and yielded a very fweet fmell.

ZARFA, in botany, a name given by Leo Africanus, and others, to the *lotus* or nettle tree.

It has been doubted by fome what tree he meant, but his own defcription of the *Zarfa* clears it up: he fays, that the leaves of the tree are like the nettle, the fruit like a cherry, but fmaller, and in tafte very much like the jujube; and that the Arabians call it *rabich*.

ZARIFU, a word by which fome of the chemical writers have expreffed tin.

ZARNAB, in the materia medica, a term ufed by Avifenna and Serapion to exprefs the *carpefia* of the antient Greeks.

This was an aromatic drug ufed as a fubftitute for cinnamon, and was the young fhoots of the tree which produces the cubebs, or fome other fuch fhrub. It was a fine aromatic, ftomachic, and cordial.

Galen gives an account of two kinds of it, called *Laerticum* and *Pontiacum*, from the names of places where they grew: both thefe feem to have been the roots of the fame tree, and both to have been produced in the fame country Pamphilia, but on two different mountains there.

Some are of opinion that the *Zarnab* of the Arabians, and *carpefia* of the Greeks, were not the fame thing, but two drugs very like one another; but though Paulus Ægineta, and fome others are of this opinion, it fcarce feems clearly made out. See the article CARPESIA.

ZARNACH, the fame as the word *Zarnich*; the name of the orpiment of the Arabians. See ZARNICH.

It was not confined however to this fenfe alone, but was ufed as a name for other things ufed in painting, and particularly for the *lapis armenus*.

Aetius tells us, that the Syrians called the *lapis armenus Zarnach*, and many others have followed their example. Diofcorides and Theophraftus keep the words, and the things fignified by them, wholly feparate. They call the *lapis armenus* by the name of *armenion*, and the *Zarnach* by that of *arrenecon*, that is orpiment. The red and yellow orpiment were both called by this name, only with the addition of an epithet that expreffed the difference of colour. Diofcorides indeed mentions a fort of red arfenic, different from the red orpiment, which he fometimes calls *fandarach*; but the Arabians confound all thefe things under the name *Zarnach*. See the article CARNID.

ZARNICH, in natural hiftory, the name of a genus of foffils; the characters of which are thefe: They are inflammable fubftances, not compofed of plates or flakes, but of a plain fimple and uniform ftructure, not flexile nor elaftic, foluble in ore, and burning with a whitifh flame, and noxious fmell like garlick.

Of this genus there are four known fpecies: 1. A red one, which is the true *fandarach*. (See the article SANDARACH.) 2. A yellow one, found in great abundance in the mines of Germany, and frequently brought over to us among and under the name of orpiment. 3. A greenifh one, very common in the mines of Germany, and fold in our colour-fhops under the name of a coarfe orpiment. This is alfo found in our own country among the tin mines of Cornwall. And, 4. A whitifh one, a very remarkable fubftance, which has the property of turning black ink to a fine florid red. This is common in the mines of Germany, but is of little value. *Hill*'s Hift. of Foffils, p. 40.

ZARUTHAN, in furgery, a word ufed by fome to exprefs a hard and unequal tumor of the breaft, attended with a burning heat, and a violent but not continual pain.

This is by fome refer'd to the cancer, and accounted a fpecies of that terrible diforder: its caufe is fuppofed to be a fharp ichorous humor in the blood.

ZAUROS, in ichthyology, a name given by the antient Greeks to that fifh which we call *faurus* and *lacertus*, and which is called at Rome the *tarantola*.

It is truly a fpecies of the ofmerus, and is diftinguifhed by Artedi by the name of the ofmerus, with eleven rays in the pinna ani. See the articles OSMERUS and SAURUS.

ZEA. In the writings of the antient Greeks, this word fometimes is ufed to exprefs the libanotis. Diofcorides tells us that the libanotis was by fome called *Zea*, and by others *cachrys*.

It is remarkable alfo, that the word *cachrys* is by fome ufed to fignify the libanotis, and by others for the *Zea*. There cannot well be conceived two more different plants than the *Zea* and the libanotis, the one being a corn, and the other a tall umbelliferous plant; and it is therefore unaccountable that that the Greeks and Romans fhould have borrowed of one another the cuftom of calling them both by the fame name.

The word *Zea*, when taken out of this ambiguity, and afcertained as the name of a corn alone, is yet not certain and determinate in its fenfe in the various writers; moft indeed make it the name of the fpelta, or fpelt corn; and this certainly is keeping up to the fenfe of Diofcorides, whofe *Zea* is evidently the fpelt corn. He mentions two kinds of it, the monococcous and the dicoccous; that is, fuch as has only one grain or two in a hufk.

The *Zea*, or *Zeia* of Theophraftus, is alfo evidently the fame with the *Zea* of Diofcorides, according to his defcription; but there is much doubt whether it can be allowed to be the *Zea* of later writers in the fame language. Theophraftus fays, that the *Zea* is the lighteft of all corn; and in this Diofcorides agrees with him: but Mnefitheus in Athenæus fays, that the grain *Zea* is heavy, and the bread made of it the heavieft and hardeft to be digefted of that of any grain, and that it was therefore to be eat very fparingly, or it would do mifchief; and that people who had not been ufed to it, could not bear even a little of it without harm.

The fame author adds, that it is a grain only fit to be cultivated in the cold northern climes, where other corn will not well grow; and that people, who could cultivate no other corn, were obliged to be very careful in the making of their bread of this, and always cautious of the quantity they eat of it.

It is fufficiently plain from this, that the *Zea* of this author is wholly different from the fpelt corn, that is, the *Zea* of the antient Greeks. Galen defcribes a *Zea* which he fays he had fomewhere feen, agreeing with the characters of this corn, and making a blackifh, heavy, and unwholfome bread.

The bread made of the fpelt corn, or *Zea* of Theophraftus, is lighter and whiter than any other bread; and the only feed of the corn kind which this heavy and coarfe *Zea* feems to agree with, is that kind of fecale or rye defcribed by Pliny, which he fays was efteemed a very bad grain, and only eaten when no other could be had, and which he defcribes as growing up with a thin ftalk, but bearing a great quantity of feeds, and thofe black, heavy, and of a bitterifh, difagreeable tafte. This agrees with the *Zea* of Mnefitheus, in growing where no other grain would, and in all its other properties.

Many authors make the fecale and olyra to be the fame, and many alfo make the olyra and *Zea* to be the fame; and thence rye and *Zea* are by many brought to be the fame corn. Herodotus tells us of the Egyptians ufing olyra, or, as it is otherwife called, *Zea*; fo he expreffes himfelf. And Hefychius fays, that *Zea* is a kind of grain otherwife called *olyra*; and Nicomedes fays, that olyra is a name given to a kind of grain otherwife called rye or fecale.

This author probably means the fecale of Pliny already defcribed, which is not the common rye, but the fame grain with the *Zea* of Mnefitheus. Diofcorides mentions olyra as a grain of the fame genus with what he calls *Zea* or fpelta, but of a different fpecies; therefore whatever authors meant by thefe words at other times, it is evident that the olyra in the days of Diofcorides, was very different from rye. The antients in general are very perplexed and confufed in their accounts of the bread corns; but thus much may be known with certainty of the meaning of the different writers on this fubject, and this may be a very fair ftep to the unriddling all the reft.

ZEBET, a word ufed by fome of the chemical writers to exprefs dung.

ZEBLICIUM *marmor*, in natural hiftory, a name given by feveral authors to a foft green marble variegated with black and white; and though the authors who have defcribed it have not obferved it, yet it no way differs from the white ophites of the antients. *Hill*'s Hift. of Foffils, p.485. See the article OPHITES.

ZEBRA, in natural hiftory, the name of an animal of the afs kind, common in Africa and in fome part of the Eaft-Indies. It is of the figure and ftature of the mule, but is very different in colour, being very beautifully variegated with fmall broad ftripes of black, white, and brown, drawn from the ridge of the back to the belly. It is a very fwift creature, and

and large droves of them are ufually feen together. *Ray*'s Syn. Quad. p. 64.

ZEFR, a word by which fome of the chemical authors exprefs pitch. See the articles PITCH and TAR.

ZEGI, or ZAGI, a word ufed by Avifenna and others, to exprefs all the feveral vitriolic minerals.

Avifenna fometimes writes it *alzagiat*. Some have fuppofed it only the name of the *calcitis*; but Avifenna tells us, that there are feveral kinds of it, the one yellow, which is *colcothar*; another white, which is *calcadis*; a third green, which is *chalcanthum*, or common vitriol; and a fourth red, which is *fory*. See the article COLCOTHAR, &c.

The old interpreter of Avifenna renders the word *Zagi* by *atramenta*, inks, and this has been much cenfured as feeming to exprefs their being all black; but this is not a juft cenfure. The word *atramentum* is ufed by many good authors to fignify ink, and all the falts of which ink is made, that is, all the forts of vitriol. See the article INK.

ZEHERECH, a word ufed by fome of the chemical writers to exprefs flowers of brafs.

ZEITRABRA, a term ufed by fome of the chemifts to exprefs any thing that is fluxile.

ZELEM, in the materia medica of the antients, a name given by Avifenna and others to a fruit common in Africa in their time, and much efteemed by the people of that country, and called there by fome *piper nigrorum*, the black people's pepper, or negro-pepper.

We have at this time given this laft name to the *capficum*; but that is very different from the plant thus called by thefe writers. Avifenna tells us, that the *Zelem* was a fattifh feed, of the fize of a cich, and of a high flavour, in colour yellow on the outfide, and white within, and that it was brought from Barbary. It has been fuppofed by fome, that the *Zelem* of the Arabians was the *trafi*, or fweet cyprus-root, dug up to be eaten in the manner of the pignut. But it is plain, from this account of Avifenna, that this is an erroneous opinion, the *Zelem* being evidently a fruit, not a root. He adds, however, that there was another plant, properly called *fulful alfuaden*, that is, *piper nigrorum*. This, he fays, was a feed contained in pods like kidney-beans, and was black, and of a pungent and acrid tafte.

This was the fame plant with that afterwards called *piper Æthiopum*, or Æthiopian pepper, which all authors figure and defcribe as growing in pods.

Guilandinus grofsly miftakes Serapio, who fpeaks alfo to this effect, and fuppofes that he fays all this of the *Zelem*, which he only fays of the Æthiopian pepper, or what was properly called *piper Nigrorum*. This author, fpeaking of the *Zelem*, calls it *hab*, which word the Arabians never ufe for a feed of a plant contained in pods, but always for the round and fingle fruit of a tree, as a berry, or the like. And Rhafes, where he is fpeaking of the virtues of feveral fruits, brings in this *Zelem* among them. From the whole, we may at leaft clear ourfelves of a great many errors in regard to the *Zelem*, by proving what it is not, though we cannot eafily fay what it is.

ZELPHI. See the article ZENDA, infra.

ZEMA, a word ufed by many of the old writers for a decoction or apozem.

ZEMASARUM, a word ufed by fome of the chemical writers, as a name for cinnabar.

ZEMECH, a word ufed by fome writers as a name for *lapis lazuli*.

ZEMIA, Ζημια, among the Athenians, is fometimes taken in a large and general fenfe for any kind of punifhment; but more frequently for a pecuniary mulct or fine laid upon the criminal, according to the degree of his offence. *Potter*, Archæol. Græc. T. 1. p. 129.

ZEMPHYRUS, in the materia medica of the antients, a name given to a precious ftone, the fragments of which they ufed as a cordial and fudorific.

It appears by their accounts, that this ftone was blue; and hence many have too haftily judged, that it was the *lapis lazuli*; but in truth it was the fapphire.

The word *Zemphyrus* is no where ufed, but in the writings of the later Greeks, and it is plainly formed, as moft of their names of things are, on the Arabian word, expreffing the fame thing. This Arabian word is *femphir*; and this, in Avifenna and Serapio, is always ufed as the name of a fapphire, never as that of any other gem. We find alfo by their accounts, that this fapphire was not the fapphire of the antient Greeks; but the fine blue pellucid gem we now know by that name; for the fapphire of Theophraftus, and the other old writers, was only a kind of lapis lazuli.

ZENDA, a general term coined by Paracelfus, by which he and his followers exprefs extraneous or equivocal generation, or the production of bodies without a feminal principle. The word *zerunda* is ufed to exprefs this particular fort of generation of men, and *zelphi* in regard to other animals.

ZENECHDON, a term ufed by the Arabian phyficians for a preparation of arfenic, for external ufe; *zeech* being their name for arfenic.

ZENEXTOR, one of the many names by which the chemifts have called mercury.

ZENGIFUR, a word by which fome of the chemical writers have expreffed cinnabar.

ZENI, a word ufed by many of the chemical writers as a name for vitriol.

ZENICON, the name of a poifon, compofed of feveral ingredients, and ufed to poifon the tips of the arrows with which the Celtic hunters fhot at the beafts they purfued for food. The poifon was known to be of that quick fpreading nature, that as foon as the beaft was fallen, the huntfman ran up to it, and cut out a large piece of the flefh about the wound, immediately to hinder the venom from fpreading farther. The antidote to this poifon was fuppofed to be the leaves of oak, beech, and other trees.

ZENITH (*Cycl.*)—*Zenith* is alfo a word ufed by fome medical writers to exprefs the firft appearance of the menfes in young women.

ZENUPH, in the Jewifh antiquities, a kind of tiara worn by the kings of Juda. See the article CIDARIS.

ZEOPHILOS, a word ufed by Quercetan as the name of an antimonial medicine.

ZEOPHYRUM, in the materia medica, the name of the *triticum æftivum*, or *hordeum nudum*, as it is called by fome authors, the naked barley. *Dale*, Pharm. p. 260.

ZEPHYRI *Fœtus*, a term ufed by Hartman, and fome other writers, to exprefs a mole, or falfe conception.

ZERICHUM, a name given by fome of the chemical writers to arfenic.

ZERNA, a word ufed by fome of the chemical writers to exprefs an ulcerated lepra or impetigo; the chemical authors ufe it alfo as a name for the foulneffes which they call the *lepræ metallorum*, or leprofies of metals.

ZERTA, the *Zerte*, a fifh caught in the rivers of Italy, and fome other places, of the figure of the chubb, and called by authors, *capito anadromus*, and the *blike*.

It very much approaches to the figure of the nafus, and has by fome been efteemed the fame fpecies of fifh. It is of a long, and not flat fhape, of a bright filvery colour, and covered with fmall fcales. Its back is of a brownifh hue, and its belly-fins of a mixed reddifh and bluifh colour; the fide-lines reaching from the gills to the tail, are fpotted with brown dots. Its head is thick, and its eyes large and white. Its mouth is foft and toothlefs; but the beginning of its throat is armed with ftrong and fharp teeth, feven in number. It feldom grows to more than two pound weight, and, at times, lives in rivers, at times in the fea; and is efteemed a very well tafted fifh, efpecially a little before the feafon of its fpawning. *Ray*'s Ichthyogr. p. 257.

The *Zerte* is that fpecies of cyprinus defcribed by Gefner and others under the name of *capito anadromus*. See the articles CAPITO and CYPRINUS.

ZERUMBETH, in the materia medica, a root found both in the Eaft and Weft Indies. The plant producing it is called by Pifo and Marggrave, *paco-ceroca*, and by Sir Hans Sloane, *zinziber fylveftre*. See the article GINGER.

It is of a yellowifh grey colour on the outfide, but whiter within; when cut, it fhews a very fmooth and gloffy furface; its fmell is very aromatic and agreeable, and its tafte very acrid, fcarce lefs fo than ginger.

It is good in nervous cafes, and on all other occafions that zedoary is. See the article ZEDOARY, *Cycl.*

ZESTOLUSIA, a term ufed by fome medical authors to exprefs bathing in warm water, by way of diftinction from *pfuchrolufia*, or bathing in cold water.

ZETETÆ, Ζηληλαι, among the athenians, were officers appointed upon extraordinary occafions, to enquire after the public debts, when through the neglect of the receivers, or by other means, they were run up to large fums, and began to be in danger to be loft, if not called in. *Potter*.

ZETUS, a word ufed by fome of the chemical writers as a name for vitriol.

ZEUGITÆ, Ζευγιλαι, among the Athenians, the third clafs of the people, or thofe who had an eftate of two hundred medimns. *Potter*, Archæol. T. 1. p. 14.

ZEUS, in the Linnæan fyftem of zoology, the name of a genus of fifhes, of the general order of the acanthopterygii, the characters of which are, that the membrane of the gills has bones not parallel, that the body is flat, and the fcales are fharp. Of this kind are the aper, faber, &c.

The characters of this genus, according to Artedi, are thefe: The branchioftege membrane does not confift of parallel bones, as in other fifhes, but contains various bones, fometimes laid longitudinally, fometimes tranfverfely, and fometimes obliquely. The fcales are rough, and the body very broad, thin, and compreffed; as is alfo the head. The back-fin is long, and as it were double, being cut in near the middle part, almoft to the bottom or bafe.

The fpecies of this genus are thefe: 1. The *Zeus* with a prickly belly, and a tail rounded at the end. This is the *faber* or *john doree*. 2. The forked-tailed *Zeus*. This is the *faber indicus*, or *piexe gallo*. 3. The red *Zeus*, with an even tail, and with the fnout bending upwards. This is the *aper* of

of Rondeletius, and the *riondo*, of the Italians. *Artedi*, Gen. Pisc. p. 35.

ZIBELLINA, or the *Mustela* ZIBELLINA, in zoology, the name of the creature whose furr is the *sable*, so much valued among us.

It is an animal of the weasel-kind, of the size of a cat, and of a dusky yellow colour, with a mixture of a deep brown; the anterior part of the head, and the ears, are of a brownish-grey, and the hairs about its eyes, nose, and mouth, very long. *Ray*'s Syn. Quad. p. 201.

ZIBETHICUM *Animal*, in zoology, the name of the creature commonly, but very improperly, called the *civet cat*; for it does not at all belong to the cat kind; but wholly to that of the dog; the head and nose are plainly of the figure of the dog's; and the figure, number, and disposition of the teeth, are plainly the same as in the wolf, fox, and dog.

Its colour varies very much; its more usual one, however, is that of a pale grey, variegated with long black streaks, though in the females it is often yellowish, and sometimes whitish, and the spots black and round, like those of the leopard, or cat of mountain.

The whole shape of the creature approaches to that of the wolf or dog; its snout is long and small; its ears are small and roundish; its hairs are like those of the badger, but very soft. It body is thick and fleshy, and something resembles the shape of a hog's; its feet are small, and its legs very short. The bags which contain the civet are placed between the anus and pudenda, and are found equally in the males and females; but in the male they are twice as large as in the female; they have a large cavity in their internal part, and their orifice is small and cartilaginous. The perfumed liquor which is found in these bags, seems to be secreted from a number of glands, which lie between the two skins, of which they are composed. See Tab. of Quadrupeds, N°. 16.

It is remarkable, that in this creature, as in the badger, its nose and belly are black, whereas in almost all other animals these parts are either whitish, or much paler than the rest. These creatures copulate backwards. *Ray*'s Syn. Quad. p. 178.

ZIBIBIÆ, in natural history, a name given by some authors to a large sort of raisins, resembling the stones of dates in shape; they have much pulp, but very little moisture.

ZICCARA, a name of an Indian fruit, resembling a pine-cone, and containing twenty, thirty, or more, kernels, of no known use in medicine.

ZIDRACH, in natural history, the name given by Cuba, and some other authors, to that species of the syngnathus of Artedi, commonly called the *hippocampus*.

ZIFIUS, in ichthyology, a name given by Albertus to the *xiphias*, or sword-fish.

ZIGER, a word used by some of the old writers, to express a very fine kind of cassia, extremely aromatic to the taste, and of a purplish black in colour.

ZIGURELLA, in zoology, the name by which some have called the *julis*, a small but very beautiful fish, common about Genoa, and in some degree approaching to the nature of the turdus or wrasse. *Willughby*, Hist. Pisc. p. 324. See the article JULIS.

It is a species of the *labrus*, according to Artedi, and is distinguished by the name of the *palmaris labrus*, with two large teeth in the upper jaw. See the article LABRUS.

ZIMENT-*Water*, or COPPER-*Water*, in natural history, the name by which some have called water found in places where there are copper-mines, and lightly impregnated with particles of that metal.

The most famous spring of this kind is about a mile distant from Newsol in Hungary, in the great copper-mine called by the Germans, *herrn grundt*. It is not easy to say at what time these waters were discovered, since there is no authentic account of it. Kircher, Brown, Toll, and others, mention them as well known in their times; but it is probable that they were not discovered in the days of Agricola, since he no where makes the least mention of them; and it is not probable that so great a curiosity, and that so immediately in his own way, would have escaped him, if known at that time, especially as he has commemorated the like virtue in the Schmolnich waters, much less famous for it, and of much less power than those of Newsol. The water in this mine is found at different depths, and is received into basons, for the purpose of separating the copper from it: in some of these it is much more highly sated with this metal than in others, and will make the supposed change of iron into that metal much sooner. The most common pieces of iron used in the experiments, are horse-shoes, nails, and the like; and they are found very little altered in shape, after the operation, except that their surfaces are more raised. Philos. Trans. N°. 479. p. 355.

The water which performs this wonderful change, appears greenish in the basons where it stands; but if a glass of it be taken up, it looks clear as crystal: it has no smell, but has a very strong vitriolic and astringent taste, insomuch that the lips and tongue are blistered and scorched on tasting it.

The people who taste this water do not perceive the effect upon their lips, while they are in the mine, otherwise than by a gentle itching; but as soon as they come into the open air, the places where it has touched begin to swell, and matter is at length found in pustules in them.

There is great difference however in the strength of the water at different times, both as to its burning the lips, and its power upon the iron; when the springs yield but a small quantity, it is always much the strongest; but when there flows a very large stream of them, they are always more languid and weak. The caverns in which the basons are placed to receive this water, are of no offensive smell; and what appears somewhat singular, are free from vitriol, which abounds so much in other parts of the mine. There are no crystals, nor filaments of it, seen on the walls; and the stones, which are in other places blue with the admixture of it in their granules, are here white, from its absence. This is probably owing to the humidity of the air in these places, which washes away all the particles of that salt, and carries them to parts of the mine, where they may concrete more easily.

The sides of the caverns near the floor or bottom, very often afford a yellowish earthy substance of a foliated texture, resembling isinglass, and of an insipid taste.

The miners are well acquainted with the virtues of this water, in changing the metals; but they also use it as a medicine; whatever sickness they are seized with, they first attempt its cure by a large dose of this water, which usually both vomits and purges them very briskly.

They also use it in disorders of the eyes, in some of which it must be of great power; but in others, it is very improper; so that upon the whole, they do more harm than good with it.

The copper produced from these waters is valued by the people much beyond any other copper, as being much more ductile, and running easier in the fire, the people in the neighbourhood have many vessels of it; but it is to be observed, that its ductility and hardness grow after it is taken out of the water; for, while immersed in it, it is friable.

It is observed, that after great rains the springs are always fuller than at other times, and the virtues of the water considerably less.

A pound of this water when strongest being evaporated over a gentle fire becomes first turbid and cloudy, and afterwards deposits a yellowish sediment, when evaporated to driness. This sediment is found to weigh two scruples and a half, and when warm water is poured upon this and afterwards filtred, there will be left about six grains of yellowish earth in the filtre; and the greenish solution being again evaporated to a pellicle, and this repeated several times, somewhat more than two scruples of a bluish-green vitriol will be separated in small crystals.

A small quantity of oil of tartar being added to a pound of this water, the whole becomes turbid, and on filtration, leaves a large residuum in the filtre; this when dried will be found to weigh about two scruples and a half, and to be a cupreous vitriol with a very small admixture of a neutral salt.

Finally, if a pint of this water be put into a bottle, and a small piece of iron thrown into it, some bubbles will be immediately found standing on the iron, and it will be by degrees changed to a copper colour; the second day will shew the water considerably turbid, and it will afterwards look whitish, and white filaments will gather about the bottom and sides of the glass, and about the iron, which by that time will look throughout of a coppery colour.

From these experiments we may easily understand what the true nature of the water is, that it contains a large quantity of the vitriol of copper, which it probably owes to a solution of that metal, by means of the acid of the common pyrites and water; when this is known, the effects are not difficultly accounted for, there being no real change of one metal into another; but the true state of the case being that the particles of one metal are dissolved and carried away, and those of another metal deposited in their place: A water thus impregnated is a menstruum capable of dissolving iron, and in the solution of that metal becomes so weakned as to let go the copper it before contained, in small parcels. This is seen to be the case, by examining the changed metal while it lies in the water, the copper then appearing not a soft malleable and even mass, but a congeries of granules closely placed together, and resembling the small granules or ova in the spawn of fishes; and it is very friable and fragile while in this state.

This solution of one metal and deposition of the particles of another in its place, is a thing very familiar in chemistry, and is seen every day in numerous instances; but in none so familiar as in a like case, or solution of iron and of copper in the same menstruum. Thus, if a piece of copper be dissolved in aqua fortis, and when this solution is perfected a piece of iron be thrown into the liquor, the same thing will be seen that is in this spring, for the iron will be dissolved, and the copper which was before dissolved in the menstruum will be slowly precipitated and deposited in the place of it.

This water can only depoſit ſo much copper as it before contained, in the ſolution; and this appears upon experiment to be much leſs than might have been imagined, the quantity being no more than in every pound ſo much as can be contained in about two ſcruples of vitriol; that being the utmoſt quantity ſeparable from it, with all the art that could be uſed. Thoſe people are therefore greatly miſtaken, who ſuppoſe, that if ever ſo much iron be put into the water there will be as much copper precipitated in its place. The quantity of copper, however, annually obtained in this manner is conſiderable, as the waters are conſiderable in quantity. Phil. Tranſ. N°. 479. p. 359.

ZIMEX, a word uſed by ſome of the old chemical writers, for verdigreaſe.

ZINARIA, a word uſed by the Arabians, for a kind of vitiated bile, called æruginous bile.

ZINC. See the article ZINC, *Cycl.* and *infra.*

ZINETUS, a word uſed by Paracelſus, as a name for one of the braſs-like marcaſites.

ZINGAR, a word uſed by ſome of the chemical writers for verdigreaſe; and by others for the flos æris, or flowers of copper or braſs.

ZINGI, in the materia medica, the name of a ſeed, ſometimes alſo called the aniſum ſtellatum, or ſtarry-headed aniſe. *J. Bauhin.* V. 1. p. 586.

ZINGIBER. See the article ZINZIBER, *Cycl.* and *Suppl.*

ZINGNITES, or ZINGRITES, a ſtone deſcribed by Albertus, Ludovicus Dulcis, and other writers of that time, and ſaid to be of a cryſtalline tranſparence; they give us no farther deſcription of it, but attribute a number of imaginary virtues to it.

ZINIAR, a name given by ſome of the chemical writers, for verdigreaſe.

ZINIAT, a word uſed by the old chemical writers, to expreſs either the action of fermentation, or any thing that is capable of exciting it in bodies.

ZINK, (*Cycl.*) in natural hiſtory, the name of a very remarkable foſſile ſubſtance, reſembling biſmuth in appearance, but of a bluer colour.

It is a very remarkable mineral, and one that has never been well underſtood as to its origin, till of late; for though the world well knew of a long time both *Zink* and *lapis calaminaris*, and knew that both of them had the remarkable property of turning copper into braſs, which one would think might have given a hint to the diſcovery of a natural alliance between them; yet have they been ever treated of as two different ſubſtances, by the writers on theſe ſubjects; and Dr. Lawſon was the firſt who ever publicly declared, and proved, *lapis calaminaris* to be the ore of *Zink*. See the article CALAMINARIS *Lapis.*

Zink is generally confounded with biſmuth, though in reality a very different body; but the regulus of theſe two minerals having a very great external reſemblance, the vulgar have not diſtinguiſhed them; and hence we hear of many ores of *Zink* in the leſs accurate writers, all which are truly the ores of biſmuth.

The *lapis calaminaris* is the true and general ore of *Zink*, yet that mineral is not confined to this ore alone, but is mixed in great abundance in its diſſeminated particles among the matter of the ores of other metals, particularly of lead. Our artificers have long been acquainted with *Zink*, under the name of *ſpelter*; but none of them till of late have ever been able to make any gueſs as to its origin. We have much *Zink* brought to us from the Eaſt-Indies, under the name of *tutenag*; yet no body ever knew from what, or how it was produced there; and all that was heretofore known of it was, that among that ſtrange mixture of ores which the great mine yields at Goſſelaer in Saxony, when they were fuſed for other metals, a large quantity of *Zink* was produced; but Dr. Lawſon obſerving, that the flowers of *Zink* and of *lapis calaminaris* were the ſame, and that their effects on copper were the ſame, never ceaſed his inquiries till he found the method of ſeparating *Zink* from it.

The pure *Zink* is a ſolid metal-like body, of a bluiſh white, and ſomewhat leſs brittle than biſmuth, eſpecially when gently heated, and moſt of all the metallic minerals approaches to malleability: It melts in a very ſmall fire, and in a ſtrong one takes fire, burning with a bluiſh-green flame, and ſubliming into white flowers, which are with difficulty reducible again into the form of *Zink*: In an open fierce fire, it wholly flies off in vapour.

There is great reaſon to believe, that all the *Zink* or *tutenag* brought from the Eaſt-Indies, is procured from calamine; and we have now on foot at home, a work eſtabliſhed by the diſcoverer of this ore, which will probably make it very ſoon unneceſſary to bring any *Zink* into England, as we have great plenty of the calamine. *Hill's* Hiſt. of Foſſ. p. 626.

The manner of extracting *Zink* from the lapis calaminaris, is this: The lapis calaminaris muſt be finely pulverized, and well mixed with an eighth part of charcoal-duſt, and put into a cloſe retort to prevent the acceſs of the air, which would inflame the *Zink* as it riſes. The retort is to be placed on a violent fire, ſufficient to melt copper. After ſome time the *Zink* riſes, and appears in the form of metallic drops within the neck of the retort. When the veſſel is cool, it muſt be taken out, by breaking off the neck of the retort. *Marggraf.* in the Mem. de l'Acad. de Berlin, 1746.

Mr. Marggraf obſerves, that different ſorts of lapis calaminaris, ſuch as the Poliſh, Hungarian, and Engliſh, afford different quantities of *Zink*. And that a particular kind found in England, gave near half its weight of *Zink*.

This extraction of *Zink*, does not always ſucceed. Some calamine from Bohemia and Aix-la-chapelle yielded nothing. But then, as theſe kinds did not tinge copper with a yellow colour, nor produce any change in it, he thinks them not true calamine. Hence he concludes, that a ſtone which mixed with charcoal, and expoſed to the moſt vehement action of a cloſe fire, produces no *Zink*; or which, in an open fire, does not produce braſs with copper and charcoal, is not true lapis calaminaris.

Zink, produced in the manner above-mentioned, may be hammered into thin plates; which cannot be done with the common *Zink*. We muſt refer to the learned author for ſeveral other obſervations relating to *Zink*, and its flowers. See the article *White* VITRIOL.

Mr. Boyle tells us he diſſolved *Zink* in an urinous ſpirit, and then put to it a quantity of acid ſpirit; but though a manifeſt conflict aroſe, yet the *Zink* remained diſſolved in the mixture. *Boyle's* Works abr. Vol. 1. p. 521.

Zink may be diſſolved, not only by aqua-fortis, aqua-regia, oil of vitriol, ſpirit of nitre, ſpirit of ſalt, and other mineral menſtruums; but alſo by vegetable ſpirits, as diſtilled vinegar; and by animal ones alſo, as ſpirit of ſal armoniac, and ſpirit of human blood. Ibid. Vol. 3. p. 478.

Mr. Boyle obſerves, that if the ſeveral ſolutions of this mineral be compared, it will ſhew what a variety of taſtes is producible from one inſipid body, by aſſociating it with different menſtrua. Works abr. Vol. 1. p. 541.

The ſame author tells us, that by the help of *Zink*, duly mixed after a certain manner, he has given copper as rich a golden colour as ever he ſaw in the beſt gold. Ibid. Vol. 2. p. 180.

Zink gains weight by ignition. *Boyle*, ibid. p. 391. §. 11. But quære the circumſtances of the experiment; for in the ſame book, p. 395. §. 26. the filings of *Zink* put in a boltglaſs with a ſlender neck, and ſet upon quick coals for four hours, loſt weight.

Flowers of ZINK. The flowers of *Zink* are a ſubſtance famous in the writings of the chemiſts, who have led their followers into a thouſand errors by the names by which they have called them.

Some have called them *talc*, and a ſolution of them in vinegar, *oil of talc*; to which they have attributed very extraordinary qualities. Some have ſet the ignorant upon a fruitleſs attempt of extracting an oil from Venetian talc, to do all the things they have commemorated of this oil. Others have called theſe flowers the *ſericum*: Others the *aqua ſicca philoſophorum*; and others the philoſophic cotton.

The moſt ſimple and eaſy way of obtaining the flowers of *Zink* pure and white, is this: Melt the *Zink* in a tall crucible inclined in the furnace in an angle of 45 degrees or thereabouts; let the fire be moderate, little ſtronger than would be neceſſary for the melting of lead. If the *Zink* is left in this ſtate without being ſtirred, it forms a grey cruſt upon its ſurface, and becomes calcined by degrees under it into a granuloſe white ſubſtance; but to have the flowers, the matter muſt be ſtirred from time to time with an iron rod, and this cruſt broken as often as it ariſes; there will then after ſome time appear a bright white flame, and about two inches above it there will be found a very thick ſmoak, and with this there will ariſe a quantity of very white flowers, which will fix themſelves to the ſides of the crucible in the form of fine cotton.

Theſe flowers are to be ſeparated at times, and by careful management there may be collected from the *Zink* a greater weight of flowers than its own weight, when put into the fire. In working four pounds of *Zink* in this manner, there will be only about an ounce of a calcined earthy matter left at the bottom of the crucible, and the quantity of flowers will be about two drams and a half in each pound, more than the quantity of *Zink*; beſide that, it is eaſy to conceive from the manner of making them, that a great quantity muſt have been carried away with the ſmoak. And this is not to be prevented, ſince if the veſſel be cloſed to keep in the fumes, the external air being denied free acceſs, the ſublimation immediately ceaſes, and no more flowers can be obtained, till the veſſel is again opened, and the air admitted.

The fumes of *Zink* have a ſtrong ſmell of garlic, and are very noxious to the lungs. The reducing *Zink* into theſe flowers, is the deſtroying it abſolutely as to its metallic form; for none of the methods uſed by chemiſts to bring back metals to their original ſtate, are able to bring theſe flowers to *Zink* again.

Mr. Hellot, of the Academy of Sciences of Paris, who has given a very accurate analyſis of *Zink*, has tried the diffe-

rent acid menftrua upon it with very great care and attention to their effects.

Diftilled vinegar was firft tried. Eight ounces of this diffolved, in ten days time, over a gentle fire, an ounce all but fix grains of *Zink*; and after this it ceafed to act upon the metal any longer, and was fweetened in the manner of vinegar which has diffolved lead: This, however, is an experiment not proper to be tried by the tafte, the folution being very mifchievous. Six ounces and two drams of an infipid phlegm were diftilled from this folution, and after this the fire being increafed, ftriæ began to appear on the top of the retort; the receiver being changed, there fucceeded to thefe ftriæ a fublimation of very white and beautiful flowers of *Zink*; and after this a few drops of an oil, yellow at firft, and afterwards green, came over into the receiver. The diftillation yielded alfo about four drams of a fulphureous liquor, inflammable as fpirit of wine. This liquor being poured into a phial of water, at firft fwam upon it, and immediately afterwards blended with it in the manner of fpirit of wine, and left only the few drops of oil fwimming on the furface. This was reddifh in colour, and of an aromatic fmell.

This is the famous liquor called by the chemifts oil of talc, and fuppofed to have fo many great virtues, one of which is the fixing of filver; that is, in other words, the concentrating it to the weight of gold, and making it indiffoluble in aqua-fortis, rendering it like gold foluble only in aqua-regia; but in all probability, this oil is really nothing but the effential oil of the grape from which the wine was made, whence the vinegar had been obtained; and then how idle muft appear all thefe expectations from it.

The flowers fublimed to the neck of the retort or head of the cucurbit, during the diftillation, burnt at the flame of a candle, emitting a fine blue flame. Three ounces of fpirit of falt diffolve perfectly three drams, except two grains, of *Zink*; a great heat is perceived while this folution is making, and this acid as well as diftilled vinegar leaves untouched a fmall blackifh refiduum, from this metal. Some authors have fuppofed, that this refiduum contained mercury; but experiments prove the contrary, and its lightnefs alone makes fuch a conjecture very improbable.

This folution being diftilled, yielded two ounces of phlegm, two drams of a weak fpirit of falt of a very agreeable fmell; and afterwards, on changing the receiver, a few drops of a very acid and yellowifh fpirit, and fome flowers, raifed themfelves to the neck of the retort.

Six ounces of fpirit of nitre diffolves five drams and a half of *Zink*, without leaving any remainder; and the remainder left in the folutions of it by diftilled vinegar, and by fpirit of falt, is itfelf foluble in this menftruum. This folution being diftilled, there were feparated four ounces of phlegm, and afterwards fix drams of fpirit of nitre; this was but very weak, and no more could be raifed; the ftronger part of the acid remaining intimately mixed with the *Zink* at the bottom of the veffel, in form of a vifcous tranfparent fubftance, of a yellow or orange colour.

Three ounces of oil of vitriol, with an equal quantity of water, diffolved fix drams and twenty grains of *Zink*; when the liquor was thus far faturated there began to be formed regular cryftals; and after two months ftanding the whole liquor was evaporated, and a cake of tranfparent vitriol left in the bottom of the veffel. Memoires Acad. Scienc. Par. 1735.

ZINZIBER, *Ginger*. See the articles GINGER, *Cycl.* and ZERUMBETH, *Suppl.*

ZINZIBER *Rubrum*, *red Ginger*, a name by which fome authors have called the officinal caffumunar-root.

ZINZIBER *Caninum*, *Dog's-ginger*, in botany, a name given by fome of the old writers to the *perficaria urens*, or biting arfmart; a plant which is very hot, and pungent to the tafte, and grows in watry places. It had hence the name of *hydropiper*, water-pepper, among the Greeks; and was called *Zinziber caninum*, or dog's-ginger, by Avifenna and others, from its heat, and from an opinion that it would poifon dogs that eat of it.

The Arabian name is *Zinzibil alkeleb*. Avifenna, when he gives the hiftory of it, begins with that of ginger: he fays that he repeats the words of Diofcorides; which he really does, but coupling together the common ginger and this, which he calls dog's-ginger, and thefe being defcribed in two different parts of Diofcorides, the commentator on Garcias accufe him of having taken the name of Diofcorides, and the fenfe of fome other Greek author.

This commentator is the only perfon who has given this part of Avifenna a Latin verfion; but when he fays, that the fruit is fmall and contained in pods, he errs; for the word *ania* fignifying fubftance, not pod; the only meaning of the author is, that the feeds are fmall, and the mifinterpreting his words into the defcription of a podded plant carries away the idea of the arfmart; which is not a podded plant, but is yet the true *Zinziber caninum* of Avifenna, and the *hydropiper* of Diofcorides.

ZINZIBER *Caninum* is alfo a name given by fome authors to the *capficum*, or Guinea pepper. *Ger.* Emac. Ind. 2.

ZINZILLA, a name by which fome medical writers have called that fpecies of the herpes, which we ufually call the *fhingles*. See the article SHINGLES, *Cycl.*

ZIRBALIS *Hernia*, a term ufed by medical writers to exprefs that kind of rupture which is caufed by a defcent of the omentum into the fcrotum.

ZIRBUS, the name by which the Arabian phyficians have called the omentum.

ZIVOLO, in zoology, a name by which fome authors have called the fmaller fpecies of *yellow-hammer*, from its conftant note, which is only *zi*, *zi*.

It is of the fize of the common fparrow; its beak is thick and fhort, its breaft and belly yellowifh, fpotted with brown; and its head, back, wing, and tail of a dufky brown, but two of the tail-feathers on each fide have a variegation of white.

The difference between the male and female in this fpecies is, that the male is yellower, and has fome yellow fpots on its neck and fides, which are wanting in the female. It is almoft always feen on the ground, and feeds on feeds, &c. It feems but little if at all effentially to differ from the common yellow-hammer; and Mr. Ray has fome fufpicion, that they are the fame fpecies. *Ray*'s Ornithol. p. 196.

ZIZANIA, in botany, a name ufed by fome for the *lolium*, or darnel. *Ger* Emac. Ind. 2. See the article LOLIUM.

ZIZANIA, according to Linnæus, is a genus of plants diftinct from the *lolium*, and its characters are thefe: It produces male and female flowers on the fame plant: The male flowers have no cup, but the flower is a bivalve glume compofed of two equal pointed leaves without awns, which furround one another; the ftamina are fix very fhort filaments; the antheræ are oblong and fimple. In the female flowers alfo there is no cup, but the flower is a one-leaved glume of a convoluted figure, having fix nerves running along it, and ending in a point terminated by a long awn or beard. The germen of the piftil is oblong, the ftyle is divided into two parts, and the ftigmata are plumofe; the fruit confifts of the flower itfelf, which continues rolled up, and finally parts off horizontally at the bafe: In this is contained one oblong feed. *Linnæi* Gen. Plant. p. 455.

ZIZERIA, a word ufed by Apicius, and fome other authors, to exprefs the inteftines of fowls of the gallinaceous kind, often ufed in decoctions for glyfters, &c.

ZIZIPHORA, in the Linnæan fyftem of botany, the name of a genus of plants, the characters of which are thefe: The cup is a very long, cylindric, and tubular perianthium; it is compofed of one leaf, and is hairy, ftriated, and at the extremity is divided into five very fmall fegments, and is bearded. The flower is ringent, and compofed of a fingle petal; the tube is cylindric, and of the length of the cup; the limb is very fmooth; the upper lip is ovated, erect, emarginated, and obtufe; the lower lip is broad and patent, and is divided into three rounded, equal fegments. The ftamina are two fimple, patent filaments, of the length of the flower; the ftigma is acuminated, and inflex. There is no fruit, but the cup contains four feeds, which are oblong and obtufe, gibbous on one fide, and angular on the other. Vid. *Linnæi* Gen. Plant. p. 13.

ZIZITH, in the Jewifh cuftoms, a name given by the Jews to the tufts or fringes, they ufed antiently to wear at the four quarters of their upper garments [a]; but which they now only wear under their cloaths, fixed to a fquare piece of cloth, which reprefents the garment they antiently wore in their own country before their difperfion. The *Zizith* of the modern Jews is a tuft made of eight threads of yarn, fpun on purpofe for this ufe; each having five knots, which take up half the length. That which is not knotted, being furled out, makes a kind of tuft or fringe [b].— [[a] Numb. xv. 36. Deuter. xxii. 12. [b] *Leo* of Modena, Cerem. of the Jews P. 1. c. 5. *Calmet.* Dict. Bibl. in voc.

ZIZYPHUS, the *Jujube-tree*, in botany, the name of a genus of trees, the characters of which are thefe: The flower is of the rofaceous kind, being compofed of feveral petals arranged in a circular form; the piftil arifes from the cup, and finally becomes a fruit of the fhape of an olive, and of a flefhy fubftance including a ftone divided into two cells, each of which contains an oblong feed.

The fpecies of *Jujube*, enumerated by Mr. Tournefort, are thefe: 1. The cultivated *Jujube*, with large oblong fruit. And, 2. The wild *Jujube*. *Tourn.* Inft. p. 626. See the article JUJUBE.

The *Zizyphus*, according to Linnæus, is only a fpecies of rhamnus, with oval leaves, and two ftyles; the fruit, or nucleus of which, contains two cells, and its corolla has five fegments.

It is a native of Spain and Italy; and the fruit, which is of the bignefs of an olive, and reddifh when ripe, was once efteemed as a pectoral, and fometimes prefcribed in fevers; but is difregarded in the prefent practice. *Hill*'s Hift. Plant. p. 292.

ZMILACES, in natural hiftory, a name given by Pliny to a ftone found in the river Euphrates, refembling marble, and of a bluifh green colour.

ZMILAMPIS, in natural history, the name of a gem, described by Pliny and the antients, which they tell us was very like the Proconnensian marble, except that in the center of the stone there was always a bluish spot, resembling the pupil of an eye.

The Proconnensian marble of the antients was of a fine clear and elegant white, variegated with irregular black veins. Pliny's description is so short, that it has been supposed from him that the *Zmilampis* was a sort of marble; he only says of it, that it was like the Proconnensian marble, but blue in the middle. Many had inferred from this, that he meant no more by it than that this was a stone, which had blue veins instead of the black ones in the Proconnensian kind. But when we examine the rest of the antients, and find that it was a small stone, found in the river Euphrates, and worn in rings; and that its blue spot was like a pupil of an eye, we may easily determine that it was one of those gems which we call *oculus beli*, or *bellocchio*; of which there are a vast variety found in the rivers of the East-Indies, and many have a fine opake white ground, and a bluish or greenish spot for the pupil.

ZMILANTHES, in natural history, a name given by Solinus, and some others, to a gem called by the more correct writers *Zmilampis*. See the article ZMILAMPIS, *supra*.

ZOCHINACAZTLIS, in botany, a name by which some authors have called the *flos auriculæ*, a flower of New Spain, used in the making of the Spanish chocolate. *Hernand.* p. 30.

ZODIAC (*Cycl.*) ZODIAC *of the comets*. Cassini hath observed a certain tract in the heavens, within whose bound (by many observations) he hath found most comets, tho' not all, to keep. This he makes as broad as the other *Zodiac*, and marks it with signs or constellations like that, which are, *Antinoüs*, *Pegasus*, *Andromeda*, *Taurus*, *Orion*, the *Lesser Dog*, *Hydra*, the *Centaur*, *Scorpion*, and *Sagittarius*.

ZODIACAL *Light*, a brightness resembling that of the milky way, and which is sometimes perceived in the heavens, at certain times of the year, after sun-set, or before its rise. The form of this light resembles that of a pyramid, lying lengthways in the *Zodiac*, within which its point and axis are always inclosed, its base being placed obliquely with respect to the horizon. This phænomenon was first discovered, described, and named by Mr. Cassini the elder. See *Mairan*, suite des Mem. de l'Acad Royale des Sciences, 1731. p. 3.

The *zodiacal light* is nothing but the solar atmosphere, a rare and subtile fluid, either luminous by itself, or made so by the rays of the sun surrounding its globe; but in a greater quantity, and more extensively, about its equator, than any other.

The *zodiacal light* is more or less visible according to circumstances: But the solar atmosphere is not always visible by means of this light, though it be always seen about the globe of the sun in total eclipses.

One of the most essential circumstances for the perception of the solar atmosphere by the *zodiacal light*, is its having a sufficient length on the *Zodiac*; for, without this, its brightness is entirely hid from us by the twilights.

Mr. de Mairan says, it may be proved from many observations, that the sun's atmosphere sometimes reaches as far as the earth's orbit, and there meeting with our atmosphere, produces the appearance of an aurora borealis. See the article AURORA *Borealis*, *Cycl.* and *Suppl.*

The length of the *zodiacal light* varies sometimes in reality, and sometimes in appearance only, from various causes.

The oblique position of this light, little different from that of the plane of the ecliptic, does not permit us to see it distinctly, and sufficiently elevated above the horizon; but some time after sun-set, towards the end of the winter, and in spring, or before sun-rising in autumn, and towards the beginning of winter. Several causes hinder our seeing it, any more than the milky way; such as moon-light and strong twilights, among others.

Mr. Cassini [a] often mentions the great resemblance of the *zodiacal light* to the tails of comets. Mr. Fatio [b] has made the same observation; and Mr. Euler has lately endeavoured to prove them owing to similar causes [c].—[[a] Decouverte de la lumiere celeste que paroit dans le *Zodiaque*, art. 41. [b] Lettre à Mr. *Cassini*, printed at Amsterd. 1686. [c] *Euler*, in Mem. de l'Acad. de Berlin, Tom. 2.] See the article TAILS *of Comets*.

The figure of this solar atmosphere must be lenticular, or that of a flatted spheroid. Mr. de Mairan gives us a draught of its appearance and projection. Lib. cit. c. 4. fig. 2.

The extent of the *zodiacal light* from the sun to its point, is seldom less than 50 or 60 degrees: It has even been known to extend to 100 and 103°. Ib. c. 6.

This light seems to have no other motion than that of the sun itself. Ib. c. 7.

Mr. Euler observes, that if the sun has an atmosphere, the force of the impulse of light issuing from that globe, must drive particles of that atmosphere before it; but as gravity is very strong at the sun, this impulse would never drive those particles beyond the limits of their atmosphere, were it not for the centrifugal force arising from the sun's motion round its axis. This being opposite to the action of gravity, and diminishing its effects, the impulse of the light may considerably dilate the figure of the solar atmosphere, from what it would be if it arose from the gravity and centrifugal force of its particles only; and this dilatation will be very considerable near the sun's equator, and very small towards its poles. The action of light thus diminishing the action of gravity, Mr. Euler attempts to calculate how far this diminution of gravity may increase the extent of the sun's atmosphere about its equator. He finds a cubic equation, the roots of which express the semi-axis, or greatest amplitude of this atmosphere. He adds, that this equation having three real roots, it is possible that the solar atmosphere may become a ring surrounding the sun's globe, as the ring of saturn surrounds the body of that planet. Loc. cit. p. 140.

ZONA, a word used by some authors for that species of herpes which others call the *zinzilla*, and we term the *shingles*.

ZONITES, in the materia medica of the antients, a name given to a kind of tutty, called also *placitis*. It had the latter name from the Greek, πλακος, a crust, it being formed by way of crust on the sides of the furnaces. The latter name *zonites* was given it from its being formed of several coats, which, when broken transversely, had the appearance of belts or zones. See the article FURNACE.

ZONITIS *Cadmia*, a name given by some authors to a kind of cadmia fornacum, from its usually surrounding the upper parts of the furnaces like a girdle or belt.

ZOOLATRIA, Ζωολατρία, a species of idolatry, wherein divine worship was offered to animals. *Hofm.* Lex. in voc.

The word is composed of Ζωον, an animal, and λατρια, worship.

ZOOLOGY, (*Cycl.*) the science of animals. This makes one of the three kingdoms, as they are called, of natural history; the vegetable and the mineral being the two others: In these, however, there is this difference made by writers, that while vegetables and minerals are treated of together, as all of a piece in each, the subjects of *Zoology* are divided, and it is made to compose, as it were, several kingdoms. Whoever is to write on plants and minerals, calls his work a treatise of botany, or mineralogy; and we have no words to express any subdivision of them into kingdoms: but, in *Zoology*, we treat, as different subjects, the different parts of it; and the history of birds is separated by some from the rest under the name of *ornithology*; that of quadrupeds under the name of *tetrapodology*; and we have for the rest, the words *entomology*, *amphibiology*, and the like, expressing these things which are properly but the parts of *Zoology*, as so many distinct and separate studies.

This may easily be amended, by our considering the animal world as we do the vegetable and mineral, and dividing it, as we do the others, into its proper families; it will then be found that these are no better distinctions than those of the families of these things, and that the authors may as well set up separate studies under the names of *bulbology*, *umbelliferology*, and the like, as those.

A natural division of the subjects of *Zoology*, on this principle, will afford six several families of its subjects. 1. The hairy quadrupeds. 2. The birds. 3. The amphibious animals, such as serpents, lizards, frogs, and tortoises. 4. The fishes. 5. The insects. And sixthly, those lowest order of animated beings the *zoophytes*. *Artedi* Ichthyol. See the articles QUADRUPED, BIRD, FISH, &c.

ZOOMINERALIA, a word used by some writers to express certain substances which are of animal origin, yet have somewhat of the nature of stones, as pearls.

ZOOPHTHALMUS, in botany, a name given by the antient Greeks to the *sedum majus*, or common great house-leek.

It had this name from the Greek Ζωὸν, an animal, and ὀφθαλμὸς, an eye, as expressing a resemblance to the eyes of large animals, in the round and radiated growth of its clusters of leaves. They also called it *ambrosia*.

ZOOPHYTE (*Cycl.*)—ZOOPHYTE-*Marygold*. See the article MARYGOLD.

ZOPHOCIDELUS, in botany, a word used sometimes as an epithet with the word *chamæleon*, and sometimes singly as the name of a plant, in both cases expressing the black chamæleon-thistle, which the antients carefully distinguished, in their writings, from the white kind, the former being a poisonous plant, the other not so.

ZOPPO, in the Italian music, is applied to all those counterpoints, described under the articles PERFIDIATO, OBLIGATO, &c. Thus they say *contra-punto alla zoppa*, a lame or hopping counter-point; because, in these, a note is placed between two others, each of half its value in time: When this comes to be played or sung, the voice or instrument seems to proceed by unequal leaps or steps, like those of a lame person. See the example here annexed.

There

There are *contra-punto alla zoppa sopra il sogetto*, as well as *sotto il sogetto*, *i. e.* above and below the subject. See the article SOGETTO.

ZORABA, a word used by some of the chemical writers to express vitriol.

ZOSTER, a word used by some to express that kind of herpes, called by others *zona* and *zingilla*, and by us usually known under the name of the *shingles*.

ZOTHECA, among the antients, the place where the animals designed for sacrifice were kept. *Pitisc.* in voc.

ZOZONISIUS, in natural history, a name of one of the gems of the antients, but of which our accounts are so short, that we can make no conjecture of what it was. Pliny only tells us, that it was found in the river Indus, and used by the magi.

ZUFFOLO, in the Italian music, a little flute or flagelet, having a very shrill sound, like the whistling of small birds. *Brossard.*

ZURNAPA, in zoology, the Arabian name of an animal of a very singular kind, and seeming properly to belong to no known genus of animals, but to be perfectly *sui generis*. It is also called *camelopardalis* by Latin authors, and *geraffa* by eastern nations.

It is not certainly known whether it chews the cud or not; but as its hoofs are cloven, and it has horns on its forehead, and wants the fore-teeth in its upper jaw, and feeds on vegetables, it is probable that it does.

It is a singular, elegant, and beautiful creature, and is very remarkably tame and tractable, even scarce less so than a sheep, and seems intended by nature for a domestic, not a savage animal. Its head is wholly of the make of the stag's, but differs in size, and has two little obtuse horns, which are not more than six fingers breadth long, and are hairy: the male and female both have these, and the latter is distinguished by having them shorter than the former. Its ears are larger, and like those of the ox-kind; its tongue is also like that of an ox, and it wants the fore-teeth in the upper jaw. Its neck is remarkably long, strait, and slender, in a grown animal. The neck is usually seven feet long, and the measure from the tail to the top of the head eighteen feet; and when it stands erect, its head is sixteen foot from the ground; it has a small mane; its legs are very slender, and the forelegs very long; the hinder ones very short, so that the creature seems always to stand upright.

Its hoofs are cloven exactly as those of the ox, its tail reaches down to its hams, and is rounded and covered with very thick hairs; the middle of its body is slender; it is very like the camel in all its natural properties; when it runs it holds the two forefeet together, it lies down on the belly, and claps its neck down on the thighs and breast in the manner of the camel. As it stands it can scarce reach to eat the grass, unless its fore-legs are very far expanded, and that is a posture of great pain to it; so that nature seems to have allotted it to feed in its wild state on the leaves of trees, which its long neck will very well enable it to get at. It is very beautifully spotted all over its body in the manner of the leopard.

The velvety covering of its horns seems to make it of the stag kind, but its shape is wholly different from those of that genus. *Bellon.* Obs. l. 2. c. 49.

ZYGÆNA, in zoology, the name of a fish of the shark kind, called in English *the ballance fish*, or the *hammer-headed shark*. See Tab. of Fishes, Nº. 2.

It is an extremely singular and remarkable fish, and differs not only from all the other sharks, but from all the fish in the world in the figure of its head: this is not placed, as in all other fishes, longitudinally, or in a line with the body, but is set on transversely as the head of a hammer or mallet upon the handle. This is semicircular at the front, and runs to so thin and sharp an edge, that as the fish swims forward with violence, it may cut other fishes, and is terminated at each end by an eye; these are very large, and so placed, that they more conveniently look down than either upward or sideway. In the farther part of the forehead also, near the eyes, on each side there is a large oblong foramen, serving either for hearing or smelling, or perhaps for both. The mouth is very large, and placed under the head, and armed with four rows of extremely sharp and strong teeth, flat, and serrated at their edges. The tail is composed of two fins, one vastly larger than the other; the body is rounded and very long, and is not covered with scales, but a thick skin; the back is ash-coloured, and the belly white. *Rondelet.* de Aquat. p. 549.

The *Zygæna* is a species of *squalus*, according to the Artedian system of ichthyology. See the article SQUALUS.

It is caught in the Mediterranean, and sometimes in different parts of the ocean. Some authors have called it *Zygena*, and others *Libella*; which last answers to the English name of the *Ballance-fish*.

ZYGASTICUM, Ζυγαστικον, among the antients, money paid for weighing things.

The word comes from Ζυγος, a ballance. *Pitisc.* Lex. Antiq. in voc.

ZYGITÆ, in the Roman galleys, a term used to express those rowers in the triremes, or three-rowed galleys, who sat on the second row, that is above the thalamitæ and below the thranitæ. *Meibom.* de Trirem, See the article THALAMITÆ.

ZYGOPHYLLUM, in botany, the name of a genus of plants described by Linnæus, the same with the *fabago* of Tournefort. See the article FABAGO.

ZYGOSTATES, among the antients, an officer who was the overseer of weights, and was to take care that tradesmen used none but what were just. *Pitisc.* Lex. Antiq. in voc.

ZYMAR, a name given by some of the chemical writers to verdigrease.

ZYME, a word used by many authors to express ferment or leaven. See the next article.

ZYMOLOGY, in chemistry, a term used by some writers to express a treatise on fermentation, or the doctrine of fermentation in general.

This is a very extensive thing, and were it well accounted for, might help us to solutions of many things which at present appear extremely difficult to us.

Dr. Sympson has written a treatise on this subject, wherein he refers the whole to the internal conflicts of acid and sulphur in bodies, and seems to think that the phænomena of hot baths, the generation of minerals, and the production of mineral waters, the grand appearances of light, heat, and fire, and the generality of the subterranean phænomena of damps, earthquakes, and firy eruptions, and the appearance of meteors, may be all explained by the doctrine of fermentation, established on this basis.

Fermentation, according to this author, is nothing but an intestine collision between acid and sulphur, put together by nature or art, and set in a combating motion, in order to the production of concretes, or some other end.

The phænomena of hot baths are explained on this foundation, by observing, that there is nothing of this kind without sulphur, evident even to the senses; and that an acid of some kind is necessary in all mineral fermentation. Acids are well known to be common in the earth, and on the conflicts of the . with the sulphurs evident in those particular places, baths are made hot, and the minerals found about them are formed. Mineral sulphurs are of different kinds, and according to these it is found that the waters of these hot baths differ also, some of them being safe to take internally, and others only fit for external use; in this the acid also may have its share, for in its passage through the earth it frequently corrodes metalline ores, and carries their particles with it; these, if of iron, give virtues to the water, and render it proper in several diseases: but if, on the other hand, they have dissolved copper, they become unwholsome.

The sulphurs and acids contained in the bowels of the earth, and occupying together large spaces of it, are thus formed into a sort of beds of fermenting and hot matter, through which the water of these baths passing slowly and leisurely on, cannot but be heated to the degree we see it of; and the greater the proportion of the acid, and the more the place abounds with metalline or mineral ores, the more hot and the more impregnated with virtues of minerals the water will be. Experiments shew, that sulphur may be made to ferment violently with acids, and that in this fermentation it becomes communicated, volatilized, and made capable of solution in water, though before it was not; and hence is capable of impregnating the baths, as we see.

These mineral productions are not all that are referred by this, and other authors who follow his system, to the doctrine of acid and sulphur fermentations. The vegetable world is said to be as much influenced by it, and the growth of plants, or vegetation itself, is said to be only a natural and slow-paced fermentation from the peculiar acid and sulphur of each plant. Tachenius's doctrine of acids and alkalies, is wholly disallowed in this scheme, and even in a great measure overthrown by it; and the doctrine of subterraneous fires is not necessary to heat the hot baths. It has been supposed that the sulphur, in order to give this heat to them, must be itself flaming and burning; but it is proved in this system, both by reason and experiment, that sulphur properly combined with an acid, may both heat, and communicate its heat to other bodies by fermentation, without being itself ignited or burning within the bowels of the earth; the great improbability of which, in many places where hot baths are found, has been one of the grand reasons for believing sulphur had no share in their production.

The acid, which is the other great cause of fermentation under ground, may be either such as is inbred in the same mineral concretion while in *succo soluto*, or in the state of its original formation; or an extrinsic and accidentally supervening one, which is well known to be of sufficient power for such an effect in the reduction of minerals already formed or completed. Some of the acid juices, which the earth in almost all parts abounds with, are loose in themselves, or fluctuating about, and others embodied in various animals: where they are bedded, and naturally contained in sulphur, they are always ready for these changes of fermentation; but when they are in either of the other states, they can only act as brought upon the sulphurs by their own natural fluctuating course, or educed by water from the other minerals, and carried by it to the beds of sulphur.

Thus the very water may be the efficient cauſe of the fermentation which afterwards gives the heat and virtues to it. All the acids, and all the ſulphurs contained in the earth, are not equally fit for this purpoſe; but ſome of the former have evidently ſo ſtrong a power over ſome of the latter, that they are ſufficient cauſes of heat in the mineral ingredients; and heat in any body concerned, is indeed the natural and neceſſary reſult of theſe fermentations.

The fermentation that ariſes between ſpirit of nitre and butter of antimony, is not from the ſalts in this ſublimate mixing with the acid in the diſſolvent, becauſe the ſame acids poured upon the ſame ſalts while incorporated with mercury in the form of ſublimate, is the cauſe of no fermentation at all: nay, ſublimate, in which the aforeſaid ſalts which are in butter of antimony are lodged, will diſſolve in an acid without the leaſt ebullition, like a piece of ice in water.

It is water always that ſets the inbred particles of acid and ſulphur into their great inward commotions, and makes the fermentation the ſtronger, and conſequently the heat by ſo much the greater. Thus a little water put to oil of vitriol, ſets the fermental principles of acid and ſulphur connatural to that oil, into ſo violent a fermentation and heat, that it is ſcarce poſſible even to endure the hand upon the glaſs where it is mixed. *Sympſon's* Zymolog. Chym.

ZYMOSIS, a word uſed by ſome to expreſs fermentation, and by others for a flatulent tumor of the liver, or other of the viſcera. See the article Zymology, *ſupra.*

ZYTHOGALA, *Beer-poſſet,* a drink recommended by Sydenham, as good to be taken after a vomit, for allaying the acrimonious and diſagreeable taſte it has occaſioned, as well as to prevent gripes. *Syden.* Obſerv. de Morb. acut. p. 39.

The word is formed of Ζυθος, *cerevifia,* and γαλα, *lac.* See the article Zythum, *Cycl.*

APPENDIX.

A P P E N D I X.

A.

ABATE, in the manege. A horse is said to *abate*, or take down his curvets, when working upon curvets, he puts his hinder legs to the ground both at once, and observes the same exactness in all the times. See the article CORVET, *Cycl.*

ABBA-*comes*. See the article ABBOT, *Cycl.*

ABDELAVI, a name given by Arabian authors to the Egyptian melon. See the article MELON, *Suppl.*

ABELMOSC, or ABELMOSCH, *(Suppl.)* is used by some authors for the Egyptian *ketmia*, with perfumed seeds. See KETMIA, N° 21. *Suppl.*

ABIGEAT. See ABIGEATUS, *Suppl.*

ABLATIVE *absolute*. See the article ABSOLUTE, *Cycl.*

ABRICOT, in botany. See the article APRICOCK, *Suppl.*

ABRUS, in botany, a name sometimes given to a species of *Orobus*. See the article OROBUS, *Suppl.*

ABSINTHIUM, *wormwood*, in botany, &c. See the article WORMWOOD, *Suppl.*

ABSINTHIUM is also a name given to other plants, by different authors; as to dwarf *ptarmica*, with leaves divided after the manner of wormwood; also to the alpine *chamæmile*, with southernwood-leaves. Vid. *Tourn.* Inst. Bot. p. 494, 496. See also the articles PTARMICA and CHAMÆMELUM, *Suppl.*

ABUTILON, the name of a genus of plants, according to Dillenius, but comprehended under the *sida* of Linnæus. See the article SIDA, *Suppl.*

ACACIA *(Suppl.)*—*Bastard* ACACIA, in botany, the name used by some for a genus of plants, called by others *robinia*. See ROBINIA, *Suppl.*

ACADEMICIAN, the same with *academic*, or *academist*. See ACADEMIC, *Cycl.* and ACADEMY, *Cycl.* and *Suppl.*

ACANTHIS, in ornithology, a name by which some call the gold-finch, from its feeding among thistles. See the articles CARDUELIS, *Suppl.* and GOLD-FINCH, *Append.*

ACAPTARE. See ACAPITARE, *Cycl.*

ACARUS *(Suppl.)* is also used by some naturalists as the classical name of the lice of animals, which are indeed of as many various genera as the animals on which they breed. See the article LOUSE, *Cycl.* and *Suppl.*

ACCENTED part of a bar, in music. See the articles ACCENT and MEASURE, *Cycl.*

ACCOMPTANT. See ACCOUNTANT, *Cycl.*

ACEPHALITÆ. See ACEPHALUS, *Cycl.*

ACH, or ACHE. See the article ACHE, *Cycl.*

ACHETA, in zoology. See the articles HARVEST-*fly* and CIGALON, *Suppl.*

ACID *(Cycl.* and *Suppl.)* —Whether the air naturally contains any *acid*, is a question among philosophers. See the article AIR, *Append.*

ACIDULÆ *(Cycl.)* — See the article WATER, *Append.*

ACINACES, in antiquity, a Persian weapon of the sword kind. The word is Persian, tho' etymologists affect to give it a Greek origin. Some represent the *acinaces*, as a kind of spear or javelin; others, with more probability, as a short crooked sword, shaped like the Turkish scymitar.

The figure was altered by Darius, and accommodated to that of the Grecian swords. Horace calls it *medus acinaces*, in regard the Romans confounded the Medes with the Persians. It was also in use among the Scythians, where divine honours were paid it. *Boxhorn.* Epist. p. 220. seq. V. *Voss.* Etym. Lat. p. 5. *Martin* Lex. Philos. T. 1. p. 9. *Suid.* Lex. T. 1. p. 84. *Hesych. Aquin.* Lex. Milit. T. 1. p. 14. *Potter*, Arch. Græc. l. 3. c. 4. T. 2. p. 39. *Hor.* l. 1. Od. 17. *Herodot.* l. 4.

ACTINIA, in the history of insects, a small sea-animal of a cylindric shape, equally thick in all parts, and about half an inch long; its tail is divided into three parts, or terminated, as it were, by three points. It lodges itself in little cavities of rocks and of the larger sea-plants of the stony kind, and only appears on their surface when all is quiet about it. Round the mouth are placed a great number of tentacula, like so many conic rays, and disposed in two or three series successively shorter than each other: these are in a continual vibratory motion, and by that means draw small animals into its mouth for food. The whole animal is of a pale flesh colour, except these tentacula, which have a beautiful variety of colours, red, yellow, blue, and many others. It is found on the coasts of the American islands.

There are a variety of species, differing from each other in figure, colour, &c. but all of them furnished with numerous tentacula, or rays. *Hill*'s Hist. of Anim. p. 94. seq.

ADAM'S *apple*, *Adami pomum*, in botany, a name given by some to the orange. See the article ORANGE and ADAMI *pomum*, *Cycl.*

ADDER *(Suppl.)*—*Sea*-ADDER, the English name of a species of *syngnathus*, with a round body, and no pectoral or tail fins. See SYNGNATHUS, *Suppl.*

Water-ADDER, in zoology, a name given to the *natrix*. See the article NATRIX, *Suppl.*

ADDER'S *wort*, in botany, a name sometimes given to snakeweed, or bistort. See BISTORT, *Suppl.*

ADDICO, in the civil law. See ADDICTIO, *Cycl.*

ADMINICULUM, in the French law. See ADMINICLE, *Cycl.*

ADMINISTRATRIX. See ADMINISTRATOR, *Cycl.*

AERIZUSA, a name given by the antients to the sky-coloured *jasper*. See the article JASPER, *Cycl. Suppl.* and *Append.*

ÆS *uxorium*, in antiquity, a sum paid as a penalty for living batchelors to old age. This answered to the Athenian Αγαμιου δικη, and the Spartan οψιγαμιου, and κακογαμιου δικη. *Fest.* and *Pitisc.* Lex. Ant.

This tax for not marrying seems to have been first imposed in the year of Rome 350, under the censorship of M. Furius Camillus, and M. Postumus. V. *Scalig.* and *Dacier*, not. in *Fest.*

The method of levying it was this; at a census or review of the people, each person was asked, *Et tu ex animi sententia uxorem habes liberûm quærendorum causâ?* He who had no wife, was hereupon fined after a certain rate, called *æs uxorium*. Hist. Acad. Inscrip. T. 1. p. 79. seq.

AESPING, in zoology, the name of a species of *coluber*. See the article COLUBER, *Append.*

AFTER-*pains*, in midwifry. See the article LYING-*in-women*, *Suppl.*

AGAUPE, in botany, a name used by some authors for the *nymphæa*, or common white water lilly, and other species of that plant. *Marcgrave*, p. 21.

AGRIÆ, in zoology, the name of a class of quadrupeds, according to Dr. Hill, the characters of which are, that they have no teeth; and that their tongues are very long and cylindric. There are only two genera belonging to this class, which are the *myrmecophaga* and *manis*. See the articles MYRMECOPHAGA and LACERTUS *squamosus*, *Suppl.*

AGRIMONY *(Suppl.)* — *Hemp*-AGRIMONY, in botany, the English name of the plant known among authors by that of *eupatorium*. See EUPATORIUM, *Suppl.*

Water-hemp-AGRIMONY, in botany, a name given to the bidens. See the article BIDENS.

AGUE *(Suppl.)*—AGUE-*cake*, the popular name for a hard tumour on the left side of the belly, lower than the false ribs, said to be the effect of intermitting fevers. Vid. *Pringle*, Observ. on Diseas. of Army, p. 179.

AIR *(Cycl.* and *Suppl.)*—It has been a question among natural philosophers, whether the *air* contains an acid or not. Monsieur Helot gives a probability to the affirmative; and it seems as if this acid were of a vitriolic nature. See Mem. Acad. Scienc. 1737. p. 378 and 1740. p. 141, 142. Edit. *Paris.*

If salt of tartar, or oil of vitriol, be exposed to the open *air*, these, tho' extremely different substances, will each receive and imbibe so great a quantity of matter from the *air* as vastly to increase its weight, without any other alteration in its nature than the diluting or weakening it. The salt becomes a fluid liquor, called *oil of tartar per deliquium*, and increases to several times its quantity; and a vial of oil of vitriol, nearly filled and left unstop'd, will soon be found to fill up of itself and run over.

In both these cases, the aerial particles afforded to the exposed substances, are only water; but the *air* evidently abounds also with a great variety of other principles, which it may and does occasionally afford to other exposed substances, whose pores are so formed as to admit them easily. Thus the mortar exposed in the joinings of old walls, from the particles it attracts out of the *air*, forms a peculiar salt; and a deal shelf, moistened with the liquor of fixed nitre, has been known to become frosted over with perfect and pellucid crystals of pure nitre, only from the imbibing, or regaining the necessary acid from the *air*, in the same manner as if spirit of nitre had been poured upon it. A vial half filled with oil of tartar per deliquium, on being exposed to the *air*, will often form a set of peculiarly figured crystals round the vessel, a little above the surface of the water. Colcothar of vitriol, which is the caput mortuum, or residuum of vitriol, after all the acid has been driven from it by fire,

will, on being exposed to the *air*, attract a new acid, and on being distilled again, it will yield more spirit or oil. Philos. Trans. N°. 157.

It is remarkable, that so strong an acid as this should float in the *air* unperceived, and exert itself only where proper admixtures and a proper nidus call it in. In both the cases of nitre and vitriol divested of their acids, the *air* gives the proper acid again; yet in the case of the exposed alkali salt, no acid, but only pure water is received; and in some acids, as the oil of vitriol, pure water, only, is received from the *air*. This is evidently proved by being careful in concentrating the liquor, first, to a certain degree of strength; and then, after exposing it a proper time, distilling away what was gained from the *air*. This will be found, by the smell and taste, to be no other than pure simple water; and the liquor remaining in the retort, when all this is driven off, will be just as strong as before, and just the same in quantity, and as ready to receive the same particles again.

The stronger the oil of vitriol is, the more powerfully it will attract the *air*'s humidity, and the more it will increase in weight. Such as is perfectly dephlegmated, will increase to more than three times its weight; three drams of it, in an experiment of Mr. Boyle's, increasing to nine drams and thirty grains. The increase is much quicker at first, when it is strongest, than afterwards when it is thoroughly diluted. Oil of vitriol, in the small quantity here mentioned, will receive eighteen grains addition at first, in the same space of time in which it will afterwards receive but two grains. The changes of moist and dry in the *air* also affect it. Philos. Transf. l. c.

It is remarkable, that sulphureous *air* makes an effervescence with pure *air*. Thus if fresh *air* be let into a glass vessel filled with sulphureous vapours, arising from a mixture of spirit of nitre, with a vitriolic mineral, an effervescence will arise, and the fresh *air* will be nearly absorbed, and the *air* in the vessel, which was transparent and clear, will become a reddish turbid fume. After the effervescence is over, the turbid *air* again becomes clear, but upon the admission of fresh *air* again becomes turbid, and the *air* is absorbed as before. But at each re-admission of fresh *air*, the quantity absorbed is less and less, 'till no more is absorbed. See *Hales*, Hæmastatics, p. 280. seq.

Dr. Hales thinks, that the effervescence arising from the mixture of fresh *air*, with that which is strongly impregnated with sulphureous fumes, may give rise to that irksome heat which we feel in summer, and is called a close, sultry, temperature of *air*. And hence the common observation, that lightning cools the *air* seems to be well founded, as being the last effort of this effervescence. *Hales*, ib. 284, 285.

ALANA *gleba*, a name sometimes given to the yellowish white tripoli. See the article TRIPOLI, *Cycl.* and *Suppl.*

ALATED *leaf*, in botany. See LEAF.

ALAUDA, (*Suppl.*) in ichthyology, a name used by some authors for several species of the fish called *blennius*. See the article BLENNIUS, *Suppl.*

ALAUSA, in zoology. See the article THRISSA, *Suppl.*

ALBUGO (*Suppl.*)—Dr. Mead tells us of several cures of the *albugo*, performed by means of an eye powder which he recommends. The receipt is thus, Take of common glass any quantity, pound it in a mortar to a very fine powder; then add an equal quantity of white sugar-candy, and levigate the mixture 'till it becomes impalpable.

A little of this powder put into the eye with a quill, every day, gradually wears off the spot.

Another method of removing the speck, is to have it pared by a surgeon every day with a knife: But this seems a doubtful remedy. See Monit. et Pract. Medic. Append.

ALCA, in ornithology. See the article ALKA, *Suppl.*

ALCALI, } See the articles { ALKALY, *Suppl.*
ALCALINE. } { ALKALINE, *Suppl.*

ALDER-*tree*, *alnus*, in botany. See the article ALNUS, *Suppl.*

Berry-bearing ALDER, the name of a genus of plants, called by authors *frangula*. See the article FRANGULA, *Suppl.*

ALDERAIMIN, or ADERAIMIN, in astronomy, a star on the left shoulder of the constellation Cepheus.

ALECTRUONURUS *gramen*, in botany, a name used by some for the *festuca* of Linnæus. See FESTUCA, *Suppl.*

ALECOST, in botany, a name given by some to a species of tanzy, more usually called *costmary*. See TANACETUM, *Suppl.*

ALEHOOF, in botany, a name by which some call *ground-ivy*. See the article GROUND-*ivy*, *Suppl.*

ALHAGI, in botany, the name of a genus of plants, according to Tournefort; but comprehended under the *hedysarums* by Linnæus.

The characters are these: the flower is papilionaceous, the germen of which finally becomes a pod composed of a great number of parts, articulating, as it were, with each other, and containing each a kidney-shaped seed. To these marks it may be added, that the leaves grow in an alternate disposition.

There is only one known species of this genus, called *genista spartium*, and *genista spinosa*, by other writers. *Tourn.* Inst. Bot. Corol. p. 54.

ALHEAL, a name given to several plants on account of their extraordinary virtues. See PANACEA, *Cycl.* and PANAX, *Append.*

ALISANDERS, in botany, a name given by some to the *smyrnium*. See the article SMYRNIUM, *Suppl.*

ALKANET, in botany. See the article ANCHUSA, *Suppl.*

ALLIARIA, in botany, the name sometimes given to a species of *hesperis*, called in English *jack by the hedge*. See the article HESPERIS, *Suppl.*

ALLIGATOR, in zoology, the name given to the crocodile in the cold climates of America, where it does not grow to its full dimensions. See CROCODILE, *Cycl.* and *Suppl.*

ALLIGATOR-*pear*, in botany. See the articles PEAR and PYRUS, *Suppl.*

ALMNOD (*Suppl.*)—*Dwarf* ALMOND, a name given by some to several species of peaches. See the article PERSICA, *Suppl.*

Ethiopian ALMOND, the name of a genus of plants, called by Linnæus *brabejum*. See BRABEJUM, *Suppl.*

ALVI *fluxus*, in medicine. See the article DIARRHOEA, *Cycl.* and *Suppl.*

ALVI *obstructio*, costiveness, in medicine. See the article OBSTRUCTIO *alvi*, *Suppl.*

AMARACUS, in botany, a name sometimes used for the *parthenium*. See the article PARTHENIUM, *Suppl.*

AMARYLLIS, in the Linnæan system of botany, the name of a genus of plants, called in English *daffodil-lilly*, and by other botanical writers *lilio-narcissus*. See the article LILIO-NARCISSUS, *Suppl.*

AMBER-*tree*, in botany, the English name of a genus of plants, called by Linnæus *anthospermum*. See ANTHOSPERMUM, *Append.*

AMBERBEI, the name of a genus of plants, according to Vaillant, but comprehended by Linnæus under that of *centauria*. See the article CENTAURIA, *Append.*

AMBULON, in botany, the name by which J. Bauhine calls the *myrica*, or sweet-willow. See the article MYRICA, *Append.*

AMENTUM, among botanists, the same with *catkin*. See the article CATKIN, *Suppl.*

AMGAILA. See LEUCACANTHA, *Suppl.*

AMMODYTES, in zoology, the name of a species of *coluber*. See the article COLUBER, *Append.*

AMMONIACUM *sal*, in chemistry, &c. See the article SAL *Ammoniacum*, *Cycl.* and *Suppl.*

AMMOSCHISTA, in natural history, a genus of stones of a laminated structure, and splitting only horizontally, or into flat plates.

The *ammoschista* are coarse, harsh, and rough stones, of a very loose texture, and appearing something porous. They are considerably heavy, and composed of a large, coarse, and obtusely angular gritt, surrounded and in part held together by a loose earthy spar. They are very soft and friable in the mass, but much more so when reduced to small pieces. They make a violent effervescence with aqua fortis, and will not easily strike fire with steel.

The species of *ammoschista*, are these: 1. The grey, friable, dull *ammoschistum*. 2. The brownish white, glittering *ammoschistum*. 3. The greenish grey, shining *ammoschistum*. 4. The yellowish grey, glittering *ammoschistum*. 5. The hard, purple, and white *ammoschistum*. And 6. The bluish, glittering slate stone. *Hill's* Hist. of Foss. p. 443. seq.

AMOMUM, a name sometimes given to a species of *sium*. See the article SIUM, *Suppl.*

AMPHITRITE, in ichthyology, the name of a genus of small water animals, the characters of which are, that they are of an oblong figure, and have a great number of deep striæ, like so many lamellæ; and but one tentaculum, of a slender and oblong form, resembling a piece of thread. They are only a few inches long, of a tolerable firm substance, and have been ranked by some authors among the *urticæ marinæ*, and by others among the *epipetrons*. Vid. *Hill*, Hist. Anim. p. 91.

ANARTHRA, in the history of insects, a classical name established by Dr. Hill, comprehending such insects as have neither wings nor limbs, and whose bodies are covered with a soft skin.

To this class belong the several genera of *worms* and *leeches*. See the articles WORM and LEECH, *Suppl.*

ANASARCOUS *swelling*. See DROPSY, *Append.*

ANEMOSPERMOS, in botany, the name sometimes given to the *arctotis* of Linnæus. See the article ARCTOTIS, *Suppl.*

ANGLE (*Cycl.*)—In the practice of surveying, no *angles* of less than thirty degrees should be taken: nor should any be assumed but such as are actually measured. See Hist. Acad. Scienc. 1740.

ANGUIS *Æsculapii*, the name of a species of *coluber*. See the article COLUBER, *Append.*

ANIMAL (*Suppl.*)—ANIMAL *substances* comprehend all the component parts of *animals*, of what use or intention soever they may be. See SUBSTANCE, *Cycl.*

Fossile ANIMAL *substances*, those found buried in the earth, at various depths, and embodied among various strata.

These are principally of four kinds: 1. Sea-shells. 2. The teeth, bony palate, and bones of fishes. 3. The bones of land *animals*. And 4. Complete fishes. See the articles *Fossile*

Foſſile Bones, *Foſſile* Shells, Marine *remains*, and *Foſſile* Ivory, *Suppl.*

Fermentative quality of Animal *ſubſtances.* See Ferment and Fermentation, *Append.*

ANIMALCULES (*Suppl.*)—Dr. Hill, in his hiſtory of animals, has arranged *animalcules* under three claſſes: 1. Such as have no tails, nor any viſible limbs. 2. Thoſe which have tails, but no viſible limbs. And 3. Thoſe which have viſible limbs. See the article Animalcule, *Cycl.* and *Suppl.*

The firſt claſs, which he calls *gymnia*, contains ſeveral genera: 1. The *enchelides*, of a cylindric or ſubcylindric figure. 2. The *cyclidia*, of a roundiſh or elliptic figure. 3. The *paramecia*, of an irregular oblong figure. 4. The *craſſpedaria*, with an apparent mouth and a ſeries of fimbriæ round it, in manner of a fringe.

The ſecond claſs, or thoſe with tails but no viſible limbs, he calls *cercaria*; of which there are only two genuſes: 1. The *cercaria*, with tails ſhorter than their bodies, and therefore called *brachuri*. 2. The *cercaria*, with tails longer than their bodies, and hence called *macroceri*.

The third and laſt claſs contains ſuch *animalcules* as have viſible limbs, and thence denominated *arthrodia*. There are only two genera belonging to this claſs: 1. The *ſcelaſius*, an *animalcule* with viſible legs. 2. The *brachionus*, or wheel-animal, an *animalcule* furniſhed with an apparatus of arms for taking its prey. *Hill*, Hiſt. Anim. p. 1. ſeq.

ANIMI *deliquium*, fainting or ſwooning, in medicine. See the articles Lipothymia and Swooning, *Suppl.*

ANNULATA, in zoology, the name of a ſpecies of *coluber*. See the article Coluber, *Append.*

ANT-*bear*, in zoology, the Engliſh name of the *myrmecophaga* of Linnæus. See the article Myrmecophaga, *Suppl.*

ANTHERICUM, in the Linnæan ſyſtem of botany, the name of a genus of plants, called by Tournefort *phalangium*, and in Engliſh *ſpider-wort*. See the article Phalangium, *Suppl.*

ANTHORA, in botany. See Aconite, *Cycl.*

ANTHOSPERMUM, in botany, the name of a genus of plants, the characters of which are theſe: the cup is a one-leaved perianthium, divided into four ſegments reaching more than half way down; there is no corolla; the ſtamina are four capillary filaments, of the length of the cup; the antheræ are two in number, oblong and quadrangular; and the germen of the piſtil ſtands below the receptacle of the flower.

The male and female flowers are ſometimes ſituate on the ſame plant, but more frequently on different plants of the ſame ſpecies; in which laſt caſe, the female flowers have the piſtil and germen, but want the ſtamina. Vid. *Linnæi*, Gen. Plant. p. 496.

ANTIMONY (*Suppl.*)—The needles perceived in *antimony*, are, according to Monſieur Geoffroi, owing to the vitriolic acid united to a bitumen. See Mem. Acad. Scienc. An. 1734. p. 418.

Eſſence of Antimony, an emetic wine made with glaſs of *antimony*; to which is ſometimes added a ſpicy ſtomachic.

Dr. Huxham ſays, he never found any antimonial preparation better, ſafer, and more efficacious than this ſimple infuſion of the glaſs of *antimony* in a generous white wine, with a little ſpice to render it more grateful to the ſtomach. This medicine given to twenty or thirty drops operates by gentle ſweats, and purges in larger doſes very mildly. The judicious phyſician here mentioned, recommends it in obſtinate rheumatiſms.

ANTIQUARY (*Suppl.*)—Since the printing this article, the ſociety of *antiquaries* have been incorporated, by the king's charter.

ANTISEPTIC, an appellation given to ſuch ſubſtances as reſiſt putrefaction. See Putrefaction, *Append.*

We have ſome curious experiments in relation to *antiſeptic* ſubſtances by Dr. Pringle, who has aſcertained their ſeveral virtues. Thus, in order to ſettle the *antiſeptic* virtue of ſalts, he compared it with that of common ſea-ſalt; which being one of the weakeſt, he ſuppoſes equal to unity, and expreſſes the proportional ſtrength of the reſt by higher numbers, as in the following table.

Salts, their antiſeptic virtue.			Salts, their antiſeptic virtue.		
Sea-ſalt	—	1	Saline mixture		3
Sal gemmæ		1+	Nitre	—	4+
Tartar vitriolated		2	Salt of hartſhorn		4+
Spiritus mindereri		2	Salt of wormwood		4+
Tartarus ſolubilis		2	Borax	—	12+
Sal diureticus		2+	Salt of amber		20+
Crude ſal ammoniac		3	Alum	—	30+

In this table the proportions are marked in integral numbers; only to ſome there is added the ſign +, to ſhew, that thoſe ſalts are poſſeſſed of a ſtronger *antiſeptic* virtue than the number in the table expreſſes, by ſome fraction; unleſs in the three laſt, where the ſame ſign imports, that the ſalt may be ſtronger by ſome units. Vid. *Pringle's* Obſerv. on the Diſeaſes of the Army, Append. p. 322. ſeq.

Some reſinous and other ſubſtances even exceed the *antiſeptic* virtues of the neutral ſalts; thus myrrh, aſa fœtida, terra japonica and aloes, are at leaſt twelve times more *antiſeptic* than ſea-ſalt. Two grains of camphor is equivalent to ſixty grains of that ſalt. An infuſion of a few grains of Virginian ſnake-root, in powder, exceeds twelve times its weight of ſea-ſalt. Chamæmile flowers have nearly the ſame extraordinary quality. The jeſuits bark has it alſo. Beſides theſe, pepper, ginger, ſaffron, contrayerva-root, are twelve times more *antiſeptic* than ſea-ſalt. Dried ſage, rhubarb, the root of the wild valerian, mint, angelica, ground-ivy, ſena, green-tea, red-roſes, wormwood, muſtard and horſe-raddiſh, were likewiſe found more antiſeptic than the ſtandard.

To the claſe of *antiſeptic* medicines may likewiſe be added fermented liquors, acids, ſpirits, and even thoſe plants called anti-acids, and erroneouſly ſuppoſed haſteners of putrefaction, particularly horſe-raddiſh. Now vegetables, poſſeſſing this virtue, are the more valuable, in that, being uſually free of acrimony, they may be taken in much greater quantities, than either ſpirits, acids, reſins, or even the neutral ſalts.

Antiſeptics are preſcribed in all putrid, malignant, and peſtilential caſes. It is to be remarked, however, that different kinds of them are to be given in different diſeaſes, and even in different ſtages of the ſame diſeaſe. Thus, the bark is a ſpecific in a gangrene, when the veſſels are relaxed and the blood reſolved or diſpoſed to putrefaction; but will fail, if the veſſels are too full, or the blood be too thick. With the ſame caution is the bark to be uſed in wounds, *viz.* chiefly in caſes of abſorbed matter, when it infects the humours, and brings on a hectic fever.

By the great *antiſeptic* virtue of alum, the bark, and other aſtringents, it ſhould ſeem, that aſtriction had no ſmall ſhare in the cure of putrid diſorders; and, indeed, the very nature of putrefaction conſiſts in a ſeparation or diſunion of the parts. But as aſtringents are improper to be adminiſtered in many caſes, contrayerva-root, ſnake-root, camphor, &c. may ſupply their place; which, tho' highly *antiſeptic*, have very little, or any, of an aſtringent quality. Id. ibid. Append. paſſim.

APAGOGE, in logic. See Abduction, *Cycl.*

APE, *ſimia*, in zoology. See the article Simia, *Suppl.*

Apes. See Apis *infra.*

APHIS, in the hiſtory of inſects, the name of a genus of animals, otherwiſe called *pediculus arboreus*, and in Engliſh the *tree-louſe*.

The trunk of the *aphis* is reflex; the body is formed into two horns behind; the wings are four, and erect, or altogether wanting; and the legs are formed for walking not leaping.

Of this genus there are a great many ſpecies, denominated from the trees or buſhes on which they are found. Vid. *Hill's* Hiſt. of Anim. p. 65.

APHRODITA, in the hiſtory of inſects, a genus of ſea-inſects about two inches in length and one in breadth, of an oval figure, and aculeated; it has alſo a perforation in the middle of the back, and is called in Engliſh the *ſea-mouſe*.

It is one of the gymnarthrodia, or inſects with naked bodies, and may be met with in great abundance on the Kentiſh coaſt, among rocks. There are ſeveral ſpecies of it. Vid. *Hill's* Hiſt. of Anim. p. 90.

Columna calls it *Pudendum regale*; Bartholine, *vermis aureus*; others, *eruca marina griſeo-fuſca*; and ſome, *mus marinus*, or the *ſea-mouſe*.

APIS, or Apes, in zoology, a large genus of four-winged inſects, the diſtinguiſhing characteriſtic of which is, that their wings are entirely membranaceous, and their tails furniſhed with a weapon, or ſting, capable of inflicting a wound.

This genus comprehends the bee, hornet, waſp, and humble-bee. See the articles Bee, Hornet, Wasp, *Suppl.* For the hiſtory of the bee, in particular, ſee alſo the articles Bee-*worm*, Wax, Honey, &c. *Suppl.*

APOSTACY, (*Cycl.*)—*Apoſtacy* is ſaid to have been antiently puniſhable, in England, by burning and tearing to pieces by horſes. Thus Fleta l. 1. c. 37. §. 2. *Apoſtatæ & ſacrilegi, & hujuſmodi, detractari debent et comburi.* And §. 4. *Si inde convincantur, detractentur, et ſuſpendantur.* Where Du Cange interprets, *detractari*, by *tirer a quatre chevaux*.

APPLE (*Suppl.*)—*Cuſtard*-Apple, in botany, a name given by ſome to the *anona*. See the article Anona, *Suppl.*

Sea-Apple, in zoology, the Engliſh name of a ſpecies of *centronia*, or *ſea-hedge-hog*. See the article Centronia, *Append.*

Sour Apple, in botany, a name given by ſome authors to ſeveral ſpecies of *anona*, called by Plumier *guanabanus*. See the article Anona, *Suppl.*

Star-Apple, the Engliſh name of a genus of plants, called by Plumier *cainito*, and deſcribed by Linnæus under that of *chryſophyllum*. See Chrysophyllum, *Append.*

Thorn Apple, the Engliſh name of a genus of plants, called by authors *ſtramonium*. See the article Stramonium, *Suppl.*

APTERIA, in the hiſtory of inſects, a claſſical name comprehending all thoſe inſects which have no wings. See the article Insect, *Append.*

This ſeries is divided into two claſſes: 1. Such as have neither wings nor limbs, called *apteria anarthra*. And 2. Such as have limbs, but no wings, called *apteria podaria*. See the articles Anarthra and Podaria, *Append.*

ARACHIDNA, in botany, the name uſed by ſome authors

for a genus of plants, described by Linnæus under that of *arachis*. See the article ARACHIS, *Append.*

ARACHIDNOIDES, in botany, the name used by some for a genus of plants called by Linnæus *arachis*. See the article ARACHIS, *Append.*

ARACHIS, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: the cup is a perianthium, divided into two parts; the flower consists of three papilionaceous petals; the stamina are two fubulated filaments, adhering at the base, and divided at the top; the antheræ are roundish; the germen of the pistil is oblong; the style fubulated, and of the length of the germen; and the stigma simple: the fruit is a pod of an oblong oval form, narrowest in the middle, with only one cell, containing two oblong gibbous seeds.

This genus comprehends the *arachidna* and *arachidnoides* of other authors. Vid. *Linnæi* Gen. Plant. p. 361.

ARALIASTRUM, in botany, the name of a distinct genus of plants, otherwise called *panax*. See the article PANAX, *Append.*

ARBOR *vine*, a name used for some species of *convolvulus*, or *bindweed*. See the article CONVOLVULUS, *Suppl.*

ARCHANGEL, in botany, a name given to the white *lamium*, or *dead-nettle*. See the article LAMIUM, *Suppl.*

ARCTOTHECA, in botany, the name used by Vaillant for the *arctotis* of Linnæus. See the next article.

ARCTOTIS, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: the common cup is roundish and imbricated with squamæ; the composite flower is radiated; the proper hermaphrodite ones infundibuliform, with the limb divided into five segments; and the proper female ones ligulated and of a lanceolated shape; the tube is extremely short; the stamina are five very short capillary filaments; the antheræ are cylindric, of the length of the flower, and divided into five parts; the germen of the female flowers is ovato-quadragonal, villose, and coronated with very small squamæ; the style is filiform; and the stigmata, which are two in number, oval, thick, and erect. There is no pericarpium, the cup serving instead of one. The seeds are single, villose, coronated with the leaves of their proper perianthium, and placed in a circle. The receptacle is plane, and somewhat hairy. *Linnæi* Gen. Plant. p. 420.

ARENÆ, *sands*, in natural history. See the article SAND, *Cycl.* and *Suppl.*

ARGENTUM, *silver*, in natural history. See the article SILVER, *Cycl.* and *Suppl.*

ARISARUM (*Suppl.*) is also the name used by some for a species of *arum*, or *wake-robin*. See the article ARUM, *Suppl.*

ARMENIAN *bole*. See the article BOLE *armenic*, *Suppl.*

ARO-ORCHIS, in botany, a name by which some call a genus of plants, described by Linnæus under that of *kæmpferia*. See the article KÆMPFERIA, *Append.*

ARMY. For diseases incident to *armies*, see the articles DISEASE, CAMP, GARRISON, HOSPITAL, SOLDIER, &c. *Append.*

ARROW-*root*, in botany, the name of a genus of plants, called by authors *maranta*. See the article MARANTA, *Append.*

ARSON, in the law of England, a felony at common law, in maliciously and voluntarily burning the house of another by night or by day. See *Hawkins*'s, Pleas of the Crown, B. 1. chap. 39.

As to the punishment of *arson*, it seems now clearly settled, that the principal, not being in holy orders, is excluded from the benefit of clergy. See *Hawk.* lib. cit. B. 2. chap. 33. sect. 107.

In some places this crime is punished by burning the offender. And this was the old Roman law. See *Pitisc.* Lex. Antiq. in voc. *Incendiarius* and INCENDIARY, *Append.*

ARTHRODIA, in zoology, the name of a lately established class of animalcules, containing those with visible limbs. See the article ANIMALCULES, *Append.*

ASARABACCA, in botany, the name of a genus of plants, called by authors *asarum*. See the article ASARUM, *Suppl.*

ASCITES. See the articles DROPSY, *Cycl. Suppl.* and *Append.*

ASCYRUM, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: the cup is a four-leaved perianthium; the two exterior ones very small, placed opposite to each other, and linear; the two interior ones large, plane, erect, and cordated; all of them being permanent. The flower consists of four oval petals; the two exterior ones being opposite to each other, and very large; the interior ones smaller. The stamina are numerous capillary filaments, connected at their bases into four distinct parts; the antheræ are roundish; the germen of the pistil is oblong; there is no style: the stigma is simple; the fruit is an oblong acuminated capsule, formed of two valves, and included in the larger leaves of the cup; the seeds are numerous, small, and roundish.

It is extremely like the *hypericum* in appearance; but these characters sufficiently distinguish them. Vid. *Linnæi* Gen. Plant. p. 369.

ASH, in botany, the English name of a genus of trees, called by authors *fraxinus*. See FRAXINUS, *Suppl.*

Mountain-ASH, a name given by some to the *sorbus*, or *service-tree*. See the article SORBUS, *Suppl.*

Poison-ASH, a name given to the *toxicodendron* of botanists. See the article TOXICODENDRON, *Suppl.*

ASILUS, in zoology, the name of a genus of insects, called in English the *hornet-fly*, or *wasp-fly*. See the articles HORNET-*fly* and WASP-*fly*, *Suppl.*

The distinguishing characters of this genus, are these: they are of the two-winged kind, with a style or oblong body, terminated by a protuberance or head, and called a ballancer, under each wing: to this add, that the head is furnished, by way of mouth, with a snout of a fubulated figure, which is simple and very sharp at the extremity. They are among the largest of the fly-kind. See the article FLY, *Suppl.*

Authors have called these insects by the names of *Muscæ crabroniformes*, *muscæ rapaces*, and *muscæ vespiformes*. *Hill*'s Hist. of Anim. p. 31.

ASINUS, the *ass*, in zoology, an animal of the horse-kind. See the article EQUUS, *Suppl.*

Though the *ass* agrees with the horse in many respects, it nevertheless has but a mean resemblance to that noble animal; being not only smaller, but wanting the symmetry and beauty, so conspicuous in the horse.

The *ass*'s ears seem much over-proportioned in length to the head. Its eyes are large, but have nothing bright or striking in them; the neck is long, but lank; and the tail is very long, but not hairy all the way, as in the horse. The fur of the *ass* is coarse and dun, only a streak of black runs down its back and across the shoulders.

So nearly allied are the horse and *ass* kind, that they will copulate together, the produce of which commixture is a mule. See the article MULE, *Suppl.*

There is a species of wild *ass*, called *zebra*, differing greatly in the colours and disposition of its streaks from the common *ass*. See ZEBRA, *Append.*

ASPEN-*tree*, in botany, the English name of the poplar with trembling leaves. See the article POPLAR, *Suppl.*

ASPHODEL, *asphodelus*, in botany. See the article ASPHODELUS, *Suppl.*

African ASPHODEL, a name used by some for the *phalangium*, or *spider-wort* of Tournefort. See PHALANGIUM, *Suppl.*

Lilly-ASPHODEL, the English name of a genus of plants. See the article LILIO-ASPHODELUS, *Suppl.*

ASS, *asinus*, in zoology. See the article ASINUS *supra*.

Wild ASS, *onager* and *zebra*. See the articles ONAGER, *Suppl.* and ZEBRA, *Append.*

ASTERIAS, in zoology, a name used by some naturalists for the star-fish, otherwise called *aster* and *stella marina*. See the article STELLA *marina*, *Suppl.*

ASTHMA (*Cycl.* and *Suppl.*)—Dr. Mead has lately given us his observations on this Distemper. Monit. & Pract. Medic. Cap. 8.

Whatever occasions the ambient air to enter the lungs with less freedom than usual, brings on this disease. Hence it may arise, 1st. From whatever is an impediment to the action of the diaphragm, the intercostal and abdominal muscles. 2dly, From whatever obstructs the free passage of the air into the aspera arteria, or its ramifications, whether the obstruction arises from a tumor, or from viscid humors. 3dly, The air itself may be a cause, if it be much heavier, or lighter than usual. 4thly, The tenderness of the lungs may sometimes occasion this distemper, as appears from those who are subject to a difficulty of breathing upon removing from the thick air of the town into the clear air of the country. 5thly, The difficult passage of the air thro' the lungs may be reckoned among the causes of difficult respiration. And this may happen either from the weakness of the heart, or the too great thickness of the blood.

The method of cure, in this distemper, must vary with its causes. Blood letting is, generally speaking, useful in every species of it. Vomits are useful, if the stomach or lungs be loaded with tough phlegm. The body must be kept open with gentle cathartics. Flatulent food and drink should be avoided; exercise used 'till weariness; and friction 'till a sweat is ready to break out.

Oxymel of squills and simple cinnamon water, or garlick, are good in case of viscid and tough humors. But if the fault lie in the nervous juice, the strong smelling gums are proper, especially the milk of gum ammoniac. Anodynes are very hurtful in the first case, but serviceable in this, if joined with volatile salts or spirits. The paregoric elixir is one of the best of this tribe.

As every kind of this disease is attended with more or less effervescence in the blood, the bark will be found useful; and the doctor assures us, that he has known instances where it has done vast services mixed with the cinnabar of antimony.

ASYLUM, in the history of insects, a name sometimes used for the gad-fly, called by zoologists *œstrum*. See the article OESTRUM, *Suppl.*

ATRACTYLIS, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: the cup is ovated, imbricated, and beset with numerous lanceolated squamæ; the flower is compound and radiated;

 the

the stamina are five extremely short and capillary filaments; the antheræ are cylindraceo-tubulose; the germen of the pistil is very short and coronated; the style is filiform, and of the length of the stamina; the stigma is bifid; and the seeds are of a compressed turbinated shape, and covered with a plumose down. Vid. *Linnæi* Gen. Plant. p. 384.

Atractylis is also the name used by Vaillant for the *carthamus*, or *bastard-saffron*. See the article Carthamus, *Suppl.*

AVENS, in botany, the English name of a genus of plants, called by authors *caryophyllata*. See Caryophyllata, *Suppl.*

AVOCADO, or Avocado-*pear*, in botany, a name given by some to the *persea* of Plumier. See Persea, *Append.*

AVOSETTA, the Italian or modern name of a genus of birds, called in Latin *recurvirostra*. See the article Recurvirostra, *Suppl.*

AURELIA, in natural history, a synonymous term with *chrysalis*. See the article Chrysalis, *Append.*

AURELIANA, in botany, a name used by some writers for the Panax, or *allheal*. See the article Panax, *Append.*

AURICULA, a name sometimes used for the *forficula*, or *earwig*. See the article Forficula, *Append.*

AURICULARIA, a name used by some for the ear-wig, a very troublesome insect. See the article Ear-*wig*, *Append.*

AURUM, *gold*, in natural history. See the article Gold, *Suppl.*

AWK, or Auk. See the article Auk, *Suppl.*

AX-*vetch*, in botany, the English name of a genus of plants, called by authors *securidaca*. See Securidaca, *Suppl.*

AXUNGIA *solis*, in natural history, a name used by some writers for the substance more usually called *silesiaca terra*. See the article *silesiaca* Terra, *Suppl.*

B.

BABOON, in zoology, the English name of such monkeys as are usually called by naturalists *papiones*. See the article Papio, *Suppl.*

BALANCE-*fish*, in zoology. See Ballance-*fish*, *Suppl.*

BALAUSTINE, a name given to the great double-flowered pomegranate. See the article Punica, *Suppl.*

BALISTES, in ichthyology. See the article Ballistes, *Suppl.*

BALM, in botany, the same with *baum*. See Baum.

BALSAM *of capevi*, or *capivi*, in pharmacy and natural history. See the article Balsam *of copaiba*, *Suppl.*

Male-Balsam, or Balsam-*apple*, the name of a genus of plants, known among authors by that of *momordica*. See the article Momordica, *Suppl.*

Balsam-*tree*, in botany, a name used by some writers for the *terebinthus*, or turpentine-tree. See Terebinthus, *Suppl.*

BALSAMINA *scandens*, a name by which some call the large fruited white bryony of Ceylon. See the article Bryonia *alba*, *Suppl.*

BALSAMINE, in botany, the name of a genus of plants, called by authors *balsamina*. See the article Balsamina, *Suppl.*

BALSAMITA, in botany, the name by which some call costmary, a species of tanzy. See Tanacetum, *Suppl.*

BANE-*berry*, in botany, the English name used by some for the herb *christopher*. See the article Christophoriana, *Suppl.*

BAR *(Suppl.)* — To Bar or Strike *a vein*, among farriers, an operation performed on the veins of a horse's legs, or other parts of his body, in order to stop the course, and lessen the quantity of malignant humors prevailing there.

It is thus performed: the farrier opens the skin, after disengaging the vein, ties it above and below, and then strikes between the two ligatures. Sportsm. Dict. in voc.

BARRACKS, in military affairs, buildings to lodge soldiers in fortified towns, or others. Thus we say the *barracks* of the Savoy, of Dublin, *&c.*

Barracks, when damp, are greatly prejudicial to the health of the soldiers lodged in them; occasioning dysenteries, intermitting fevers, coughs, rheumatic pains, *&c.* For which reason quarter-masters ought to be careful in examining every *barrack*, offered by the magistrates of a place; rejecting all ground floors in houses that have either been uninhabited, or have any signs of moisture. Vid. *Pringle*, Observ. on the Diseases of the Army, p. 13, 37, 81 and 97.

BARREN-*wort*, in botany, the English name of a genus of plants, known among authors by that of *epimedium*. See Epimedium, *Suppl.*

BARBADOES-*cherry*, in botany, the English name of a genus of plants, called by authors *malpighia*. See Malpighia, *Suppl.*

Barbadoes-*tar*, a name sometimes used for the thick black kind of *pissasphaltum*. See the article Pissasphaltum, *Suppl.*

BASELLA, in botany, the name used by some botanists for the *cuscuta*, or dodder. See the article Cuscuta, *Suppl.*

BATATAS, the name by which the plant producing our potatoes is sometimes called. See the article Potatoes, *Suppl.* and *Append.*

BATCHELOR's *button*, in botany, the English name of a genus of plants, called by authors *lychnis*. See Lychnis, *Suppl.*

Batchelor's *pear*, a name used by some for several species of *solanum*, or night-shade. See Solanum, *Suppl.*

BATTERING-*ram*, in the military art of the antients. See Aries, *Cycl.*

BAUM *(Suppl.)*—*Turky*-Baum, a name given by some to the *dracocephalon*. See the article Dracocephalon, *Suppl.*

Shrubby-Baum, a name used by some for a genus of plants, called by authors *molucca*. See Molucca, *Suppl.*

BAY *(Suppl.)* —*Alexandria*-Bay, in botany, a name given to the *ruscus*, or butcher's broom. See Ruscus, *Suppl.*

Cherry-Bay, or *cherry*-Laurel, in botany, the English names of a genus of plants, called by Linnæus *padus*. See Padus, *Append.*

Dwarf-Bay, a name sometimes given to the *thymelæa* of authors. See the article Thymelæa, *Suppl.*

Indian Bay, a name given by some to a species of myrtle. See the article Myrtus, *Suppl.*

Rose-Bay, a name used by some writers for the *chamærododendros*. See Chamærododendros, *Suppl.*

Sweet flowering Bay, the English name of a genus of plants, described by Linnæus under that of *magnolia*. See Magnolia, *Suppl.*

BEAD *(Suppl.)*—Bead-*tree*, in botany, the English name of a genus of trees, called by authors *azedarach*. See Azedarach, *Suppl.*

BEAM-*tree*, in botany, a name given to the *cratægus*. See the article Cratægus, *Suppl.*

Hard-Beam, or *horn*-Beam, in botany. See the article Carpinus, *Suppl.*

BEAN *(Suppl.)*—*Bog*-Bean, *bug*-Bean, or *buck*-Bean, names given to the *menyanthes*. See the article Menyanthes, *Suppl.*

Caper-Bean, in botany, the English name of a genus of plants, called by authors *fabago*. See the article Fabago, *Suppl.*

Trefoil-Bean, in botany, the English name of a genus of plants, called by authors *cytisus*. See Cytisus, *Suppl.*

Bean-*tree*, a name given to a genus of plants, called by authors *corallodendron*. See the article Corallodendron, *Suppl.*

Kidney-Bean-*tree*, a name used by some for the *glycine* of Linnæus. See the article Glycine, *Suppl.*

BEAR *(Suppl.)* — *Ant*-Bear. See the article Tamandua, *Suppl.*

Bear's *ear*, in botany, the name of a genus of plants, known among authors by that of *auricula*. See Auricula, *Suppl.*

Bear's *ear fanicle*, in botany, a name given by some to the *cortusa* of Linnæus. See the article Cortusa, *Suppl.*

Bear's *foot*, in botany, a name given to several species of *hellebore*. See the article Helleborus, *Suppl.* and Hellebore, *Cycl.*

BEARD *(Suppl.)*—*Old man's* Beard, in botany, a name given by some to the *clematis* of authors. See Clematis, *Append.*

BECCA-BUNGA, in botany, a name given to the *anagallis aquatica*, called in English *brook-lime*. See the article Anagallis, *Suppl.*

BEDSTRAW, or *ladies* Bedstraw, in botany, the English name of a genus of plants, called by authors *gallium*. See Gallium, *Suppl.*

BEE-*flower*, in botany, the English name of a genus of plants, called by authors *orchis*. See Orchis, *Suppl.*

Bee-*fly (Suppl.)*—*Humble*-Bee-*fly*, a species of *culex*. See the articles Humble, *Suppl.* and Culex, *Append.*

BEER-*posset*. See Zythogala, *Suppl.*

BEETLE *(Suppl.)*—*Oil*-Beetle, the English name of the *meloe* of zoologists. See the article Meloe, *Append.*

Water-BEETLE, the Engliſh name of a genus of *beetles*, called by Dr. Hill *dytiſcus*. See the article DYTISCUS, *Append.*

BELI *oculus*, in natural hiſtory. See OCULUS *beli*, *Suppl.*

BELL-*flower*, in botany, the Engliſh name of a genus of plants, called by authors *campanula*. See the article CAMPANULA, *Suppl.*

BELL-*pepper*, in botany, a name uſed by ſome for the *capſicum*. See the article CAPSICUM, *Suppl.*

BELLS, or *Canterbury* BELLS, in botany, a name given to the *campanula*. See CAMPANULA, *Suppl.*

Hair-BELLS, in botany, a name given to the *hyacinth*. See the article HYACINTH, *Suppl.*

BELLY-*ach-weed*, in botany, a name given to the *ricinoides*. See the article RICINOIDES, *Suppl.*

BELMUSK, or ABELMOSCH, in botany, names uſed for the *ketmia*. See the article KETMIA, *Suppl.*

BENJAMIN-*tree*, in botany, the name of a ſpecies of *laurus*, according to Linnæus, with deciduous leaves, without ribs, of an obverſely oval figure. See the article LAURUS, *Append.*

It is a native of the Eaſt and Weſt Indies, and is called by many late writers *arbor limonii folio, benzoinum fundens*, by reaſon benzoin is procured from it. See BENZOIN, *Suppl.*

BENNET-*herb*, *herba benedicta*, a name uſed by ſome for the *caryophyllata*, or avens. See CARYOPHYLLATA, *Suppl.*

BERBERRY, or BARBERRY-*buſh*, in botany. See the article BERBERIS, *Suppl.*

BERNARD *the hermit*, the Engliſh name of a ſpecies of *ſquill*. See the article SQUILLA, *Append.*

BETHLEHEM-*ſtar*, in botany, a name given to the *ornithogalum*. See the article ORNITHOGALUM, *Suppl.*

BETONY (*Suppl.*)—*Water*-BETONY, a name given to the *ſcrophularia*, or fig-wort. See the article SCROPHULARIA, *Suppl.*

BEZOAR-*goat*, a name uſed for the Indian antelope, or *gazella*, on account of the *bezoar-ſtone* found in its ſtomach. See GAZELLA, *Suppl.*

BIFOL, in botany, a name given by ſome to the *ophris*, or twyblade. See the article OPHRIS, *Suppl.*

BILBERRY, in botany, an Engliſh name given to the *vaccinium*, or *vitis idæa* of authors, called alſo the *whortle-berry*. See VITIS *idæa*, *Suppl.*

BILE (*Cycl.*)—The influence of *bile* upon the animal œconomy is allowed to be very great. By its fermentative quality, it promotes digeſtion; in which reſpect, it differs widely from vegetable bitters, which are retarders of fermentation. Vid. *Pringle*, Obſerv. on the Diſeaſes of the Army, p. 377.

However, in one thing, it agrees with them, *viz.* as a corrector of acidities. Id. ibid. p. 378.

Bile ſpeedily corrupts, but not to ſuch an high or offenſive degree as the blood or fibrous parts of the body. To this corruption of the *bile*, as one cauſe, Dr. Pringle attributes the paroxyſms in bilious fevers: nay, all bilious diſorders, as the cholera morbus, dyſentery, *&c.* are thought to be chiefly owing to a redundance or corruption of the *bile*. Hence, the reaſon why theſe diſorders are moſt frequent in hot countries, and in armies when much expoſed to the ſun, is, that the *bile*, if not more abundant, is in ſuch circumſtances more corrupted than uſual. Id. ibid. p. 184. 74.

BILIOUS *fever* (*Suppl.*)—Dr. Pringle, in his Obſervations on the Diſeaſes of the Army, remarks, that the *bilious* or putrid fever is epidemic in camps, eſpecially in low and marſhy countries, where the air being full of moiſt and putrid effluvia, tends to relax the fibres and promote putrefaction. As to the ſymptoms of the *bilious* fever, it always begins with chillneſs and laſſitude, pains of the head and bones, and a diſorder at the ſtomach. At night the fever runs high; the heat and thirſt are great; the tongue is parched; the head aches violently; the perſon gets no reſt, and often becomes delirious; but generally in the morning an imperfect ſweat brings on a remiſſion of all the ſymptoms. In the evening the paroxyſm returns, but without any cold fit, and is commonly worſe than the former: on the ſecond morning it remits as before. Theſe periods go on, daily, 'till the fever changes inſenſibly, either into a confirmed or into an intermitting ſhape. Sometimes looſe ſtools carry off the fit, and ſupply the place of ſweats: however, tho' it reſembles an ague in many particulars, yet it is rare to meet with a real ague in the camp, unleſs the perſon has been ill of it before he took the field. The remiſſions uſually appear from the beginning, eſpecially if the patient has been plentifully blooded: but ſometimes there are no remiſſions for the laſt two or three days. Hæmorrhages of the noſe happen frequently in the height of the paroxyſm, and always bring on the remiſſion ſooner and make it fuller. Vomiting or purging have the like effects. The fits are ſeldom preceded by ſhiverings, or any ſenſe of cold after the firſt attack; the pulſe is always full and quick during the paroxyſms, and in the remiſſions it ſtill indicates ſome degree of fever. The blood is florid, the craſſamentum is firm, in large quantity, and ſinks in the ſerum. Whilſt the weather continues warm, the *bilious* ſymptoms are moſt frequent, but as winter approaches, the inflammatory ones prevail. See INFLAMMATORY.

The doctor enumerates other ſymptoms, as crudeneſs of the urine, *bilious* ſtools, coſtiveneſs, *&c.* and farther obſerves, that the infantry are more liable to it than the cavalry.

As to the cure of the *camp-fever*, before it becomes continued, it depends upon the proper uſe of evacuations, the neutral ſalts, and the bark. Bleeding he judges indiſpenſible; which he would have repeated once or oftner, according to the urgency of the ſymptoms. After bleeding it will be neceſſary to give an emetic, the beſt time for doing which is in the remiſſion of the fever, and rather ſooner after a paroxyſm than before one. He adds, however, that vomits do harm when the ſtomach is anywiſe inflamed; in which caſe they ought never to be given. Ipecacuanha is the ſafeſt and eaſieſt, but antimonials make the moſt efficacious vomit. If the body remains coſtive, it is neceſſary to open it with ſome lenient phyſic; and eſpecially if the bowels are affected with pains, or a teneſmus. He likewiſe recommends ſalt of wormwood, lemon-juice, ſpiritus mindereri, and the bark; which laſt ought not to be given 'till the urine breaks, and the intermiſſions take place. Bleeding and purging are alſo neceſſary before the bark ought to be given: it anſwers beſt in ſubſtance adminiſtered in rheniſh wine, after ſtanding a night in infuſion.

If, after remiſſions or intermiſſions, the diſeaſe changes into a continued fever, bleeding becomes neceſſary, unleſs other ſymptoms forbid it; but whether there be room for bleeding or no, bliſters are not only uſeful, but the beſt remedy. To theſe may be joined the neutral ſalts and diaphoretic powders. But, tho' a ſweat be the proper criſis, it ought never to be promoted by theriaca, or the like hot medicines; unleſs the pulſe ſhould ſink and the petechiæ or other bad ſymptoms appear: in which caſe the warmer alexipharmics are neceſſary, as the diſeaſe has changed into a malignant fever. *Pringle*, Obſerv. on Diſeaſes of the Army, p. 165 and 202. ſeq. See *Malignant catarrhal* FEVER, *Suppl.* and MALIGNANT, *Append.*

BILOCULAR, in botany, is applied to a capſule having two cells. See CAPSULE, *Cycl.*

BIND-*weed* (*Suppl.*) —*Black*-BIND-*weed*, a name ſometimes for uſed the *tamnus*. See the article TAMNUS, *Cycl.*

Prickly-BIND-*weed*, a name given to the *ſmilax* of authors. See the article SMILAX, *Suppl.*

Sea-BIND-*weed*, the Engliſh name of a diſtinct genus of plants, called by botaniſts *ſoldanella*. See the article SOLDANELLA, *Suppl.*

BINN, (*Suppl.*) or BIN, the peaſe and whole oatmeal, uſed at Sea, and which are apt to ſpoil in caſks, Dr. Hales propoſes to prevent this, by putting them into large *bins*, with falſe bottoms of hair clothes laid on bars, whereby freſh air may be blown upwards thro' them, at proper times, with ſmall ventilators. See VENTILATOR, *Append.*

BINOMIAL (*Cycl.*) — *Impoſſible* BINOMIAL, in algebra, is uſed for a *binomial*, one of the terms of which is an impoſſible quantity. Thus, $a + \surd - bb$, is an *impoſſible binomial*.

BINOMIAL *ſurd* is uſed for a *binomial*, the terms of which are ſurds; as, $\surd a + \surd b$, or $a^m + b^m$, if m and n be fractions. The term *binomial ſurd*, is alſo applied to any quantity having a rational part and a ſurd part, as $25 + \surd 968$. For the extraction of roots of *binomial ſurds*, ſee *Newton's* Arithmetica Univerſalis, and *Mac Laurin's* Algebra, p. 114---130.

BINOMIAL *curve* is uſed for a curve, the ordinate of which is expreſſed by a *binomial*. Thus if the ordinate of a curve be of this form $x \times \overline{e + f x^{\lambda}}^{\theta}$, the curve is called a *binomial curve*. *Stirling*, Method. differ. p. 58.

BINOMIAL *theorem* is often uſed to ſignify Sir Iſaac Newton's theorem for raiſing a *binomial* to any power, or for extracting any root of a *binomial*. See ROOT, *Suppl.*

BIOTA, in zoology, a name introduced by Dr. Hill for the *polype*. See the article POLYPE, *Suppl.*

It is of a cylindric figure, but variable; the tentacula are arranged in a ſingle ſeries round the aperture of the mouth, at the extremity of the body. There are ſeveral ſpecies of this animal.

Linnæus calls this creature *hydra*, no doubt, from the reproduction or repullulation of the parts, when cut off; and this name, *biota*, is likewiſe given it on the ſame account, being derived from βιος, life.

BIRCH (*Suppl.*) — BIRCH-*tree of America*, a name given by ſome to the *terebinthus*, or turpentine-tree. See TEREBINTHUS, *Suppl.*

BIRD (*Cycl.* and *Suppl.*)---*Admiſſive* BIRDS, *aves admiſſivæ*, in the augural ſcience of the antients, were birds of a happy omen, which denoted the approbation of the gods in an enterprize. *Danet*. Lex. in voc. *Baxt*. Gloſſ. p. 35. ſeq.

In which ſenſe *aves admiſſivæ* ſtand oppoſed to *arcivæ aves*.

BIRD'S *cherry*, in botany, the Engliſh name of a genus of plants, called by Linnæus *padus*. See PADUS, *Append.*

BIRD'S *eye*, in botany, the name of a genus of plants, called by authors *adonis flos*. See the article ADONIS *flos*, *Suppl.*

BIRD'S *foot*, the Engliſh name of a genus of plants, called by authors *ornithopodium*. See the article ORNITHOPODIUM, *Suppl.*

BIRD'S *foot trefoil*, a name given to ſome ſpecies of *lotus*. See the article LOTUS, *Suppl.*

BIRD-*lime.* See LIME-*twigs*, *Suppl.*

Water-BIRD-*lime.* See LIME-*twigs*, *Suppl.*

BIRD'*s neſt*, in botany, a name uſed by ſome for the *daucus*, or carrot. See the article DAUCUS, *Suppl.*

BIRD'*s pepper*, a name given to the *capſicum*, or Guinea pepper. See the article CAPSICUM, *Suppl.*

BIRD'*s tongue.* See LINGUA *avis*, *Suppl.*

BIRTH (*Cycl.* and *Suppl.*)—*Difficult* BIRTH. See the article DELIVERY, *Suppl.*

BISHOP'*s weed*, in botany, the Engliſh name of the *ammi*. See the article AMMI, *Suppl.*

BITTER (*Suppl.*)—*Bitters* are ſaid to reſiſt putrefaction and moderate fermentation: hence appears their uſe in putrid diſorders. *Bitters* likewiſe correct acidities, and aſſiſt digeſtion, by bracing the fibres of the ſtomach.

BITTER-*ſweet*, in botany, the Engliſh name of the *ſolanum ſcandens*, or climbing nightſhade. See the article SOLANUM, *Suppl.*

BITTER *vetch*, the Engliſh name of the *orobus*. See the article OROBUS, *Suppl.*

BITTER *wort*, the Engliſh name for the *gentiana* of authors. See the article GENTIANA, *Suppl.*

BLACK *berry*, the Engliſh name of a genus of plants called by authors *rubus*. See the article RUBUS, *Suppl.*

BLACK-*bind-weed*, or BLACK-*bryony*, a name given to the *tamnus* of authors. See the article TAMNUS, *Suppl.*

BLACK-*thorn*, a name uſed by ſome for the *prunus ſylveſtris*, or ſloe-tree. See the article PRUNUS, *Suppl.*

BLADDER-*lotus*. See the article LOTUS, *infra.*

BLADDER-*nut*, in botany, the Engliſh name of the *ſtaphylodendron*. See the article STAPHYLODENDRON, *Suppl.*

African BLADDER-*nut*, a name given to the *royena* of Linnæus. See the article ROYENA, *Suppl.*

Laurel-leaved-BLADDER-*nut*, the name uſed by ſome for the *Dodonæa* of Linnæus. See the article DODONÆA, *Suppl.*

BLADDER-*ſena*, a name given by ſome to the *colutea*. See the article COLUTEA. *Suppl.*

BLATTA *byzantia*, in the materia medica. See the article UNGUIS *odoratus*, *Suppl.*

BLEEDING, (*Suppl.*) according to Dr. Pringle, is the moſt indiſpenſible of all remedies in inflammatory diſeaſes; to the delaying of which too long, or not repeating it, are chiefly owing the bad conſequences of colds, as dangerous fevers, rheumatiſms, and conſumptions. He obſerves farther, that, in general, young practitioners are apt to be too ſparing in letting blood, by which means many lives are loſt: for a ſurgeon may be aſſured a ſoldier will never complain of a cough, or pains with inflammatory ſymptoms, wherein *bleeding* is not neceſſary; and from the ſizineſs of the blood, and continuance of the complaints, he is to judge of the neceſſity of repeating it, which, in caſe of a ſtitch, or difficult breathing, is never to be delayed. In inflammatory caſes, from twelve to fifteen ounces may be taken for the firſt *bleeding*, and ſomewhat leſs for all the reſt; and when it is neceſſary to exceed this quantity, it may be proper to follow Celſus's rule, in minding the colour of the blood whilſt it flows, and when it is of a blackiſh caſt, which is always the caſe in difficult breathing and great inflammations, to let it run till it becomes more florid. In all caſes where plentiful *bleeding* is indicated, it is beſt to do it in bed, to prevent fainting; and we may obſerve, that a perſon will bear the loſs of a much greater quantity of blood if the ſtream is ſmall, than by a large orifice, which ſome have thought neceſſary for making a more ſpeedy revulſion.

Bleeding is highly neceſſary in the phrenitis, ophthalmia, quinſey, rheumatiſm, cough, hectic fits, and, in general, in all inflammatory caſes. See *Pringle*'s Obſervations on the Diſeaſes of the Army, *paſſim.*

It is to be obſerved, however, that, in malignant and putrid diſorders *bleeding* frequently renders them more malignant, and therefore to be omitted, or at leaſt not repeated unleſs there appear evident marks of inflammation. See the articles MALIGNANT *fever*, BILIOUS *fever*, DYSENTERY, &c.

BLISTERS (*Suppl.*) are often neceſſary in inflammatory diſorders, as the phrenitis, ophthalmia, quinſey, pleuriſy, &c. as well as in chronic diſtempers, ſuch as palſies, &c. See PHRENITIS, OPHTHALMIA, &c. *Suppl.*

BLITE, in huſbandry. See the articles BLIGHT and RUBIGO, *Suppl.*

BLOIS, *Bole of* BLOIS, *Bolus Bleſenſis*. See the article BLESENSIS *bolus*, *Suppl.*

BLOOD (*Suppl.*)—In order to aſcertain the colour of the different parts of corrupted *blood*, Dr. Pringle made the following experiment. He took a freſh quantity without any inflammatory cruſt, and divided it into the craſſamentum, the ſerum with a few red globules in it, and the pure ſerum. The phials containing theſe ſeveral liquors were put into a furnace, where they ſtood ſome days, till they became thoroughly putrid.

The craſſamentum was changed from a deep crimſon to a dark livid colour; ſo that when any portion of it was diluted with water, it appeared of a tawney hue. Of the ſame colour was the ſerum in which the red globules remained. But the pure ſerum, after becoming turbid, dropped a white purulent ſediment, and changed into a faint olive green.

From this experiment he concludes, that the ichor of ſordes, and that of dyſentery fluxes, conſiſts of the ſerum tinged with a ſmall quantity of red blood putrified; and that when the ſerous veſſels are of a tawney caſt, we are not to refer that colour to inflammation, but to a ſudden ſolution of ſome of the red globules mixed with the ſerum.

A few drops of this putrid craſſamentum was mixed with the recent urine of a healthy perſon, which it immediately changed into a flame-coloured water, common in fevers and in the ſcurvy. After ſtanding an hour or two, the ſame gathered a cloud, reſembling what is ſeen in the crude urine of perſons in acute diſtempers.

As to a green ſerum, it is perhaps never to be ſeen in the veſſels of a living body, ſince it is not to be ſuppoſed that a perſon could ſurvive ſo great a change of the *blood*. In foul ulcers, indeed, and in other ſores, where the ſerum is left to ſtagnate long, the matter is found of a greeniſh colour, and is then always acrimonious. But the effects of a green ſerum is no where to be ſo much dreaded as in the caſe of an aſcites, where it is collected in ſo large a quantity. Of which we had, ſome time ſince, almoſt a fatal inſtance in Mr. Cox, ſurgeon at Peterborough, who, upon tapping a woman but a few hours after death, was ſo affected with the poiſonous ſteams of a green ſerum, that he was preſently ſeized with a peſtilential fever, and narrowly eſcaped with his life.

In regard to the ſediment which the ſerum dropped on becoming turbid, and which reſembled well digeſted matter, the doctor thinks it a terreſtrial ſubſtance, intended for the nouriſhment or reparation of the ſolid; in which opinion he was the more confirmed by obſerving a like ſediment in the urine of men in perfect health: and therefore concludes that the pus, or digeſted matter of ſores, is nothing but this ſubſtance ſeparated from the ſerum of the blood. And hence it is that all large ulcers are extremely weakening, from the great expence of *blood* in furniſhing this ſubſtance. Hence alſo it is, that iſſues are of more conſequence for making drains, than one would expect from the viſible evacuation: as near as the doctor could gueſs, an ounce of ſerum, after ſtanding ſome days, not furniſhing more of this matter than what might be produced in the daily diſcharge of a large pea-iſſue, or from a ſeton. *Pringle*, Obſerv. on Diſeaſes of the Army, Append. p. 386, *ſeq.* Experim. xlv.

There are frequent inſtances of the tawney colour of the ſerum, the reſolution of the craſſamentum, and even of the offenſive ſmell of *blood* recently drawn. And, indeed, if we reflect how putreſcent *blood* is in a heat equal to that of the human body, we may be convinced, that no ſooner is the perſpiration by the lungs impeded, than a corruption begins in the whole maſs; which, if not timely prevented, brings on ſome putrid diſeaſe. If the acrimony is great and ſudden, a fever or flux will enſue; but if the accumulation is ſo ſlow that the body grows habituated to the putrefaction, a ſcurvy prevails. This is the caſe in long voyages, on board unventilated ſhips; in marſhy countries; and, in a leſſer degree, in all northerly climates, in moiſt ſituations. *Id.* p. 400.

BLOOD-*flower*, in botany, the Engliſh name of the *hæmanthus*. See the article HÆMANTHUS, *Suppl.*

BLOWER, among dealers in horſes, a term uſed for ſuch horſes as wheeze much, without wanting wind. See the article WHEEZING, *Suppl.*

BOAR (*Suppl.*) The wild *boar*, among the huntſmen, has ſeveral names, according to its different ages; the firſt year it is called *a pig of the ſaunder*; the ſecond it is called *a hog*; the third, *a hog-ſteer*; and the fourth, *a boar*; when leaving the ſaunder he is called *a ſingler* or *ſangler*.

The *boar* generally lives to twenty-five or thirty years, if he eſcapes accidents. The time of going to rut is in December, and laſts about three weeks. They feed on all ſorts of fruits, and on the roots of many plants; the root of fern in particular ſeems a great favourite with them: and when they frequent places near the ſea coaſts, they will deſcend to the ſhores and demoliſh the tenderer ſhell-fiſh in very great numbers. Their general places of reſt are among the thickeſt buſhes that can be found, and they are not eaſily put up out of them, but will ſtand the bay a long time. In April and May they ſleep more ſound than at any other time of the year, and this is therefore the ſucceſsful time for the taking them in the toils. When a *boar* is rouzed out of the thicket, he always goes from it, if poſſible, the ſame way by which he came to it; and when he is once up, he will never ſtop till he comes to ſome place of more ſecurity. If it happens that a ſaunder of them are found together, when any one breaks away, the reſt all follow the ſame way. When the *boar* is hunted in the wood, where he was bred, he will ſcarce ever be brought to quit it; he will ſometimes make toward the ſides to liſten to the noiſe of the dogs, but retires into the middle again, and uſually dies or eſcapes there. When it happens that a *boar* runs a-head, he will not be ſtopt, or put out of his way by man or beaſt, ſo long as he has any ſtrength left. He makes no doubles nor croſſings when chaſed; and when killed makes no noiſe, if an old *boar*; the ſows and pigs will ſqueak when wounded.

The ſeaſon for hunting the wild *boar* begins in September and ends in December, when they go to rut. If it be a large *boar*, and

and one that has lain long at rest, he must be hunted with a great number of dogs, and those such as will keep close to him, and the huntsman, with his spear, should always be riding in among them, and charging the *boar* as often as he can, to discourage him: such a *boar* as this, with five or six couple of dogs, will run to the first convenient place of shelter, and there stand at bay, and make at them as they attempt to come up with him.

There ought always to be relays also set of the best and staunchest hounds in the kennel; for if they are of young eager dogs, they will be apt to seize him, and be killed or spoiled before the rest come up. The putting collars with bells about the dogs necks is a great security for them, for the *boar* will not so soon strike at them when they have these, but will rather run before them. The huntsmen generally kill the *boar* with their swords or spears; but great caution is necessary in making the blows, for he is very apt to catch them upon his snout or tusks, and if wounded and not killed, he will attack the huntsmen in the most furious manner. The places to give the wound with the spear is either between the eyes in the middle of the forehead or in the shoulder, both these places make the wound mortal.

When this creature makes at the hunter there is nothing for it but courage and address, if he flies for it he is surely overtaken and killed; if the *boar* comes strait up, he is to be received at the point of the spear; but if he makes doubles and windings, he is to be watched very cautiously, for he will attempt getting hold of the spear in his mouth, and if he does so nothing can save the huntsman but another person attacking him behind; he will on this attack the second person, and the first must then attack him again; two people will thus have enough to do with him, and were it not for the forks of the boar-spears that make it impossible to press forward upon them, the huntsman who gives the creature his death's wound would seldom escape falling a sacrifice to his revenge for it.

The modern way of boar-hunting is generally to dispatch the creature by all the huntsmen striking him at once; but the antient Roman way was, for a person on foot, armed with a spear, to keep the creature at bay, and in this case the *boar* would run of himself upon the spear to come at the huntsman, and push forward till the spear pierced him through.

The hinder claws of a *boar* are called *guards*.

In the corn he is said to *feed*; in the meadows or fallow fields, to *rout*, *worm*, or *fern*; in a close, to *graze*.

The *boar* is farrowed with as many teeth as he will ever have, his teeth increasing only in bigness, not in number; among these there are four called *tushes* or *tusks*, the two biggest of which do not hurt when he strikes, but serve only to whet the other two lowest, with which the beast defends himself, and frequently kills, as being greater and longer than the rest. Gent. Recr. p. 1, 7, and 119. Trev. Dict. Univ. tom. iv. p. 1489, *voc.* *Sanglier*.

It is very remarkable, that these creatures in the West Indies are subject to the stone in a very remarkable manner: few of them are absolutely free from it, yet scarce any have the stones of any considerable size. It is common to find a great number in the same bladder, and they are usually of about a scruple weight, and are angular, and that with great regularity, each having five angles. Phil. Trans. n. xxxvi.

Among the antient Romans *boar's* flesh was a delicacy; a *boar* served up whole was a dish of state. *Pitisc.* Lex. Ant. tom. i. p. 120. *voc.* Aper.

The *boar* was sometimes also the military ensign borne by the Roman armies, in lieu of the eagle. *Salmuth.* ad Pancirol. P. I. tit. liii. p. 278.

Among physicians a *boar's* bladder has been reputed a specific for the epilepsy. *Friend*, Hist. of Phys. tom. ii. p. 280. The tush of the wild *boar* still passes with some as of great efficacy in quinzies and pleurisies. *Alleyn*, Dispens. p. 150.

Boar, in the manege. A horse is said to *boar*, when he shoots out his nose as high as his ears, and tosses it in the wind. *Guill.* Gent. Dict. *in voc.*

BOLBONACH, in botany, a name given to the *lunaria* of authors. See the article Lunaria, *Suppl.*

BOLE (*Suppl.*) — See the article Bolus, *Suppl.* and *Append.*

BOLUS *Blesensis*. See the article Blesensis *bolus*, *Suppl.*

Bolus *Etrusca*, the same with *Etrusca terra*. See the article Etrusca *terra*, *Suppl.*

Bolus *Goltbergensis*, the same with *terra Goltbergensis*. See the article Goltbergensis *terra*, *Suppl.*

Bolus *Lemnia*, the same with *terra Lemnia*. See the article Lemnian *earth*, *Suppl.*

Bolus *Livonica*, the same with the *Livonica terra*. See the article Livonica *terra*, *Suppl.*

Bolus *Noceriana*, the same same with *terra Noceriana*. See the article Noceriana *terra*, *Suppl.*

Bolus *Veneta*. See the article Veneta *bolus*, *Suppl.*

BONANA, in botany, the name used for a genus of plants called by authors *musa*. See the article Musa, *Suppl.*

BONE (*Cycl.* and *Suppl.*)—All sorts of *bone* may be stained, or dyed, any kind of colour, as directed under the article Ivory, *Append.*

BOREA, a name given by the antients to a species of jasper, of a blueish green colour. See the article Jasper, *Append.*

BORECOLE, in botany, a name used for a species of *brassica*. See the article Brassica, *Suppl.*

BOTRYS, in botany, a name sometimes given to a species of *chenopodium*, called also *oak of Jerusalem*. See the article Chenopodium, *Suppl.*

BOTRYTIS, in botany, the name given by Micheli to a genus of mosses, called by authors *byssus*. See the article Byssus, *Suppl.*

BOTTLE (*Suppl.*)—*Blue* Bottle, a name used for the *cyanus* of authors. See the article Cyanus, *Suppl.*

BOWER (*Suppl.*)—*Ladies* Bower, or *virgin's* Bower, names given by us to a distinct genus of plants called by botanists *clematitis*. See the article Virgin's *bower*. *Suppl.*

BOX-*thorn*, in botany, the English name of a genus of plants called by authors *lycium*. See the article Lycium, *Append.*

BRACHIONUS, in zoology, the name of a genus of animalcules of the *arthrodia* kind, containing all the wheel animals. See the articles Arthrodia, and Animalcule, *Append.* and Wheel, *Suppl.*

BRACHURI, in zoology, a name given by Dr. Hill to a genus of animalcules of the tailed kind. See the article Animalcule, *Suppl.* and *Append.*

These animalcules are of a roundish figure, with tails shorter than their bodies; their skin is perfectly smooth, thin, and colourless. They are frequent in water-ponds, in pepper-water, and many other infusions of vegetable substances. See *Hill*, Hist. Anim. p. 6, *seq.*

BRACHYPYRENIA, in natural history, a genus of fossils of the class of *septariæ*. See the article Septariæ, *Suppl.*

The *brachypyrenia* have a short roundish nucleus, enclosed by and contained within the body of the mass.

BRAMA *marina*, the sea-bream, in ichthyology, a species of *sparus*, according to Artedi. See the article Sparus, *Sppul.*

BRAMBLE, or Bramble *bush*, in botany, the English name of a genus of plants called by authors *rubus*. See the article Rubus, *Suppl.*

BRAMBLING, in zoology. See the article Bramble, *Suppl.*

BRANCK *ursine*, a name used by some authors for the *acanthus*. See the article Acanthus, *Suppl.*

BRASSE, in ichythology, a name sometimes given to the *lucioperca*, a species of pearch. See the articles Perca and Lucioperca, *Suppl.*

BREAD (*Suppl.*)—*S. John's* Bread, in botany, the English name of the carob-tree, described by Tournefort under that of *siliqua*. See the article Siliqua, *Suppl.*

BREAM (*Suppl.*)—*Sea*-Bream, *brama marina*, in ichthyology, a species of *sparus*. See the article Sparus, *Suppl.*

BREAST (*Suppl.*) — *Diseases of the* Breast. See the article Asthma, *Append.*

BRIAR, in botany, a name given to several species of rose. See the article Rose, *Suppl.*

BRIMSTONE *wort*, in botany, a name given to the *peucedanum* of authors. See the article Pucedanum, *Suppl.*

BRIONY, in botany. See the article Erionia, *Suppl.*

BRISTOL *flower*, in botany, a name used by some for the *lychnis*. See the article Lychnis, *Suppl.*

BROCADE (*Cycl.*) — Brocade-*shell*, the English name of a species of *cylindrus*. See the article Cylindrus, *Suppl.*

It is of a silvery white colour variegated with brown.

BROCATELLO, a name used by our lapidaries for the white and gold veined red marble. See the article Marble, *Suppl.*

BROCOLI, among gardeners. See Broccoli, *Suppl.*

BROMELIA, in the Linnæan system of botany, the name of a genus of plants called by Tournefort *ananas*. See the article Ananas, *Suppl.*

BROOM (*Suppl.*) — *Butcher's* Broom, in botany, the English name of a genus of plants called by authors *ruscus*. See the article Ruscus, *Suppl.*

Green, and *white* Broom, names given to the *spartium* of authors. See the article Spartium, *Suppl.*

Spanish Broom, *spartium*, in botany. See the article Spartium, *Suppl.*

Broom-*lime*, a name used for the plant known among authors by that of *veronica*. See the article Veronica.

Broom-*rape*, a name given to the orobanche of authors. See the article Orobanche, *Suppl.*

BROWN *wort*, in botany, a name given sometimes to the *brunella*, or *prunella* of authors. See the article Prunella, *Suppl.*

Brown *wort* is also sometimes used for the *scrophularia*. See the article Scrophularia, *Suppl.*

BRUISE *wort*, in botany, a name given by some authors to the *lychnis*. See the article Lychnis, *Suppl.*

BRUSH (*Suppl.*) — *Silver*-Brush, the name by which some call the *barba Jovis*, a distinct genus of plants. See the article Barba *Jovis*, *Suppl.*

BUBO, in ornithology. See the article Owl, *Suppl.* and *Append.*

BUCEROS, in ornithology, the name of a species of raven found in the East Indies, China, and Tartary. Its head, neck, rump, and tail are of a glossy black without the least tinge of any other colour. It is of the bigness of a well grown pullet: its head is remarkably large, as is its beak, which has a considerable gibbosity towards the base, rising above the rest of the surface. See *Hill*, Hist. Anim. p. 383.

BUCK's

BUCK's *horn*, or *hart's horn plantain*, in botany, names given to the *coronopus* of authors. See the article CORONOPUS, *Suppl.*

BUCK's *horn cress*, in botany, a name given to the *nasturtium* of authors. See the article NASTURTIUM, *Suppl.*

BUCK-*thorn*, in botany, the English name of a genus of plants called by authors *rhamnus*. See the article RHAMNUS, *Suppl.*

Sea-BUCK-*thorn*, in botany, a name given to the *rhamnoides* of authors. See the article RHAMNOIDES, *Suppl.*

BUCK-*wheat*, in botany, the English name of the *fagopyrum* of authors. See the article FAGOPYRUM, *Suppl.*

BUDDING, among gardeners, the same with innoculation, or innoculating. See the article INNOCULATION, *Cycl.* and *Suppl.*

BUGG, in the history of insects, the English name of the *cimex*. See the article CIMEX, *Suppl.*

BUGG is also the English name of another genus of insects found on several trees. See the article CHERMES, *Append.*

House BUGG, in the history of insects, the English name of a species of *coccus*. See the article COCCUS, *Append.*

BUGLOSS (*Suppl.*) — *Viper's* BUGLOSS, in botany, the English name of the *echium*. See the article ECHIUM, *Suppl.*

BULBINE, in botany, a name used by some for the *phalanguim* or spider-wort of Tournefort. See the article PHALANGIUM, *Suppl.*

BULL-*frog*, the English name of the largest species of the frog kind. See the articles FROG and RANA, *Suppl.*

BULLACE-*tree*, in botany, a name given to a species of the *prunus*, or plum tree. See the article PRUNUS, *Suppl.*

BULLY-*tree*, in botany, a name given to the *cainito* or *chrysophyllum* of authors. See the article CHRYSOPHYLLUM, *Append.*

BUNIUM, in the Linnæan system of botany, the name of a genus of plants called by Tournefort *bulbocastanum*. See the article BULBOCASTANUM, *Suppl.*

BUNK, BUNKEN. See the article LEUCACANTHA, *Suppl.*

BUPLEURUM, hare's ear, in botany. See the article HARE'S *ear*, *Suppl.*

BURDOCK, in botany, the English name of a genus of plants called by authors *Xanthium*. See the article XANTHIUM, *Suppl.*

BURNET, in botany, the English name of a genus of plants called by authors *sanguisorba*. See the article SANGUISORBA, *Suppl.*

BURNET-*saxifrage*, in botany, a name improperly given by some to a species of *tragoselinum*. See the article TRAGOSELINUM, *Suppl.*

BURNING *of diamonds*, is used among the jewellers for putting the diamonds into a fierce fire, in order to divest them of a yellow or brown colour. See DIAMOND, *Suppl.*

BURSA *pastoris minor*, in botany, the name by which the *draba* of Linnæus is called by some writers. See the article DRABA, *Append.*

BUSH (*Suppl.*) — *Poison*-BUSH, the name by which the *tithymalus*, or spurge is sometimes called. See the article TITHYMALUS, *Suppl.*

BUSTARD, the English name of a genus of birds called *otis* by authors. See the article OTIS, *Suppl.*

BUTTER-*bump*, a name used in some parts of England for the bittern, or *ardea stellaris*. See the article BITTERN, *Suppl.*

BUTTERFLY-*flower*, the name of a plant called by authors *orchis*. See the article ORCHIS, *Suppl.*

BUTTERFLY-*shell*, the English name of a species of *voluta*. See the article VOLUTA, *Suppl.*

BUTTERIS, among farriers, the same with *buttress*. See the article BUTTRESS, *Cycl.*

BUTTON-*tree*, a name given to some species of *platanus* and *cephalanthus*. See the articles PLANE-*tree*, *Suppl.* and CEPHALANTHUS, *Append.*

BUTTON-*tree of Jamaica*, a name given to the *conocarpus* of Linnæus. See the article CONOCARPUS, *Append.*

C.

CABBAGE (*Suppl.*) — *Sea*-CABBAGE, or sea-cale, in botany, a name given to the *crambe* of authors. See the article CRAMBE, *Suppl.*

CABBAGE-*tree*, a name used by some for the palm-tree described by Linnæus under that of *phœnix*. See the article PHOENIX, *Suppl.*

CACALIANTHEMUM, in botany, the name by which Dillenius calls a genus of plants described by Linnæus under that of *kleinia*. See the article KLEINIA, *Append.*

CACTUS, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: the cup is a deciduous perianthium, formed of a single leaf of a tubulated concave form, standing on the germen, and covered with a kind of squamose leaves; the flower consists of a great number of broad obtuse petals, the exterior ones short, the interior longer and connivent; the stamina are numerous subulated filaments, inserted into the calyx, and shorter than the flower. The antheræ are oblong and erect; the germen stands under the tube of the cup: the style is cylindric, and of the length of the stamina: the stigma is capitated and multifid: the fruit is an oblong umbilicated berry, containing only one cell, and covered with little leaves, like the cup: the seeds are numerous, roundish, and small.

This genus comprehends the *cereus*, *opuntia*, *melocactus*, *tuna*, and *pereskia* of botanical authors. The *cereus* is a long cylindraceo-angulated plant; the *melocactus*, a roundish and angulated one; the *opuntia* is ramose and dichotomous; and the *pereskia* is arborescent and foliose. Vide *Linnæi* Gener. Plant. p. 210.

CADLOCK, in botany, a name used in several parts of England for the *rapistrum* of authors. See the article RAPISTRUM, *Suppl.*

CÆMENT (*Cycl.* and *Suppl.*) — We have various receipts for making *cæments* to mend broken china or glasses; one of the finest, and at the same time strongest *cæments* for this purpose, is the juice of garlick stamped in a stone mortar; this will leave little or no mark, if done with care.

Another *cæment* for broken glasses, china, or earthen ware may be prepared by beating the white of an egg very clear, and mixing with it fine powdered quick lime; or isinglass, powdered chalk, and a little lime may be mixed together, and dissolved in fair water, with which the glasses, &c. are to be cæmented, and then set in the shade to dry; a precaution that should be always observed, whichever of the above *cæments* be used.

CÆMENTS *for cracked chemical glasses*. To prepare a *cæment* for these glasses that will stand the fire: take wheat flour, fine powdered Venice glass, pulverized chalk, of each an equal quantity; fine brick dust, one half of the quantity; and a little scraped lint: mix them all together with the whites of eggs: then, spreading this mixture upon a linnen cloth, apply it to the cracks of the glass, which must be well dried before you put it to the fire.

Old varnish is another *cæment* which will answer the same purpose; for by gluing the pieces together therewith, and setting them to dry in the sun, or a warm place, they will hold very well. *Smith's* Laboratory, p. 171.

For the manner of preparing a *cæment* to bind together the various embellishments of grottos, see the article GROTTO, *Append.*

CAINITO, in botany, a name given by Plumier to a genus of plants described by Linnæus under that of *chrysophyllum*. See the article CHRYSOPHYLLUM, *Append.*

CALABASH, in botany, a name used by some for the *melopepo* of authors. See the article MELOPEPO, *Suppl.*

CALABASH-*tree*, the name of a genus of plants called by Plumier *cujete*, and described by Linnæus under that of *crescentia*. See the article CRESCENTIA, *Suppl.*

CALAMINT (*Suppl.*) — *Water*-CALAMINT, in botany, a name given by some to several species of mint. See the article MENTHA, *Suppl.*

CALCITRAPA is made by Vaillant a distinct genus of plants, but ranked by Linnæus among the *centauria*. See the article CENTAURIA, *Append.*

CALCITAPRA is a name by which some call a species of *cnicus*. See the article CNICUS.

CALCITRAPA is also used as the name of several species of our common thistle. See the article THISTLE, *Suppl.*

CALCITRAPOIDES, a distinct genus of plants, according to Vaillant, but comprehended among the *centauria* by Linnæus. See the article CENTAURIA, *Append.*

CALF (*Suppl.*) — *Sea*-CALF, the Engliſh name of a genus of animals called by authors *phoca*. See the article PHOCA, *Suppl.*

CALF's *ſnout*, in botany, an Engliſh name for the *antirrhinum* of authors, otherwiſe called *ſnap-dragon*. See the article SNAP-DRAGON, *Suppl.*

CALKING, among painters, the ſame with calquing. See the article CALQUING, *Cycl.*

CALL, a name given by the miners in many parts of the kingdom to the red *telaugium*, variegated with black and white. See the article TELAUGIUM, *Append.*

CALLITRICHUM, καλλιτριχον. See the article ADIANTUM, *Suppl.*

CAMEA, in natural hiſtory, the ſame with *camæa*, a genus of ſemipellucid gems. See the article CAMÆA, *Suppl.*

CAMEHUIA, in natural hiſtory, the ſame with what is called *camaieu* in the *Supplement*. See the article CAMAIEU, *Suppl.*

CAMPANULA *lychnidea*, the name by which J. Bauhine calls a ſpecies of the *convolvulus*, or bind-weed. See the article CONVOLVULUS, *Suppl.*

CAMMOCK, in botany, a name given by ſome to the *anonis*, or reſt harrow. See the article REST-HARROW, *Suppl.*

CAMOMILE, CHAMOMILE, or *Chamemile*, in botany, the Engliſh name of a genus of plants called by authors *chamæmelum*. See the article CHAMÆMELUM, *Suppl.*

CAMP (*Suppl.*)—Where the grounds are equally dry, thoſe *camps* are always moſt healthful which are pitched on the banks of large rivers; becauſe in the hot ſeaſon ſituations of this kind have a ſtream of freſh air from the water, ſerving to carry off the moiſt and putrid exhalations. On the other hand, next to marſhes, the worſt encampments are on low grounds cloſe beſet with trees: for then the air is not only moiſt and hurtful in itſelf, but, by ſtagnating, becomes more ſuſceptible of corruption. However, let the ſituation be ever ſo good, *camps* are frequently rendered infectious by the putrid effluvia of rotten ſtraw, and the privies of the army; more eſpecially if the bloody flux prevails, in which caſe the beſt method of preventing a general infection is to leave the ground with the privies, foul ſtraw, and other filth of the *camp* behind. This is to be frequently done, if conſiſtent with the military operations; but when theſe render it improper to change the ground often, the privies ſhould be made deeper than uſual, and once a day a thick layer of earth thrown into them till the pits are near full, and then they are to be well covered, and ſupplied by others. It may alſo be a proper caution, to order the pits to be made either in the front or rear, as the then ſtationary winds may beſt carry off their effluvia from the *camp*. Moreover, it will be neceſſary to change the ſtraw frequently, as being not only apt to rot, but to retain the infectious ſteams of the ſick. But if freſh ſtraw cannot be procured, more care muſt be taken in airing the tents as well as the old ſtraw. See *Pringle*, Obſerv. on the Diſeaſes of the army, p. 99, 103, &c.

CAMP-*diſeaſes*. See the article SOLDIER, *Append.*

CAMP-*fever*. See the article BILIOUS *fever*.

CAMP-*hoſpital*. See the article HOSPITAL.

CAMPAIGN (*Cycl.*)—The beginning of every *campaign* is conſiderably more unhealthy than if the men were to remain in quarters. After the firſt fortnight or three week's encampment, the ſickneſs decreaſes daily; the moſt infirm being by that time in the hoſpitals, the reſt more hardened, and the weather growing daily warmer. This healthy ſtate continues throughout the ſummer, unleſs the men get wet cloaths or wet beds; in which caſe a greater or leſſer degree of the dyſentery will appear, in proportion to the preceding heats. But the moſt ſickly part of the *campaign* begins about the middle or end of Auguſt, whilſt the days are ſtill hot but the nights cool and damp, with fogs and dews: then, if not ſooner, the dyſentery prevails; and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the reſt of the *campaign*, and never entirely ceaſes even in winter-quarters till the froſts begin.

At the beginning of a *campaign* the ſickneſs is ſo uniform, that the number may be nearly prædicted; but, for the reſt of the ſeaſon, as the diſeaſes are then of a contagious nature, and depend ſo much upon the heats of ſummer, it is impoſſible to foreſee how many may fall ſick from the beginning to the end of autumn. It is alſo obſerved, that the laſt fortnight of a *campaign*, if protracted till the beginning of November, is attended with more ſickneſs than the firſt two months of the encampment: ſo that it is better to take the field a fortnight ſooner, in order to return into winter-quarters ſo much the earlier.

As to winter-expeditions, though ſevere in appearance, they are attended with little ſickneſs, if the men have ſtrong ſhoes, quarters, fuel, and proviſions.

Long marches in ſummer are not without danger, unleſs made in the night, or ſo early in the morning as to be over before the heat of the day. See *Pringle*, Obſerv. on the Diſeaſes of the army, p. 118, *ſeq.*

CAMPHOR-*tree*, in botany, the name of a ſpecies of *laurus*, according to Linnæus, with oval gloſſy leaves on lax pedicles. See the article LAURUS, *Append.* It is a native of many parts of the Eaſt: Breynius calls it *arbor camphorifera Japonica foliis laurinis*, &c.

The *camphor* of the ſhops is prepared from the wood of this tree by a coarſe kind of ſublimation. See the article CAMPHOR, *Cycl.* and *Suppl.*

CAMPION, in botany, the Engliſh name of a genus of plants called by authors *lychnis*. See the article LYCHNIS, *Suppl.*

CANARY. See *Colouring of* MARBLE.

CANARY-*graſs*, in botany. See the article GRASS, *Append.*

CANCER, the crab, in zoology, the name of a genus of *ſquillæ*. See the article SQUILLA, *infra*.

CANDLE-*berry-tree*, a name uſed by ſome for the *myrica* of authors. See the article MYRICA, *Append.*

CANDY-*carrot*, in botany, a name uſed by ſome for the *myrrhis* of Candia. See the article MYRRHIS, *Suppl.*

CANDY-*tuft-tree*, in botany, a name given to the *thlaſpi* of authors. See the article THLASPI, *Suppl.*

CANE (*Suppl.*) — *Bambo* or *bamboo* CANE. See the articles BAMBO and ARUNDO, *Suppl.*

Dumb CANE, in botany, a name given by ſome writers to the *arum*. See the article ARUM, *Suppl.*

Fiſhing-rod-CANE, the name of a ſpecies of *arundo*, or reed. See the article ARUNDO, *Suppl.*

Indian flowering CANE, in botany, the name of a genus of plants called by Linnæus and Tournefort *canna* and *cannacorus*. Se the articles CANNA and CANNACORUS, *Suppl.*

Sugar-CANE, in botany, the Engliſh name of a genus of plants called by Linnæus *ſaccharum*. See the article SACCHARUM, *Suppl.* and SUGAR, *Cycl.*

CANNABINA, baſtard-hemp, in botany, the name of a diſtinct genus of plants, the characters of which are theſe: the flower is apetalous, conſiſting of a number of ſtamina, and is barren, the ſeed being produced on diſtinct female plants of the ſame genus, which have no viſible flower. The ſeeds are triangular, oblong, and contained in membranous capſules.

The ſpecies of *cannabina* enumerated by M. Tournefort, are theſe: 1. The Cretic male *cannabina*, with flowers. 2. The Cretic fruit-bearing or female *cannabina*. Vide *Tourn.* Inſt. Bot. Coroll. p. 52.

CANTERBURY-*bell*, in botany, a name given by ſome to the *campanula* of authors. See the article CAMPANULA, *Suppl.*

CANTHARIS, the glow-worm, in the hiſtory of inſects. See the article GLOW-*worm*, *Suppl.*

CANTHARUS *unctuoſus*, a name by which ſome authors call the *meloe*, or oil-beetle. See the article MELOE, *Append.*

CANUTI *avis*, the name by which ſome call a ſpecies of *tringa*. See the article TRINGA, *Suppl.*

CAP (*Suppl.*)—*Black* CAP, the name uſed by the common people in many parts of the kingdom for the pewit, a bird of the *larus* or ſea-gull kind. See the article PEWIT. *Suppl.*

CAPER (*Suppl.*)— *Bean* CAPER, a name given by ſome to the *fabago* of authors. See the article FABAGO, *Suppl.*

CAPILLUS *veneris*. See the article ADIANTUM.

CAPILLUS *terræ*. See the article ADIANTUM.

CAPITALIS *reflexa*, in ſurgery, a kind of bandage called by the French *capeline*. See the article CAPELINE, *Suppl.*

CAPITO *anodromus*, a name by which ſome authors have called the *zerta* or *zerte*, a fiſh living partly in large rivers and partly in the ſea, and in ſome degree reſembling the common river chubb in ſhape. *Geſner*, de Piſc. p. 1269. See the article ZERTA, *Suppl.*

CAPNIAS, or *capnitis*, in natural hiſtory, names uſed by the antients for the pale bluiſh jaſper with black veins and clouds. See the article JASPER, *Append.*

CAPNORCHIS, the Indian bulbous-rooted fumitory, in botany, the name of a ſpecies of fumitory. See the article FUMARIA, *Suppl.*

CAPON's *tail graſs*, in botany, the Engliſh name of a genus of plants called by authors *feſtuca*. See the article FESTUCA, *Suppl.*

CAPRA, in ornithology, the name by which ſome call the *capella*, or lapwing. See the article CAPELLA, *Suppl.*

CAPREA, a name uſed by Pliny for the roe-deer, a creature not in the leaſt allied to the goat kind. See the article CAPREOLUS, *Suppl.*

CAPRICORNUS, in zoology, the name of a ſpecies of *mordella*, a genus of four-winged flies. See the article MORDELLA, *Append.*

CARABUS, in zoology, the name of a genus of four-winged flies, whoſe antennæ are oblong, ſlender, and ſetaceous; the thorax is ſomewhat convex, marginated, of a cordated figure, and truncated in the hinder part. Vide *Hill*, Hiſt. Animal. p. 47.

CARASSIUS, a name given by ſome to a ſpecies of *cyprinus*, with twenty bones in the back fin, and the ſide line ſtrait. See CYPRINUS, *Suppl.*

CARATAS, in botany. See the article KARATAS, *Append.*

CARAWAY, or CARRAWAY, in botany, the Engliſh name of a genus of plants called by authors *carui*. See the article CARUI, *Suppl.*

CARBO *aquaticus*, a name uſed by Geſner for the cormorant. See the article CORMORANT, *infra*.

CARDIA,

CARDIA, a name given by Dr. Hill to the heart-shells. See the article HEART-*shell*, *Suppl.*

CARDINAL'S *flower*, in botany, a name used by some for the *rapuntium* of authors. See the article RAPUNTIUM, *Suppl.*

CARIQUEIBEIU, in zoology. See the article JIYA.

CARLOCK, a name used by some for the *raphanistrum* of authors. See the article RHAPHANISTRUM, *Suppl.*

CARNATION, in botany, a name given to several species of the *caryophyllus*, or pink, see the article PINK, *Suppl.*

Spanish CARNATION, a name given by some writers to the *poinciana*. See the article POINCIANA, *Suppl.*

CAROB-*tree*, the English name of the *siliqua* of Tournefort and the *ceratonia* of Linnæus. See the article SILIQUA, *Suppl.*

Candy-CARROT, a name given by some to the *myrrhis*. See the article MYRRHIS, *Suppl.*

Deadly, or *scorching* CARROT, in botany, a name given to the *thapsia* of authors. See the article THAPSIA, *Suppl.*

Mountain CARROT, a name sometimes given to a species of *fennel*. See the article FOENICULUM, *Suppl.*

CASSIA, in the Linnæan system of botany is made to comprehend both the *cassia* and *sena* of Tournefort. See the articles CASSIA and SENA, *Suppl.*

CASSIDA, in zoology, the name given by Dr. Hill to a genus of beetles, called in English the tortoise-beetles. See the article SCARABÆUS, *Suppl.*

Under this genus are comprehended all the clypeated beetles, or those covered with a hard crust, of which there are a great many species.

CASSIDONY, in botany, a name given by some to the *stoechas* of authors. See the articles STOECHAS, *Append.*

Mountain CASSIDONY, or *Golden* CASSIDONY, names used for the *gnaphalium* of authors. See the article GNAPHALIUM, *Suppl.*

CASSINE, the cassioberry-tree, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: the cup is a decompound umbel; the perianthium is very small, thick at the base, divided into five parts, obtuse and permanent; the flower consists of a single petal, divided into five suboval, obtuse, patent segments, larger than the cup; the stamina are five subulated patent filaments, shorter than the flower; the antheræ are simple; the germen of the pistil is conic; there is no style; the stigmata are three, reflex and obtuse: the fruit is a roundish berry, with three cells; the seeds are single and oval.

The *maurocenia* is nearly allied to this genus, which Dillenius makes a species of *phyllerea*. Vide *Linnæi* Gen. Plant. p. 126.

CASSIOBERRY *tree*, in botany, the name of a genus of plants called by Linnæus *Cassine*. See the article CASSINE, *supra*.

CASSUMNIAR, in the materia medica, a root approaching to the nature of zeodary, though belonging to a different species of plants.

We have it from the East Indies; its surface is somewhat wrinkled, and is marked at certain distances with circular rings, which surround it and rise prominent above the rest of the surface. It is of a very compact nature, hard and heavy; not easily cut through with a knife, or powdered in a mortar. When cut it shews a very smooth and shining surface; and when broken, is found to be much yellower within.

It has a fragrant aromatic smell, and is a very famous medicine in nervous cases, being accounted an excellent cardiac and sudorific. It is also given as a stomachic and carminative with success, and is mostly prescribed in powder, boluses, or infusions. Vide *Hill*, Hist. Mat. Med. p. 568.

CAT, the English name of a well known domestic quadruped, of the *felis* kind. See the article FELIS, *Suppl.*

CAT-*mint*, in botany, the English name of the *cataria* of authors. See the article CATARIA, *Suppl.*

CATARACT *(Cycl.* and *Suppl.)* — Though it be, generally speaking, true, that the cause of *cataracts* is the opacity of the crystalline humor, yet it is certain that a real membrane covering the pupil, has been sometimes, though rarely, found. See Mem. Acad. Scienc. 1708. and Dr. *Mead's* Monit. & Pract. Medic. cap. xi.

CATERPILLAR *(Suppl.)*—*Connaught* CATERPILLAR, a kind of caterpillar found in Ireland. See the article WORM, *Suppl.*

CATERPILLAR-*plant*, in botany, a name given to the *scorpioides* of Tournefort. See the article SCORPIOIDES, *Suppl.*

CATERPILLAR-*shell*, the English name of a species of *turbo*. See the article TURBO, *Suppl.*

CAUDA *marina*, in botany, the name used by Dodonæus for the *myosurus* of botanical writers. See the article MYOSURUS, *Append.*

Dead CAVES }
Live CAVES } See the article LIVE *caves*, *Suppl.*

CEDAR *(Suppl.)*—*Bastard* CEDAR, a name given to the *guazuma*, or *theobroma*, of authors. See the article THEOBROMA, *Suppl.*

Bermudas CEDAR, a name given to a species of juniper. See the article JUNIPER, *Suppl.*

CEDAR *of Lycia*, or *Phœnicia*, names given to a species of juniper. See the article JUNIPER, *Suppl.*

Virginia and Carolina CEDAR, names given to a species of juniper. See the article JUNIPER, *Suppl.*

White CEDAR, a name given to a species of cypress. See the article CUPRESSUS, *Suppl.*

CEIBA, in botany, a name given to the *xylon* of authors. See the article XYLON, *Suppl.*

CELANDINE *(Suppl.)* *Lesser* CELANDINE, in botany, the name of a genus of plants called by authors *ranunculus*. See the article RANUNCULUS, *Suppl.*

CELASTRUS, in botany, the name of a genus of trees, called also *euonymoides*, and in English, the African spindle-tree.

The characters are these: the cup is a very small plane perianthium, formed of one leaf, divided into five unequal obtuse segments: the flower consists of five equal, oval, patent, sessile petals, with their tops turned back; the stamina are five subulated filaments, of the length of the flowers; the antheræ are very small, the germen of the pistil is also very small, and is immersed in a large plane receptacle marked with ten striæ; the style is subulated and shorter than the stamina; the stigma is obtuse and trifid; the fruit is a coloured oval capsule, obtusely trigonal, gibbous, formed of three valves, and containing three cells, in each of which are some oval coloured seeds, smooth and half covered by a calyptra, which is also coloured, and has an unequal rim divided into four parts. *Linnæi* Gen. Plant. p. 88.

There is a species with a triple stigma, and no style.

CELLS *of plants*, *Cellæ plantarum*, those partitions or hollow places in the husks or pods of plants, in which the seeds are lodged. *Miller*, Gard. Dict.

CENTAURIA, in the Linnæan system of botany, the name of a large genus of plants, comprehending the *centaurium majus*, *jacea*, and *cyanus* of Tournefort and others; the *calcitrapa*, *calcitrapoides*, *rhaponticum*, *rhaponticoides*, *amberboi*, and *crocodilium* of Vaillant.

The characteristics of this genus are these: the cup is imbricated with squamæ; the stamina are five extremely short capillary filaments; there is no stigma, nor pericarpium; the receptacle is setose.

As to the distinctions of the above genera, as they are called, they are these: the cup of the *calcitrapa* is armed with single spines, which are large and erect; and the seeds either naked or coronated: the cup of the *calcitrapoides* has small clustered spines: the cup of the *rhaponticum* is formed of lax undivided membranes: and in the *rhaponticoides*, of lanceolated and acuminated squamæ: in the *amberboi*, the squamæ of the cup are obtuse and simple: in the *jacea* the squamæ are ciliated: in the *cyanus* they are likewise ciliated, but shorter; and, lastly, the squamæ in the *crocodilium* are aculeated, and the seed downy and plumose. Vide *Linnæi* Gener. Plant. p. 417.

CENTAURIUM *majus*. This is made a distinct genus of plants by Tournefort, but comprehended along with several others under that of *centauria* by Linnæus. See the article CENTAURIA, *supra*.

CENTAURY, in botany. See the article CENTAURIUM, *Suppl.*

CENTIPED *worm*, a term used for such worms as have a great many feet, tho' the number does not amount to an hundred, as the word seems to import. See the article SCOLOPENDRA, *Suppl.*

Mr. Maloet relates the history of a man, who for three years had a violent pain at the lower part of the forehead, near the root of the nose; at length he felt an itching, and afterwards something moving within his nostril, which he brought away with his finger; it was a worm of the *centiped* kind, an inch and an half long, which run swiftly. It lived five or six days among tobacco. The patient was free of his pain ever after. Mr. Littre mentioned a like case in 1708, of a larger *centiped* voided at the nose, after it had thrown the woman, in whose frontal sinus it was, into convulsions, and had almost taken away her reason. Hist. Acad. Scienc. 1733.

CENTRONIA, in ichthyology, the name by which Dr. Hill calls the *echini marini*, or *echinodermata*, called in English sea-hedge-hogs. See the article ECHINODERMA, *Suppl.*

The doctor makes them a distinct series of animals, living under the defence of shelly coverings, formed of one piece, and furnished with a vast number of spines, moveable at the creature's pleasure.

Of the *centronia*, or sea-hedge-hog, we have the following species: 1. The roundish *centronia*, with small papillæ: this is a considerably large species; the colour of the whole shell being of a dusky red, and the spines only a third of an inch long. 2. The roundish *centronia*, with very large square spines. 3. The roundish *centronia*, with very large rounded spines. 4. The roundish bluish *centronia*, with differently shaped spines. 5. The depressed cordated *centronia*, with capillaceous spines. 6. The depressed flat *centronia*, with a digitated edge. 7. The depressed plane *centronia*, with five perforations on the disk. 8. The depressed *centronia*, with two perforations near the edge. 9. The flat biperforate *centronia*, with a digitated edge. 10. The oval depressed *centronia*, with an undulated edge and six perforations. 11. The roundish *centronia*, with crooked and fasciculated spines, called in English the sea-apple. 12. The globose *centronia*, with needle-like spines, and thence called the needle-shell.

The other species of *centronia* are very numerous, but may be all comprehended under the following divisions. 1. The

roundish, or subglobose kind, called by Klein *cidares*. See the article TURBAN-*shell*, *Suppl.*

2. The cordated kinds, called by Klein *spatangi* and *spatagides*. See the articles SPATANGI and SPATAGOIDES, *Suppl.*

3. The flat kinds, called by Klein *placentæ*. See the article PLACENTA, *Suppl.*

Klein, who has been at much pains to arrange these bodies, has divided them into a number of other genera; but they may be all ranked under one or other of these divisions. But beside the known recent species, we meet with several others, fossile, of a very singular figure; for which see the articles ECHINITES and ECHINI *fossiles*, *Suppl.*

CEPA *Ascalonica*, the same with eschalot, vulgarly called *shallot*. See ONION, *Suppl.*

CEPHALANTHUS, in the Linnæan system of botany, the name of a genus of trees, the characters of which are these: the cup consists of a common perianthium, which contains several flowers collected into a kind of head; and of a proper perianthium, which is erect, permanent, and divided into four segments; the flower consists of a single petal; the tube is slender; the limb is divided into four parts, acute, reflex, and of the length of the tube; the stamina are four filaments, inserted into the flower, and shorter than its limbs; the antheræ are simple; the germen of the pistil is placed within the flower; the style and stigma are both simple; the fruit is an oblong capsule, containing only one cell, several of these grow together, and form a roundish head; the seeds are numerous and oblong; the flower has its limb sometimes divided into five segments, instead of four; and then the proper perianthium has also five segments, and there are five stamina.

This genus comprehends the *platanocephalus* of Vaillant, and the *valerianoides* of Petiver. Vid. *Linnæi* Gen. Plant. p. 38.

CERAMBYX, a name given by some authors to the *capricorn-beetle*. See CAPRICORN *beetle*, *Suppl.*

CERATONIA, in botany, the name under which Linnæus describes the *siliqua* of Tournefort. See SILIQUA, *Suppl.*

CERCARIA, in zoology, a class of animalcules lately established by Dr. Hill, and containing all those with visible tails and no limbs. See the article ANIMALCULE, *Append.*

CERCIS, in the Linnæan system of botany, the name of a distinct genus of plants, called by Tournefort *siliquastrum*. See the article SILIQUASTRUM, *Suppl.*

CERNUA, in zoology, a name used by Gaza for the *orpheus*, a species of *sparus*. See the article ORPHEUS, *Suppl.*

CESSAMPELUS, a name by which many call the hoary branched species of *convolvulus*. See the article CONVOLVULUS, *Suppl.*

CESTRUM, in the Linnæan system of botany, the name of a genus of plants, called by other botanists *jasminoidis species* and *hediunda*.

The characters are these: the cup is a small, cylindric, obtuse, perianthium, formed of a single leaf, which is divided into five segments at the rim, erect, and obscure; the flower consists of a single infundibuliform petal; the tube is cylindric, very long and slender, the opening being roundish and the limb plicated, and formed into five equal oval segments; the stamina are five thread-like filaments, adhering longitudinally to the tube, only sending out a little denticle in the middle, which stands inward; the antheræ are roundish, but somewhat tetragonal, and stand within the opening of the petal; the germen of the pistil is of a cylindric, but somewhat oval form, of the length of the cup; the style is filiform, and of the length of the stamina; the stigma is thick, obtuse, and slightly emarginated; the fruit is an oval oblong berry, containing only one cell; in which are numerous and roundish seeds. *Linnæi* Gen. Plant. p. 82.

CHACE (*Cycl.*)—*Wild goose* CHACE, a term used to express a sort of racing on horseback, used formerly, which resembled the flying of wild geese, those birds generally going a train one after another, not in confused flocks as other fowls do. In this sort of race the two horses after running twelve score yards had liberty, which horse soever could get the leading, to ride what ground the jockey pleased, the hindmost horse being bound to follow him within a certain distance agreed on by articles, or else to be whipped in by the tryers and judges who rode by; and which ever horse could distance the other, won the race. This sort of racing was not long in common use, for it was found inhuman and destructive to good horses when two such horses were matched together. For in this case neither was able to distance the other 'till they were both ready to sink under their riders, and often two very good horses were both spoiled, and the wagers forced to be drawn at last. The mischief of this sort of racing soon brought in the method now in use, of running only a certain quantity of ground, and determining the plate or wager, by the coming in first at the post.

CHÆTIA, in zoology, the name of a genus of insects of the *apteria* kind, without any visible limbs. See INSECT, *Append.*

The *chætia* resembles a hair, or a piece of fine thread; its surface is smooth, its body rounded, and very slender in proportion to its length. It is called in English the *hair-worm*, or *guinea-worm*. *Hill's* Hist. of Anim. p. 14. See the article WORM, *Suppl.*

CHAFFER, in zoology, the English name of a species of beetle. See the article SCARABÆUS, *Suppl.*

CHAFFINCH, in ornithology, a bird of the *fringilla* kind, with a ferrugineous breast, and the wings black, spotted with white. See the article FRINGILLA, *Suppl.*

CHALICE-*shell*, or CUP-*shell*. See SHELL, *infra.*

CHALK (*Suppl.*)—*Silver* CHALK, *argentaria creta*, the English name of a kind of earth, not *chalk*. See the article ARGENTARIA *creta*, *Suppl.*

CHAMÆCRISTA, in botany, the name given by Rivinus to the *cassia* of other botanists. See the article CASSIA, *Suppl.*

CHAMÆMILE, in botany, a name given to the *chamæmelum* of authors. See the article CHAMÆMELUM, *Suppl.*

CHAMÆMORUS, in botany, the name of a genus of plants, the characters of which are these: the flower consists of five leaves; the fruit is composed of many acini, in form of the mulberry.

There is only one species of this plant known, which grows on the tops of the highest hills in the north part of England, but cannot be cultivated in a garden by any art. Vid. *Miller's* Gard. Dict. in voc.

CHAMBER (*Cycl.*)—As to the proportions of *chambers*, their length should be to the breadth as $1\frac{1}{2}$ to 1, or some small matter less, but ought never to exceed that proportion; and as for the height, it should be three fourths of the breadth. The height of the *chambers* of the second story, should be a twelfth part less than the height of those below: thus, if the height of the first story be sixteen feet, that of the second will be fourteen feet eight inches. As to the height of the third story, it should be only three fourths of the second.

In building bed-*chambers*, regard should be had as well to the situation of the bed, as to that of the chimney. For which reason, the chimney ought not to be placed just in the middle, but distant from it about two feet, or two and an half, in order to make room for the bed, which prevents this inequality from being discerned. Build. Dict. in voc.

CHAR, in ichthyology. See the article CHARRE, *Suppl.*

CHARVIL, or CHERVIL, in botany. See the article CHERVIL, *Suppl.*

CHEESE-*runnet*, in botany, a name used by some for the *gallium* of authors. See the article GALLIUM, *Suppl.*

CHEMICAL *glasses*, how cæmented, when cracked: see the article CÆMENT, *Append.*

CHERMES, in the history of insects, a genus of the four-winged flies, the rostrum of which is situate under the breast, and the lateral legs formed for leaping.

This genus comprehends the alder-bug, the fir-tree-bug, the grass-bug, and elm-tree-bug; together with those of the birch, maple, willow, ash, nettle, apple-tree, poplar, &c. *Hill's* Hist. of Anim. p. 64.

CHERRY-*tree*, in botany, the English name of a distinct genus of plants, called by authors *cerasus*. See the article CERASUS, *Suppl.*

Barbadoes-CHERRY, or *cowhedge*-CHERRY, names given by some to the *malpighia* of authors. See the article MALPIGHIA, *Suppl.*

Bay-CHERRY, *Bird*-CHERRY, *Laurel*-CHERRY, &c. names used by some for a genus of plants, called by authors *padus*. See the article PADUS, *Append.*

Cornelian-CHERRY, a name given by some to the *cornus*, or cornel-tree, of others. See the article CORNUS, *Suppl.*

Winter-CHERRY, a name used by some for the *alkekengi* and *solanum* of others. See the articles ALKEKENGI and SOLANUM, *Suppl.*

CHERVIL (*Suppl.*) — *Wild*-CHERVIL, in botany, a name given to the *myrrhis* of authors. See the article MYRRHIS, *Suppl.*

CHESNUT-*tree*, the English name of a genus of plants, called by authors *castanea*. See the article CASTANEA, *Suppl.*

It is pity *chesnut*-plantations are not more common. They quickly grow up, and are not only pleasing to the eye, but their flowers prove no less agreeable to the smell, and even the taste will be gratified in time. Another considerable use of these plantations, is to defend those of other trees from the injuries of cold and frost, which they do to admiration.

Next to oak-timber, that of *chesnuts* is most coveted by carpenters and joiners. It likewise makes the best stakes, vine-props, and hop poles; and is extremely proper for mill-timber, and water-works, or wherever it may lie buried.

Chesnut-timber is also proper for columns, tables, chests, chairs, stools, bedsteads, and wine-casks; giving the liquor the least tincture of any wood whatsoever, and is exceeding durable, if dipped in scalding oil, or well pitched. Build. Diction. in voc.

Horse-CHESNUT, in botany. See HIPPOCASTANUM, *Suppl.*

Scarlet-horse-CHESNUT, a name given by some to the *pavia* of authors. See the article PAVIA, *Suppl.*

CHIAN *marble*. See the article CHIUM *marmor*, *Suppl.*

CHIARO *scuro*, among painters. See CLAIR *obscure*, *Cycl.*

CHICHES, a name given to the *cicer*, or chich-pea. See the article CICER, *Suppl.*

CHICK-*weed* (*Suppl.*)—*Berry bearing* CHICK-*weed*, in botany, a name given to the *cucubalus*. See the article CUCUBALUS, *Suppl.*

CHICKLING-*pea*, a name used by some for the *lathyrus* of authors. See the article LATHYRUS, *Suppl.*

Cements for broken CHINA-ware. See CÆMENT, *Append.*

CHIONANTHUS, the *snow-drop-tree*, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: the cup is a one-leaved perianthium, divided into four segments at the edge, erect, acuminated, and permanent; the flower consists of a single petal, and is divided into four parts; the tube is very short and patulous; the limb is divided into four extremely long segments, which are erect, acute, of a linear figure, and somewhat uneven; the stamina are two very short filaments, of a subulated figure, and are inserted into the tube; the antheræ are cordated and erect; the germen of the pistil is of an oval figure; the style is simple and of the length of the cup; the stigma is obtuse and trifid; the fruit is a round berry, containing only one cell, in which is included a single striated osicle. *Linnæi* Gen. Plant. p. 8.

This genus is allied to the *nyctanthes*, *syringa*, *olea*, *ligustrum*, *phillyrea*, and *jasmine*, but, most of all, to the flower bearing *fraxinus*. There is only one known species of it.

CHIVES, a name given to a species of onion. See the article ONION, *Suppl.*

CHIVES is also a name given to the stamina of plants. See STAMINA, *Suppl.*

CHLOREUS, a name given to a bird of the thrush kind, otherwise called *galbula*. See GALBULA.

CHOCOLATE-*tree*, in botany. See the article CACAO, *Suppl.*

CHOUGH, *coracias*, a bird of the corvus kind, no where so frequent with us as in Cornwall, and thence called the *cornish chough*. See the article CORACIAS, *Suppl.*

CHRENECRUDA, a term occurring in writers of the middle age, and expressing a custom of those times, but its signification is doubtful. It is mentioned in *Lege Salica*, Tit. 61. which says, he who kills a man, and hath not wherewithal to satisfy the law, or pay the fine, makes oath that he has delivered up every thing he was possessed of; the truth of which must be confirmed by the oaths of twelve other persons. Then he invites his next relations by the father's side to pay off the remainder of the fine, having first made over to them all his effects by the following ceremony. He goes into his house, and taking in his hand a small quantity of dust from each of the four corners, he returns to the door, and with his face inward throws the dust with his left hand over his shoulders upon his nearest of kin. Which done, he strips to his shirt; and coming out with a pole in his hand, jumps over the hedge. His relations, whether one or several, are upon this obliged to pay off the composition for the murder. And if these (or any one of them) are not able to pay, *iterum super illum chrenecruda qui pauperior est, jactat, & ille totam legem componat.* Whence it appears, that *chrenecruda jactare*, is the same with throwing the dust, gathered from the four corners of the house. Goldastus and Spelman translate it *viridem herbam*, green grass, from the German *gruen kraut*, or from the Dutch *groen*, green, and *gruid*, grass. Wendelinus is of a contrary opinion, who thinks that by this word *denotari purificationis approbationem*, from *chrein*, pure, chaste, clean; and *keuren*, to prove: so that it must refer to the oaths of the twelve jurors. Be this as it will, king Childebert reformed this law by a decree, chap. 15. both because it favoured of pagan ceremonies, and by reason several persons were thereby obliged to make over all their effects: *De crenecruda lex quam paganorum tempore observabant, deinceps nunquam valeat, quia per ipsam cecidit multorum potestas. Du Cange*, Gloss. Lat.

CHRISTMAS-*rose*, in botany, the name used by some for a species of black *hellebore*. See the article HELLEBORUS, *Suppl.*

CHRISTOPHER-*herb*. See the article CHRISTOPHORIANA, *Suppl.*

CHROASTACES, in natural history, a genus of pellucid gems, comprehending all those of variable colours, as viewed in different lights.

Of this kind are the *opal* and the *asteria*, or *oculus cati*. See the articles OPAL and ASTERIA, *Suppl.*

CHRONOMETER, a term used by some for a kind of clock, or machine, so contrived as to measure a small part of time very exactly, even to the sixteenth part of a second.

We have a description of one of these, made by the ingenious Mr. George Graham, in *Desaguliers*, Experim. Philos. vol. I. p. 375.

A *chronometer* is of great use for measuring small parts of time in astronomical observations, the time of the fall of bodies, the velocity of running waters, &c. But long spaces of time cannot be measured by it with sufficient exactness, unless its pendulum be made to vibrate in a cycloid; because, otherwise, it is liable to err considerably, as all clocks are which have short pendulums that swing large arcs of a circle. Id. ibid. p. 376.

CHROSTASIMA, in natural history, the name used by Dr. Hill for all pellucid gems, which have one simple and permanent appearance in all lights.

Of this kind are the diamond, the carbuncle, the amethyst, the sapphire, the beryl, the emerald, and the topaz. See the articles DIAMOND, CARBUNCLE, &c. *Suppl.*

CHRYSALIS, in natural history, the name of that state otherwise called *aurelia*, in which butterflies and several other animals pass the time between their caterpillar or other creeping state, and their winged one.

In this state no creatures afford so beautiful a variety as the butterfly kinds; and they all pass thro' this middle state, without one exception.

The figure of the *aurelia* or *chrysalis*, generally approaches to that of a cone, or at least the hinder part of it is of this shape; and the creature, while in this state, seems to have neither legs nor wings, nor has any power of walking. It seems, indeed, to have hardly so much as life, and to be reduced to a very imperfectly organized mass of matter. It takes in no nourishment in this state, nor has it any organs for the taking any; and indeed its posterior part is all that seems animated, this having a power of giving itself some motions. The external covering of the *chrysalis* is cartilaginous and considerably large, and is usually smooth and glossy; but some few of them have a few hairs, some are also as hairy as the caterpillars from which they are produced, and others are rough, or, as it were, chagreened all over.

In all of these there may be distinguished two sides; the one of which is the back, the other the belly of the animal; and on the anterior part of the latter, there may always be distinguished certain little elevations running in ridges and resembling the fillets wound about mummies. The part whence these have their origin, is esteemed the head of the animal; the other side or back is smooth, and is of a rounded figure in most of the *chrysalises*; but some have ridges on the anterior part and sides of this part; and these usually terminate in a point, and make an angular appearance on the *chrysalis*.

From this difference is drawn the first general distinction of these bodies. They are by this divided into two classes; the round and the angular kinds. The first kind are by the French naturalists called also *feves*, from the common custom of calling the *chrysalis* of the silk worm, which is round, by this name.

There is something more regular in this distinction also than might be at first conceived; for the division is continued from the fly state: the rounded *chrysalises* being almost all produced by the phalenæ or moths; and the angular ones by the papilios or day-flies. There are several subordinate distinctions of these kinds, but in general they are less different from one another than the caterpillars from whence they are produced.

The head of those of the first class, usually terminates itself by two angular parts, which stand separate one from the other, and resemble a pair of horns. In some these horns are bent into the form of crescents, and turned one towards the other. The elm caterpillar, called the *bedaude*, is one that furnishes a *chrysalis* of this kind; other *chrysalises* have only one such horn, instead of two. These horns always give a remarkable figure in their extension along the belly of the *chrysalis*; and when the bark is examined, there is a very remarkable appearance from the lines which run there, the figure often resembling, very exactly, a human face, or a masque of some kind: there is an eminence in the middle of the back, which represents a nose as well as an engraver could have fashioned it; and there are always a number of other marks and eminences, which imagination may form into eyes, chin, and the other parts of a face; and often the resemblance is so perfect as to surprize the observer.

There are a great variety, and a great deal of beauty in the figures and arrangement of the eminences and spots on the other parts of the body of the *chrysalis* of different kinds; some have an arrangement of elegant figures all along one side, and seeming to be a sort of prickles propagated from every ring of the body; and others have a second arrangement of these sort of spines, which begin about the end of the figure of the human face, and run quite to the extremity. The *chrysalises* that are thus furnished, appear actually prickly; and there are some others which have only a few of these prickles on every part; but these have usually two protuberances on their sides, which have the appearance of the fins of fishes. These and the like varieties in marks and figure, give very plain means of dividing the *aurelia* of the several classes into a number of distinct genera.

It is a general observation, that those *chrysalises* which are terminated by a single horn, afford day-butterflies of the kind of those which have buttoned antennæ, and whose wings, in a state of rest, cover the under part of the body, and which use all their six legs in walking, those of many other kinds using only four of them. Those *chrysalises*, which are terminated by two angular bodies, and which are covered with a great number of spines, and have the figure of a human face on their back in the greatest perfection, afford butterflies of the day kind and of that class, the characters of which are, their walking on four legs and using the other two, that is, the anterior pair, in the manner of arms or hands. The

chryſaliſes which have two angular bodies on their heads, but ſhorter than thoſe of the preceding, and whoſe back ſhews but a faint ſketch of the human face, and which have fewer ſpines, and thoſe leſs ſharp, always turn into that ſort of butterfly, the upper-wings of which are divided into ſegments, one of which is ſo long as to repreſent a tail, and whoſe under-wings are folded over the upper part of the back. A careful obſervation will eſtabliſh many more rules of this kind, which is not ſo perfect as to be free from all exceptions, yet are of great uſe, as they teach us in general what ſort of fly we are to expect from the *chryſalis*, of which we know not the caterpillar, and therefore can only judge from appearances.

Theſe are the principal differences of the angular *chryſaliſes*; the round ones alſo have their different marks not leſs regular than thoſe.

The greater number of the round *chryſaliſes* have the hinder part of their body of the figure of a cone; but the upper end, which ought to be its circular plane baſe, is uſually bent and rounded into a ſort of knee: this is uſually called the head of the *chryſalis*; but there are alſo ſome of this kind, the head of which is terminated by a nearly plane ſurface: ſome of the creeping ten-legged caterpillars give *chryſaliſes* of this kind, which have each of them two eminences that ſeem to bring them towards the angular kind. Some of theſe are of a long and ſlender conic figure, terminating in a ſharp point; others are more thick and ſhort, and blunter at the ends; and ſome are very ſhort, and have no part conic except the point: in ſome of the kinds alſo the rounded end or head is flatted on two ſides, and this flatneſs is continued a little way along the belly; and of the conic ones, ſome have a ſort of hollow on the back, reſembling engraved work. Some of this kind alſo are not conic, but are flatted on the belly, and only rounded on the back; and ſome of them have, as it were, a ſort of noſe that bends over the belly.

Among the angular *chryſaliſes* there are ſome whoſe colours ſeem as worthy our obſervation as the ſhapes of the others. Many of them appear ſuperbly clothed in gold: and this in the ſeveral ſpecies is of ſeveral colours; in ſome it is a pure yellow, in others a very pale whitiſh yellow, and in others a greeniſh; but in all, the gold is very bright, and appears like the burniſhed parts of gilding. It is theſe elegant ſpecies which have obtained the names of *chryſalis* and *aurelia*, which are derived from Greek and Latin words, ſignifying gold; and from theſe all other bodies of the ſame kind have been called by the ſame names, though leſs or not at all entitled to them. As ſome kinds are thus gilded all over, ſo others are ornamented with this gay appearance in a more ſparing manner, having only a few ſpots of it in different places on their back and belly. Some ſpecies alſo have ſilver in the place of gold, either extending itſelf all over them, or forming ſome particular ſpots upon their back and belly. Theſe obvious marks, however, are not to be depended upon as certain characters of diſtinction, for accidents in the formation of the *chryſalis* may alter them; and thoſe which naturally would have been gilded all over, may be ſometimes only ſo in part, and either theſe or the others may by accidents be ſo formed as to ſhew nothing of this kind at all, but be only of a duſky brown. Thoſe, however, which have neither ſilver nor gold to recommend them to our eyes, do not want other colours, and thoſe beautifully variegated. Some of them are all over of an elegant green, as is the *chryſalis* of the fennel caterpillar; others are of an elegant yellow, and ſome of a bright greeniſh tinge, variegated with ſpots of a ſhining black; we have a very beautiful inſtance of this laſt kind in the *chryſalis* of the elegant cabbage-caterpillar. The general colour of the *chryſalis* of the common butterflies, however, is brown: they are of a very elegant cheſnut colour, and vary from this into all the ſhades of brown, from the moſt deep and duſky to ſuch as are almoſt white. Some alſo are of a fine deep black, and of theſe many are ſo ſmooth and gloſſy, that they are equal to the fineſt Indian japan. The common caterpillar of the fig-tree gives an inſtance of one of theſe beautifully gloſſy ones; the caterpillar of the vine affords another of theſe fine black *chryſaliſes*.

The rounded *chryſaliſes* do not afford any thing of that variety of colouring ſo remarkably beautiful in the angular ones; they are uſually of a duſky yellow, in different ſhades, and are often variouſly ſpotted with black: but theſe, as well as all other *chryſaliſes*, before they arrive at their fixed colour, paſs through ſeveral other temporary ones, ſome being of a different colour when firſt produced from the caterpillar, from what they are a few days afterwards; and ſome varying ſo greatly, though only in degree, as not to be diſtinguiſhable by the moſt converſant eye for what they were when firſt produced. The green rough caterpillar of the cabbage has a *chryſalis* which is green at firſt, and from that gradually goes through all the ſhades of green to a faint yellow, which is its laſting colour; and one of the oak caterpillars yields a *chryſalis* beautifully ſpotted with red at its firſt appearance, but theſe ſpots change to brown for their fixed colour: the third day from their formation uſually fixes their laſting colours; and if they are obſerved to turn black in any part after this time, it is a ſign that they are dead or dying.

The ſeveral ſpecies of inſects, as a fly, a ſpider, and an ant, do not differ more evidently from one another, in regard to appearance, than do a caterpillar, its *chryſalis*, and a butterfly produced from it; yet it is certain that theſe are all the product of the ſame individual egg; and nothing is more certain than that the creature which was for a while a caterpillar, is, after a certain time, a *chryſalis*, and then a butterfly. Theſe great changes produced in ſo ſudden a manner, ſeem like the metamorphoſes recorded in the fables of the antients, and indeed it is very probable that thoſe fables firſt took their origin from theſe changes. It appears in theſe caſes, that an inſect is immediately transformed into another perfectly different inſect, and this was for a long time ſuppoſed to be really the caſe: better obſervation, however, and the more improved modern philoſophy informs us, that nature does not uſe any ſuch violent and ſudden changes in any of her operations. Malpighi and Swammerdam were the firſt who traced the animal through all its ſeveral forms, and they ſoon found that there was in reality no ſuch change as was here talked of, but that the creature remained the ſame in all: they diſſected the creature a little before the times of their ſeveral changes, and found that the whole ſuppoſed metamorphoſis was due to the firſt ſtate's being a ſort of caſe; under cover of which it was neceſſary that certain parts, hereafter to become neceſſary to the animal, ſhould arrive at their proper ſtate; and that theſe parts were very diſtinct in the body of the animal at the time that it threw off its outer coat, in order to appear in another form, in which they had a better opportunity of becoming as dry and hard as they ought to be, and to be prepared for their final appearance in the open ſtate of the flying inſect. They evidently ſaw and proved, that the butterfly was all the time alive and growing within the body of the caterpillar, and that this growth was effected by a developement of parts, as we ſee to be the caſe in all ſorts of organized bodies, in the vegetable as well as animal world: and while they threw off all the falſe marvels of the transformations and changes which the world had before believed, in regard to theſe animals, they gave matter enough of real admiration in the diſcovery of the truth itſelf.

The words transformation and metamorphoſis then are found to be falſe terms in theſe ſubjects; but as we have already explained the true ſyſtem of the whole, we may be allowed to uſe theſe ſtill, as the moſt received terms, for theſe ſudden changes.

Every animal of this kind, we find, undergoes two of theſe transformations, the one out of the caterpillar into the *chryſalis*, the other out of the *chryſalis* into the butterfly. The laſt of theſe, when properly conſidered, has nothing very wonderful in it, as we find, on an accurate inſpection, that the *chryſalis* itſelf is a butterfly, only folded over with a thin ſkin. We find in it, while yet in this ſtate, every part of a butterfly; the wings, the legs, the antennæ, and the trunk may be all traced out; but they are folded and laid together in ſuch a manner, that the creature cannot in this ſtate make any uſe of them, nor is it fit that it ſhould, as they are all of them yet too ſoft and tender for uſe, and are placed in this ſtate with no other intent, than that they may be by degrees hardened.

The back of a *chryſalis*, when nicely obſerved, ſhews us the origin of the wings; and we may count in it the number of rings of the body. It is eaſy to find that there are nine of theſe rings; there are therefore three wanting of the number that the caterpillar had: theſe are the three at the anterior end, and of theſe the third, or that moſt diſtant from the head, is in part ſeen and in part hid by a cruſt, which is not divided in an annular manner, but which takes up the place of the two firſt rings; this is uſually called the corcelet, in the *chryſalis*, becauſe it is found to lie over the corcelet of the body of the encloſed butterfly: but it is on examining the other ſide, or belly of the *chryſalis*, that we find the ſeveral parts moſt peculiar to the butterfly. This part of the *chryſalis* is always carved as it were in relief, and every figure of this work is ſome part of the animal. Two plates, larger than all the reſt, which have their origin at the corcelet, and either touch or nearly meet one another on the belly, are the elevations formed by the four wings; theſe are placed two on each ſide, and have a much ſmaller extent allowed them than they have afterwards, when the animal is at liberty to fly about. There remains a triangular ſpace between the origin of the wings and the place where they meet in a point, and this is the receptacle of the parts, of the utmoſt conſequence to the animal. In this part one may eaſily trace nine ſtreaks, running longitudinally from the top, or head part, toward the tail; theſe are the legs, antennæ, and trunk of the butterfly, which are all extended ſtrait along the belly, in this ſtate; theſe are all much ſhorter than when the animal is in its perfect ſtate; and the trunk, when the *chryſalis* belongs to a ſpecies that has one, is not rolled up into a ſpiral form, but lies at length in the middle between the antennæ and pairs of legs.

The parts being thus diſtinguiſhable in the *chryſalis*, we eaſily find the difference of the ſpecies or claſs of the fly that is to proceed from it. The naked eye ſhews whether it be one of thoſe that have, or of thoſe that have not a trunk, and the aſſiſtance of a microſcope ſhews the antennæ ſo diſtinctly, that we are able to diſcern whether it belongs to the day or night claſs; and often to what genus, if not the very ſpecies: nay, in

in the plumose horned kinds we may fee by the antennæ whether a male or female phalena is to be produced from the *chryfalis*, the horns of the female being in this ftate evidently narrower and appearing lefs elevated above the common furface of the body, than thofe of the male.

All their parts of the *chryfalis*, however, though feen very diftinctly, are laid clofe to one another, and feem to form only one mafs; each of them is covered with its own peculiar membrane in this ftate, and all are furrounded together by a common one, and it is only through thefe that we fee them, or rather we fee on thefe the figures of all the parts moulded within, and therefore it requires attention to diftinguifh them. There is however a time at which they are very eafily diftinguifhed, when the external covering is thin and tranfparent, nay when this no longer exifts, and when the others are perfectly tranfparent; and all the exterior parts may, after this ftate, be eafily feparated from one another. This however is at a time when it might be leaft expected that any thing worthy obfervation fhould appear; and therefore authors have difregarded it; it is at that time when they fay the whole is a mafs of jelly-like matter that this is to be feen, that is, at the time of its being firft produced out of the body of the caterpillar; but this is a feafon of fhort duration, and muft be carefully attended to.

The *chryfalis* is foft when firft produced, and is wetted on the front with a vifcous liquor; its fkin, though very tender at firft, dries and hardens by degrees; but this vifcous liquor, which furrounds the wings, legs, &c. hardens almoft immediately, and in confequence faftens all thofe limbs, &c. into a mafs, which were before loofe from one another; this liquor as it hardens lofes its tranfparence and becomes brown: fo that it is only while it is yet moift that thefe parts are to be feen diftinct.

It is evident from the whole, that the *chryfalis* is no other than a butterfly, the parts of which are hid under certain membranes, which faften them together, and when the limbs are arrived at their due ftrength they become able to break through thefe membranes, and then expand and arrange themfelves in their proper order.

The firft metamorphofis therefore differs in nothing from the fecond, except that the butterfly comes from the body of the caterpillar in a weak ftate, with limbs unable to perform their offices; whereas it comes from the *chryfalis* perfect. *Reaumur*, Hift. Inf. vol. i. p. 2—17. See the article FEVE, *Suppl.*

Mr. Reaumur has given us many curious obfervations on the ftructure and ufes of the feveral coverings that attend the varieties of the caterpillar kind in this ftate.

The creatures in general remain wholly immoveable in this ftate, and feem to have no bufinefs in it, but a patient attendance on the time when they are to become butterflies: and this is a change that can happen to them only as their parts, before extremely foft and weak, are capable of hardening and becoming firm by degrees, by the tranfpiration of that abundant humidity which before kept them foft; and this is proved by an experiment of Mr. Reaumur, who enclofing fome *chryfalifes* in a glafs tube, found, after fome time, a fmall quantity of water at the bottom of it, which could have come there no other way but from the body of the inclofed animal. This tranfpiration depends greatly on the temperature of the air: it is augmented by heat, and diminifhed by cold; but it has alfo its peculiarities in regard to the feveral fpecies of butterfly to which the *chryfalis* belongs.

According to thefe obfervations, the time of the duration of the animal in the *chryfalis* ftate muft be in different fpecies very different; and there is indeed this wide difference in the extremes, that fome fpecies remain only eight days in this ftate, and others eight months. It may be eafily conceived from this, that there may be in one year two generations of caterpillars of the fame fpecies; and that the eggs laid by the butterfly in the latter end of autumn, having lain the winter in that ftate, become hatched early in the fpring, and the caterpillars produced from thefe being come to the *chryfalis* ftate, remain in it but a little time, becaufe they are favoured by the warmth of the feafon; and hatching into butterflies, thefe fpeedily lay their eggs, that they may have a remainder of warm weather to be hatched in the remainder of the fummer feafon, and give a race of ftrong caterpillars before the end of autumn: but circumftances muft happen very favourably in all refpects, in order to bring this about.

Mr. Reaumur has proved that heat and cold make great differences in the time of hatching of the butterfly from the *chryfalis* ftate: and this he particularly tried with great accuracy and attention, by putting them in veffels in warm rooms, and in icehoufes, and it feemed wholly owing to the haftening or retarding the evaporation of the abundant humidity of the animal in the *chryfalis* ftate, that it fooner or later appeared in the butterfly form. He varnifhed over fome *chryfalifes*, in order to try what would be the effect of thus wholly preventing their tranfpiration; and the confequence was, that the butterfly came forth from thefe two months later than their natural time. Thus was the duration of the animal in this ftate lengthened, that is its life was lengthened, but that without any advantage to the creature, fince it was in the time of its ftate of inaction, and probably of infenfibility. Though this was of no confequence, Mr. Reaumur deduces from it a hint that feems to be of fome. He obferves that hen's eggs, of which we make fo many ufes, and eat in fo many forms, are properly a fort of *chryfalis* of the animal; their germ, after they are impregnated by the cock, containing the young animal alive, and waiting only a due degree of warmth to be hatched and appear in its own form. Eggs tranfpire notwithftanding the hardnefs of their fhells; and when they have been long kept, there is a void found near one of their ends between the fhell and the internal membrane; this is a mark of their being ftale, and is the effect of an evaporation of part of their humidity: and the fame varnifh which had been ufed to the *chryfalifes*, being tried on eggs, was found to preferve them for two years, as frefh as if laid but the fame day, and fuch as the niceft palate could not diftinguifh from thofe that were fo.

It is not yet known how much farther this ufeful fpeculation might be carried, and whether it might not be of great ufe even to human life, to invent fomething that fhould act in the manner of this varnifh, by being rubbed over the body, as the athletæ did of old, and the favages of the Weft Indies do at this time, without knowing why. See the article EGGS, *Suppl.*

But to return to the infects which are the fubjects of this article: their third ftate, that in which they are winged, is always very fhort, and feems deftined for no other action but the propagation of the fpecies. See the article GENERATION, *Suppl.*

CHRYSTAL (*Suppl.*)—*Sprig* CHRYSTAL, the Englifh name of a genus of *chryftals*, called by authors *ellipomacroftyla*. See the article ELLIPOMACROSTYLA, *Suppl.*

Pebble CHRYSTAL, the name of a fpecies of *petridium*. See the article PETRIDIA, *Append.*

CHRYSOLITE *pafte*. The way of making an artifical *chryfolite* pafte is this: take of prepared *chryftal* two ounces, ordinary red lead eight ounces; mix thefe well together, and add crocus martis made with vinegar, twelve grains: mix all together; put them into a crucible, lute it over, and bake the whole for twenty-four hours, or longer, in a potter's kiln, and it will produce a very elegant refemblance of the true *chryfolite*.

CHRYSOMELA, in zoology, a genus of infects frequently confounded with the beetles, the antennæ of which are made in form of bracelets, or necklaces of beads, and are thickeft toward their extremity: the body, in figure, approaches to oval, and the thorax is oblong and rounded.

Of this genus Dr. Hill enumerates a great many fpecies, for which fee his Hift. Anim. p. 43, *feq.* See alfo the article SCARABÆUS, *Suppl.*

CHRYSOMITHRES, in ornithology, the name by which fome call the gold-finch. See the articles CARDUELIS, *Suppl.* and GOLD-FINCH, *Append.*

CHRYSOPHYLLUM, the *ftar-apple*, in the Linnæan fyftem of botany, the name of a genus of plants, the characters of which are thefe: the cup is a fmall permanent perianthium, compofed of five roundifh leaves; the flower is formed of a fimple campanulated petal; the limb being divided into ten fegments, which are alternately roundifh and patalous, and narrow and erect; the ftamina are five fubulated filaments; the antheræ are fimple; the germen of the piftil is roundifh; the ftyle is fubulated; the ftigma is fimple; the fruit is a large berry, containing only one cell; the feeds are offeous, and three in number.

This genus comprehends the *cainito* of Plumier, and is of kin to the *rhamnus* and *fideroxylum*. Vide *Linnæi* Gen. Plant, p. 81. See the articles RHAMNUS, *Suppl.* and SIDEROXYLUM, *Append.*

CHURN *owl*, a name given to a beautiful bird called by authors *caprimulgus*. See the article CAPRIMULGUS, *Suppl.*

CICUTARIA (*Suppl.*) is alfo ufed for a fpecies of *cicuta*, or hemlock, called by fome writers fool's-parfley. See the article CICUTA, *Suppl.*

Sweet CICUTARIA, the name fometimes given to a fpecies of *myrrhis*. See the article MYRRHIS, *Suppl.*

CIBOULS, a name given by fome to a fpecies of onions. See the article ONION, *Suppl.*

CICELY, the name of a genus of plants, called by authors *myrrhis*. See the article MYRRHIS, *Suppl.*

CILERY, in architecture, a term ufed to denote the drapery, or leaveage, which is wrought upon the heads of pillars. Build. Dict. *in voc.*

CIMELIARC, in church-architecture, the room where the plate, veftments, &c. belonging to the church, are kept; this, in Englifh, is called a veftry.

CINNAMON-*tree*, in botany, makes only a fpecies of the *laurus*, according to Linnæus; diftinguifhed by its oblong-ovated, trinervous, plane leaves. See the article LAURUS, *Append.*

Its berries are an excellent carminative, and much ufed in medicine.

CINQUEFOIL (*Suppl.*) — *Strawberry*-CINQUEFOIL, the name by which fome call the *pentaphylloides* of Tournefort. See the article PENTAPHYLLOIDES, *Suppl.*

CIRSIUM, in botany, the name of a genus of plants, according to Tournefort, but comprehended under the *carduus*, or thiftle, by Linnæus. See the article THISTLE, *Suppl.*

CISTUS (*Suppl.*) — *Dwarf* CISTUS, a name given by fome to the *helianthemum*, or fmall fun-flower. See the article HELIANTHEMUM, *Suppl.*

CITRINE *ftæchas*, in botany, a name ufed by fome for a genus of plants called goldy-locks. See the article ELYCHRYSUM, *Suppl.*

CITRON (*Cycl.* and *Suppl.*) — CITRON *water*, a well known ftrong water, or cordial, which may be thus made: take of fine thin lemon-peel eighteen ounces, of orange-peel nine ounces, perfect nutmegs one quarter of a pound, alcohol perfect, that is, the fineft and beft rectified fpirit of wine two gallons and an half; digeft in balneo mariæ for one night; draw off with a flow fire; then add as much water as will juft make the mixture milky (which will be about feven quarts or two gallons) and add alfo two pounds of fine fugar candy.

This compofition may be improved by frefh elder-flowers hung in a cloth in the head of the ftill, fprinkled with ambergreefe in powder, or its effence. This article is referred to WATER, but is there omitted.

CITY (*Cycl.*) — It has been obferved that large *cities* are more liable than other places to peftilential and putrid diforders, which is owing to the ftagnation and corruption of the air. This is always the cafe in thofe which are low and unprovided with common fewers; where the ftreets are narrow and foul, the houfes dirty, water fcarce, and jails and hofpitals crowded: alfo when in fickly times the burials are within the walls, or when dead animals and offals are left to rot in the kennels or on dunghills; when drains are not provided to carry off any large body of ftagnating water in the neighbourhood; when flefh-meats make the greateft part of the diet, without a proper mixture of greens, bread, wine, or fermented liquors; from the ufe of old mouldy grain. In proportion to the number of thefe and the like caufes concurring, a *city* will be more or lefs fubject to peftilential difeafes, or to receive the leaven of the true plague brought into it by any merchandize. *Pringle*, Obfervat. on the Difeafes of the Army, p. 284, *feq.*

However, as great *cities* furnifh many materials for vitiating the air, they likewife afford two confiderable antidotes; the firft arifes from the circulation of the air, by means of the conftant motion of people and carriages, and of the draughts made by fires: the other depends on the great quantity of an acid produced by fuel, the ftrongeft refifter of putrefaction. *Id. ibid.* p. 297.

CLARY, or *garden* CLARY, a name given to the *fclarea* of Tournefort. See the article SCLAREA, *Suppl.*

Wild CLARY, in botany, the fame with the *horminum* of Tournefort. See the article HORMINUM, *Suppl.*

CLEAVERS, or CLIVERS, in botany, the Englifh name of a genus of plants called by authors *aparine*. See the article APARINE, *Suppl.*

CLEDGE, a name given by the miners to the upper part of the ftratum of fuller's earth. See the article FULLER's *earth*, *Suppl.*

CLEMATIS, in botany, the name of a genus of plants, the characters of which are thefe: there is no calyx; the flower confifts of four lax oblong petals, of an uncertain fhape; the ftamina are numerous fubulated filaments, fhorter than the flower; the antheræ adhere to the fides of them; the germina are numerous, compreffed, and terminate in fubulated ftyles, which are longer than the ftamina; the ftigmata are fimple; there is no pericarpium; the receptacle is capitated and fmall; the feeds are numerous, roundifh, compreffed, and have the ftyle adhering to them.

This genus comprehends the *clematitis*, *flammula*, and *viticella* of authors. See the article CLEMATITIS, *Suppl.*

CLIMBER, in botany, a name given to the *clematitis* of authors. See the article CLEMATIS, *Append.*

CLIVERS, or CLEAVERS, in botany. See the article APARINE, *Suppl.*

CLOCK (*Cycl.*) — What is inferted in the *Cyclopædia* on this head, is taken from *Derham*'s Artificial Clock-maker. Since that time a fuller and more complete treatife on this fubject has been publifhed by Mr. Thiout, at Paris, which is recommended in the Hiftory of the Royal Academy of Sciences, an. 1740.

CLOUDBERRY, in botany, the Englifh name of a genus of plants, called in Latin *chamæmorus*. See the article CHAMÆMORUS, *Append.*

CLOWN's *wound-wort*, in botany, a name ufed by fome for the *fideritis* of authors. See the article SIDERITIS, *Suppl.*

COASTMARY, or COSTMARY, a name given by fome to a fpecies of tanzy, called by others *balfamita*. See the article TANACETUM, *Suppl.*

COB-*nut*, a name given by fome to the *corylus*, or hazle. See the article HAZLE, *Suppl.*

COBELLA, in zoology, the name of a fpecies of *coluber*. See the article COLUBER, *Append.*

COBWEB. This fubftance, dried and powdered, is efteemed by fome as a good aftringent and abforbent.

COCCUS, in the hiftory of infects, the name of a very comprehenfive genus, the trunk of which arifes from their breaft; the body is cetofe behind; the wings only two, placed erect, and to be found only on the males.

This genus contains all the progal-infects of Reaumur. See the article PROGAL-INSECT, *Suppl.*

The principal fpecies are: 1. The *kermes*, or *coccus* of the holm-oak. 2. The Poland fcarlet-grain, or the purple *coccus* of the roots of plants. 3. Cochineal, or the *coccus* of the opuntia. 4. The green houfe-bug, or the *coccus* of the orange tree. 5. The water-*coccus*, found on the leaves of the water-lilly. 6. The *coccus* of the birch tree. 7. The *coccus* of other infects. 8. The *coccus* of canary-grafs. 9. The *coccus* of the *jacobæa*. 10. The *coccufes* of the alder, peach, &c. See the article KERMES, &c. *Suppl.*

COCCYGRIA, in botany, the name of a genus of plants, called by Tournefort *cotinus*. See the article COTINUS, *Suppl.*

COCK, *gallus*, in ornithology, the Englifh name of the male of the gallinæ-kind. See the articles GALLINÆ and GALLUS, *Suppl.*

The front part of the *cock*'s head is ornamented with a longitudinal flefhy creft, or comb; and the wattles on the throat are two, they alfo are longitudinal and flefhy.

In the choice of a dunghill-*cock*, he fhould be of a large body, very long from the head to the rump, thick in the girth, the neck long, loofe, and high; the comb, wattles, and throat large; the eyes round and large, and anfwerable to the colour of his plume or main, as grey with grey, yellow with yellow, and fo of the reft; his beak fhould be ftrong and hooked; and his main or neck-feathers very long and gloffy, covering his neck and fhoulders; the legs fhould be ftrait and of a long beam, with very large and long fpurs, a little bending; the colour fhould be black, yellow, or brownifh; the claws fhould be long and ftrong; the tail long, bending back and covering the whole body; the wings very ftrong; and the general colour fhould be reddifh.

Game COCK. See the article GAME, *Suppl.*

Indian COCK, the Englifh name of a diftinct genus of birds called by zoologifts *crax*. See the article CRAX, *Suppl.*

COCK's-*comb*, in botany, a name given to a fpecies of *pedicularis*, or loufe-wort. See the article PEDICULARIS, *Suppl.*

COCK's-*comb* is alfo a name given to a fpecies of amaranth. See the article AMARANTH, *Suppl.*

COCK's-*foot-grafs*, in botany, a name given to a fpecies of grafs. See the article GRASS, *Append.*

COCK's-*head*, in botany, the Englifh name of a genus of plants called by authors *onobrychis*. See the article ONOBRYCHIS, *Suppl.*

COCK-*throppled*, a name given by dealers in horfes to one whofe wind-pipe is fmall and bends like a bow when he bridles his head. See the articles HORSE and HUNTER, *Suppl.*

COCKLE, *pectunculus*, the Englifh name of thofe *pectens* which have no ears. See the article PECTEN, *Suppl.*

COCO-*nut*, or COCOA-*nut*, in botany, the fame with the cacao of Tournefort. See the articles CACAO, *Suppl.* and CHOCOLATE, *Cycl.*

COCOON. See the article SILK.

COD, in ichthyology, the Englifh name of a fpecies of *gadus*. See the article GADUS.

CODLIN-*tree*, in botany, the name of a fpecies of apple-tree. See the articles APPLE and MALUS, *Suppl.*

CODLINS *and cream*, the name of a genus of plants called by Tournefort *Chamænerium*. See the article CHAMÆNERIUM, *Suppl.*

CŒNOTAPH. See the article CENOTAPH, *Cycl.*

CŒRULEUM *nativum*, a name frequently ufed by the antients for the friable blue ochre, called *lapis armenus*. See the article ARMENUS *lapis*, *Suppl.*

COFFEE-*tree*, the Englifh name of a fpecies of jafmine. See the articles JASMINE, *Suppl.* and COFFEE, *Cycl.*

COGGLE, a fmall fifhing-boat upon the coaft of Yorkfhire: it is alfo called a little *cogge*, from the old Teutonic *kogge*, a fhip; whence the middle aged Latin *coggo*, *cogga*, &c. *Preparatis coggionibus, galleis, & aliis navibus*, &c. Mat. Paris. And hence the Latin *cogcio*, a wandering and begging feaman; and the *cogciones*, cog-men or boat-men, who, after fhipwreck, or loffes by fea, travelled about to defraud the people by begging and ftealing, are reftrained by many civil and good laws. *Du Frefne.*

COIX, in the Linnæan fyfem of botany, the name of a genus of plants, called by others *lacryma Jobi*. See the article LACRYMA, *Append.*

COLCOTHAR (*Cycl.* and *Suppl.*) — The Latin writers of the middle ages ufe *colcothar* as a name of vitriol in general, which was called by the Greeks *chalcanthum*.

Colcothar is originally an Arabic word, which does not fignify the common vitriol, but the *chalcitis*. The word has been fpelt *calchuthar*, and from this the word *chalcitis* differs not very much. The Greeks of the middle ages followed the Arabians in the ufe of the word *colcothar*, but added to it a termination proper to their language, and particularly to the cuftom of thofe times, which feemed not to exprefs exactly the fame thing, but a diminutive of it: they wrote it *colcotharion*, or *chalcitarion*. This they alfo called the *orchis*, *orchidion*, the *ladi eladion*, and fo in a thoufand other inftances. Avicenna ufes the word *zagi* to exprefs this fubftance, but then he is by no means determinate

minate in it, but makes it include the *mify*, *fory*, and *melanteria*, as well as the *chalcitis*; but diftinguifhing in another place the feveral kinds of *zagi*, he tells us, that one was the *chalcand*, which was green; a fecond the *chalcitis*, which was yellow; a third the *fory*, which was red. *Alzagiat* is a name alfo ufed by him to exprefs all thefe kinds; and this word the interpreters generally render *atramenta*, inks. This is generally fuppofed to exprefs their being all black fubftances, which is not the cafe; but all that it does fignify is, that they are all vitriolic foffils: *atramentum* being a name of vitriol, as a fubftance ufed in the making of ink.

COLD (*Suppl.*) — The difeafes arifing from *cold*, are all of the inflammatory kind, *viz.* coughs, pleurifies, peripneumonies, rheumatic pains, and confumptions; which, in the army, are almoft always owing to neglected coughs. All poffible means ought therefore to be ufed, in order to remove thefe in the beginning; for which purpofe, fmall and repeated bleedings are moft efficacious, and likewife prove highly beneficial in coughs and the confirmed confumption, even after a purulent fpitting and hectic fymptoms have appeared. The quantity drawn may be from four to feven or eight ounces, once in eight or ten days. It is obfervable, that the patients never find themfelves fo much relieved on the firft, as on the fecond or third night after venefection. See CONSUMPTION, *Append.*

COLD-*finch*, in zoology, the name of a bird of the *œnanthe* kind, or nearly approaching to that genus, common about the Peak in Derbyfhire. Its belly is white; its breaft of a yellowifh brown, and its head and back of a brownifh or greenifh grey; the long feathers of its wings and tail are black, but with fome variegation of white toward the end; its beak is flender, ftrait, and fomewhat ridged or triangular; it feeds on worms and other infects. *Ray's* Ornithology, p. 170.

COLE-*fish*, a name given to a fpecies of beardlefs *gadus*. See the article GADUS, *Suppl.*

COLE-*wort*, the Englifh name of a fpecies of *cabbage*. See the articles CABBAGE and BRASSICA, *Suppl.*

Sea-COLE-*wort*, a name given to the *convolvulus* of authors. See the article CONVOLVULUS, *Suppl.*

COLLAR, among builders, the fame with *cincture*. See CINCTURE, *Cycl.*

COLLAR-*beam*, among houfe-carpenters, the beam which is framed crofs betwixt two principal rafters. Build. Dict. in voc.

COLLIFLOWER, the name of a kind of *cabbage*. See the articles CABBAGE and BRASSICA, *Suppl.*

COLOCASIA, in botany, a name ufed by fome for a fpecies of *arum*. See the article ARUM, *Suppl.*

COLOQUINTIDA, a name often ufed for the *colocynthis* of botanical writers. See the article COLOCYNTHIS, *Suppl.*

COLT'S *foot* (*Suppl.*)—*Alpine* COLT'S *foot*, a name ufed by fome for the *cacalia* of authors. See the article CACALIA, *Suppl.*

COLUBER, in zoology, the name of a very numerous genus of ferpents, the abdomen of which is covered with fcuta, and the under part of the tail with fquamæ or fcales.

Of this genus are the *natrix torquata*, the viper, and a great many other fpecies. See the articles NATRIX, VIPER, *&c.* *Suppl.*

COLUMBINA *marga*, the name by which Pliny calls the ftony bluifh marle. See the article MARLE, *Suppl.*

COLUMBINE (*Suppl.*) — *Feathered* COLUMBINE, a name ufed by fome for a plant known among authors by that of *thalictrum*. See the article THALICTRUM, *Suppl.*

COLUMNAR-*marble*, the fame with the *bafaltes*, or *lapis lydius*. See the article BASALTES, *Cycl.* and *Suppl.*

COMB (*Suppl.*)— *Ladies*-COMB, or *Venus* COMB, the name of a diftinct genus of plants, called by Tournefort *fcandix*. See the article SCANDIX, *Suppl.*

COMB-*fish*, *pecten*, in ichthyology, a genus of fifhes fo called from the longitudinal ftriæ refembling the teeth of a *comb*, with which its ftructure is covered. See PECTEN, *Suppl.*

COMBUSTIO *pecuniæ*, the antient way of trying mixed and corrupt money, by melting it down, upon payments into the Exchequer. In the time of king Henry II. a conftitution was made called the trial by *combuftion*; the practice of which differed little or nothing from the prefent method of affaying filver. But whether this examination of money by *combuftion* was to reduce an equation of money only of fterling, *viz.* a due proportion of alloy with copper, or to reduce it to pure fine filver, doth not appear. On making the conftitution of trial it was confidered, that tho' the money did anfwer *Numero et Pondere*, it might be deficient in value; becaufe mixed with copper or brafs, *&c.* Vide *Lownde's* Effay upon Coin, p. 5.

COMET (*Suppl.*) — The *comet* which appeared in December 1743, and in January and February following was exceeding bright and diftinct. The diameter of its nucleus being nearly equal to that of Jupiter. Its tail extended above 16 degrees from its body.

From the obfervations of Mr. Blifs, and from fome taken at the obfervatory of the earl of Macclesfield, Mr. Betts has determined this *comet's* parabolic trajectory. He found the place of the afcending node to be ♉. 15°. 45'. 20''; the logarithm of the perihelion diftance 9.346472; the logarithm of the diurnal motion 0.940420; the place of the perihelion ♎. 17°. 12'. 55''; the diftance of the perihelion from the node 151°. 27'. 35''; the logarithm, fine, and cofine of the inclination of the orbit to the ecliptic 9.865138, 9.832616; and thence the time the *comet* was in the vertex of the parabola, or the time of the perihelion was Febr. 19^d. 8^h. 12'. The motion of the *comet* in its orbit was according to the order of the figns.

From thefe elements, by the help of Dr. Halley's general table, he has given us the computation of the *comets* places, for the times of obfervation, and the differences between the obferved and computed places, which feldom amount to above half a minute.

The nodes of this *comet* and of the planet Mercury, are within lefs than half a degree of each other, which perhaps gave rife to a report, that the *comet* had carried Mercury from its orbit. But the *comet* was at that time diftant from Mercury nearly $\frac{1}{3}$ of the femi-diameter of the *orbis magnus*, and almoft twice as near to the fun; hence it could have no fenfible influence on the motions of that planet.

This *comet* is fuppofed at leaft equal in magnitude to the earth. See Phil. Tranf. N°. 474. fect. 2.

Comet of 1743. See obfervations of this *comet* made at Vienna by father Frank, a Jefuit, in Phil. Tranf. N°. 470. fect. 1.

The parabolic orbit of the *comet* of 1739, as obferved by Signior Zanotti at Bologna, is defcribed in Phil. Tranf. N°. 461. fect. 15.

The path of the *comet* which appeared from the beginning of March to the beginning of April 1742, has been computed by Mr. Hodgfon from the obfervations of the Jefuits of Pekin in China. Vide Phil. Tranf. N°. 481. p. 264.

COMFREY (*Suppl.*)—*Spotted* COMFREY, a name by which fome call the *pulmonaria*. See the article PULMONARIA, *Suppl.*

COMMENDATORY *Abbot*. See ABBOT *in commendam*, *Cycl.*

COMPOSITION (*Cycl.*)—COMPOSITION *of ratios*, in arithmetic and algebra, is performed by multiplying the quantities or exponents of two or more ratios together; the produce is then faid to be compounded of the ratios whofe components were multiplied. Thus if the quantities or exponents of the ratios a to b, c to d, e to f, be multiplied, we fhall have $\frac{a}{b} \times \frac{c}{d} \times \frac{e}{f} = \frac{ace}{bdf}$. And the ratio ace to bdf, is then faid to be compounded of the feveral ratios a to b, c to d, e to f, *&c.* Thus alfo the ratio of 10 to 12, is compounded of the ratio of 2 to 5, and of 3 to 4; for $\frac{2}{5} \times \frac{3}{4} = \frac{10}{12}$.

This operation is by fome called *addition* of ratios.

CONCAMERATED, among builders, an appellation given to fuch roofs as are arched in the manner of vaults.

CONCHA *anatifera*, in the hiftory of fhell-fifh. See the article ANATIFERA *concha*, *Suppl.*

CONCHA *veneris*, in natural hiftory, the name by which feveral fpecies of *chama* are called. See the article CHAMA, *Suppl.*

CONCHÆ *margaritiferæ*, a name fometimes ufed for thofe *mytuli* which produce pearls. See the article MYTULUS, *Suppl.*

CONE (*Cycl.*)—CONE *and key*. Bracton, lib. 2. c. 37. num. 3. fays, *Fæmina in tali ætate* (*i. e.* 14 *et* 15 *Annorum*) *poteft difponere domui fuæ et habere* Cone *et* Key.

The words come from the Saxon *colne*, *i. e. calculus*, and key *clavis*; fo that a woman was then held to be of competent years when fhe was able to keep the accounts and keys of the houfe: and *Glan.* lib. 7. cap. 9. has fomewhat to the fame purpofe.

CONE, in botany, an hard dry feed-veffel of a conical figure, confifting of feveral woody parts; and is, for the moft part, fcaly, adhering clofely together, and feparating when ripe. *Miller's* Gardener's Dict. in voc.

CONGE (*Cycl.* and *Suppl.*) — The *conge*, originally, was a ring or ferril, fixed on the extremities of wooden pillars, to keep them from fplitting; this, afterwards, came to be imitated in ftone-work. Build. Dict. in voc.

CONGELATIONS. See FREEZING, *Suppl.*

CONIC-*fection* (*Cycl.*) —The doctrine of the *conic-fections* is of great ufe in phyfical and geometrical aftronomy, and the phyfico-mathematical fciences. This doctrine has been much cultivated by geometers antient and modern; and we have many good treatifes on the fubject; but that publifhed by Mr. Simfon, profeffor of mathematics at Glafgow, deferves to be particularly mentioned not only for its elegance, but for its geometrical accuracy, which as he juftly remarks in his preface, has not always been fo well obferved in treatifes of this kind, as it ought to be.

To the properties of the *conic-fections* mentioned in the *Cyclopædia*, it may be proper to add the properties of their ofculatory circles or circles of curvature. See CURVATURE.

CONJUGATE (*Cycl.*)—CONJUGATE *hyperbolas*, in geometry. See HYPERBOLA, *Append.*

CONJURATION, *conjuratio*, (*Cycl.*) signifies a plot or confederacy, made by perfons combining together by oath or promife, to do fome public harm.

But it was more particularly ufed, formerly, for the having a perfonal conference with the devil, or fome evil Spirit, to know any fecret, or to effect any purpofe. *Anno* 5 *Eliz.* c. 16.

It is faid in fome of our law books, that the difference between *conjuration* and *witchcraft* is, that the former endeavours by prayers and invocation of God's powerful name, to compel the devil to fay or do what the offender commands him; the latter deals rather by friendly and voluntary conference or agreement with the devil or familiar, to have the offender's defires ferved, in lieu of blood, or other gift offered to the devil, efpecially of the offender's foul. And both thefe differ from *inchantment* or *forceries*; becaufe thofe are perfonal conferences with the devil, and thefe are but medicines and ceremonious forms of words (commonly called *charms*) without apparition. *Cowel.*

But all thefe nice diftinctions are now ufelefs, fince the ftatute of his prefent majefty forbidding all profecutions for witchcraft, &c.

CONOCARPODENDRON, in botany, a name given by Boerhaave to a genus of plants, defcribed by Linnæus under that of *leucodendros*, or the filver pine-tree. See the article PINE-*tree*, *Suppl.*

CONOCARPUS, the *button-tree*, in the Linnæan fyftem of botany, the name of a genus of plants, the characters of which are thefe: the cup is a very fmall, erect perianthium, formed of one leaf, and divided, at the extremity, into five fubulated fegments; it is placed on the germen, and is permanent; there is no corolla; the ftamina are five; the germen is large, compreffed, obtufe, thickeft towards the point, and placed under the receptacle of the flower; the ftyle is fimple; there is no fruit, but the feed is naked and fingle, and has on each fide a prominent, membranaceous margin; a number of the germina are arranged together, in an imbricated manner, and form a fhort and roundifh one; they appear like fo many reflex fquamæ.

This genus comprehends the *rudbeckia* of Houfton, and is called *alni fructu laurifolia arbor*, by Sir Hans Sloane. Vide *Linnæi* Gen. Plant. p. 75.

CONSOLIDA, in botany, a name given by fome authors to the plant more ufually called *bugle*. See BUGULA, *Suppl.*

CONSOUND, a name given to feveral different plants: thus *fymphytum* is called the great *confound*, *bugula* the middle *confound*, *bellis* the leaft *confound*, and *folidago* the faracens *confound*. See SYMPHYTUM, &c. *Suppl.*

CONSUMPTION (*Suppl.*) is frequently the confequence of a neglected cold. See COLD, *Append.*

Befides repeated fmall bleedings, which is the beft of all remedies for diminifhing the hectic fits, the faline draughts and a cool diet are to be ufed. Colliquative fweats may be checked by drinking about a pint of lime-water, foftened with a little new milk.

In the advanced ftate of a *confumption*, we may diftinguifh two kinds of coughs, one caufed by the ulcers of the lungs, and the other by a thin rheum falling upon the fauces and trachea. For the firft of thefe, about ten drops of balfam of Peru or Copaiba may be given twice a day in a bolus of conferve of rofes; and for the latter, incraffants, as conferve of rofes and opium; which laft ought to be given with caution, as being apt to beat the body.

CONVAL-*lilly*, *lilium convallium*, or lilly of the valley. See the article LILIUM *convallium*, *Suppl.*

CONVALLARIA, in botany, the name given by Linnæus to a large genus of plants, comprehending the *lilium convallium*, *polygonatum*, and *unifolium* of other botanical writers. See LILIUM *convallium*, &c. *Suppl.*

The characters of the *convallaria*, according to Linnæus, are thefe: there is no calyx; the flower confifts of a fingle fmooth petal, of a campanulated form, divided at the extremity into fix fhort, obtufe, patento-reflex fegments; the ftamina are fix fubulated filaments, inferted into the petal of the flower, and fhorter than it; the antheræ are oblong and erect; the germen of the piftil is globofe; the ftyle is filiform and longer than the ftamina; the ftigma is obtufe and trigonal; the fruit is a globofe berry, containing three cells, and is fpotted before it is ripe; the feeds are fingle and roundifh.

In the *lilium convallium*, the petal of the flower is globofe, campanulated and patent; in the *polygonatum*, it is tubulato-campanulated; and in the *unifolium*, a third part of all the fructification is wanting.

Some of the fpecies of Tournefort's *fmilax* are likewife included in this genus; in which the petal of the flower is divided into fix very acute and patent fegments. Vide *Linnæi* Gen. Plant. p. 146.

CONYZA is alfo ufed, by C. Bauhine, for a different genus of plants from the *flea-bane*, and called *erigeron* by Linnæus. See the article ERIGERON, *Append.*

CONYZOIDES, or CONYZELLA, in botany, names by which Dillenius calls the *erigeron*, or fweet flea-bane of Linnæus. See the article ERIGERON, *Append.*

COPAIBA, or COPAYBA, in natural hiftory and pharmacy. See the articles COPIVI, *Cycl.* and BALSAM *of Copaiba*, *Suppl.*

COPERAS, in natural hiftory, the fame with *copperas*. See the article COPPERAS, *Cycl.* and *Suppl.*

COPPER (*Cycl.* and *Suppl.*)—*White* COPPER, a kind of metal frequently brought from China, and fuppofed, by many, to be natural. But according to Mr. Geoffroi, *white copper* is only a mixture of red *copper* with arfenic. See Hift. Acad. Scienc. 1739. p. 24.

CORAAGE, *coraagium*, in our old cuftoms, a kind of impofition extraordinary, growing upon fome unufual occafion; and it feems to be of certain meafures of corn: for *corus tritici* is a meafure of wheat. *Bracton*, l. 2. c. 116. num. 6. who in the fame chapter, num. 8. has thefe words,—— *Sunt etiam quædam communes præftationes, quæ fervitia non dicuntur, nec de confuetudine veniunt, nifi cum neceffitas intervenerit, vel cum rex venerit; ficut funt hidagia, coraagia, & carvagia, et alia plura de neceffitate et ex confenfu communi totius regni introducta*, &c.

CORAL (*Cycl.* and *Suppl.*)—For the method of making artificial *coral* to adorn grottos, fee GROTTO, *Append.*

CORAL-*tree*, or CORAL-*wood*, in botany, the Englifh name of a plant, called by authors *corallodendron*. See the article CORALLODENDRON, *Suppl.*

CORCHORUS, the name of a genus of plants, by miftake printed *corehorus*. See the article COREHORUS, *Suppl.*

CORIARIA, *myrtle-fumach*, in the Linnæan fyftem of botany, the name of a genus of plants, the characters of which are thefe: the cup is compofed of five very fhort leaves, which are concave and of a fomewhat oval figure; the flower confifts of five petals, and is very like the cup; the ftamina are ten filaments of the length of the flower; the antheræ are fimple; the germina of the piftil are five in number, compreffed, and adhering together by their inner fides; there are likewife five fetaceous long ftyles; the ftigmata are fimple; there is no pericarpium; the feeds, which are five in number, and kidney-fhaped, being inclofed in the petals of the flower, which become carnous. Vid. *Linnæi* Gen. Plant. p. 204.

CORK (*Cycl.*)—Cups made of *cork*, are faid by fome to be good for hectical perfons to drink out of. The Egyptians made coffins of *cork*; which being lined with a refinous compofition, preferved dead bodies uncorrupted. The Spaniards line ftone-walls with it, which not only renders them very warm, but corrects the moifture of the air. The wood of the *cork*-tree is not only good firing, but applicable to feveral other ufes.

CORK-*tree*, the Englifh name of a genus of plants, called by authors *fuber*. See the article SUBER, *Suppl.*

CORMORANT, in ornithology, the Englifh name of a bird of the order of *anferes*, or goofe kind, called alfo *pelicanus* and *corvus aquaticus*. See the articles PELICAN and CORVUS *aquaticus*, *Suppl.*

CORN-*bottle*, or *blue-bottle*, a name given to the *cyanus* of authors. See the article CYANUS, *Suppl.*

CORN-*flag*, in botany, a name given to the *gladiolus* of authors. See the article GLADIOLUS, *Suppl.*

CORN-*marygold*, a name given to the *chryfanthemum* of authors. See the article CHRYSANTHEMUM, *Suppl.*

CORN-*parfley*, in botany, a name given to a fpecies of *fium*. See the article SIUM, *Append.*

CORN-*fallet*, in botany, a name given to the *valerianella* of authors. See the article VALERIANELLA, *Suppl.*

CORN-*violet*, a name ufed by fome for the *campanula* of authors. See the article CAMPANULA, *Suppl.*

CORNEL-*tree*, in botany, the Englifh name of a genus of plants, called by Latin writers *cornus*. See the article CORNUS, *Suppl.*

CORNELIAN, *farda*, in the hiftory of gems. See the articles CORNELIAN, *Cycl.* and SARDA, *Suppl.*

CORNELIAN-*cherry*, a name ufed by fome for a fpecies of the *cornus*, or cornel-tree. See the article CORNUS, *Suppl.*

CORNER-*ftones*, among builders, the name of the two ftones which ftand one in each jaumb of a chimney. Their faces are hollowed in breadth, being a certain fweep of a circle. The breadth of each ftone is equal to that of the jaumb, and their height reaches from the hearth to the mantle-tree *Corner-ftones* are commonly made of Rigate or fire-ftone. Build. Dict. in voc.

CORSA, in architecture, the fame with *plat-band*. See the article PLAT-BAND, *Cycl.*

CORTEX *aurantiorum*. The powder of *cortices aurantiorum*, fometimes cures quartan agues. Commerc. Norimb. 1735. hebd. 11. §. 3.

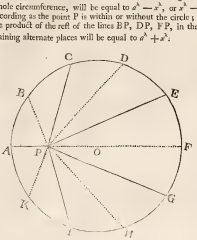
COSTMARY, the Englifh name of a fpecies of tanzy, called by fome writers *balfamita*. See the article TANACETUM, *Suppl.*

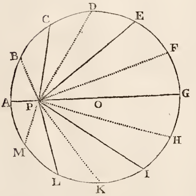
COSTUME (*Suppl.*)—To obferve the *coftume*, among painters, is to make every perfon and thing fuftain the proper character, by not only obferving the ftory, but the circumftances, the fcene of action, the country or place, habit, manners, &c.

The word is Italian, fignifying cuftom.

COTESIAN *theorem*, in Geometry, an appellation ufed for an elegant property of the circle difcovered by Mr. Cotes. The theorem is,

If the factors of the binomial $a^\lambda \pm x^\lambda$ be required, the index λ being any integer: let the circumference ABCD, the center of which is O, be divided into as many equal parts as there are units in 2λ; and from all the diviſions let there be drawn to any point P in the radius OA, produced if neceſſary, the right lines AP, BP, CP, DP, EP, FP, &c. then ſuppoſing $OA = a$, $OP = x$, the product of all the lines AP, CP, EP, &c. taken from the alternate diviſions throughout the whole circumference, will be equal to $a^\lambda - x^\lambda$, or $x^\lambda - a^\lambda$, according as the point P is within or without the circle; and the product of the reſt of the lines BP, DP, FP, in the remaining alternate places will be equal to $a^\lambda + x^\lambda$:





For inſtance, if $\lambda = 5$, let the circumference be divided into 10 equal parts, and the point P be within the circle, then will $AP \times CP \times EP \times GP \times IP$ be equal to $\overline{OA}^5 - \overline{OP}^5$, and $BP \times DP \times FP \times HP \times KP = \overline{OA}^5 + \overline{OP}^5$. In like manner if λ be $= 6$, having divided the circumference into twelve equal parts, $AP \times CP \times EP \times GP \times IP \times LP$ will be equal to $\overline{OA}^6 - \overline{OP}^6$, and $BP \times DP \times FP \times HP \times KP \times MP = \overline{OA}^6 + \overline{OP}^6$.

The demonſtration of this theorem may be ſeen in Dr. *Pemberton*'s Epiſt. de Coteſii inventis.

By means of this theorem the acute and elegant author was enabled to make a farther progreſs in the inverſe method of fluxions, than had been done before. But in the application of his diſcovery there ſtill remained a limitation, which was removed by Mr. de Moivre. See Dr. *Smith*'s Theoremata logometrica & trigonometrica, added to *Cotes*'s Harmonia menſurarum, p. 114, 115. *De Moivre*, Miſcel. Analyt. p. 17, *ſeq.*

COTTON (*Cycl.*) — *Lavender*-COTTON, a name ſometimes given to a genus of plants, called by authors *ſantolina*. See the article SANTOLINA, *Suppl.*

COTTON-*tree*, in botany, the Engliſh name of a genus of plants, called by authors *goſſypium*. See the article GOSSYPIUM, *Append.*

Silk-COTTON, a name uſed by ſome for a genus of plants, called by authors *xylon*. See the article XYLON, *Append.*

COTTON-*weed*, a name uſed for the *gnaphalium* of authors. See the article GNAPHALIUM, *Suppl.*

COUCH-*graſs*, or dog's-graſs, in botany. See the article GRASS, *Append.*

COVENTRY-*bells*, a name ſometimes given to the *campanula*. See the article CAMPANULA, *Suppl.*

COUGHS (*Cycl.*) — See the articles COLD and CONSUMPTION, *Append.* and TUSSIS, *Suppl.*

COULTER *neb*, in zoology, a name given to the *anas arctica*. See the article DUCK, *Suppl.*

COW, in zoology, the female of the ox-kind. See the articles Bos and Ox, *Suppl.*

Sea-COW, the Engliſh name of a genus of ſea-animals, called by zoologiſts *manati*. See the article MANATI, *Suppl.*

COW-*itch*, *phaſeolus hirſutis*, in botany. See the article PHASEOLUS, *Suppl.* Vide *Quinc.* Pharm. p. 230.

COW's-*lip of Jeruſalem*, in botany, a name ſometimes given to the *pulmonaria* of authors. See the article PULMONARIA, *Suppl.*

French COW's-*lip*, a name by which ſome call the *auricula*, or bear's ears of botanical authors. See the article AURICULA, *Suppl.*

COWL (*Cycl.*) — *Friar's*-COWL, in botany, a name ſometimes uſed for the *ariſarum* of authors. See the article ARISARUM, *Suppl.*

CRAB, in zoology, the Engliſh name of a genus of ſhell-fiſh, of the *ſquilla* kind. See the article SQUILLA, *infra.*

CRAB-*tree*, in botany, the Engliſh name of the *malus ſylveſtris* of authors. See the article MALUS, *Suppl.* and *Append.*

CRABRO, the hornet, in zoology, the name of a genus of flies of the *apis*, or bee-kind. See the articles BEE and HORNET, *Suppl.* and APIS, *Append.*

CRANE (*Cycl.*) — There are ſeveral improvements of this uſeful machine mentioned in *Deſagulier*'s Experim. Philoſ. p. 178, *ſeq.* particularly how to prevent the inconveniencies ariſing from ſudden jerks, as well as to increaſe its force by uſing a double axis in peritrochio, and two handles.

CRASPEDARIA, a genus of animalcules, without any viſible limbs or tails, but with an apparent mouth, and a ſeries of fimbriæ round it in the manner of a fringe.

Of this genus there are three ſpecies: 1. The *craſpedarium* with a roundiſh body. 2. The *craſpedarium* with an oval body. 3. The *craſpedarium* with a cylindric body. *Hill*'s Hiſt. of Anim. p. 5.

CRASSULA, in botany, the name of a diſtinct genus of plants called by ſome *baſtard-navel-wort*.

The characters of this genus are theſe: the cup is a perianthium, formed of five lanceolated, hollowed, acute, erect, and permanent leaves, which meet in ſuch a manner as to form a kind of tube; the corolla is ſomewhat of an infundibuliform ſhape, and is compoſed of five petals, the ungues of which are very long, linear, ſtrait, connivent, and joined at their baſes; and the bracteæ, which form the limb, oval and reflexo-patent; the nectaria are five very ſmall emarginated ſquamæ, annexed outwardly to the baſe of the germen; the ſtamina are five ſubulated filaments, of the length of the tube, and inſerted into the ungues of the corolla; the antheræ are ſimple; the germina are five, oblong, acuminated, and terminated by ſubulated ſtyles, of the length of the ſtamina; the ſtigmata are obtuſe; the fruit is compoſed of five oblong, acuminated, ſtrait, compreſſed capſules, opening longitudinally inwards; the ſeeds are numerous and ſmall. *Linnæi* Gen. Plant. p. 133.

Vaillant makes it only a ſpecies of *ſedum*. See the article SEDUM, *Suppl.*

CRAX, in zoology, a name given by the antients to the *ortygometra*, or daker hen, a bird larger than the quail, and common in Ireland and ſome of the northern counties of England. *Ray*'s Ornithology, p. 122. See the article ORTYGOMETRA, *Suppl.*

CRAY-*fiſh*. Theſe fiſh are comprehended among the ſpecies of *ſquillæ*. See the articles CRAY-*fiſh*, *Suppl.* and SQUILLA, *Append.*

CRAZE-*mill*, or CRAZING-*mill*, a mill in all reſpects like a griſt-mill to grind corn, and is ſo called by the tin-miners, who uſe it to grind their tin, which is yet too great, after trambling, and then it is trambled only.

CREEPER, the Engliſh name of a ſpecies of *iſpida*, which, though very unlike the common king's-fiſher both in colour and figure, yet is comprehended under that genus on account of the ſtructure of its feet. See the article ISPIDA, *Suppl.*

This ſmall bird has likewiſe been called *certhia* and *certhius*, by authors, and in Engliſh the ox-eye. See the article CERTHIA, *Suppl.*

CREODIBA, in the cuſtoms of the middle age, a robbery and murther committed in a wood, where the body of the perſon killed was burnt, in order to prevent any diſcovery of the crime. The word, ſays Wendelinus, is compounded of *gruy* and *diven*, that is, wood-robbers. Tit. 74. of the Salic Law, edit. Heroldi, relates to *creodiba*. *Du Cange*, Gloſſ. Lat.

CRESSES (*Suppl.*) — *Indian* CRESS, *Naſturtium Indicum*, in botany, the Engliſh name of a genus of plants, called by authors *cardamindum* and *tropæolum*. See the articles CARDAMINDUM, *Suppl.* and TROPÆOLUM, *Append.*

Sciatica CRESS, a name uſed by ſome for a genus of plants, called by others *iberis* and *cardamine*. See the article CARDAMINE, *Suppl.*

Sciatica CRESS, or *babylonian* CRESS, are names ſometimes alſo given to the *lepidium*, or Dittander. See the article LEPIDIUM, *Suppl.*

Water-CRESS, or *winter*-CRESS, names given by ſome writers to a genus of plants known among authors by that of *ſiſymbrium*. See the article SISYMBRIUM, *Suppl.*

CRESTED *graſs*, in botany. See the article GRASS, *Append.*

CRIMSON

CRIMSON *graſs-vetch*, a name given to the *niſſolia*, a genus of plants. See the article NISSOLIA, *Suppl.*

CRINUM, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe: the cup is a ſpathiform general involucrum, compoſed of two oblong leaves, which bend downwards, and expoſe to ſighta kind of little umbel; the flower conſiſts of a ſingle petal, which is infundibuliform; the tube is oblong, cylindric, and bent; the limb is divided into ſix lanceolato-linear, obtuſe, concave, reflex ſegments, three of which, alternately, are diſtinguiſhed by an uncinated appendage; the ſtamina are ſix fubulated filaments ariſing from the baſe of the limb, they are of the length of the limb, and connivent; the antheræ are oblong, linear, incumbent, and aſſurgent; the germen of the piſtil is placed in the bottom of the flower; the ſtyle is fubulated and ſhorter than the ſtamina; the ſtigma is trifid and very ſmall; the fruit is a capſule of a ſuboval figure, with three cells; the ſeeds are numerous.

This genus, of which we know only one ſpecies, is commonly, though improperly, reckoned a ſpecies of lilly-aſphodel. *Linnæi* Gen. Plant. p. 140.

CROCEUS, in natural hiſtory, is ſaid to be an amphibious animal which is neither fiſh nor bird, but both. All the ſummer it is a bird, of a ſaffron colour, and flies through the mountains; but towards the end of autumn it returns to the ſea and becomes a fiſh. It is only in the winter that they catch it, when it proves a very ſavoury bit. *Hoffm.* Lex. Univ. in voc.

CROCODILIUM, in botany, a diſtinct genus of plants, according to Vaillant; but comprehended by Linnæus under the *centauria*. See the article CENTAURIA, *Append.*

CROCODILODES, in botany, the name uſed by Vaillant for a genus of plants, called by others *atractylis*. See the article ATRACTYLIS, *Append.*

CROSS (*Cycl.*) — The adoration of the *croſs* appears to have been practiſed in the antient church, in as much as the heathens, particularly Julian, reproach the primitive chriſtians with it [a]. And we do not find that their apologiſts diſclaimed the charge. Mornay, indeed, aſſerted that this had been done by St. Cyril, but could not ſupport his allegation at the conference of Fontainbleau. St. Helena is ſaid to have reduced the adoration of the *croſs* to its juſt principle, ſince ſhe adored in the wood, not the wood itſelf, which had been direct idolatry and heatheniſm, but him who had been nailed to this wood [b]. With ſuch modifications ſome proteſtants have been induced to admit the adoration of the *croſs*: John Huſs allowed of the phraſe, provided it were expreſly added, that the adoration was relative to the perſon of Chriſt. But however Roman catholics may ſeem to triumph by virtue of ſuch diſtinctions and mitigations, it is well known they have no great place in their own practice: Imbert [c], the good prior of Gaſcony, was ſeverely proſecuted in 1683, for telling the people, that in the ceremony of adoring the *croſs*, practiſed in that church on Good-friday, they were not to adore the wood, but Chriſt who was crucified on it: the curate of the pariſh told them the contrary; it was the wood, the wood! they were to adore. Imbert replied, it was Chriſt, not the wood: for which he was cited before the archbiſhop of Bourdeaux, ſuſpended from his functions, and even threatened with chains and perpetual impriſonment. It little availed him to cite the biſhop of Meaux's diſtinction; it was anſwered, that the church allowed it not. [[a] Nouv. Rep. Lett. tom. x. p. 508. [b] *Du Pin*, Bibl. CROSS-*wort*, in botany, the Engliſh name of a genus of plants called by authors *cruciata*. See the article CRUCIATA, *Suppl.*

CROSS *of Jeruſalem*, a name ſometimes given to the *lychnis* of authors. See the article LYCHNIS, *Suppl.*

CROW (*Suppl.*) — *Scare*-CROW, the Engliſh name of a bird of the *larus* kind. See the articles LARUS, *Suppl.* and SCARE-*crow*, *Append.*

CROW-*flowers*, in botany, a name ſometimes give to a genus of plants, called by authors *lychnis*. See the article LYCHNIS, *Suppl.*

CROW-*garlick*, a name given by ſome writers to a ſpecies of onion. See the article ONION, *Suppl.*

CROWN-*imperial-ſhell*, the name of a ſpecies of *voluta*. See the article VOLUTA, *Suppl.*

CRYSTALLIZATION *of ſalts*. See the articles SALT and VEGETATION *of ſalts*, *Suppl.*

CTENITA, or CTENOIDES, names ſometimes given to thoſe *pectens*, which have one of their ſhells very convex. See the article PECTEN, *Suppl.*

CUBICLE, a name ſometimes uſed for a bed-chamber. See the article CHAMBER, *Cycl.* and *Suppl.*

CUCKOW-*flower*, in botany, a name uſed by ſome writers for the *cardamine*, or lady's-ſmock. See the article CARDAMINE, *Suppl.*

CUCKOW-*ſpit-inſect*, the Engliſh name of a ſpecies of *cicada*. See the articles CICADA and HARVEST-*fly*, *Suppl.*

CUCKSOO, the name of a common diſh among the Moors of Africa, made of flower, and prepared for ſeveral ways of dreſſing afterwards. They take fine wheat flower, or, when that is ſcarce, barley, millet, or *Indian* corn flower is made to ſerve: they firſt ſprinkle ſome water over the bottom of an unglazed earthen pan, and then ſhake ſome of this flower into it; they knead theſe together with their hands, and roll it backwards and forwards under their open palms; by this means they work it into grains like ſago, and then it is fit for uſe: when they have meat to ſtew, they do this in an earthen pot, and over the mouth of this they place a colander, in which is put a quantity of this granulated paſte; over this colander is fixed on a top or cover for the pot, and by this means as the meat ſtews, all the vapour that aſcends from it is received into the grains of *cuckſoo*; by that time the meat is done enough, the *cuckſoo* is ſo too; and opening the pot, they firſt take out this, which is ſoft, ſwelled, and tender, and piling it up in a diſh, they make a hollow in the top of the heap, in which they lay the meat, and then add their ſpices, which are better than thoſe of many neighbouring nations; the pooreſt uſing pepper, ginger, and ſaffron, the richer a great variety. The diſh is ſet upon a mat on the ground, and four people conveniently may eat at it, ſometimes ſix do.

CUCULLA, a cowl. See the articles ABBOT and COWL, *Cycl.*

CUCULARIA, in botany, a term by which Juſſieu calls the fumitory. See the article FUMARIA, *Suppl.*

CUCUMBER, in botany See the article CUCUMIS, *Suppl.*

Wild CUCUMBER, a name ſometimes uſed for the *elaterium* or *momordica* of authors. See the article MOMORDICA, *Suppl.*

CULEX, in zoology, the name of a genus of two-winged flies, comprehending the gnats and humble-bee-flies. See the articles GNAT and HUMBLE-*bee-fly*, *Suppl.*

The diſtinguiſhing characteriſtic of this genus, is, that their head is furniſhed with a ſiphon, or ſucker, very ſlender, oblong, and filiform. *Hill*, Hiſt. Anim. p. 35.

CULLION, in botany, a name uſed by ſome for a genus of plants called by authors *orchis*. See the article ORCHIS. *Suppl.*

CUMIN, or CUMMIN, (*Cycl.*) in botany, the name of a genus of plants, the characters of which are theſe: the general umbel, as well as the partial ones, are frequently quadripartite; the general involucrum is compoſed of four leaves, longer than the umbel, they are ſometimes entire, ſometimes trifid; the partial involucrum is ſimilar; the proper perianthium is very ſmall; the general corolla is uniform; the ſingle flowers conſiſt each of five inflexo-emarginated and ſomewhat unequal petals; the ſtamina are five ſimple filaments; the antheræ are ſimple; the germen is oval, larger than the flower, and ſtands under its cup; the ſtyles are two, and very ſmall; the ſtigmata are ſimple; the fruit is naked, of an oval figure, and ſtriated; the ſeeds are two, of an oval figure, convex, and ſtriated on one ſide, ſmooth and plain on the other.

Of this genus there is only one known ſpecies, which is the common *cummin*. See *Linnæi* Gen. Plant. p. 115.

Meadow CUMMIN, a name ſometimes given to a ſpecies of *carui*. See the article CARUI, *Suppl.*

CUNEI, in natural hiſtory, a name given to thoſe *tellinæ*, which have one ſide of their ſhell much more extended in length than the other. See the article MYTULUS, *Suppl.*

CUNICULUS, in zoology, the name of a genus of animals of the *lepus*, or hare kind, called in Engliſh rabbits. See the articles RABBIT and LEPUS, *Suppl.*

CUNICULUS *Sibericus*, the name of the long-tailed Siberian rabbit, the fur of which is much valued. During the ſummer months many of them are beautifully variegated with oblique and tranſverſe ſtreaks of black and grey. *Hill*, Hiſt. Anim. p. 525.

CUNICULUS *Braſilienſis*, the name of a ſpecies of rabbit called by zoologiſts *aperea*. See the article APEREA, *Suppl.*

CUNILA, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants called by Tournefort *marrubiaſtrum*. See the article MARRUBIASTRUM, *Suppl.*

CUP-*ſhell*, or CHALICE-*ſhell*. See the article SHELL, *infra*.

CUPRUM, *copper*, in natural hiſtory. See the article COPPER, *Cycl.* and *Suppl.*

CURATAS, a title given to the petty princes of Peru. See the article CAZIC, *Suppl.*

CURATOR, among the Romans, an officer under the emperors, who regulated the price of all kinds of merchandize and things to ſell in the cities of the empire.

They had likewiſe the ſuperintendence of the cuſtoms and tributes; whence alſo they were called *logiſtæ*. *Hoffm.* Lex. in voc.

CURCULIO, in zoology, the name of a genus of beetles diſtinguiſhed from the others by having their antennæ affixed to an elongated horny ſnout. See the article SCARABÆUS, *Suppl.*

CURRENT (*Cycl.*) — The doctrine of *currents*, their cauſes, &c. is ſtill very imperfect: it were to be wiſhed that it were otherwiſe, for the improvement of navigation and natural hiſtory. See *Marſigli*, Hiſt. Phyſ. de la Mer, p. 44—47.

CURRODREPANUS, in antiquity, a kind of chariot armed with ſcythes. The driver of theſe chariots was obliged to

ride on one of the horses, as there was no other seat for him: the usual place for him being all armed with knives, as was likewise the hinder part of the chariot. There were no scythes pointing down to the earth, either from the beam or axle-tree; but these were fixed at the head of the axle-tree in such a manner as to be moveable by means of a rope, and thereby could be raised or let down, and drawn forward or let fall backward by relaxing the rope. *Pitisc.* Lex. Ant. *in voc.*

CURVATURE *(Cycl.)* — The theory of the *curvature* of lines is of great use in geometry, and in the physico-mathematical sciences. Hence mathematicians have treated this subject fully. We shall here insert as much of this doctrine as seems necessary to enable beginners to form a just notion of the subject, and refer those who desire a farther knowledge to Mr. Mac Laurin's Treatise of Fluxions, whom we have in this, as in many other articles, followed; because he every where endeavours to avoid that air of paradox and mystery which has been more than once made a reproach to modern mathematicians.

Any two right lines applied to each other, perfectly coincide; and the rectitude of lines admits of no variety. Arches of equal circles applied upon each other, perfectly coincide likewise; and the *curvature* is uniform in all the parts of the same, or of equal circles. Arches of unequal circles cannot be applied upon each other so as to coincide; but when they touch each other, the arch of the greater circle is less inflected from the common tangent, and passes betwixt it and the arch of the lesser circle, through the angle of contacts formed by them, and is therefore less curve. Any two arches of curve lines touch each other when the same right line is the tangent of both at the same point; but when they are applied upon each other in this manner, they never perfectly coincide, unless they be similar arches of equal and similar figures: and the *curvature* of lines admits of indefinite variety. As the *curvature* is uniform in a given circle, and may be varied at pleasure in circles by increasing or diminishing their diameters, their flexure or *curvature* will therefore serve for measuring that of other lines. There is but one right line that can be the tangent of a given arch of a curve at the same point; but an indefinite variety of circles may touch it there; and these have various degrees of more and less intimate contact with it. And as of all the right lines that can be drawn through a given point in the arch of a curve, that is the tangent which touches the arch so closely, that no right line can be drawn between them; so of all the circles that touch a curve in any given point, that is said to have the same *curvature* with it, which touches it so closely that no circle can be drawn through the point of contact between them, all other circles passing either within or without them both.

This circle is called the *circle of curvature*; its centre, the *centre of curvature*; and its semidiameter, the *ray* or *radius of curvature*, belonging to the point of contact. It is also called, especially by foreign mathematicians, the *osculatory circle*.

The arch of this circle cannot coincide with the arch of the curve, but it is sufficient to denote it the circle of *curvature*, that no other can pass between them; as the tangent of the arch of a curve cannot coincide with it, but is applied to it so that no right line can be drawn between them.

As in all figures, rectilinear ones excepted, the position of the tangent is continually varying; so the *curvature* is continually varying in all curvilinear figures, the circle only excepted.

As the curve is separated from its tangent by its flexure or *curvature*, so it is separated from the circle of *curvature* in consequence of the increase or decrease of its *curvature*; and as its *curvature* is greater or less, according as it is more or less inflected from the tangent, so the variation of *curvature* is the greater or less according as it is more or less separated from the circle of *curvature*.

It is manifest, that there is but one circle of *curvature* belonging to an arch of a curve at the same point. For if there were two such circles, any circle described between these through that point, would pass between the curve and circle of *curvature*; against the supposition.

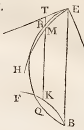
When any two curves touch each other in such a manner that no circle can pass between them, they must have the same *curvature*; for the circle that touches the one so closely that no circle can pass between them, must touch the other in the same manner.

It appears from the demonstrations of geometricians, that circles may touch curve lines in this manner; that there may be indefinite degrees of more or less intimate contact between the curve and the circle of *curvature*; and that a conic section may be described that shall have the same *curvature* with a given line at a given point, and the same variation of *curvature*, or a contact of the same kind with the circle of *curvature*.

If we conceive the tangent of any proposed curve to be a base, and that a new line be described, whose ordinate is a third proportional to the ordinate and base of the first; this new line will determine the chord of the circle of *curvature*, by its intersection with the ordinate at the point of contact; and by the tangent of the angle in which it cuts that circle, it will measure the variation of the *curvature*. The less this angle is, the closer is the contact of the curve and circle of *curvature*; and of this contact there may be indefinite degrees.

To give an example: let any curve EMH (fig. I.) and a circle ERB touch the right line ET on the same side at E; let any right line TK, parallel to the chord EB, meet the tangent in T, EMH in M, and a curve BKF that passes through B in K: then if the rectangle MTK be always equal to the square of ET, the *curvature* of EMH at E will be the same as that of the circle ERB; and the contact EM and ER will always be the closer, the less the angle is that is contained at B by the curve BKF, and the circle of *curvature* BQE.

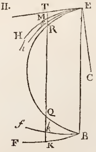
Fig. I.



For it is demonstrable from the elements of geometry (see Mac *Laurin's* Fluxions, art. 366.) that all the circles that can be described through E fall without both ER and EM, or within them both, and no circle whatever can pass between them when the rectangle MTK is always equal to the square of ET, and the curve in which K is always found, passes thro' B, and consequently the circle ERB, and the curve EM, have the same *curvature* at E.

Now let E*m* (fig. II.), any other curve touching ET in E, and *fk*B another curve passing through B meet TK in *m* and *k*, and let the rectangle *m*T*k* be likewise equal to the square of ET; then will the *curvature* of E*m* at E be the same as that of the curve EM, as has been mentioned. But the rectangles *m*T*k*, MTK, RTQ being equal to each other, and their sides therefore in a reciprocal proportion to each other, it is plain that if the arch B*k* pass between BK the arch of the curve BKF, and BQ the arch of the circle BQE; the curve E*m* must pass between EM the arch of the curve EMH, and ER the arch of the circle of *curvature* ERB: so that E*m* must have a closer contact with this circle than EM has with it; and the less the angle is that is formed by the curve FKB and the circle of *curvature* EQB at B, the closer is the contact at E of the curve EMH and the circle of *curvature* ERB. Thus the curve BKF, by its intersection with EB, determines the *curvature* of EM; and by the angle in which it cuts the circle of *curvature* it determines the degree of contact of EM and that circle, the angle BET and the right line ET being given.

Fig. II.



Hence it follows, that the contact of the curve EMH, and the circle of *curvature*, is closest when the curve BK touches the arch BQ in B, the angle BET being given; but it is farthest from this, or is most open, when BK touches the right line EB in B.

Hence, also, there may be indefinite degrees of more and more intimate contact between a circle and a curve.

The first degree is, when the same right line touches them both in the same point; and a contact of this sort may take place betwixt any circle and any arch of a curve. The second is when the curve EMH, and circle ERB have the same *curvature*, and the tangents of the curve BKF and circle BQE intersect each other at B in any assignable angle. The contact of the curve EM and circle of *curvature*, ER, at E is of the third degree, or order, and their osculation is of the second, when the curve BKF touches the circle BQE at B, but so as not to have the same *curvature* with it. The contact is of the fourth degree, or order, and their osculation of the third, when the curve BKF has the same *curvature* with the circle BQE at B, but so as that their contact is only

only of the fecond degree: and this gradation of more and more intimate contact, or of approximation towards coincidence, may be continued indefinitely, the contact of EM and ER at E being always of an order two degrees clofer than that of BK and BQ at B. There is alfo an indefinite variety comprehended under each order: thus, when EM and ER have the fame *curvature*, the angle formed by the tangents of BK and BQ admits of indefinite variety, and the contact of EM and ER is the clofer, the lefs that angle is. And when that angle is of the fame magnitude, the contact of EM and ER is the clofer the greater the circle of *curvature* is. When BK and BQ touch at B, they may touch on the fame or on different fides of their common tangent; and the angle of contact KBQ may admit of the fame variety with the angle of contact MER; but as there is feldom occafion for confidering thofe higher degrees of more intimate contact of the curve EMH and circle of *curvature* ERB, Mr. Mac Laurin calls the contact or ofculation of the fame kind, when the chord EB and angle BET being given, the angle contained by the tangents of BK and BQ is of the fame magnitude. Lib. cit. Art. 368.

When the *curvature* of EMH increafes from E towards H, and confequently correfponds to that of a circle gradually lefs and lefs, the arch EM falls within ER, the arch of the circle of *curvature*, and BK is within BQ. The contrary happens when the *curvature* of EM decreafes from E towards H, and confequently correfponds to that of a circle that is gradually greater and greater, the arch EM falls without ER, the arch of the circle of *curvature*, and BK is without BQ. And according as the *curvature* of EM varies more or lefs, it is more or lefs unlike to the uniform *curvature* of a circle; the arch of the curve EMH feparates more or lefs from the arch of the circle of *curvature* ERB, and the angle contained by the tangents of BKF and BQE at B, is greater or lefs. Thus the quality of *curvature*, as it is called by Sir Ifaac Newton [a], depends on the angle contained by the tangents of BK and BQ at B; and the meafure of the inequability or variation of *curvature*, is as the tangent of this angle, the radius being given and the angle BET being right [b]. — [[a] Method of Flux. and Inf. Ser. Prob. vi. p. 75. [b] *Mac Laurin*, lib. cit. Art. 369.]

The rays of *curvature* of fimilar arches in fimilar figures, are in the fame ratio as any homologous lines of thefe figures; and the variation of *curvature* is the fame. See *Mac Laurin*, lib. cit. fect. 370.

When the propofed curve EMH, is a conic-fection, the new line BKF is alfo a conic-fection; and it is a right line when EMH is a parabola, to the axis of which the ordinates TK are parallel. BKF is alfo a right line when EMH is an hyperbola, to one afymptote of which the ordinate TK is parallel. *Mac Laurin*, lib. cit. Art. 371, 372.

When the ordinate EB, at the point of contact E, inftead of meeting the new curve BK, is an affymptote to it, the *curvature* of EM will be lefs than in any circle; and this is the cafe in which it is faid to be infinitely little, or that the radius of *curvature* is infinitely great. Of this kind is the *curvature* at the points of contrary flexure in lines of the third order. See *Mac Laurin*, lib. cit. Art. 377—379.

When the curve BK paffes thro' the point of contact E, the *curvature* is greater than in any circle, or the radius of *curvature* vanifhes; and in this cafe the *curvature* is faid to be infinitely great. Of this kind is the *curvature* at the cufpids of the lines of the third order. See *Mac Laurin*, lib. cit. Art. 378, 379.

As to the circles of *curvature* for lines of the third or higher orders, fee lib. cit. Art. 379; and Art. 380, when the propofed curve is mechanical.

As lines which pafs thro' the fame point have the fame tangent when the firft fluxions of the ordinates are equal, fo they have the fame *curvature* when the fecond fluxions of the ordinate are likewife equal; and half the chord of the circle of *curvature* that is intercepted between the points wherein it interfects the ordinate, is a third proportional to the right lines that meafure the fecond fluxion of the ordinate and firft fluxion of the curve, the bafe being fuppofed to flow uniformly. When a ray revolving about a given point, and terminated by the curve, becomes perpendicular to it, the firft fluxion of the radius vanifhes; and if its fecond fluxion vanifhes at the fame time, that point muft be the center of *curvature* [a]. The fame may be faid, when the angular motion of the ray about that point is equal to the angular motion of the tangent of the curve; as the angular motion of the radius of a circle about its center is always equal to the angular motion of the tangent of the circle. Hence the various properties of the circle may fuggeft feveral theorems for determining the center of *curvature* [b]. — [[a] *Mac Laurin*, lib. cit. Art. 382, &c. [b] *Ibid.* Art. 389, &c.]

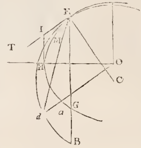
See alfo Art. 396, of the faid treatife, and the following, concerning the *curvature* of lines that are defcribed by means of right lines revolving about given poles, or of angles that either revolve about fuch poles, or are carried along fixed lines.

It is to be obferved, that as when a right line interfects an arch of a curve in two points, if by varying the pofition of that line the two interfections unite in one point, it then becomes the tangent of the arch; fo when a circle touches a curve in one point and interfects it in another, if, by varying the center, this interfection joins the point of contact, the circle then has the clofeft contact with the arch, and becomes the circle of *curvature*; but it ftill continues to interfect the curve at the fame point where it touches it, that is, where the fame right line is their common tangent, unlefs another interfection join that point at the fame time. In general, the circle of *curvature* interfects the curve at the point of ofculation, only, when the number of the fucceffive orders of fluxions of the radius of *curvature*, that vanifhes at the term of time that this radius comes to the point of ofculation, is an even number. *Mac Laurin*, Flux. Art. 493.

It has been fuppofed by fome, that two points of contact, or four interfections of the curve and circle of *curvature*, muft join to form an ofculation. But Mr. James Bernoulli infifted juftly, that the coalition of one point of contact and one interfection, or of three interfections, was fufficient. In which cafe, and in general, when an odd number of interfections only join each other, the point where they coincide continues to be an interfection of the curve and circle of *curvature*, as well as a point of their mutual contact and ofculation. See *Mac Laurin*'s Fluxions, Art. 493.

From thefe principles the circle of *curvature* at any point of a conic-fection may be determined. Suppofe EMH (fig. III.) to be any conic-fection, ET the tangent at E, HI a tangent parallel to EB, (a chord of the circle of *curvature*) that meets ET in I, and let EMH meet EB in G. Take EB to EG, in the fame ratio as the fquare of EI is to the fquare of HI; or, when the fection has a center as in the ellipfis and hyperbola, as the fquare of the femi-diameter O*a* parallel to ET, is to the fquare of the femi-diameter OA parallel to EB; and a circle defcribed upon the chord EB that touches ET, will be the circle of *curvature*.

Fig. III.



When BET is a right angle, or EB is the diameter of the circle of *curvature*, EG will be the axis of the conic-fection, and EB will be the parameter of this axis; and when the point G where the conic-fection cuts EB, and B are on the fame fide of the point E, EMG will be an ellipfis, and EG the greater or leffer axis, according as EG is greater or lefs than EB.

The propofitions relating to the *curvature* of the conic-fections, commonly given by authors, follow without much difficulty from this conftruction.

1. When the chord of *curvature* thus found paffes thro' the center of the conic-fection, it will then be equal to the parameter of the diameter that paffes thro' the point of contact.

2. The fquare of the femi-diameter O*a*, is to the rectangle of half the tranverfe and half the conjugate axis, as the ray of *curvature* CE is to O*a*. And therefore the cube of the femi-diameter O*a*, parallel to the tangent ET, is equal to the folid contained by the radius of *curvature* CE, and the rectangle of the two axes. See *De Moivre*, Mifcel. Analyt. p. 235.

3. The perpendicular to either axis bifects the angle made by the chord of *curvature*, and the common tangent of the conic-fection and circle of *curvature*.

4. The chord of the circle of *curvature* that paffes thro' the focus, the diameter conjugate to that which paffes thro' the point of contact, and the tranfverfe axis of the figure, are in continued proportion.

5. When the fection is an ellipfis, if the circle of *curvature* at E meet O*a* in *d*, the fquare of E*d* will be equal to twice the fquare of O*a*. Hence $Ed : Oa :: \sqrt{2} : 1$. Which gives an eafy method of determining the circle of *curvature* to any point E, when the femi-diameter O*a* is given in magnitude and pofition.

Several other properties of the circle of *curvature*, and methods of determining it when the fection is given; or *vice verfa*, of determining the fection when the circle of *curvature* is given, may be feen in Mr. *Mac Laurin*'s Fluxions, Art. 375.

Variation of CURVATURE. See VARIATION, *Suppl.*

Double CURVATURE is used for the *curvature* of a line, all the parts of which are not situated in the same plane. See the next article.

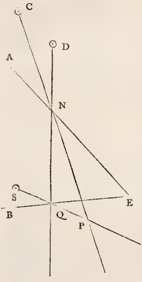
CURVE (*Cycl.* and *Supl.*)—The theory of *curves* is a very considerable branch of the mathematical sciences. Those who are curious of advancing beyond the knowledge of the circle and the conic-sections, and to consider geometrical *curves* of a higher nature, and in a general view, will do well to study Mr. Cramer's Introduction a *L'Analyse des lignes Courbes Algebriques*, printed at Geneva, 4. 1750, which the learned and ingenious author composed for the use of beginners. We have an elegant posthumous work of Mr. Mac Laurin's, printed at the end of his Algebra, and intituled *De Linearum geometricarum proprietatibus generalibus*. The same author at a very early age gave a remarkable specimen of his genius and knowledge in his *Geometria Organica*, and carried these speculations farther afterwards, as may be seen in the theorems he has given us in the Philosophical Transactions. See Dr. *Martin's* Abridg. vol. viii. p. 62, seq.

Curves may be organically described by the rotation of angles, in the manner mentioned in the *Cyclopædia*, which is Sir Isaac Newton's invention.

But there is another general method of describing *curves* by the rotation of rulers or strait lines, instead of angles.

Thus, if instead of angles we use three rulers, DQ, CN, SP, (fig. IV.) which are supposed to revolve about the poles D, C, S, and to cut one another always in three Points N, Q, and P; if any two of these intersections as N and Q, be carried along the given strait lines A E, E B, the third intersection P will describe a conic-section. See *Mac Laurin's* Algebra, p. 346. seq.

Fig. IV.



If you assume any number of poles whatsoever, and make rulers revolve about each of them, and all the intersections but one, be carried along given right lines, that one shall never describe a line of a higher nature than a conic-section. And if instead of rulers you substitute given angles which move on the same poles, the *curve* described will still be no more than a conic-section.

But by carrying one of the intersections necessary in the description over a conic-section, lines of higher orders may be described. *Mac Laurin*, ib. p. 351.

The Rev. Mr. Brakenridge has given us a general method of describing *curves* by the intersection of right lines moving about points in a given plane. See Phil. Transf. N°. 436. Dr. *Martin's* Abridg. vol. viii. p. 58. seq. But the demonstrations are not yet extant, excepting the particular cases demonstrated in his *Exercitatio Geometrica de Curvarum descriptione*, *Lond.* 1733, 4°.

Curves may also be described by the projection, or shadows of other *curves*. Thus the projection, or shadow of the circle upon different planes, will form the rest of the lines of the second order, or conic-sections. This is evident, because the rays of light proceeding from a point out of the plane of a circle, and falling upon the circumference of that circle form a cone, which being cut by the plane upon which the shadow of the circle is projected, the different conic-sections will be formed according to the position of the intersecting plane.

In like manner the projections or shadows of lines of the third order, will form other lines of the third order; and projections or shadows of lines of the fourth order, will form lines of the fourth order, *&c.*

And as the circle, by the projection of its shadow, forms the conic-sections, so the five diverging parabolas among the lines of the third order, will, by their shadows, form and exhibit all the rest of the lines of that order. See *Newton*, enumerat. lin. tertij. ordin. published by Mr. *Jones*, 1711.

This hint of Sir Isaac Newton has been lately pursued and illustrated with great elegance by Mr. Murdoch, in his treatise entitled, *Newtoni Genesis curvarum per Umbras, seu perspectivæ universalis elementa. Lond.* 1746, 8°.

By an accurate enumeration of these projections, Mr. Murdoch finds, that the number of species of the lines of the third order amount to seventy-eight in all.

CURVE *of a double curvature*, or CURVE *having a double curvature*, is used for a *curve*, all the parts of which do not lie in the same plane, that is, such as cannot be described on the same plane.

The *curves* commonly treated of in geometry, are supposed to be described, or to have all their points placed in the same plane; but if a *curve* be supposed to be described on a *curve* surface, in such a manner that all the points of that *curve* cannot lie or be situated in one and the same plane, then will the *curve* so described have a *double curvature*.

Monsieur Clairaut has published an ingenious treatise on *curves of a double curvature*. See his *Recherches sur les Courbes, a double Courbure*, at *Paris*, 4°. 1731. Mr. Euler has also treated this subject in the Appendix to his *Analysis infinitorum*, Vol. II. p. 323, seq.

CUSTARD-*apple*, a name used by some for the *guanabanus*, a species of *anona*. See the article ANONA, *Suppl.*

CUTTLE-*fish*, the English name of the *sepia* of authors, called also the *ink-fish*. See the articles SEPIA and INK-*fish*, *Append.*

CYANEUS, in zoology, the name of a species of *coluber*. See the article COLUBER, *Append.*

CYANUS. This is made a distinct genus of plants by Tournefort, but comprehended under that of *centauria* by Linnæus. See the article CENTAURIA, *Append.*

CYCLIDIA, in zoology, the name used by Dr. Hill for a genus of animalcules of a roundish or elliptic figure, and without any visible limbs or tail. See the article ANIMALCULE, *Suppl.* and *Append.*

CYMBIUM, in natural history, a name given to the *gondola*-shell. See GONDOLA.

CYNOCRAMBE, in botany, a name given to a species of *dog's* mercury. See the article MERCURIALIS, *Append.*

CYNOCTONUM. See ACONITE, *Cycl.*

CYPRESS (*Cycl.* and *Suppl.*)—The timber of the *cypress-tree* is good for making chests, musical instruments, and other utensils. It never cleaves, and is extremely hard and durable; its bitter juice resisting worms and putrefaction. Thus, we are told, that the gates of St. Peter's church at Rome, made of *cypress-wood*, had lasted had six hundred years as fresh as new, when pope Eugenio ordered gates of brass in their stead. Some will have it, that the wood, gophir, of which Noah's ark was made, was *cypress*; which Plato preferred to brass itself, for writing his laws on. Build. Dict. in voc.

Summer-CYPRESS, a name used by some for the *chenopodium* of authors. See the article CHENOPODIUM, *Append.*

CYSTICAPNOS, in botany, a name used by Boerhaave for the *fumaria*, or fumitory. See FUMARIA, *Suppl.*

D.

D.

DAFFODIL, the English name of a genus of plants known among authors by that of *narcissus*. See the article NARCISSUS, *Suppl.*

DAFFODIL-*lilly*, in botany, a name sometimes given to the *lilio-narcissus* of authors. See the article LILIO-*Narcissus*, *Suppl.*

Sea-DAFFODIL, the English name of a genus of plants called by authors *pancratium*. See the article PANCRATIUM, *Append.*

DARE. See the article LEUCISCUS, *Suppl.*

DAIRY, or DAIRY-*house*, in rural architecture, a building where milk, butter, cheese, whey, &c. are made or kept. See the articles MILK, BUTTER, &c. *Suppl.*

DAISY, in botany, the English name of a genus of plants called by authors *bellis*. See the article BELLIS, *Suppl.*

Great DAISY, a name sometimes given to a genus of plants known among authors by that of *leucanthemum*. See the article LEUCANTHEMUM, *Suppl.*

Ox-eye DAISY, a genus of plants called by botanical writers *buphthalmum*. See the article BUPHTHALMUM, *Suppl.*

DAME's *violet*, in botany, a name used by some for the *hesperis* of authors. See the article HESPERIS, *Suppl.*

DAMP is sometimes used in a synonymous sense with moisture. See the article MOISTURE, *Append.*

DANE-*wort*, or dwarf-elder, names sometimes given to a genus of plants called by authors *sambucus*. Seethe article SAMBUCUS, *Suppl.*

DARNEL, the English name given to a genus of plants called by botanical writers *lolium*. See the article LOLIUM, *Suppl.*

DARNEL-*grass*. See the article GRASS, *Append.*

DARSINE, a kind of cinnamon. See the article CINNAMUM, *Suppl.*

DASYPUS, in zoology, the name of a genus of animals called *armadillo* and *tatu-mustelinus*. See the articles ARMADILLO, TATU, and TATUETE, *Suppl.*

DATE (*Cycl.*) — DATE-*tree*, in botany, a name given to several species of palm-tree. See the article PALM, *Suppl.*

DATE-*plum*, the name of a genus of plants called by Linnæus *diospyros*, and by Tournefort *guaiacana*. See the article GUAIACANA, *Suppl.*

DAY-*lilly*, a name used sometimes for the *hemerocallis* of authors. See the article HEMEROCALLIS, *Suppl.*

DEAD-*nettle*, in botany, the English name of a genus of plants called by authors *lamium*. See the article LAMIUM, *Suppl.*

DEADLY *carrot*, the English name of a genus of plants called by authors *thapsia*. See the article THAPSIA, *Suppl.*

DEADLY *nightshade*, in botany, a name given to the *belladonna* of authors. See the article BELLADONNA, *Suppl.*

DEATH-*watch*, in zoology, the English name of the *pediculus* of old wood. It is nearly of the size of the common louse, and the noise, resembling the beating of a watch, is made by the male or female, when wooing each other. *Hill*, Hist. Anim. p. 22.

DECURSIO, in Roman antiquity, See the article CAMPICURSIO, *Suppl.*

DEER (*Suppl.*) — *Rein*-DEER, the English name of an animal of the *deer* kind, called by authors *rangifer*. See the article RANGIFER, *Suppl.*

DENTALIUM, in zoology, the same with *dentale*. See the article DENTALE, *Suppl.*

DERMESTES, the name given by Dr. Hill to a numerous genus of insects commonly confounded with the *scarabæi*, or beetles, from which they are distinguished by having their antennæ of a clavated figure. Vide *Hill*, Hist. Anim. p. 40.

DETTANDER. See the article LEPIDIUM, *Suppl.*

DEVICE, among painters, &c. the same with devise. See the article DEVISE, *Cycl.*

DEVIL *in a bush*, a name sometimes given to a genus of plants called by authors *nigella*. See the article NIGELLA, *Suppl.*

DEVIL's *bit*, in botany, a name used by some writers for the *scabiosa* of others. See the article SCABIOSA, *Suppl.*

DEW-*born*, in the management of cattle, an excessive swelling of the body, proceeding from the greediness of a beast to feed, when put into rank pasture.

This swelling is often so great that the creature runs the utmost hazard of bursting; in which case it should be made to stir much, and purge well: but the proper cure is to bleed the creature in the tail, then putting a nutmeg into an egg, to thrust it down the creature's throat, shell and all; after which by walking him up and down he will soon mend. Rust. Dict. in voc.

DIABETES (*Cycl.* and *Suppl.*) — According to Dr. Mead, the *diabetes* is a disease of the liver, and not of the kidneys, as has been generally thought. See Monit. & Pract. Medic. cap. ix. § 2. and Mechanic Account of Poisons, Essay i. Ed. 4.

The Doctor recommends the following medicine as efficacious in this distemper: take four pints of milk, boil it a little, and turn it with three drachms of alum; four ounces of this should be taken three times a day at least.

This disease happens most frequently to those who, without due exercise, indulge themselves with drinking vinous liquors, and then quench the thirst arising from thence by too great a quantity of such as are cooling.

The *diabetes* seem to have been rare among the antients, since Galen says he saw it but twice only.

DIAGONAL *scale*. See the article PLOTTING *scale*, *Cycl.*

DIALLING (*Cycl.*) — We have a treatise, by Mr. Deparcieux, on this subject, published 1740, recommended in Hist. Acad. Scienc. 1740.

DIAMOND (*Cycl.* and *Suppl.*) — When *diamonds* are fouled with a yellow or brown colour, it is a common practice among jewellers to put them into a fierce fire; this divests them of their colour, without doing them the least sensible injury. *Du Fay*, in Mem. Acad. Paris. 1735.

DIAPENTE, (*Cycl.*) among farriers, a drink made for horses, of gentian, round birthwort, barberries, myrrh, and ivory shavings, of each a like quantity, which are to be pounded separately, and finely searced: this powder, to the quantity of two or three spoonfuls, is mixed with a pint and a half of muscadine, or sack, or, for want of either, with strong ale or beer, and given in fevers, the cough, glanders, surfeits, inflammations, yellows, &c. It is said to purify the blood from all foulnesses, as well as to restrain the overflowing of the gall, working of the spleen, &c. Rust. Dict. in voc.

DIARY, a term sometimes used for a journal, or day-book, containing an account of every day's proceedings. Thus we say *diaries* of the weather, &c.

DIAUGOPHRAGMIA, in natural history, a genus of *septariæ*, whose septa are of spar, with an admixture of crystal, which being sometimes also mixed among the matter of the tali, renders the whole more bright and glossy. See the article SEPTARIÆ, *Suppl.*

Of this genus we have the following species: 1. The ferrugineous red *diaugophragmia*, with brownish yellow partitions. 2. The brownish yellow *diaugophragmium*, with whitish partitions. 3. The blueish white *diaugophragmium*, with strawcoloured partitions. Vide *Hill*, Hist. Foss. p. 522.

DIBBLE, among gardeners, a setting-tool, or forked stick, wherewith plants are set. Rust. Dict. in voc.

DICTAMNUS, in the Linnæan system of botany, the name of a genus of plants called by Tournefort *fraxinella*. See the article FRAXINELLA, *Suppl.*

DIE. See the article DYE, *Cycl.*

DIER. See the article DYER, *Suppl.* and *Append.*

DIESIS (*Suppl.*) — a wrong notation has crept into this article; for E, ♮ E, F, read E, ♯E, F. And so in other places of this article, where ♮ E occurs, substitute ♯ E.

DIET. See the article FOOD, *Suppl.*

One great reason why leprosies, hot scurvies, dysenteries, plagues, pestilential fevers, and the like distempers, formerly so frequent in London, are now so rare, is the change that has been made in the *diet* of the inhabitants. Hopped beer, wine, and spirituous liquors coming into general use, have been a great means of suppressing putrid diseases; greens and fruit are likewise more universally eat, and salted meats make a much less part of *diet* than formerly: to this add the more general consumption of tea and sugar. *Pringle*, Observ. on the Diseases of the army, p. 294, *seq.*

A vegetable *diet* is most proper for scorbutic and hectical persons, and does very well with people who have great exercise; but, in other circumstances, a mixed *diet* of vegetable and animal substances, such as is commonly used, seems best calculated to nourish and preserve the body from decay. *Id. ibid.* p. 366, *seq.*

Irregularities in *diet* are commonly, though unjustly, supposed to have the greatest share in producing military diseases; were this the case, the changes in the weather and seasons would not so remarkably affect their health; the soberest and most regular corps would not be so sickly; different nations in the same camp, living variously, would not be afflicted with the same distempers; nor would there be such an inequality in the numbers of the sick in different years, were the greatest part of diseases owing solely to *diet*.

Against excess, the most common error in *diet*, the smallness of a soldier's pay is a sufficient security: in regard to them, therefore

therefore, the danger lies on the other hand; for, when all are not obliged to eat in messes, some will be apt to lay out their pay upon strong liquors, and to squander away in one day what is but barely a maintenance for a week; but, on the supposition that every man contributes his share to a mess, we may be assured there can be no errors in *diet* of any consequence, whilst almost the whole pay is spent upon common food. As to the abuse of spirits and fruit, soldiers are generally blamed without any foundation; spirits being rather beneficial than hurtful to them, so often exposed to the extremes of heat and cold, to moist and bad air, long marches, wet cloaths, and scanty provisions; and as to fruit, a few disorderly men may rob orchards, which is the only way they can come at fruit, but the camp-diseases are incident to the most regular equally with them. See *Pringle*, Observ. on the Diseases of the army, p. 86, *seq*.

A fundamental rule in regard to the *diet* of soldiers, is to oblige them to eat in messes, by which means their pay will be laid out upon wholesome food. The greatest impediment to messing are the wives and children, who must often be maintained on the soldier's pay; in which circumstances it is not improper food, but the want of it, that may endanger a soldier's health.

The messing being established, there remains only to see that the men be well supplied with bread, and that the markets be so regulated that the traders may have encouragement to come to the camp, and the messes have good provisions at a moderate price; and particularly vegetables, which, during the hot weather, ought to make a great part of the *diet*. In establishing the messes, some regulations might be made with regard to an allowance of spirits, either by stoppages on the pay or otherwise. This is already practised in the navy, and probably for the same reasons that make spirits necessary for soldiers; since in ships men are liable to distempers from moist and corrupted air.

As to the *diet* of officers, their chief rule, in sickly times, is to eat moderately, avoiding all surfeits and indigestion, and using wine in moderation. *Id. ibid.* p. 112, *seq*.

DIFFERENTIAL *equation* is used by some mathematicians for an equation involving infinitesimal differences, or fluxions. Thus the equation $3x^2dx - 2axdx + aydx - 3y^2dy + axdy = 0$ in the foreign notation, or $3xx\dot{x} - 2ax\dot{x} + ay\dot{x} - 3y^2\dot{y} + ax\dot{y} = 0$ in the English notation, is called a *differential equation*. But these equations should consistently with the English or Sir Isaac Newton's notation, be rather called fluxional equations.

Hence some of our mathematicians have applied the term *differential equation* in another sense, to certain equations defining the nature of series's. See the article SERIES, *Append.*

DIFFERENTIAL *method*, in mathematics, an appellation given to a method of describing a curve of the parabolic kind thro' any given number of points.

This method is given by Sir Isaac Newton in the fifth lemma of the third book of his Principles. He distinguishes two cases of this problem; the first, when the ordinates drawn from the given points to any line given in position, are at equal distances from each other; and the second, when these ordinates are not at equal distances. He has given a solution of both cases, but without demonstration in that place, which has since been supplied by himself and others. See his Methodus Differentialis, published with other tracts of the same author, by Mr. Jones, London, 1711; and Stirling's explanation of the Newtonian *differential method* in the Philos. Transf. N°. 362. *Cotes*, de Methodo differentiali Newtoniana, in his works published by Dr. Smith; *Herman*. Phoronomia in Append. p. 389; see also *Le Seur* and *Jacquier*, in their Comment on Sir Isaac's Principles, tom. ii. p. 42, *seq*.

Where it is to be observed, that the methods there demonstrated by some of these authors extend to the description of any algebraic curve through a given number of points, which Sir Isaac, writing to Mr. Leibnitz, mentions as a problem of the greatest use.

By this method, some terms of a series being given, and supposed to be placed at given intervals, any intermediate term may be found nearly; and this therefore gives a method for interpolations. *Newt.* Meth. Differ. prop. v.

Any curvilinear figure may also be squared nearly, of which some ordinates may be found. *Newt. ibid.* prop. vi.

And this method may be extended to the construction of mathematical tables by interpolation. *Ibid.* in schol. p. 100.

The successive differences of the ordinates of parabolic curves, becoming ultimately equal, and the intermediate ordinate required being determined according to Sir Isaac's rules, by these differences of the ordinates, is the reason of this method's being called the *differential method*.

To be a little more particular:

The first case of Sir Isaac's problem amounts to this; a series of numbers, placed at equal intervals being given, to find any intermediate number of that series when its interval from the first term of the series is given.

Subtract every term of the series from the next following, and let the remainders be called first differences; then subtract each difference from the next following, and let these remainders be called second differences; again, let each second difference be subtracted from the next following, and let these remainders be called third differences, and so on: then if A be the first term of the series, d' the first of the first differences, d'' the first of the second differences, d''' the first of the third differences, &c. and if x be the interval between the first term of the series and any term sought, E, that is, let the number of terms from A to E, both inclusive, be $= x + 1$, then will the term sought,

$$E = A + \frac{xd'}{1} + \frac{x.\overline{x-1}}{1.2}d'' + \frac{x.\overline{x-1}.\overline{x-2}}{1.2.3}d''' + \frac{x.\overline{x-1}.\overline{x-2}.\overline{x-3}}{1.2.3.4}d'''' + \&c.$$

which series differs from the Newtonian in this, that the quantities $\frac{d''}{1.2}$, $\frac{d'''}{1.2.3}$, $\frac{d''''}{1.2.3.4}$ here used, signify the same with d'', d''', d'''', used by Sir Isaac.

Hence if the differences of any order become equal, that is, if any of the quantities d'', d''', d'''' become $= 0$, we shall have a finite expression for E, the term sought; it being evident, that the series must terminate when any of the differences d'', d''', &c. become $= 0$.

It is also evident that the coefficients $\frac{x}{1}$, $\frac{x.\overline{x-1}}{1.2}$, &c. of the differences, are the unciæ of the binomial theorem.

A method may be deduced from the foregoing expression, of finding the sums of the terms of such a series. For if we imagine a new series, whereof the first term shall be $= 0$, the second $= A$, the third $= A + B$, the fourth $= A + B + C$, the fifth $= A + B + C + D$, and so on, it is plain that the assigning one term of this series is finding the sum of all the terms A, B, C, D, &c. Now since those terms are the differences of the sums 0, A, $A + B$, $A + B + C$, $A + B + C + D$, and that, by the supposition, some of the differences of A, B, C, D, &c. are $= 0$; it follows that some of the differences of the sums will also be $= 0$; and that whereas in the series $A + xd' + \frac{x.\overline{x-1}}{1.2}d''$, &c. whereby a term was assigned, A represented the first term, d' the first of the first differences, and that x represented the interval between the first term and the last, we are to write 0 instead of A, A instead of d', d' instead of d'', d'' instead of d''', &c. and $x + 1$ instead of x; which being done, the series expressing the sums will be

$$0 + \overline{x+1}.A + \frac{\overline{x+1}.x}{1.2}d' + \frac{\overline{x+1}.x.\overline{x-1}}{1.2.3}d'' + \&c.$$

or

$$\overline{x+1} \times A + \frac{x}{2}d' + \frac{x.\overline{x-1}}{2\ 3}d'' + \frac{x.\overline{x-1}.\overline{x-2}}{2.3.4}d''', \&c.$$

Or again, if the real number of terms of the lines be called z, that is, if $z = x + 1$, or $z - 1 = x$, we shall have the sum of the series

$$= z \times \overline{A + \frac{z-1}{2}d' + \frac{\overline{z-1}.\overline{z-2}}{2.3}d'' + \frac{\overline{z-1}.\overline{z-2}.\overline{z-3}}{2.3.4}d''' + \&c.}$$

See *De Moivre*, Doctr. of Chances, p. 52, 53. Misc. Analyt. p. 153.

For instance, let it be required to find the sum of a series of the squares of the natural numbers $1 + 4 + 9 + 16 + 25 + 36$

Then,

$$\begin{array}{llll}
A = 1 & d' & & \\
 & 3 & d'' & \\
4 & & 2 & d''' \\
9 & 5 & & 0 \\
16 & 7 & & 0 \\
 & & 2 & \\
25 & 9 & & 0 \\
 & & 2 & \\
36 & 11 & &
\end{array}$$

The sum consequently will be,

$$= z \times \overline{1 + \frac{z-1}{2} \times 3 + \frac{\overline{z-1}.\overline{z-2}}{2.3} \times 2}$$

$$= z \times \overline{1 + \frac{3z-3}{2} + \frac{zz-3z+2}{3}}$$

$$= z \times \frac{6 + 9z - 9 + 2zz - 6z + 4}{6}$$

$$= z \times \frac{1 + 3z + 2zz}{6} = \frac{z.\overline{1+z}.\overline{1+2z}}{6} = \frac{6.7.13}{6} = 91$$

This easy example will be sufficient to shew the applications of the rule. Those who are desirous of seeing its use in questions of chance, may consult Mr. *de Moivre*'s Doctrine of chances, p. 53, *seq*. Various other instances of the use of this rule in finding sums of progressions of figurate members, &c. may be seen in Misc. Analyt. p. 154, *seq*.

As to the *differential method*, it is to be observed, that though Sir Isaac and others have treated it as a method of describing an algebraic curve, at least of the parabolic kind, through any number of given points; yet the consideration of curves is not at all essential, though it may help the imagination. The description of a parabolic curve through given points, is the same problem as the assigning of quantities from their given differences, which may always be done by algebra, and by the

the reſolution of ſimple equations. See Mr. *Stirling*'s Methodus Differentialis, p. 97. This ingenious author has treated fully of the *differential method*, and ſhewn its uſe in the ſolution of ſome very difficult problems.

DIFFERENTIAL *ſcale*, in algebra, is uſed for the ſcale of relation ſubtracted from unity. See the article *Recurring* SERIES, *Append.*

DIGESTION, how promoted by fermentation. See the article FERMENTATION, *Append.*

DIMNESS *of ſight*, in horſes. Seethe article SIGHT, *Append.*

DISAFFORESTED, the ſame with deafforeſted. See the article DEAFFORESTED, *Cycl.*

DISBUDDING *of trees*, is the taking away ſuch branches or ſprigs, newly put forth, as are ill placed. Dict. Ruſt. in voc.

DISBURDENING *of fruit-trees*, is the taking off part of the leaves and fruit, when too numerous, that thoſe which remain may grow the larger. Dict. Ruſt. in voc.

DISCLOSED, a term uſed for chickens or hawks newly hatched, or juſt peeping through the ſhells; alſo for buds or flowers juſt blown. Dict. Ruſt. in voc.

DISEASES *of ſoldiers*. See the article SOLDIERS, *Append.*

DISEMBARK, in the ſea-language, ſignifies to land goods from on ſhip-board. Dict. Ruſt. in voc.

DISPLANTING, among gardeners, is the plucking up a tree or plant out of the ground. Dict. Ruſt. in voc.

DISPLANTING *ſcoop*, an inſtrument for taking up plants with earth about their roots. *Id. ibid.*

DISSEPIMENTUM, among botaniſts, the thin ſeptum ſeparating the cells of the fruits of plants.

DISTAFF, an inſtrument about which flax is tied, in order to the ſpinning it.

DISTAFF-*thiſtle*, a name ſometimes given to the *atractylis* of authors. See the article ATRACTYLIS, *Append.*

DITTANDER, in botany, the Engliſh name of a genus of plants, called by authors *lepidium*. See the article LEPIDIUM, *Suppl.*

DITTANY (*Suppl.*) — *Baſtard*-DITTANY, the Engliſh name of a genus of plants called by authors *Pſeudo-dictamnus*. See the article PSEUDO-*dictamnus*, *Suppl.*

DOCK (*Suppl.*) in botany, the Engliſh name of a genus of plants called by authors *lapathum*. See the article LAPATHUM, *Suppl.*

DOCK, among ſportſmen, denotes the fleſhy part of a boar's chine, between the middle and the buttock.

DOCTOR *Tinkar's weed*, in botany, a name given to a genus of plants called by authors *trioſteoſpermum* and *lonicera*. See the article LONICERA, *Append.*

DOE, the female of the buck-kind. See the article BUCK, *Cycl.* and *Suppl.*

DOG, (*Suppl.*) the Engliſh name of a very numerous genus of animals. See the articles DOG and CANIS, *Suppl.*

DOG's *bane*, in botany, the Engliſh name of a genus of plants called by authors *apocynum*. See the article DOG's *bane*, *Suppl.*

DOG-*berry-tree*, a name given to the *cornus*, or cornel-tree. See the article CORNUS, *Suppl.*

DOG-*days*, the ſame with canicular days. See the article CANICULAR, *Cycl.*

DOG's *graſs*, in botany. See the article GRASS, *Append.*

DOG's *mercury*, in botany, a name given to a ſpecies of *mercurialis*. See the article MERCURIALIS, *Suppl.*

DOG's *ſtones*, in botany, a name by which ſome call the *orchis*. See the article ORCHIS, *Suppl.*

DOG's *tongue*, in botany, the Engliſh name of a genus of plants called by authors *cynogloſſum*. See the article CYNOGLOSSUM, *Suppl.*

DOG's *tooth-ſhell*, the Engliſh name of a ſpecies of *dentalium*. See the article DENTALIUM, *ſupra*.

DOG-*wood*, a name ſometimes given to the *cornus*, or cornel-tree. See the article CORNUS, *Suppl.*

DOG-*wood of Jamaica*, the name by which ſome authors call *robinia*, a genus of plants. See the article ROBINIA, *Suppl.*

DOG-*wood of Virginia*, a name ſometimes given to a ſpecies of *laurus*, or bay-tree. See the article LAURUS, *Suppl.*

DOGGS, machines of iron for burning wood on; alſo hooks fixed in large timbers, for drawing them with horſes. *Blanckley*, Nav. Expoſitor, p. 51.

DOOLS, a term uſed in ſeveral parts of the kingdom for balks, or ſlips of paſture, left between the furrows of ploughed lands. Dict. Ruſt. in voc.

DORIA, in botany, the name uſed by Dillenius for the *ſolidago*, or *virga aurea* of other botaniſts. See the article VIRGA *aurea*, *Suppl.*

DORMOUSE, the Engliſh name of a genus of animals called by authors *ſorex*. See the article SOREX, *Suppl.*

DOTTEREL (*Suppl.*) — For MAINELLUS, referred to in this article, read MORINELLUS.

DOUBLE (*Cycl.* and *Suppl.*) — A hare is ſaid to *double* when ſhe keeps in plain fields, and winds about to deceive the hounds. Dict. Ruſt. in voc.

DOUBLE-*leaf*, or TWYBLADE, in botany, names given by ſome to the *ophris* of authors. See the article OPHRIS, *Suppl.*

DOUBLE-*tongue*, a name ſometimes given to the *ruſcus*, or butcher's broom. See the article RUSCUS, *Suppl.*

DOUCETS, or DOULCETS, among ſportſmen, denote the teſtes of a deer or ſtag. Dict. Ruſt. in voc.

DOVE's *foot*, in botany, a name ſometimes uſed for the *geranium*, or crane's bill of authors. See the article GERANIUM, *Suppl.*

DOWN, in natural hiſtory, denotes the fineſt feathers of geeſe, with which beds, pillows, &c. are ſtuffed: alſo the cottony ſubſtance growing on the tops of thiſtles, and other plants.

DOWNY, ſomething partaking of the nature, or abounding with down: thus, ſome leaves, fruit, &c. are found covered with a *downy* matter.

DRABA, in the Linnæan ſyſtem of botany, makes a diſtinct genus of plants, which have no ſtyle, and whoſe fruit is an oval pod of an oblong figure.

C. Bauhine calls it the *burſa paſtoris minor*.

DRABA is alſo a name by which ſome ſpecies of two very diſtinct genuſes of plants, not only from the former, but from each other, are ſometimes called; thoſe are the *lepidium* and *heſperis* of botanical writers. See the articles LEPIDIUM and HESPERIS, *Suppl.*

DRAFF, a term uſed in many parts of the kingdom for the waſh given to hogs: alſo for the grains of brewers uſually given to cows.

DRAGG (*Suppl.*) — *Draggs* are alſo a kind of baſket uſed in clearing the aprons of ſhip-docks of filth. *Blanckley*, Nav. Expoſ. p. 51.

DRAGON (*Suppl.*) — *Sea*-DRAGON, in ichthyology, the Engliſh name of the *cottus*, with the ſecond back-fin white. See the article COTTUS, *Suppl.*

DRAGON-*tree*, a name ſometimes uſed for the palm-tree. See the article PALM, *Suppl.*

Wild DRAGON, a name ſometimes given to *abrotanum*, or ſouthernwood. See the article SOUTHERNWOOD, *Suppl.*

DRAW-*net*, a kind of net for taking the larger ſort of wild fowl, which ought to be made of the beſt packthread, with wide meſhes: they ſhould be about two fathoms deep and ſix long, verged on each ſide with a very ſtrong cord, and ſtretched at each end on long poles.

It ſhould be ſpread ſmooth and flat upon the ground, and ſtrewed over with ſedge, graſs, or the like, to hide it from the fowl; and the ſportſman is to place himſelf in ſome ſhelter of graſs, fern, or ſome ſuch thing. Dict. Ruſt. in voc.

DRAW-*gear*, in huſbandry, any kind of harneſs for drawing a waggon or other carriage.

DRAWING *of teeth*, or *Tooth*-DRAWING, in ſurgery. See the article TOOTH-*drawing*, *Suppl.*

DRAY, a name given by ſportſmen to ſquirrel-neſts, built in the tops of trees. See the article SQUIRREL, *Suppl.*

DRAY is alſo a kind of cart uſed by brewers for carrying barrels of beer; alſo a ſledge drawn without wheels. Dict. Ruſt. in voc.

DREDGE, or DREG, a term uſed by the farmers for oats and barley mingled together. Dict. Ruſt. in voc.

DREDGERS, a term uſed in the admiralty-courts for the fiſhers for oyſters. Dict. Ruſt. in voc.

DRIFFLAND, the ſame with droffland. See the next article.

DROFFLAND, or DRIFFLAND, in our old cuſtoms, a yearly payment made by ſome tenants to their landlords, for driving their cattle through the manor to fairs and markets. Dict. Ruſt. in voc.

DROP-*wort*, the Engliſh name of a genus of plants called by authors *filipendula*. See the article FILIPENDULA, *Suppl.*

Water-DROP-*wort*, the Engliſh name of a genus of plants called *œnanthe* by authors. See the article ŒNANTHE, *Suppl.*

DROPSY (*Suppl.*) — *Dropſies*, attended with anaſarcous ſwellings, are not to be cured with purging alone, nor by ſoap, nor mercurials; but chiefly by the lixivial ſalts, either in the form of broom-aſhes, ſalt of wormwood, or ſalt of tartar. The common method is this; about thirty or forty grains of ſalt of tartar is diſſolved in an infuſion of wormwood, to which is added ſpirit of juniper; and this mixture is to be given in three doſes, and repeated daily. Beſides this it may be proper to give the patient, once in four or five days, half a dram of *pilulæ ex coloquintida cum aloe*, as a purge; and toward the decline of the diſeaſe, ſome common chalybeate. The diureſis may alſo be promoted by ſwallowing garlick, or muſtard-ſeed. See *Pringle*, Obſerv. on Diſeaſes of the Army, p. 213.

DROSERA, in the Linnæan ſyſtem of botany, the name of a genus of plants called by Tournefort *ros ſolis*. See the article ROS *ſolis*, *Suppl.*

DRUM (*Cycl.*) — *Mire*-DRUM, the name by which the bittern is called in ſeveral parts of the kingdom. See the article BITTERN. *Suppl.*

DUBBING *of a cock*, a term uſed by cock-maſters for the cutting off a cock's comb and wattles. Dict. Ruſt.

DUCK's *foot*, in botany, the Engliſh name of a genus of plants known among authors by thoſe of *podophyllum* or *anapodophyllum*. See the article ANAPODOPHYLLUM, *Suppl.*

DUCK-*weed*, or DUCK's *meat*, the Engliſh name of a genus of plants called by authors *lemna*. See the article LEMNA, *Append.*

DUMBNESS (*Cycl.*) — When this diſorder ariſes from deafneſs, it ſometimes admits of a cure. See the Phil. Tranſ. N°. 61. where Dr. Wallis gives an account of two perſons deaf and dumb, who were taught to underſtand and ſpeak a language. And in N°. 245. the doctor gives an account of his method for this purpoſe. This art is now practiſed ſucceſsfully in London by the ingenious Mr. Baker.

DWALE, a name fometimes given to the deadly nightfhade, or *belladonna*. See the article BELLADONNA, *Suppl.*

DYER's *broom*, in botany, the name of a fpecies of *geniſta*. See the article GENISTA, *Suppl.*

DYNA, in commerce, a kind of Eaft-Indian coin, worth about thirty Shillings of Englifh money.

DYSENTERY (*Cycl.* and *Suppl.*) — The *dyfentery* is owing to caufes little different from thofe which produce the bilious or putrid fever. Accordingly it is agreed on all hands, that it proceeds chiefly from two caufes, different in appearance, but in effect the fame; one from acrimony generated within the body, and the other from foul fteams, which being received into it, act as a ferment, and fuddenly produces the fame diforder that arifes more flowly from an internal caufe.

As to the acrimony, it appears to be of the putrid kind, the *dyfentery* being moft frequent in hot, clofe, and moift feafons, when bodies are moft fubject to putrefaction; and, befides, prevails chiefly among thofe of a fcorbutic habit, or the meaneft and pooreft people, who, from foul air, bad diet, and naftinefs, are moft liable to putrid difeafes.

There is likewife an old obfervation, that fuch feafons as produce moft flies, caterpillars, and other infects (the increafe whereof depends fo much upon heat, moifture, and confequently upon corruption) have likewife been the moft productive of *dyfenteries*.

Laftly, it is beyond difpute, that the infection is communicated by putrid effluvia from the bodies, but more efpecially the fæces of thofe who are ill of the diftemper. See *Pringle*, Obfervations on the Difeafes of the Army, p. 224, *feq.*

This difeafe is the fame in camps as in other places; its greater fatality in the former arifing more from want of neceffaries than from any extraordinary virulence in the *dyfentery* itfelf.

Phyficians diftinguifh three ftates of the *dyfentery*; the firft, when recent, the fecond, when it has continued fome time, and has much impaired the ftrength, weakened the tone of the inteftines, and abraded their villous coat; and the third, when, either from the putrid fumes within the body, or the foul air of an hofpital, a malignant fever is joined, and a mortification threatened.

In the firft ftage bleeding is proper, though not in the fubfequent ones; alfo vomiting with *ipecacuhana*, in fmall quantities, and repeated feveral times. *Vitrum ceratum antimonii* is alfo recommended as the moft efficacious emetic for relieving the ftomach and bowels, provided it be given in the beginning of the diftemper. After vomiting, a purge of rhubarb, to which are added a few grains of falt of wormwood, may be given. In winter, indeed, and vernal fluxes, bleeding and rhubarb have been found fufficient, without vomits. In regard to diet, the common practice is to confine the patient in the beginning to rice-gruel, panado, mutton-broth, and the like; and for drink rice or barley-water, or the white decoction are recommended. In the convalefcent ftate they may be allowed meat, but no fmall beer, and never any milk unlefs diluted with lime-water. *Pringle*, Obferv. on the Difeafes of the Army, p. 230, *feq.*

In the fecond ftage, the fame diet, with fmall dofes of the bark, to which has been added the extract of logwood, or the *tinctura Japonica*, is recommended.

The *dyfentery*, after a feeming cure, is apt to recur upon any cold, or error in diet: however, it is to be obferved, that, for the moft part, relapfes are not attended with fuch acrimony as at firft. When relapfes are apprehended, or the cure imperfect, the patient muft ftill ufe a foft mucilaginous diet, and continue to take fome mild aftringent; which laft intention may be anfwered by lime-water, given to a pint a day, and foftened with half that quantity of boiled milk. Sometimes fmall dofes of the bark have been no lefs effectual. *Id. ibid.*

Gripes always attend the *dyfentery*, and are relieved by opiates, by fomenting the belly, and by drinking chamemile-tea; for, carminatives, in this cafe, inftead of mitigating, increafe the pains. The tea produces this effect not only by its antifpafmodic but antifeptic virtue. The fomentations, which are made of herbs, adding fome fpirits, muft be frequently repeated; and when thefe are found ineffectual, the pains may be relieved with a blifter, or only a warm plafter with a fourth or fifth part of the *emplaftrum epifpafticum* added to it.

As to the third ftage of this diftemper, it coincides with the malignant or hofpital fever. See the article HOSPITAL *fever*, *Append.*

DYTISCUS, in zoology, the name of a genus of four-winged flies, the antennæ of which are flender and fetaceous. They have likewife feet formed for fwimming, and their habitation is generally in the water, whence they have been called in Englifh, water-beetles.

E.

EADISH, among farmers. See the article EDDISH, *Append.*

EAGLE (*Suppl.*) — *Sea*-EAGLE, in ichthyology, the Englifh name of the *aquila marina*, a fpecies of *raja*. See the articles RAJA and AQUILA *marina*, *Suppl.*

EAGLE-*bat*, the Englifh name of an animal of the bat-kind. See the article VESPERTILIO, *Suppl.*

EAGLE-*flower*, the name by which fome call the *balfamina*, a diftinct genus of plants. See the article BALSAMINA, *Suppl.*

EAGRASS. See the article EDDISH, *Append.*

EAR-*wig*, *forficula*, a well known infect, very fwift, with two fmall horns on its head, and fix feet; its tail is forked; its body is about the thicknefs of a fmall worm, and very fmooth.

It is a very troublefome creature, frequently introducing itfelf into the ears, and caufing a great deal of pain by its biting: it likewife burrows in other parts of the body, which it bites in the fame manner.

The dried powder of *ear-wigs* is efteemed good for deafnefs; and the oil prepared from them, in convulfions and fpafms. Vide *Lemery*, Dict. des Drog. *in voc. Forficula.*

EARNING, or YEARNING, a name ufed in feveral parts of the kingdom for rennet.

EARSH. See the article EDDISH, *Append.*

EARTH (*Suppl.*) — *Fuller's* EARTH, *terra fullonica*, the Englifh name of a fpecies of marle. See the articles MARLE and FULLER's*earth*, *Suppl.*

EARTH-*nut*, in botany, the Englifh name of a genus of plants called by authors *bulbocaftanum*. See the article BULBOCASTANUM, *Suppl.*

EARTH-*nut-peas*, in botany, the name of a genus of plants called by authors *lathyrus*. See the article LATHYRUS, *Suppl.*

African EARTH-*nut-peas*, in botany, a name fometimes given to the *arachis* of authors. See the article ARACHIS, *Append.*

ECHINI *marini*. See the article CENTRONIA, *Append.*

ECLIPTIC (*Cycl.*) — The obliquity of the *ecliptic* is not conftant. The mean obliquity is, according to Dr. Bradley, 23° 28′ 30″. Whether this obliquity be the refult only of the nutation of the earth's axis from the caufe mentioned in the article STAR, *Append.* or whether there be befides fome caufe producing a gradual approach of the *ecliptic* to the equator, either at the rate of 1′ in 100 years, or at any other rate, is not yet afcertained.

EDDISH, or EADISH, among farmers, denotes the latter pafture, or grafs, which comes after mowing or reaping, and is otherwife called eagrafs, earfh, and etch.

EEL-*backed*, a term ufe by dealers in horfes, for thofe which have black lifts along their backs.

EFFLUVIA, (*Suppl.*) in medicine, are affigned as the caufe of various diforders, efpecially of the contagious kind. Thus, when a confiderable quantity of putrid *effluvia* has been admitted into the blood, befides acting thereupon flowly, by way of inquinamentum, or ferment, they feem immediately to affect the nerves, and thereby to bring on fome extraordinary diforder of the whole frame. Hence arife fpafms, obftructions, palpitations, a high degree of fever, or a languid circulation, chillnefs, or intenfe heat, and a variety of contrary fymptoms, according to the different affection of the nerves. To putrid *effluvia* is likewife owing the jail diftemper, which is the fame with the hofpital fever. See the article HOSPITAL-*fever*, *Append.*

Some, indeed, unacquainted with the dangerous nature of putrid *effluvia*, have afcribed the mortality occafioned by them, to a cold, or other the like caufe; but, in this, they have entirely miftaken the caufe. Vide *Pringle*, Obferv. on the Difeafes of the Army, p. 186, *feq.*

Effluvia iffuing from corrupted fubftances chiefly confift of the phlogifton or fulphur principle, fince they fo readily unite with, and volatilize acids, as appears from the increafe and particular change of the fmell. But it is proper to remark, that from a fimple putrid fubftance the phlogifton does not arife alone, but combined with the faline parts of the body; for this principle, when fingle, is perhaps imperceptible to the fmell; and, when divefted of thefe falts, is never, fo far as is known, peftilential: fo that the deleterious particles of rotten fubftances

ſubſtances ſeem to conſiſt of a certain combination of the ſulphureous with the ſaline principle, which united, not only become the moſt irritating ſtimuli to the nerves, but act upon the humours as a putrid ferment in promoting their corruption. *Id. ibid.* p. 385. See the article MALIGNANT, *Append.*

EGG *(Suppl.)* — *Sea*-EGG, the Engliſh name of a ſpecies of *centronia*. See the article CENTRONIA, *Suppl.*

EGLANTINE, in botany, a name given to the ſweet-briar, a ſpecies of roſe. See the article ROSE, *Suppl.*

EGLECOPALA, a name ſometimes uſed for the ſtony, blueiſh marle. See the article MARLE, *Suppl.*

ELAEAGNON, or ELAEAGNON *Theophraſti*, in botany. See the article AGNUS *caſtus*.

ELATER, the name of a genus of four-winged flies with ſetaceous antennæ; which, when laid on their backs, have a power of leaping with great force and agility.

ELATERIUM, in botany, a name uſed by ſome for the *momordica* of others. See the article MOMORDICA, *Suppl.*

ELDEN, a word uſed in ſome parts of the kingdom for fuel. Dict. Ruſt.

ELDER-*tree*, *alnus*, in botany, the Engliſh name of a genus of plants. See the article ALNUS, *Suppl.*

Dwarf-ELDER, in botany, a name given ſometimes to the *ſambucus* of authors. See the article SAMBUCUS, *Suppl.*

Marſh-ELDER, or *Water*-ELDER, the name by which ſome writers call the OPULUS. See the article OPULUS, *Suppl.*

Spaniſh-ELDER, the Engliſh name of a genus of plants called by authors *Saururus*. See the article SAURURUS, *Suppl.*

ELEPHAS, the elephant, in zoology. See the article ELEPHANT, *Suppl.*

ELICHRYSUM, in botany, the name of a genus of plants, called in Engliſh *goldy-lock*. See the article ELYCHRYSUM, *Suppl.*

ELICHRYSUM, in botany, is alſo a name given by Tournefort to the *gnaphalium*, or cut-weed, of Linnæus. See the article GNAPHALIUM, *Suppl.*

EMPHEREPYRA, in natural hiſtory, a genus of *ſiderochita*, compoſed of various cruſts, or coats, ſurrounding a nucleus of the ſame matter and ſtructure with themſelves. See the article SIDEROCHITA, *Append.*

Of this genus we have the following ſpecies: 1. The very hard ſmooth *empherepyra*, with brown, yellow, and red cruſts. 2. The hard, glittering, rough *empherepyra*, with brown, purple, and deep yellow cruſts. 3. The ſoft browniſh-yellow *empherepyra*. 4. The ſoft *empherepyra*, with ſhining brown and duſky green cruſts. 5. The ſoft *empherepyra*, with lucid, whitiſh, yellowiſh, and red cruſts. *Hill*, Hiſt. Foſſ. p. 532, *ſeq.*

EMPRIMED, among ſportſmen, a term applied to a hart when he forſakes the herd. Dict. Ruſt. in voc.

ENCAMPMENT. See the article CAMP, *Append.*

ENCEPHALOS, ἐγκέφαλος, in phyſiology, is uſed for the brain. *Caſtel.* Lexic. Medic. See the article BRAIN, *Cycl.*

ENCHANTER's *nightſhade*, a name ſometimes given to a genus of plants, called by authors *circæa*. See the article CIRCÆA, *Suppl.*

ENCHELIDES, in zoology, the name of a genus of animalcules, containing the capillary eels, whether of pepper-water, vinegar, &c. See the articles ANIMALCULE, *Append.* and PEPPER, VINEGAR, and EEL, *Suppl.*

ENDEW, in falconry, is ſaid of a hawk that digeſts her meat ſo well, that ſhe not only diſcharges her gorge of it, but even cleanſes her pannel. Dict. Ruſt.

ENDIVE, *endivia*, in botany, a name given to ſeveral ſpecies of *cichorium*. See the article CICHORIUM, *Suppl.*

ENGOUTED, in falconry, is ſaid of a hawk's feathers when they have black ſpots in them. Dict. Ruſt.

ENHYDRIS, in zoology, a name given by the antient Greeks to the otter, from its living in the water. See the article LUTRA, *Suppl.*

ENHYDRI, in natural hiſtory, a genus of cruſtated ferrugineous bodies, formed into large, and in great part, empty caſes, encloſing a ſmall quantity of an aqueous fluid.

Of this genus we have only two ſpecies: 1. The thick ſhelled *enhydrus*, with black, reddiſh, brown, and yellow cruſts. 2. The thinner ſhelled *enhydrus*, with yellowiſh, brown, and purpliſh cruſts. *Hill*, Hiſt. Foſſ. p. 544.

ENSEELED, in falconry, a term uſed for a hawk which has a thread drawn through her upper eye-lid, and made faſt under her beak, to take away the ſight. Dict. Ruſt.

ENTERING *of a hawk*, among falconers, denotes her being allowed to kill for the firſt time. Dict. Ruſt.

ENTERING *of hounds*, is the inſtructing them how to hunt. Dict. Ruſt. See the article ENTRANCE, *Suppl.*

ENTERMEW, in falconry. See the article FALCON.

ENTERMEWER, among falconers, a hawk which changes the colours of her wings by degrees. Dict. Ruſt.

ENTERSELE, in architecture, a kind of ſmall ſtory, ſometimes called a *mezanine*. See the article MEZANINE, *Cycl.*

ENTRY, among ſportſmen, a term by which ſome call thoſe places or thickets, through which deer are found lately to have paſſed. Dict. Ruſt.

EPILOBIUM, in the Linnæan ſyſem of botany, the name of a diſtinct genus of plants, called by Tournefort *chamænerium*. See the article CHAMÆNERIUM, *Suppl.*

EQUATION *(Suppl.)* — Dr. Halley's method for the ſolution of *equations* is thus:

Let the root z of any *equation* be taken equal to $a \pm e$; where a is ſuppoſed to be taken near to the true value. Then from the quantity $a \pm e$ let all the powers of z found in the propoſed *equation*, be formed; and to theſe let their reſpective coefficients be prefixed. Let the power to be reſolved be ſubducted from the ſum of the parts of the firſt column where e is not found; and let the difference be $\pm b$. Then take the ſum of all the coefficients of e in the ſecond column, which call s: and having added all the coefficients of ee, the ſum of which is called t; the root ſought z, will, in a rational form, $= a \pm \frac{sb}{-ss \pm tb}$; and, in an irrational form, $= a$ $\frac{\mp \frac{1}{2}s \mp \sqrt{\frac{1}{4}ss \mp bt}}{t}$

For inſtance, let it be propoſed to find a root of the *equation* $z^4 - \underset{d}{3}zz + \underset{c}{75}z = 10000$, where 10000 is the reſolvend.

For a firſt ſuppoſition let $a = 10$; we ſhall therefore have the *equation*

$$
\begin{aligned}
&z^4 = a^4 \pm 4a^3e + 6a^2ee \pm 4ae^3 + e^4 \\
&-dzz = -da^2 \pm dae - dee \\
&+cz = +ca \pm ce \\
&= 10000 \pm 4000e + 600e \pm 40e^3 + e^4 \\
&- \quad 300 \pm \quad 600e - \quad 3e \\
&+ \quad 750 \pm e \quad 75e \\
&- 10000 \\
\hline
&+450 \mp \underset{s}{4015}e + \underset{t}{597}ee \mp \underset{u}{40}e^3 + e^4 = 0
\end{aligned}
$$

The ſigns $+$ and $-$ with reſpect to e and e^3 are left doubtful, till it be known whether e be affirmative or negative; in which there is ſome difficulty, as in *equations* having ſeveral roots, the *homogenea comparationis*, as they are called, are often increaſed by diminiſhing a, and on the contrary diminiſhed by increaſing a. But the ſign of e is determined by the ſign of the quantity b; for the reſolvend being ſubtracted from the *homogeneum* formed from a, the ſign of se, and therefore of the parts prevailing in its compoſition, will always be contrary to the ſign of the difference b. Hence it will appear whether e be affirmative or negative, or whether a has been aſſumed greater or leſs than the true root. But e is always equal to $\frac{\frac{1}{2}s - \sqrt{\frac{1}{4}ss - bt}}{t}$, as often as b and t have the ſame ſign; but when they are connected with different ſigns, e becomes $= \frac{\sqrt{\frac{1}{4}ss + bt} - \frac{1}{2}s}{t}$. After that e has been found to be negative, e, e^3, e^5, &c. muſt be made negative in the affirmative members of the *equation*; and affirmative in the negative members, that is, they muſt be writ with a contrary ſign: but if e be affirmative, then muſt e, e^3, e^5, &c. be affirmative in the affirmative members, and negative in the negative.

In the propoſed example we have 10450 inſtead of the reſolvend 10000, or $b = +450$; from whence it appears that a was taken greater than the true root, and conſequently that e is negative. Hence the *equation* becomes $10450 - 4015e + 597ee - 4e^3 + e^4 = 10000$; that is, $450 - 4015e + 597ee = 0$. Therefore, $450 = 4015e - 597ee$, or $b = se - tee$; the root of which is $e = \frac{\frac{1}{2}s - \sqrt{\frac{1}{4}ss - bt}}{t}$, or $\frac{s}{2t} - \sqrt{\frac{ss}{4tt} - \frac{b}{t}}$, that is, in the preſent caſe, $e = \frac{2007\frac{1}{2} - \sqrt{3761406\frac{1}{4}}}{597}$, from whence the approximated root is found to be $= 9.886$. Now this root being taken for a ſecond ſuppoſition, and the operation being repeated we ſhall have $a + e = z = 9.88626039364 95$, which is very exact, ſcarcely exceeding the truth by above 2 the laſt figure.

This is ſufficient to give a notion of Dr. Halley's method: thoſe who deſire more examples, and farther inſtructions, may conſult the Philoſ. Tranſ. N°. 210. or Lowthorp's Abridg. vol. i. p. 85, *ſeq.*

Differential EQUATION. See the article DIFFERENTIAL, *Append.*

ERIFFS, a name given to canary birds about two years old. See the article CANARY, *Suppl.*

ERIGERON, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants, called by other botaniſts *conyzoides*, *conyzella*, and *ſenecionis ſpecies*; and by us the great ſweet fleabane.

The characters of this genus, according to Linnæus, are theſe: the common cup is oblong, cylindric, imbricated, and beſet with ſubulated ſquamæ; the compoſite flower is radiated; the proper hermaphrodite ones are of an infundibuliform ſhape, the limb being divided into five ſegments; and the proper female ones linear, ſubulated, erect, and moſt frequently entire; the ſtamina of the hermaphrodite flowers are five very ſhort capillary filaments, the antheræ, cylindraceo-tubuloſe; the germen of the piſtil is extremely ſmall; the ſtyle is filiform; the ſtigmata are two, oblong and revolute; there is no

no pericarpium; the feeds are fmall, oblong, and covered with long down; the receptacle is naked and plane. See *Linnæi* Gen. Plant. p. 400.

The fpecies of *erigeron* are thefe: 1. The fingle lateral flowered *erigeron*, with fquamofe cups. 2. The toad-flax-leaved annual Canada *erigeron*, called by fome *conyza*. 3. The coronopus-leaved *erigeron* of America. 4. The ovato-lanceolate-leaved camphorated *erigeron*. 5. The fhort leaved *erigeron*. 6. The ramofe, long leaved, fmall flowered *erigeron*. 7. The larger flowered *erigeron*. *Hill*, Hift. Plant. p. 575.

ERINGO, in botany, the Englifh name of the *eryngium*, a diftinct genus of plants. See the article ERYNGIUM, *Suppl.*

ERUCA *marina grifeo-fufca*, a name fometimes given to the *aphrodita*, a genus of fea-infects. See the article APHRODITA, *Append.*

ETCH. See the article EDDISH, *Append.*

ETCH-*crop*, among farmers, the third crop of corn upon land newly broken up. Ruft. Dict. in voc.

ETERNAL *flower*, the Englifh name of two different genufes of plants, the *gnaphalium* and *xeranthemum*. See the articles GNAPHALIUM and XERANTHEMUM, *Suppl.*

EVERLASTING-*pea*, the name of a genus of plants, called by authors *lathyrus*. See the article LATHYRUS, *Suppl.*

EUONYMOIDES, in botany, a name ufed by fome for the *celaftrus* of Linnæus. See the article CELASTRUS, *Append.*

EUPHONIC *accent*. See the article ACCENT, *Cycl.*

EWE, the Englifh name of the female of the fheep-kind. See the articles SHEEP and OVIS, *Suppl.*

EXAGON, the fame with hexagon. See the article HEXAGON. *Suppl.*

EXERCISE (*Cycl.*) — Proper *exercife* conduces much to the health of foldiers in camp.

The *exercife* of a foldier may be confidered under three heads; the firft relating to his duty, the fecond to his living more commodioufly, and the third to his diverfions.

The firft, confifting chiefly in the *exercife* of his arms, will be no lefs the means of preferving health, than of making him expert in his duty; and frequent returns of this, early and before the fun grows hot, will be made more advantageous than repeating it feldom, and ftaying too long out at a time; for a camp affording little convenience for refrefhment, all unneceffary fatigue is to be avoided.

As to the fecond article, cutting boughs for fhading the tents, making trenches round them for carrying off the water, airing the ftraw, cleaning their cloaths and accoutrements, and affifting in the bufinefs of the mefs, ought to be no difagreeable *exercife* to to the men, for fome part of the day.

Laftly, as to diverfions, the men muft be encouraged to them either by the example of their officers, or by fmall premiums to thofe who fhall excel in any kind of fports, as fhall be judged moft conducive to health; but herein great caution is neceffary, not to allow them to fatigue themfelves too much, efpecially in hot weather, or fickly times; and above all, that their cloaths be kept dry, wet cloaths being the moft frequent caufe of camp-difeafes.

EXPEDITIONS *in winter*. See the article CAMPAIGN, *Append.*

EYE (*Suppl.*) — EYE-*flaps*, thofe pieces of leather which covers the *eyes* of coach-horfes. Ruft. Dict. in voc.

EYE-*brow*, in architecture, the fame with lift, or fillet. See the article FILLET, *Cycl.*

EYESSE, in falconry. See the article FALCON, *Suppl.*

F.

FABA *Græca*, in botany, a name fometimes given to the *guiacana* of Tournefort. See the article GUIACANA, *Suppl.*

FAGG, in the fea language, denotes the end of thofe ftrands which do not go through the tops, when a cable or rope is clofed. *Blanckley*, Nav. Expof. p. 54.

FAINTING. Some people are extremely apt to *faint* during the operation of bleeding. In all cafes, therefore, where plentiful bleeding is indicated, it is beft to do it in bed, in order to prevent the patient's *fainting*. It is likewife obferved, that a perfon will bear the lofs of a much greater quantity of blood, if the ftream is fmall, than by a large orifice, which fome think neceffary for making a more fpeedy revulfion. *Pringle*, Obferv. on the Difeafes of the Army, p. 131. See the article LIPOTHYMIA, *Suppl.*

FAKE, in the fea-language, one round or circle of a cable: this is otherwife called quoil. *Blanckley*, Nav. Expof. p. 54.

FAN (*Suppl.*)—FAN is alfo an inftrument ufed in winnowing corn.

FAR, in horfemanfhip, a term ufed to denote any part of the horfe's right fide: thus the *far*-foot, *far*-fhoulder, &c. is the right foot, right fhoulder, &c.

FASHIONS, a name fometimes ufed for the farcin. See the article FARCIN, *Cycl.*

FAT (*Cycl.*)—The antients ufed the terms *adeps*, *pinguedo*, *fevum*, indifferently: but modern anatomifts have found it convenient to eftablifh a diftinction; according to thefe *pinguedo* is made the general name for all *fat*, and *adeps* and *fevum*, made branches or fpecies of it: the *adeps* comprehends the thinner, fofter, and moifter fort, which eafily liquifies and difficultly coalefces; the *fevum*, fuet, or leaf, includes the harder, coarfer, and drier [a].

According to an antient gloffarift *adeps* is properly the inner *fat*, or that which cleaves to the inteftines [b].

The fpecific virtues afcribed to certain *fats* do not feem well warranted; fome even doubt their being poffeffed of any properties different from other fubftances of like kind, unlefs what may arife out of their different confiftencies and degrees of volatility: that of the viper feems to have the moft right to claim fomething extraordinary upon that account [c].

The way of preparing *fat* for medicinal purpofes, is to take out the fkins, veins, fibres, &c. wafh it till it becomes unbloody; then melt, ftrain, and preferve it from air [d].

Some chemifts defcribe *adeps* as a pinguedo coagulaled or condenfed to a confiftence by the admixture of fomething faline; for in diftillation the fulphureous part of the *adeps* afcending, leaves only a faline matter at the bottom, the coagulation being deftroyed, the fubftance ceafes to be *adeps*, and is called *oleum adipis* [e].

[[a] *Blaf.* Comm. ad Vefling, cap. i. p. 10. *Gal.* De ufu partium, lib. 16. *Gorr.* Def. Med. p. 374. *feq. in voc.* πιμελη. [b] See *Du Cange*, Gloff. Lat. tom. i. p. 56. [c] *Quinc.* Pharm. P. II. §. xii. p. 27. [d] Pharmac. Edinb. [e] See *Johnf.* Chym. in Addit. p. 7.]

FAT, in the brewery. See the article VAT, *Cycl.*

FEATHER (*Suppl.*) — *Prince's* FEATHER, in botany, the name of a genus of plants called by authors *amaranthus*. See the article AMARANTHUS, *Suppl.*

FEE (*Cycl.*) in Latin *feudum*, and more antiently *feodum*, is defined by Struckius [a], "Feudum eft conceffio dominii utilis "fub lege fidelitatis." Thefe *feuds*, no doubt, took their origin from the conquefts of the northern hive that overfpread Europe. The general divided the conquered country into large diftricts, over each of which he placed one of his principal officers, and they again fubdivided their provinces among the fubalterns and foldiers; this was in lieu of pay, and thefe lands being given under the condition of fidelity, by which was chiefly meant affiftance in war, made an united kingdom under the general, who generally affumed the title of king, as Hengift did in Kent, though he had it not before he made his conqueft. [[a] Examen Juris Feudal. cap. ii. qu. 11.]

We muft not imagine that *feuds* were always invariably of the fame form; they altered much in procefs of time. Craig diftinguifhes them into four ages, calling them *infantia*, *pueritia*, *adolefcentia*, and *virilis ætas*. *Infantia* was from the firft irruption of the northern nations, about the middle of the fifth century to *an.* 650, during which *feuds* were annual, or at moft for life, like the Turkifh timariots. *Pueritia* he reckons from 650 to 800, the time of Charlemagne; during which fons crept into the fucceffion of their fathers. *Adolefcentia* extended from this to Conrad II. *an.* 1022, or 1027. This emperor intending an expedition into Italy, the better to encourage his followers extended the right of fucceffion to grand-children and brothers. *Virilis ætas* followed, from Conrad to Frederic, *an.* 1155. in whofe time the feudal books were compiled, and fucceffions to all heirs whatfoever eftablifhed.

This is the general account of the origin and progrefs of *feuds*. When they were firft eftablifhed in this ifland has been matter of difpute among the learned: Craig and Spelman fay at the conqueft; others affert their higher antiquity; lord chief juftice Hale, particularly, afferts that the Norman cuftoms derive from the Englifh: this carries little probability with it. Sir Edward Coke, in the preface to his Sixth Report, brings an old Saxon charter, to prove that lands efcheated for felony. In this charter, dated *an.* 995, Ethelred gives lands, forfeited by one Ethelfig, for ftealing fome fwine, to one Ulfric, "in

" perpetuam hæreditatem," and then adds, " post istius labilis vitæ excessum, cuicunque sibi libuerit successori relinquat." This clause of disposing of his land by last will, and the omission of fealty throughout the whole, shews this to have been no *feud* but rather allod, it being well known that after the conquest, till the time of Henry VIII, lands were not generally deviseable by will; and that in all charters fealty was expressed: so that this forfeiture of the land, must rather be considered as a fine, or like the *confiscatio bonorum* among the Romans, who knew nothing of *feuds*, than as a feudal escheat. Besides, it must be observed in general, that no great stress can be laid on Saxon charters, most of them being forged by monks, and imposed upon the ignorant Normans, when they enquired into the titles of convents to their lands. See *Rapin*, Hist. d'Angl. p. 500.

Craig's reasons for affirming that the feudal law came in with William I. are, 1. That all the terms of art are French; nor does it appear that the Saxons had any words to express the same things. 2. That the penalties inflicted for crimes, among the Saxons, were not the *amissio feudi*, but pecuniary, if the crimes were small; and capital for those of a higher nature. 3. It appears from all historians, that William asserted his dominion over all the lands in England, confiscated the lands of all those that followed Harold, and let others retain theirs *sub lege fidelitatis*. Craig gives two examples of investiture, one of Athelstan, the other of the conqueror: Athelstan's words are, " Ego Athelstanus rex, do tibi Pauline Oddam & Roddam tam bona atque pulchra quam unquam mea erant, teste Mathilde conjuge mea." The conqueror invested Hugo Lupus, his sister's son, in the county of Chester, " tenendum sibi & hæredibus ita liberè ad gladium, ut ipse rex totam tenebat Angliam ad coronam." And Craig adds, " licet hæc posterior dispositio magis affinis investituto videatur, neutra tamen feudalem dispositionem sapit, cum nulla sit in eis servitiorum aut recognitionis præstatio nulla, de dominio superiore mentio: propriusque ad allodii formam accedunt." Vide *Craig*, De Jur. Feud. lib. i. diegef. 7.

Authors are not agreed as to the etymology of *feudum* or *feodum*; their different opinions may be seen in *Strykii* Examen Juris Feudalis. He himself derives it from the Italian *fede*, with little reason, since *feuds* were by no means of an Italian but Gothic original, and therefore the Gothic languages should be enquired into for the etymology of the word. That of Grotius [a] seems probable enough; he derives *feod* from *fe* and *od*, that is, *stipendii possessio*; *fe*, according to him, signifying of old *stipendium*, and *od*, or *oed*, *possessio*. This holds even now in the German language, where the word *kleinod* is used for a jewel, " quasi *parvum bonum*, vel *parva possessio*." Schilter, in his Praxis Juris Romani in Foro Germanico, Exerc. lib. iv. § 23. derives *feod* pretty much in the same manner, *viz.* from the verb *fa* or *fahen*, which signifies *capere*, *in custodiam tradere*, and *od*, signifying *bona*, *facultates*, *possessionem*, as Grotius says. Stryckius adds, that *feuds* were sometimes called *leod*, from *od* and the verb *lehnen*, or *leihen*, to lend; and the Germans call a feud *lehn guht*, or simply *lehn*, to this day. *Leodum* and *leodes* was also taken for the vassal and for homage, as in an old record mentioned by Schilter, loc. cit. where it is said, " fidelitatem præcelso filio nostro vel nobis & leode & *Samio* debeant promittere & conjurare." Where he thinks *famio* to be an error for *famto*, the abbreviation of *sacramento*. Somner, in his Treatise of Gavelkind, gives another etymon (approved of by serjeant Wright, in his Treatise of Tenures) of *feod*, *viz.* from *fe*, *stipendium*, and the termination *hode*, *hoad*, or *head*, signifying a quality in abstract: but this seems too metaphysical and forced, and does not seem near so natural as the derivation from *od*, *bonum*, *possessio*, &c. [[a] Florum sparsio ad Jus Justinian. p. 340.]

Craig defines a *feud* thus [b]: " *Feudum* est beneficium, seu benevola & libera rei immobilis aut æquipollentis concessio, cum utilis dominii translatione retenta proprietate, seu dominio directo, sub fidelitate & exhibitione servitiorum honestorum." See his explanation, loc. cit. This is the proper and original meaning of a *feud*; time has so much altered it, that Hottoman thinks it should be no longer called *feudum*, but *feudastrum*: the original intent and consideration of granting them was for assistance in war; now, money is the chief consideration; and variety of other than military services have been introduced. [[b] De Jure Feudal. p. 42.]

The vassal or tenant could not alien his *fee* without the consent of his lord [c]. However it seems that this was not long rigorously observed in England, since Magna Charta, cap. xxxii. provides, " quod nullus liber homo det de cætero amplius alicui de terra sua, quam ut de residuo terræ suæ possit sufficient. fieri domino feodi servitium ei debitum quod pertinet ad feodum illud." But neither was this well observed; since by West. 3. 18 Ed. I. it was provided, that any one might alien any part, or the whole, " ita ut feoffatus teneat de capitali domino. In Scotland, where the feudal law is more strictly observed, alienating half without licence, incurs a forfeiture of the whole; this they call recognition, and is the punishment of the vassal's ingratitude.

[[c] Stryck. Examen Juris Feudalis, cap. xix. quest. 2.]

Writers on the feudal law have distinguished the *substantialia*, the *naturalia*, and the *accidentalia* of *feuds*.

Substantialia, called by Craig *essentialia*, are the essentials, that is, qualities not implying each other, which if taken away the *feud* can no longer subsist.

Naturalia are the qualities superadded by law.

Accidentalia are the qualities superadded by agreement of the lord and vassal.

The *naturalia* are different in different places, and always presumed, unless it be otherwise agreed between the parties. The *accidentalia* must be expressed not presumed. Vide *Wolfii* Horæ Subs. Marburg. an. 1729. trimestr. æstiv. and *Craig*, p. 61.

Wolfius defines a *feud* thus, " Feudum est, dominium utile in re aliqua alteri a domino concessum sub conditione fidelitatis mutuæ.

" *Substantialia* sunt determinationes essentiales, quibus notio feudi in genere absolvitur.

" *Naturalia* sunt differentiæ specificæ feudi auctoritate legis communiter recepta.

" *Accidentalia* sunt differentiæ specificæ specierum feudorum a specie juris auctoritate communiter recepta diversorum."

FELIS, in zoology, the name of a very comprehensive genus, or rather order, of animals. See the article CAT, *Suppl.*

This order takes in the lion, the tyger, leopard, cat of the mountain, lynx, ounce, and the domestic cat. See the articles LION, TYGER, &c. *Suppl.*

FELL-*wort*, a name sometimes given to the *gentiana*, or gentian of authors. See the article GENTIANA, *Suppl.*

FELON-*wort*, a name given to the *solanum*, or nightshade of authors. See the article SOLANUM, *Suppl.*

FENNEL, in botany, the English name of a genus of plants called by authors *fœniculum*. See the article FOENICULUM, *Suppl.*

Scorching FENNEL, a name sometimes given to a genus of plants known among authors by that of *thapsia*. See the article THAPSIA, *Suppl.*

FENNEL-*flower*, in botany, a name sometimes given to the *nigella* of authors. See the article NIGELLA, *Suppl.*

FERMENT, (*Suppl.*) among physicians, is sometimes used in a synonymous sense with putrefaction, or rather for a putrid habit of body, considered as the cause of malignant disorders.

But these authors are, nevertheless, very careful not to confound putrefaction with vegetable fermentation, accounting them only analogous processes; for which reason they use the same term for the putrefying and fermenting agent. It were to be wished, to avoid ambiguity, that we had two different words to denote the exciting cause of these two intestine commotions; but this is the less to be expected, on account of the tendency of all putrid animal substances to promote both animal putrefaction, and a vinous fermentation in vegetables. See the next article.

FERMENTATION (*Suppl.*) — In order to ascertain the *fermentative* quality of animal substances, Dr. Pringle, in the Appendix to his Observ. on the Dis. of the Army, has made several curious experiments: bread and water only stood several days, in a furnace, heated, as usual, to 100 degrees; but two drams of fresh meat being added to double the former quantity of bread, and water in proportion, the mixture began to *ferment* in a few hours, and continued to do so about two days. For the most part the *fermentation* was so strong that if the corks had not frequently given way the phials must have burst. The bread and flesh which at first lay at the bottom, soon rose to the top, and, constantly, as the air elapsed, let fall some particles that had been buoyed up by the fluid; thus a sediment was formed, resembling lees, whilst the lightest part, or flowers, remained on the surface; but the *fermentation* continuing, these also subsided, and the acid taste and smell of the liquors, after the action ceased, was a farther proof of the preceding *fermentation*. This change was the more extraordinary, that when the motion began the mixture was tending to corruption, and, in effect, in a few hours afterwards, became offensive; but next day the putrid smell abated, and went off, before the *fermentation* ceased.

The doctor made several other experiments, to the same purpose, and with nearly similar effects; from all which, he thinks it probable that most animal substances tending to putrefaction, are endowed with a power of raising a *fermentation* in the farinacea, and even of renewing that action in such as have undergone it before.

The effect of *fermentation* therefore is to change putrid substances to a state of acidity, which they not only retain, but grow still more and more acid. It is observed, indeed, that the acid arising from *fermentation* has something of an austere and saltish taste, but without any offensive smell. Now, considering how much air is generated by *fermentation*, it may seem strange that the same materials, used as food, should make so little disturbance in the body. And the difficulty would be the greater, did the saliva, as some suppose, promote both *fermentation* and putrefaction. See the article SALIVA.

From this theory of *fermentation* the doctor accounts for the sourness or acidity of the stomach, a disorder to which many people are subject; since not only a strong, but an austere acid may be produced from the food of those who live on flesh, bread, and water only, as often as the stomach is relaxed, or

or any way disabled from conveying the whole aliment into the intestines; for, what is left having time to undergo a complete *fermentation*, is thereby changed into a harsh sort of vinegar. See the article HEART-*burn*, *Append.*

Spirits, wines, acids, bitters, aromatics, and the hotter antiscorbutic plants retard alimentary *fermentation*, by their power of correcting putrefaction. However, they may have their several uses; some for checking immoderate *fermentation*, when by reason of a putrid effluvia, or a defect of it, the aliment may ferment too violently; and others, again, for bracing the stomach, and fitting it for expelling its contents in due time. All these facts correspond with digestion; for the most nourishing and digestable food to people in health, consists in a due mixture of animal and vegetable substances with water: scorbutic or putrid habits require acids, wine, or other antiseptics. An acid abounding in the stomach, is corrected by absorbents; and, in a want of natural heat, and a debility of the stomach, wines, bitters, and warm and acid substances become necessary. See *Pringle*, Observ. on the Diseases of the Army, Append. p. 350, *seq.*

Fermentations have been usually supposed to engender great heat, and effervescence has been used as a synonimous term to express it by; it has not been imagined all this while, that many of the most violent of them are, instead of heat, attended with a very violent cold, as is easily proved by the thermometer.

It might be supposed, that water poured into spirit of wine should cool so fiery a liquor; but on the contrary, experiment proves, that there is always a considerable heat from this mixture, and that this heat is greater, as the proportion of the water is so. There is another phænomenon however in regard to spirit of wine more remarkable than this: as water, which is a cold phlegmatic liquor, might naturally be supposed to cool it, so a mixture of the essential vegetable oil might be as naturally expected to heat it; these being disposed the most readily of all bodies to take fire, and being composed almost entirely of a sulphureous matter; yet these liquors, mixed with spirit of wine, produce cold and not heat with it; and water, which generates so great a heat with spirit of wine, has no effect at all with these oils.

The reason of all this phænomena is, that water will not mix with oil, but that salts will. All spirit of wine contains a great deal of water, and all essential oils are well known to contain a great deal of essential salt. The water added to oils makes no change, because it mixes not with them; with spirit of wine it makes a heat by mixing with the water in that spirit, and dissipating the sulphur it is well known to contain; and the oils cool the spirit on the common principle of all salts cooling water, the salts originally contained in these oils immediately dissolving on the mixture, in the water contained in the spirit of wine: and the degree of cold, which is different with the different oils, is wholly regulated by the greater or lesser quantity of salt the several oils contain. Mem. Acad. Par. 1727.

FERMENTED *liquors (Suppl.)* are esteemed great antidotes to putrefaction; accordingly the abstinence from them is assigned as one cause why the Turks are more subject than other people to the plague, and other contagious distempers. It is likewise observed, that beer, wine, and spirituous liquors coming more into general use, has been one great means of suppressing putrid diseases. See *Pringle*, Observ. on the Diseases of the Army, p. 286, 294.

FERN *(Suppl.)* — *Dwarf*-FERN, the English name of a genus of plants called by botanists *filicula*. See the article FILICULA, *Suppl.*

Sweet FERN, a name by which some call the *myrrhis*, or wild chervil. See the article MYRRHIS, *Suppl.*

FERRET, the English name of an animal of the *mustela* kind. See the article MUSTELA, *Suppl.*

FERRY-*boat*. See the article BAC, *Suppl.*

FEVER *(Suppl.)* — *Ardent* FEVER. See the article INFLAMMATORY *fever*, *Append.*

Bilious FEVER. See the article BILIOUS, *Append.*

Malignant FEVER, or *jail* FEVER, the same with that called *hospital fever*. See the article HOSPITAL *fever*, *Append.*

FEVERFEW *(Suppl.)* — *Bastard*-FEVERFEW, in botany, a name sometimes given to the *parthenium* of authors. See the article PARTHENIUM, *Suppl.*

FEWMET, among sportsmen. See the article FUMET, *Append.*

FIANTS, or FUANTS, the dung of a badger, or fox, and of all other vermin. Rust. Dict. in voc.

FIDDLE, *(Cycl.)* — FIDDLE-*dock*, the name of a species of *lapathum*. See the article LAPATHUM, *Suppl.*

FIG-*tree*, *ficus*, in botany. See the article FICUS, *Suppl.*

Indian FIG, a name sometimes given to a genus of plants called by authors *opuntia*. See the article OPUNTIA, *Suppl.*

Infernal FIG, a name by which some call the *argemone*, called by authors the thorny Mexican poppy. See the article ARGEMONE, *Suppl.*

Pharaoh's FIG, a name sometimes used for a genus of plants called by authors *musa*. See the article MUSA, *Suppl.*

Marigold FIG, a name used by some for the *ficoides* of Tournefort, called by Linnæus *mesembryanthemum*. See the article FICOIDES, *Suppl.*

FIG-*shell*, a species of *dolium*. See the article DOLIUM, *Suppl.*

FILACEOUS, a term applied to such roots of plants as are full of filaments. See the article FILAMENT, *Cycl.*

FILAGO, in botany, a name used by Vailliant for the *gnaphalium*, or cud-weed. See the article GNAPHALIUM, *Suppl.*

FILBERT-*tree*, in botany, the English name of the hazle, called by authors *corylus*. See the article HAZLE, *Suppl.*

FILLAR-*horse*, that yoked immediately to a cart. See the article CART, *Suppl.*

FILLY, a term used in many parts of the kingdom for a female colt. See the article COLT, *Suppl.*

Ladies FINGER. See the article LADIES, *infra.*

FINGRIGO, in botany, a name used by some for a genus of plants called by Plumier *pisonia*. See the article PISONIA, *Suppl.*

FIR *(Suppl.)* — *Scotch* FIR, a name commonly given to the mountain-pine. See the article PINE, *Suppl.*

FIRE-*engine*, the common name of a machine to raise water by fire, or rather by the force of water turned into steam.

The first who gave a hint of the possibility of such a machine was the marquis of Worcester, in his Century of Inventions, printed at London in 1663. Captain Savery took the hint from him, and put the engine in practice: the captain's engine is described in Harris's Lexicon Technicum, under the head *Engine*. Farther improvements were afterwards made by Mess. Newcomen and Cawley, who brought it to the form in which it is now most commonly used.

The moving force in this machine is the expansion of water into steam; and that power is raised by fire, from whence the engine takes its name.

It is not possible in a few words, and without figures, to give any adequate idea of this most philosophical and useful contrivance. Dr. Desagliers has given a very full description of the engine, in his Course of Experimental Philosophy; and as we may suppose that none of the curious in mechanics will choose to be without the doctor's book, we shall content ourselves with referring to his second volume, from p. 465 to 490.

This engine working by the steam into which water rises after it boils, should entitle it more properly to the name of the *steam-engine*, than to that of *fire-engine*, by which the engines for extinguishing fires are sometimes called.

It is considered as a defect in this fire or steam-engine, that the vessel in which the water is always kept boiling, is so large when only an inconsiderable part of the water is employed in the work. Mr. Blake has therefore endeavoured to regulate the just proportion between the altitude and base of the cylindrical vessel employed in this machine; and he finds that the broader the cylinder is, the better. See Phil. Transact. vol. xlvii. p. 197, *seq.*

This engine to raise water by steam seems to have received a farther improvement from Monf. De Moura, a Portuguese gentleman, who, by an ingenious contrivance, has rendered it capable of working itself. See Phil. Transact. vol. xlvii. p. 436, *seq.*

As to the engines for putting out fires, those of Mr. Newsham seem to have merited universal approbation: for a detail of their construction, see *Desaguliers*, Course of Experim. Philos. vol. ii. p. 505, *seq.*

FIRM *ore*. See the article LEAD *ore*, *Suppl.*

FISH *(Suppl.)* — *Needle* FISH. See the article NEEDLE, *infra.*

FISH-*garth*, a wear or dam in a river for the taking of *fish*. Rust. Dict. in voc.

FITCH, or FITCHOW, a name given to the pole-cat, or to the skin or fur of that animal. See the article PUTORIUS, *Suppl.*

FIVES, among farriers, the same with VIVES. See the article VIVES, *Suppl.*

FIXEN, among sportsmen. See the article VIXEN, *Append.*

FLAG *(Suppl.)* — *Corn*-FLAG, a name by which some writers call the *gladiolus*. See the article GLADIOLUS, *Suppl.*

Sweet-scented FLAG, a name used by some for the *acorus* of botanical writers. See the article ACORUS, *Cycl.* and *Suppl.*

FLAG is also used for a kind of rush called sedge, as well as for the upper part of the turf, pared off to burn. Rust. Dict. in voc.

FLAG-*worm*, a kind of worm so called on account of its being found in flaggy ponds, and other sedgy places. Rust. Dict. in voc.

FLAREING, among seamen. See the article FLAIR, *Suppl.*

FLEA-*bane (Suppl.)* — *African* FLEA-*bane*, a term sometimes used for a genus of plants otherwise called *tarconanthus* and *parthenium*. See the article PARTHENIUM, *Suppl.*

Sweet FLEA-*bane*, the English name of a distinct genus of plants, called by Linnæus *erigeron*. See the article ERIGERON, *Suppl.*

FLIX-*weed*, the name of a genus of plants called by Tournefort and others *erysimum*. See the article ERYSIMUM, *Suppl.*

FLOAT-*boards*, those boards fixed to water-wheels of undershot mills, serving to receive the impulse of the stream, whereby the wheel is carried round. See the article *Water*-WHEEL, *Append.*

It is a disadvantage to have too great a number of *float-boards*. The best rule in this case is, to have just so many, that each of them may come out of the water as soon as possible, after it has received and acted with its full impulse; or, which

comes to the same thing, when the succeeding one is in a perpendicular direction to the surface of the water.

As to the length of these *float-boards*, it may be regulated according to the breadth of the stream. See *Desaguliers*, vol. ii. p. 425, *seq*.

FLOAT-*grass*, in botany. See the article GRASS, *Append.*

FLOWER *of Bristol*, a name sometimes used for the *lychnis* of botanical writers. See the article LYCHNIS, *Suppl.*

Gentle FLOWER, the English name of a genus of plants called by botanical writers *amaranthus*. See the article AMARANTHUS, *Suppl.*

Eternal FLOWER, a name by which some call the *xeranthemum* of botanical writers. See the article XERANTHEMUM, *Suppl.*

Everlasting FLOWER, a term by which some call the *gnaphalium*, or cud-weed, of Linnæus and Tournefort. See the article GNAPHALIUM, *Suppl.*

FLOWER-*fence*, a term sometimes used for a genus of plants known among authors by the name of *poinciana*. See the article POINCIANA, *Suppl.*

Four o' clock FLOWER, a name given by some to *jalap*. See the article JALAP, *Suppl.*

Side-saddle FLOWER, the name used by some for the *Sarracena* of botanists. See the article SARRACENA, *Suppl.*

Sultan-FLOWER, a name sometimes used for the *cyanus*, or bluebottle. See the article CYANUS, *Suppl.*

Sun-FLOWER, the English name of a genus of plants, called by botanical writers *helianthus* and *corona solis*. See the article SUN-*flower*, *Suppl.*

FLUELLIN, in botany, a name sometimes given to speed-well, called by authors *veronica*. See the article VERONICA, *Suppl.*

FLY (*Cycl.* and *Suppl.*) — *Humble-bee* FLY, the English name of a species of *culex*. See the articles HUMBLE, *Suppl.* and CULEX, *Append.*

FLY-*wort*, in botany, a name by which some call the *lychnis* of authors. See the article LYCHNIS, *Suppl.*

FLY, in mechanics, a cross with leaden weights at its ends, or rather a heavy wheel at right angles to the axis of a heavy windlas or roller, by means of which the force of the power is not only preserved, but equally distributed in all the parts of the revolution.

The *fly* may be applied to several sorts of engines, whether moved by men, horses, wind, or water; and is of great use in those parts of an engine, which have a quick circular motion, and where the power or resistance act unequally in the different parts of a revolution. In this case the *fly* becomes a moderator, making the motion of revolution almost every where equal.

The force of a *fly*, when joined with the screw, for stamping the image upon coins, may be calculated thus: suppose its two arms to be each 15 inches long, measuring from the center of the weights to the axis of motion, and the weights to be 50lb. each, and the diameter of the axis pressing upon the dye to be 1 inch; if every stroke be made in half a second, and the weights describe an half circumference, which will in this case be of 4 feet, the velocity will at the instant of the stroke be at the rate of 8 feet in a second, and therefore the momentum 800; but the arms of the *fly* being as leavers, one brachium of which is 15 inches long, whilst the other, *viz.* the semi-axis, is but of half an inch, we must increase this force 30 times, which will give 24000; an immense force, equal to that of 100lb. weight falling 120 feet, or near 3 seconds in time; or to that of a body of 750lb. falling $16\frac{1}{12}$ feet, or one second in time.

Some of these engines for coining crown-pieces have the arms of the *flies* five times as long, and the weights twice as heavy as those here mentioned, so that the effect is ten times greater. *Desaguliers*, Exper. Philosoph. p. 245, 339.

FŒNUM *sanctum*, *saint* FOIN, in botany, a name by which the *Onobrychis* of anatomists is sometimes called. See the articles ONOBRYCHIS and SAINT-*foin*, *Suppl.*

FŒTUS (*Cycl.*) — The question about the circulation of the blood in the *fœtus* seems not yet determined. See Mem. Acad. Scienc. 1699, 1701, 1703, 1717, 1725, and 1739.

FOLDAGE, among farmers, denotes the liberty of penning sheep by night. Dict. Rust. in voc.

FOND, the same with fund. See the article FUND, *Cycl.*

FOOL's-*stones*, in botany, an appellation given by some to a genus of plants called *orchis* by botanical writers. See the article ORCHIS, *Suppl.*

FOOT-*husks*, among herbalists, the same with the cup of a flower. See the article CALYX, *Suppl.*

FORCE, (*Cycl.*) in mechanics. — Whenever a body, which was at rest begins to move, or has a motion which is either not uniform, or not direct, the cause of this change in the state of the body is called *force* [a].

While a body remains in the same state, either of rest, or of uniform and rectilinear motion, the cause of its remaining in such a state, is in the nature of the body, and it cannot be said, that any extrinsic *force* has acted on it: this internal cause or principle is called *inertia* [b]. [[a] Mr. *Euler*, in Mem. Acad. Berlin. 1745, p. 21. [b] *Ibid.*]

Mechanical *forces* may be reduced to two sorts; one of a body at rest, the other of a body in motion.

The *force* of a body at rest, is that which we conceive to be in a body lying still on a table, or hanging by a rope, or supported by a spring, &c. And this is called by the names of *pressure*, *tension*, *force*, or *vis mortua*, *solicitatio*, *conatus movendi*, *conamen*, &c. To this class also of *forces* we must refer centripetal and centrifugal *forces*, though they reside in a body in motion; because these *forces* are homogeneous to weights, pressures, or tensions of any kind. But of this more particularly farther on.

The measure of this *force* is the weight with which the table is pressed, or the rope stretched, or the spring is bent. And as to this measure there is no dispute, notwithstanding the diversity of appellations by which it is called.

The *force of a body in motion* is on all hands agreed to be a power residing in that body, so long as it continues its motion, by means of which it is able to remove obstacles lying in its way; to lessen, destroy, or overcome the *force* of any other moving body, which meet it in an opposite direction; or to surmount any dead pressure or resistance, as tension, gravity, friction, &c. for some time; but which will be lessened or destroyed by such resistance as lessens or destroys the motion of the body.

This is called *moving force*, *vis motrix*, and by some late writers *vis viva*, to distinguish it from the *vis mortua* spoken of before: and by these appellations, however different, the same thing is understood by all mathematicians; namely, that power of displacing, of withstanding opposite moving *forces*, or of overcoming any dead resistance, which resides in a moving body, and which, in whole or in part, continues to accompany it, so long as the body moves.

But about the measure of this sort of *force*, mathematicians are divided into two parties. Both sides agree that the measure of this *force* depends partly upon the mass, or weight, of the body, and partly upon its velocity; so that upon any increase either of weight or velocity, the moving *force* will become greater. It is also agreed that the velocity being given, or being the same in two bodies, their *forces* will be in proportion to their masses or weights.

But when two bodies are equal, and the velocities with which they move are different, the two parties no longer agree about the measure of the moving *force*.

The Newtonians and Cartesians maintain, that the moving *force* is in proportion to the velocity with which the bodies move. But the Leibnitians assert, that the moving *force* is in proportion to the square of the velocity; so that if the velocity of a moving body be double, triple, quadruple, &c. of that of another equal body, the *force* of the former will be fourtimes, nine times, sixteen times as great as that of the latter. Hence the Newtonians pretend that the *vis motrix*, or moving *force* of bodies is in the compound ratio of their weights and velocities; and the Leibnitians maintain it to be in the compound ratio of the weights and the squares of the velocities.

This controversy was first started by the famous Mr. Leibnitz, and has been carried on by him and his followers near seventy years, during whith time a great number of pieces have been published on both sides of the question, and a great number of experiments have been made, or proposed to be made in order to decide it: but tho' both parties agree in the event of the experiments, whether actually made or only proposed, yet as the writers on each side have found a way of deducing from those experiments a conclusion suitable to their own opinion, the disagreement still continues as wide as ever.

Now it must be owned that these opposite conclusions from the same experiments are not so much owing to false reasoning on either side, as to their disagreement in the principles on which the reasoning is founded. See Dr. *Jurin*, in Phil. Transf. N°. 476.

Those who maintain that the moving *force* is as the weight into the velocity, lay down for a principle or axiom, that when two bodies meet one another in contrary directions, if their moving *forces* be equal, neither body will prevail over each other: and if their moving *forces* be unequal, the stronger will always prevail over the weaker. This is maintained by Mr. Mac Laurin, among others, in his piece which gained the prize in the Royal Academy of Sciences, in 1724, in his Fluxions, and lately in his Account of Sir Isaac Newton's discoveries; it is also agreed to by all the opposers of the Leibnitian doctrine, though some do not formally lay it down as an axiom, but pretend to derive it from the more general principles of pressure and the time it acts.

But the followers of Leibnitz deny the truth of this principle, and lay down others, which, as they pretend, are more clear and satisfactory, such as, that it always requires a determinate degree of *force* to bend a given spring to a given degree, whether this be performed in a longer or shorter time, or *vice versa*; that a given spring bent to a given degree, always communicates the same *force* to a body, by unbending itself, whether the time it takes to unbend itself be longer or shorter. Mr. 'S Gravesande's words are express: *Idem elasterium, eodem modo flexum, dum relaxatur equalem semper vim corpori communicat, sive lentius sive velocius relaxetur.* '*S Gravesande*, Phys. Elem. Math. § 731. edit. 1742. It is true, he does not assume it as a principle, but derives it from a more general principle, that the *force* communicated by a pressure is in a compound ratio of the pressure and the space through which it passes. But these propositions are alike denied by the Newtonians. Now if it be admitted, that those bodies have equal *forces*,

which meeting each other in contrary directions, do not prevail over each other, it cannot be disputed, that bodies which have equal quantities of motion, have also equal *forces*; and consequently that the moving *forces* of bodies are in a compound ratio of their masses and velocities.

On the other hand, if it be admitted that a given spring bent to a given degree, always communicates the same *force* to whatever body it be applied to, it is no less indisputable that the *forces* of moving bodies will be in a compound ratio of their masses and the squares of their velocities. For the bending of a spring to the same degree; cannot be done by different masses with equal quantities of motion, or a spring by unbending itself cannot communicate to different masses equal quantities of motion; but the bending or unbending of the spring always corresponds to and with what the Leibnitians call the *vis viva*; that is, the product of the mass of a body by the square of its velocity. This is admitted by the Newtonians, and follows from the avowed principles of both parties.

Thus, let M and m denote the masses of two bodies, V and v their respective velocities; then if any spring, a cross-bow for instance, bent to a certain degree, give the body M a certain velocity V, the same spring or cross-bow, bent to the same degree, will never give another body m a velocity v, so that MV shall be equal to mv, but will always communicate such a velocity to m, that MVV shall be equal to mvv. See the article SPRING, *Suppl.*

This is admitted by the Newtonians, but the conclusion, that the *forces* of the bodies M and m are equal, is denied.

To put an end, therefore, to this controversy, other principles must be found. This has been attempted by several authors, and we have had no small profusion of obscure metaphysics on this occasion. Many subtile reasonings have been formed from the nature of action, cause, effect, time, space, &c. by which we believe more readers have been confounded than enlightened; and after all the controversy is still undecided, and must remain so while the Newtonians, on one hand, assume, that *equal pressures in equal times produce equal moving forces*; and that the Leibnitians, on the contrary maintain, that *equal pressures urging a body through equal spaces produce equal forces.* Hence, supposing equal pressures to act on equal bodies, either to produce motion in them, or to stop what motion they have, the question will be, *whether the force generated or destroyed be proportional to the time the pressure acts, or to the space through which it acts.* For example, let two equal bodies, with the velocities, as 1 and 2, ascend against the action of uniform gravity, according to Galileo's hypothesis; it is certain that the body whose velocity is 2, will resist the *force* of gravity twice the time that the body whose velocity is only 1 can: and it is no less certain, that the body whose velocity is 2, will ascend to four times the height that the other can. So that if we measure the forces of these bodies by the pressure and time requisite to destroy their motion these *forces* will be as the velocities of the moving bodies; but if we measure the *forces* by the pressure, and space through which it extends, requisite to destroy these *forces*, we shall find them proportional to the squares of the velocities of the moving bodies.

This holds in uniform pressures, such as gravity is supposed to be near the earth; but if the pressure be not uniform, as it is not in the action of springs, which press more or less as they are more or less bent, we must then have recourse to the fluxions of the space and time. Thus if p stand for the pressure, t for the time, s for the space; the fluxion, or infinitesimal element as some call it, of the velocity will, according to both parties, be expressed by $p\dot{t}$. According to the Newtonians this is also the fluxion or element of the *force*; but according to the Leibnitians the element of the *force* is proportional to $p\dot{s}$[a]. As to any demonstration, either that in uniform pressures on the same body, the *force* produced is in proportion to the pressure and the time it acts, and in pressures not uniform that the element of the *force* is proportional to $p\dot{t}$; or that, on the contrary, the *force* thus produced is proportional to the pressure and space in the first case, or that its element is proportional to $p\dot{s}$ in the second case, we have never been fortunate enough to meet with any conclusive argument on either side: nor do we believe any such demonstration possible, till somebody shall be metaphysician enough to analyse the notions of *force*, action, time and space farther than has hitherto been done. — [[a] See *Dan. Bernoulli* in Act. Petrop. vol. viii. p. 100.]

It has been already mentioned, that some Leibnitians do not assume it as a first principle, that action or *force* is proportional to the pressure and space; but they say, that a pressure being given, its action will be proportional to the velocity of the point moved by that pressure. Hence they infer, that the whole action of a pressure, is at its intensity, as the velocity of the point to which it is applied, and as the time the pressure acts. And space being as the time and velocity, they conclude, the action of a pressure to be as that pressure and the space through which it acts. And hence they infer, that the force communicated by the pressure is also as the pressure and space. Thus, say they, if a point runs through a determinate space AB, and presses with a certain given *force* or intensity of pressure, it will perform the same action whe-

ther it move fast or slow, and therefore the time of the action in this case ought not to be regarded. *'S Gravesande*, lib. cit. § 723—728.

But the Newtonians do not submit to this reasoning, and insist, notwithstanding, that the action of the pressure is as the intensity of the pressure, and the time during which it acts, without any regard to the space through which it acts; and they make it an axiom, that equal pressures in equal times produce equal *moving forces.*

Leibnitz himself assumed it as certain, that the action is as the effect by the velocity with which it is produced: and hence he deduces, that the power is as the mass by the square of the velocity: his words, as quoted by Wolfius, are, *Calculum virium purarum seu actionum talem instituo. Sit spatium s, tempus t, velocitas v, corpus c, effectus e, potentia p, actio a, in motu æquabili erit tv ut s, e ut cs, tp ut a. Atque hæc quidem sine demonstratione assumi possunt. Accedit quod demonstrandum, ev ut a. Huic porro plurima theoremata demonstrari possunt,* e. gr. *p ut* cv^2. *Nam tp ut cv: sed e ut cs & s ut tv. Ergo fit tp ut* ctv^2, *seu p ut* cv^2. Vide Act. Petrop. tom. i. p. 232.

But as we cannot pretend to give a full account of all the arguments that have been made use of in this controversy, we must refer the curious to some of the principal authors on this subject, such as Sir Isaac Newton[a], Mr. Mac Laurin[b], Dr. Jurin[c], Dr. Pemberton[d], Mr. Robins[e], Monf. de Mairan[f], and others, on one side: Mess. Leibnitz[g], John[h] and Daniel Bernoulli[i], Herman[k], Poleni[l], Wolfius[m], 'S Gravesande[n], Camus[o], and many more, on the other. But notwithstanding all that has been said, the difficulty of determining whether the element of the moving *force* be proportional to $p\dot{t}$, or to $p\dot{s}$ still remains, and till that be demonstratively decided, we do not see but the question about the measure of the *force* of bodies in motion, must remain undetermined. See *Dan. Bernoulli*, in Act. Petrop. tom. i. p. 131, *seq.* [Philos. Trans. N°. 371. one of the arguments there proposed being Sir Isaac's, according to Dr. Pemberton. [b] Acc[t]. of Sir. If. Newton's discoveries. Fluxions, art. 511, in the notes. Recueil des pieces qui ont emporté le prix, &c. tom. i. [c] Philos. Transact. N 476, and in some other pieces. [d] Phil. Trans. N°. 371. Though Leibnitz was the first that expressly asserted the *force* of a body in motion to be as the square of its velocity, yet Huygens has been thought to have led him into this notion. This eminent mathematician had demonstrated, that in the collisions of two bodies, perfectly elastic, the sum of the products of the bodies by the squares of their respective velocities, was the same after the shock as before. And this proposition is so far general as to obtain in all collisions of bodies that are perfectly elastic. It is also true when bodies of a perfect elasticity strike any immoveable obstacle, as well as when they strike one another; or when they are constrained by any power or resistance to move in directions different from those in which they impel one another[a]. These considerations might have induced Huygens to lay it down as a general rule, that bodies constantly preserve their *ascensional force*[b], that is, the product of their mass, by the height to which their center of gravity can ascend; and, therefore, in a given system of bodies the sum of the squares of their velocities will remain the same and not be altered by the action of the bodies among themselves, nor against immoveable obstacles. Leibnitz's metaphysical system led him to think that the same quantity of action or *force* subsisted in the universe; and finding this impossible, if *force* were estimated by the quantities of motion[c], be adopted Huygens's principle of the preservation of the ascensional *force*, and made it the measure of moving *forces*. But it is to be observed, that Huygens's principle is general only when bodies are perfectly elastic; and in some other cases, which Mr. Mac Laurin has endeavoured to distinguish[d]. — [[a] See *Mac Laurin*'s Fluxions, art. 571. [b] *Hæc constans lex est, corpora servare* vim suam ascendentem, *& idcirco summam quadratorum velocitatum illorm semper manere eandem. Hoc autem non solum obtinet in ponderibus pendulorum & percussione corporum durorum, sed in multis quoque mechanicis experimentis. Huygen.* Oper. tom. i. p. 248. [c] Huygens, p. 247. of the same book, observes, *Quod sæpe pereat pars motus, licet hunc in aliquo effectu edendo consumi, affirmare non possumus, ut in multis casibus percussionis durorum corporum — ita ut minime pro lege naturæ habendum sit, eandem motus quantitatem semper conservari, nisi alicui impendatur & consumatur; sed hæc constans lex est corpora servare vim suam ascendentem, &c.* Where it is to be observed, that by hard

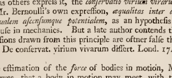
bodies Huygens means ſuch as are elaſtic, as appears from his treatiſe De motu corporum & percuſſione, oper. vol. ii. [d] *Mac Laurin*, lib. cit. art. 533.]

But it is to be obſerved, that though it be true, that in the colliſion of elaſtic bodies the *vis viva*, or aſcenſional *force* is preſerved before and after the ſhock; yet during the ſhock, while the elaſtic bodies are bending and preſs on each other, there ſeems to be a diminution of this *force*, which is afterwards reſtored by the action of their elaſticity; though the followers of Leibnitz do not allow that any *force* is loſt even during the ſhock. They ſay, the *vis viva* is communicated to the ſpring while it is bending, and then is recommunicated to the bodies by the unbending of the ſpring. They alſo deny that any *force* is loſt in the percuſſion of ſoft bodies. For though the *force* of the bodies impelling each other be diminiſhed, yet their *force* does not periſh, but is communicated to ſome other matter [e], ſuch as the ſubtle fluid cauſing coheſion and elaſticity [f]. — [[e] *Vis viva quæ in percuſſione amittitur, non perit, ſed conſervatur. Wolf.* Coſmol. § 486. *In toto univerſo ſemper conſervatur eadem virium vivarum quantitas.* ibid. § 487. *Vis viva — dum figura corporum in contactu mutatur, in alia materia conſervatur.* Ibid. demonſtr. § 486. [f] Mr. Dan. Bernoulli, ſpeaking of this principle of the preſervation of the *vis viva*, obſerves, *Quamvis principium univerſale ſit, non tamen eſt ſine circumſpectione adhibendum, quia ſæpe contingit ut motus tranſeat in materiam alienam. Ita verbi gratia poſitio illius valet pro regulis motuum ex percuſſione eruendis, ſi modo corpora ſint perfectè elaſtica; ſed cum talia non ſunt, facile eſt videre, partem* virium vivarum *ſive* aſcenſus potentialis *in compreſſionem corporum impenſam corporibus non reſtitui, ſed materiæ cuidam ſubtili, ad quam tranſiit, impreſſam hærere.* Hydrodynam. p. 12, 13. And Mr. Daniel Bernoulli, in this treatiſe, has aſſumed the preſervation of the *vis aſcendens* of Huygens, or, as others expreſs it, the *conſervatio virium virarum*; and, in Mr. Bernoulli's own expreſſion, *æqualitas inter deſcenſum actualem aſcenſumque potentialem*, as an hypotheſis of wonderful uſe in mechanics. But a late author contends that the concluſions drawn from this principle are oftner falſe than true. See De conſervat. virium vivarum diſſert. Lond. 1744. quarto.]

As to the eſtimation of the *force* of bodies in motion, Mr. Euler obſerves, that a body in motion may meet with two kinds of obſtacles, one oppoſing its velocity only, the other its direction. In either caſe, the body exerts its *force* on theſe obſtacles. When the velocity only of the body is changed, as it happens when two bodies in motion meet each other directly, the change reſulting is then ſaid to happen by ſhock, percuſſion, or colliſion. If the obſtacle be of ſuch a nature as only to oppoſe the direction of the body, as when it revolves in a ſling, or moves in an incurvated tube, the obſtacle then acts by preſſure, and this preſſure is called centrifugal *force*. Hence a double *force* is the reſult of the inertia of bodies: that produced by an obſtacle to its velocity is denominated *force* of percuſſion, and the other ariſing from the change of its direction is called *force* of preſſure [g]. — [[g] *Euler*, Mem. Acad. Berlin. p. 25.]

Leibnitz and his followers make a great difference between theſe two kinds of *forces*. They call *force* of preſſure *vis mortua*, and the *force* of percuſſion *vis viva*. By this oppoſition of terms, they not only ſignify that there is a difference between theſe *forces*, but alſo that they are heterogeneous or not comparable. Hence, though we have an exact meaſure of preſſures, they invented new rules for the meaſure and compariſon of percuſſions, and have thereby occaſioned great diſputes in the philoſophical world.

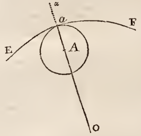
Philoſophers have ſtated this queſtion ſomewhat vaguely: to fix our notions, let us conſider the body B at reſt, and another body A ſtriking it with a given velocity, in the direction *ab*; it is manifeſt that A exerts an action of a certain *force* on B to diſturb its ſtate. The queſtion is, what



is the *force* exerted on B? Philoſophers have given themſelves little trouble to determine the true meaſure of this *force*: They have confined themſelves to the compariſon of different *forces* of the ſame kind. In eſtimating the quantity of *force* of the body A, by the quantity of the alteration which happens in the ſtate of the body B, they eaſily perceived that this change would be greater, according as the body A had a greater maſs, or a greater velocity. The Newtonians, or rather the Carteſians, and Leibnitians could not agree how to expreſs the reſults of the maſs, and velocity of the ſtriking body: the firſt inſiſt, that the *force* ſhould be expreſſed by the product of the maſs by the velocity. Leibnitz, on the other hand, pretends, that the meaſure of this *force* is the product of the maſs by the ſquare of the velocity. The diſpute has been carried on with great warmth on both ſides; but it ſeems almoſt needleſs to relate the various arguments brought by them in ſupport of their different opinions: for as they have never agreed about the effect, the quantity of which was to be the meaſure of the *force*, the diſpute often degenerated into a logomachy.

It is evident, that neither the one nor the other of theſe opinions admit any compariſon between the *force* of percuſſion and that of preſſure: for this is neither comparable to the product of the maſs by the velocity, nor to the product of the maſs by the ſquare of the velocity. The Leibnitians particularly deny the *vires mortuæ* and *vivæ* to be homogeneous; they make the ſame difference between them as between a line and a ſurface. It ſeems to them that experience confirms their notions; a ſmall blow, as that of a hammer on a nail, often producing an effect ſuperior to that of the greateſt preſſure, eſpecially if the ſame effect is to be produced in ſo ſhort a time as that of driving in the nail by the hammer. But thoſe who lay a ſtreſs on this example ſeem to think, that percuſſion is inſtantaneous. If this were true, there could be no doubt of the heterogeneity of the *vires mortuæ* and *vivæ*; for no preſſure, however great, can produce the leaſt ſenſible effect in an inſtant. Beſides, although the effect of percuſſion were not inſtantaneous, there ſtill appears ſo great a difference between the effects of ſtriking and thoſe of preſſing, that whether the force of percuſſion be proportional to its velocity, or to the ſquare or other power of its velocity, we can never produce a preſſure equivalent to a percuſſion: all which confirms the Leibnitians in their notion that preſſure and percuſſion are heterogeneous [h]. — [[h] Mem. Acad. Berlin. 1745. p. 29.]

Mr. Euler obſerves, with reſpect to this diſpute concerning the meaſure of vivid *force*, that we cannot abſolutely aſcribe any *force* to a body in motion, whether we ſuppoſe this *force* proportional to the velocity, or to the ſquare of the velocity: for the *force* exerted by a body, ſtriking another at reſt, is different from that which it exerts in ſtriking the ſame body in motion; ſo that this *force* cannot be aſcribed to any body conſidered in itſelf, but only relatively to the other bodies it meets with. There is no *force* in a body abſolutely conſidered, but its inertia, which is always the ſame whether the body be at reſt or in motion. But if this body be forced by others to change its ſtate, its inertia then exerts itſelf as a *force*, properly ſo called, which is not abſolutely determinable; becauſe it depends on the changes that happen in the ſtate of the body. Suppoſe, for inſtance, a body A forced to move in an incurvated tube, or along the curve ſurface E*a*F, the body in this caſe will preſs the ſurface wherever it touches it in a direction *a*α normal to the curve; and with a certain *force* commonly determined in mechanics, by the maſs of the body, its velocity, and by the radius of curvature O*a*. Now the body exerts a preſſure, or *vis mortua*;



yet it would be abſurd to aſcribe a certain and determinate *force* of preſſure to this body conſidered in itſelf, ſince this preſſure may vary very much, acording to the difference of the curvature of E*a*F. In like manner it ſeems unreaſonable to place a certain abſolute *force* of percuſſion in bodies, ſince it principally depends on the external circumſtances accompanying the ſhock.

A ſecond obſervation which has been made by ſeveral great men, is, that the effect of a ſhock of two or more bodies is not produced in an inſtant, but requires a certain interval of time. If this be ſo, the heterogeneity between the *vires vivæ* and *mortuæ* vaniſhes; ſince a preſſure may always be aſſigned, which in the ſame time, however little, ſhall produce the ſame effect. If then the *vires vivæ* be homogeneous to the *vires mortuæ*, and ſince we have a perfect meaſure and knowledge of the latter, we need require no other meaſure of the former than that which is derived from the *vires mortuæ* equivalent to them.

Now that the change of ſtate in the ſhock of two bodies does not happen in an inſtant, appears evidently from the experiments made on ſoft bodies: in theſe, percuſſion forms a ſmall cavity, viſible after the ſhock, if the bodies have no elaſticity. Such a cavity cannot certainly be made in an inſtant. And if the ſhock of ſoft bodies require a determinate time, we muſt certainly ſay as much of the hardeſt, though this time may be ſo ſmall as to be beyond all our ideas. Neither can any inſtantaneous ſhock agree with that conſtant law of nature,

by

by virtue of which nothing is performed *per saltum*. But it is needless to insist farther on this, since the duration of any shock may be determined from from the most certain principles.

There can be no shock or collision of bodies, without their making mutual impressions on each other: these impressions will be greater or less according as the bodies are more or less soft, other circumstances being the same. In bodies called hard, the impressions are small; but a perfect hardness, which admits of no impression, seems inconsistent with the laws of nature [i]: so that while the collision lasts, the action of bodies is the result of their mutually pressing each other. This pressure changes their state; and the *forces* exerted in percussion are really pressures, and truly *vires mortuæ*, if we will use this expression, which is no longer proper, since the pretended infinite difference between the *vires vivæ* and *mortuæ* ceases [k].—[[i] See the article HARD *bodies*, *Suppl.* [k] *Euler*, ibid. p. 32, 33.]

The *force* of percussion, resulting from the pressures bodies exert on each other while the collision lasts, may be perfectly known, if these pressures be determined for every instant of the shock.

The mutual action of the bodies begins the first moment of their contact, and is then least; after which this action increases, and becomes greatest when the reciprocal impressions are strongest [l]. If the bodies have no elasticity, and the impressions, they have received, remain, the *forces* will then cease. But if the bodies be elastic, and the parts compressed restore themselves to their former state, then will the bodies continue to press each other, till they separate. To comprehend therefore perfectly the *force* of percussion, it is requisite to define, first, the time the shock lasts, and then to assign the pressure corresponding to each instant of this time: and as the effect of pressures in changing the state of any body may be known, we may thence come at the true cause of the change of motion arising from collision. The *force* of percussion, therefore, is no more than the operation of a variable pressure during a given time; and to measure this *force* we must have regard to the time, and to the variations according to which the pressure increases and decreases. [[l] Vide infra.]

Mr. Euler has given us some calculations with respect to these particulars [m]. It will be sufficient here only to illustrate their tendency by the instance he brings. Suppose two bodies A and B; that the hardness of these bodies is equal; and such, that being pressed together with the *force* of 100lb. the impression made on each is of the depth of $\frac{1}{1000}$ part of a foot. Suppose, farther, B to be at rest, and fixed, and that A strikes it with the velocity of 100 feet in a second; according to Mr. Euler, the greatest *force* of compression will be equivalent to 400olb. and this *force* will produce in each of these bodies an impression equal to $\frac{1}{25}$ of a foot; and the duration of the collision, that is, till the bodies arrive at their greatest compression, will be about $\frac{1}{500}$ of a second. Mr. Euler, in his calculations, supposes the hardness of a body to be proportional to the *force* or pressure requisite to make a given impression on it; so that the *force* by which a given impression is made on a body, is in a compound ratio of the hardness of the body and of the quantity of the impression. But he observes, that regard must be had to the magnitude of the bodies, as the same impression cannot be made on the least bodies as on the greatest, from the defect of space through which their component particles must be driven: he, therefore, only considers the least impressions, and that the bodies are of such magnitudes, that with respect to them the impressions may be looked upon as nothing. What he supposes about the hardness of bodies, neither implies elasticity nor its defect, elasticity only producing a restitution of figure and impression when the pressing *force* ceases; but this restitution needs not be here considered. It is likewise supposed, that the bodies shocking have plane and equal bases, by which they touch each other in the collision; so that the impression hereby made diminishes the length of each body. It is farther to be observed, that in Mr. Euler's calculations, bodies are supposed so constituted, that they may not only receive impressions from the *forces* pressing them, but that a greater *force* is requisite to make a greater impression. This excludes all bodies fluid or solid in which the same *force* may penetrate farther and farther, providing it have time, without ever being *in equilibrio* with the resistance. Thus a body may continually penetrate farther into soft wax, although the *force* impelling it be not increased. In these, and the like cases, nothing is required but to surmount the first obstacles; which being once done, and the connexion of parts broken, the penetrating body always advances, meeting with the same obstacles as before, and destroying them by an equal *force*. But Mr. Euler only considers the first obstacles which exist before any separation of parts, and which are, no doubt, such, that a greater impression requires a greater *force*. This, indeed, principally takes place in elastic bodies; but it seems likewise to obtain in all bodies, when the impressions made on them are small, and that the contexture of their parts is not altered. —[[m] Ibid. p. 37, *seq.*]

These things being premised, let the mass or weight of the body A be expressed in general by A, and let its velocity before the shock be that which it might acquire by falling from the height *a*. Farther, let the hardness of A be expressed by M, and that of B by N, and let the amplitude of the base, by which the impression is made be *cc*; then will the greatest compression be made with a *force* $\sqrt{\frac{MNcc}{M+N}\times Aa}$. Therefore if the hardness of the two bodies, and the plane of their contact during the whole time of their collision be the same, this *force* will be $\sqrt{Aa}$, that is, as the square root of the *vis viva* of the striking body A. And as $\sqrt{a}$ is proportional to the velocity of the body A, the *force* of percussion will be in a compound ratio of the velocity and of the subduplicate ratio of the mass of the body striking: so that in this case neither the Leibnitian nor the Cartesian proportions take place. But this *force* of percussion depends chiefly on the hardness of the bodies; the greater this is, the greater will the *force* of percussion be. If M = N, this *force* will be as $\sqrt{Mcc\times Aa}$, that is, in a compound subduplicate ratio of the *vis viva* of the body striking, of the hardness, and of the plane of contact. But if M, the hardness of one of the bodies, be infinite, the *force* of percussion will be as $\sqrt{Ncc\times Aa}$; at the same time if M = N, this force will be as $\sqrt{\frac{1}{2}Ncc\times Aa}$. Therefore all other things being equal, the *force* of percussion, if the striking body be infinitely hard, will be to the *force* of percussion if both the bodies be equally hard, as $\sqrt{2}$ to 1. Mr. Euler farther deduces from his calculation, that the impression received by the body A will be as $\sqrt{\frac{N\times Aa}{\overline{M+N}\times Mcc}}$ and the impression on B will be as $\sqrt{\frac{M\times Aa}{\overline{M+N}\times Ncc}}$. If, therefore, the hardness of A, that is M, be infinite, it will suffer no impression, whereas that on B will extend to the depth of $\sqrt{\frac{Aa}{Ncc}}$. But if the hardness of the two bodies be the same, or that M = N, they will each receive equal impressions of the depth $\sqrt{\frac{Aa}{2Ncc}}$. So that the impression received by the body B, in this case, will be to the impression it receives in the former as 1 to $\sqrt{2}$ [n]. —[[n] Ibid. p. 46, 47.]

Mr. Euler has likewise considered and computed the case when the striking body has its anterior surface convex, with which it strikes an immoveable body whose surface is plane [o]. He has also examined the case when both bodies are supposed immoveable [p]; and from his formulæ he deduces the known laws of the collision of non-elastic and elastic bodies. He has also determined the greatest pressures the bodies receive in these cases [q]; and likewise the impressions made on them. In particular he shews that the impression received by the body struck, or B, if moveable, is to the impression received by the same body when immoveable as $\sqrt{B}$ to $\sqrt{A+B}$. —[[o] Ibid. p. 48. § xxiv. [p] Ibid. § xxv. xxvi. [q] Ibid. § xxvii.]

This doctrine of Mr. Euler may serve to shew, that the dispute about the measure of *forces* is very needless in physics; since the laws of motion may, independently of any hypothesis about the measure of the *vis viva*, be deduced from the most uncontested principles of pressure and time. But we doubt whether we shall be enabled hereby to settle the metaphysical part of this dispute to the satisfaction of both parties, each of which may assent to all that Mr. Euler says, and yet adhere either to the Cartesians or Leibnitians. — But whatever may be said of the metaphysical part of the dispute, it is certain, from experience,

That the number of equal springs requisite to produce any velocity in a given body, is always proportional to the square of the velocity to be produced. Thus if one spring can, by unbending half, produce one degree of velocity in a body, it will require four equal springs to produce two degrees of velocity in that body; nine springs to produce three degrees of velocity, *&c.* See the article SPRING, *Suppl.*

Also, if a portion of a yielding substance, as clay, tallow, *&c.* be just sufficient to stop the motion of a body moving with a certain degree of velocity, it will require four times the quantity of the same resisting substance to stop it, if the velocity of the moving body be double, *&c.* The same holds in the resistance of wood against musquet-balls, as Mr. Robins observes in his New Principles of Gunnery: so that a ball moving with twice the velocity of another, will penetrate four times as deep into earth, clay, tallow, wood, *&c.* And in like manner if the action of one man, one horse, or other animal, can give a certain degree of velocity to a given mass, it will require the action of four equal men, horses, *&c.* to give the same mass two degrees of velocity; nine men, horses, *&c.* to give it three degrees of velocity; and so on.

These practical points have been put out of all question by the experiments of Poleni, 'S Gravesande, Desaguliers, and others, and are of great use, although they do not decide the controversy about the measure of the *force* of bodies in motion.

FORCE *of inertia*, or *vis inertiæ*. It may be a question, whether the *vis inertiæ* of bodies can properly be called a *force*? As to

to which Mr. Euler obſerves, that if we give the name of *force* to ſuch cauſes only as can change the ſtate of bodies, the *inertia*, by which all bodies remain in their ſtate of motion, or reſt, cannot properly be called *force*; although a true *force* may ſometimes be the reſult of it. For when the inertia preſerves a body in its ſtate of reſt, or an uniform and direct progreſſion, the ſame inertia may be the cauſe of a change in the ſtate of other bodies: ſo that tho' the name of *force* does not belong to this inertia, with reſpect to the body wherein it reſides, yet it may change into a *force* with reſpect to other bodies. Mr. Euler[a] even thinks it probable that all the changes which happen in the world, ariſe, without exception, from the inertia of bodies, and that there are no other *forces* in nature than what are excited by this inertia. — [[a] In Mem. Acad. Berlin. 1745. p. 22.]

To illuſtrate this, he conſiders a body A (fig. I.) moving with a given velocity in the direction *ac*: ſo long as this body meets with no obſtacle, its motion will continue with the ſame velocity, and in the ſame direction, and thus it will perſevere in the ſame ſtate, the cauſe of this perſeverance being the inertia of the body. But ſuppoſing another body B at reſt, and that the body A has approached ſo near to B, that their extremities touch; what will happen? The bodies

Fig. I.

being impenetrable, it is plain that A cannot remain in its ſtate, without diſturbing that of B; ſince A muſt, in order to continue its motion, either drive B before it with a velocity equal to, or greater than its own, or it muſt turn aſide. Alſo the body B cannot remain in its ſtate of repoſe, unleſs A ſtops, or returns, or deflects to one ſide. All this clearly ſhews, that theſe two bodies cannot at the ſame time preſerve their ſtate. When A touches B, the ſtate of one or both muſt be changed, ſince both equally endeavour to preſerve their ſtate: there can be no reaſon why the one ſhould ſuffer a change rather than the other, and therefore the ſtate of both muſt be altered. But whatever change happens in this reſpect it muſt ariſe from the *vis inertiæ*; for when B's ſtate of reſt is changed to motion, the cauſe is the inertia of A; ſince B would have remained eternally at reſt had it not been for the appulſe of A. In like manner, the cauſe of the change which happens in the motion of the body A, can be nothing elſe than the inertia of B, ſince without this A would have preſerved its motion without any alteration. The inertia being the cauſe of the perſeverance of a body in its ſtate, cannot be conceived but as a principle of reſiſtance to any change of ſtate; ſince we could not ſay that a body has power of remaining in its ſtate, if it gave way without reſiſtance to any cauſe endeavouring to alter that ſtate. This conſideration authoriſes the giving the name of *force* to the inertia, taking the term *force* in an extenſive ſenſe. When then the body A endeavours by its inertia to preſerve its uniform rectilinear motion, it has at the ſame time the *force* to reſiſt all obſtacles; and the body B, the inertia of which exerts itſelf in the preſervation of its ſtate of reſt, has a *force* by which it reſiſts all cauſes endeavouring to draw it out of that ſtate. Hence in the ſhock of theſe two bodies, both being unable to preſerve their ſtate, becauſe of their impenetrability, and the inertia of each reſiſting a change, this inertia of the one muſt produce a change in the other; therefore, though the inertia cannot be called a *force* with reſpect to the body in which it reſides, becauſe it only produces a preſervation of its ſtate, yet with reſpect to other bodies it may become a true *force*, by which their ſtate is changed. Now as many bodies muſt ſhock each other in a world full of bodies differently moved, and that ſome muſt hinder others from perſevering in their ſtate, it follows, that the ſtate of all thoſe bodies muſt undergo perpetual changes; and the cauſe of all theſe will be the inertia by which all bodies have a tendency to preſerve their ſtate. Nor do the changes which continually happen in the world oblige us to aſcribe moving *forces* to bodies, different from their inertia, ſince this alone may produce all the alterations we obſerve [b]. — [[b] Ibid. p. 23, 24.]

The inertia, as well as impenetrability and extenſion, is an univerſal property of all matter; and this inertia is proportional to the maſs or quantity of matter. A body, whether at reſt or in motion, has the ſame inertia, or the ſame power or *force* to preſerve its ſtate. This inertia is the cauſe of a body's reſiſting either to a change of its velocity, or of its direction: and from hence ariſes the two kinds of *forces* before mentioned [c]. — [[c] Ibid. p. 25.]

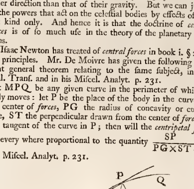
Central Force. It may be proper here to ſubjoin ſomething on the head of *centripetal* and *centrifugal*, or, in one word, *central forces*, to what is ſaid in the *Cyclopœdia*, under the head Central. The doctrine of *central* or *centripetal* and *centrifugal forces* has been much cultivated by mathematicians, as being of extenſive uſe in the theory of gravity and other phyſico-mathematical ſciences.

In this doctrine it is ſuppoſed, that a body at reſt never moves itſelf: and that a body in motion never changes the velocity or direction of its motion of itſelf; but that every motion would continue uniform, and its direction rectilinear, unleſs ſome external *force* or reſiſtance affected it. Hence, when a body at reſt always tends to move, or when the velocity of any rectilinear motion is accelerated continually, or when the direction of a motion is continually varied and a curve line deſcribed, theſe are ſuppoſed to proceed equally from the influence of ſome power that acts inceſſantly; which may be meaſured either by the preſſure of the quieſcent body againſt the obſtacle that hinders it to move, in the firſt caſe; or by the acceleration of the motion, in the ſecond; or by the flexure of the curve deſcribed, in the third caſe; due regard being had to the time in which theſe effects are produced, and the other circumſtances, according to the principles of mechanics. Effects of the power of gravity of each kind fall under our conſtant obſervation near the ſurface of the earth; for the ſame power which renders bodies heavy while they are at reſt, accelerates them when they deſcend perpendicularly, and bends their motion into a curve line when they are projected in any other direction than that of their gravity. But we can judge of the powers that act on the celeſtial bodies by effects of the laſt kind only. And hence it is that the doctrine of *central forces* is of ſo much uſe in the theory of the planetary motions.

Sir Iſaac Newton has treated of *central forces* in book i. § 2. of his principles. Mr. De Moivre has given the following elegant general theorem relating to the ſame ſubject, in the Phil. Tranſ. and in his Miſcel. Analyt. p. 231.

Let MPQ be any given curve in the perimeter of which a body moves: let P be the place of the body in the curve, S the center of *forces*, PG the radius of concavity or curvature, ST the perpendicular drawn from the center of *forces* to the tangent of the curve in P; then will the *centripetal force* be every where proportional to the quantity $\frac{SP}{PG \times ST \text{ cub.}}$ See Miſcel. Analyt. p. 231.

Fig. II.



What is here called the *center of force*, is the point to which the *central force* is always directed.

Monſ. Varignon has alſo given two general theorems on this ſubject in the Memoirs of the Acad. Scienc. an. 1700, 1701, and has ſhewn their application to the motions of the planets. See alſo the ſame Memoirs, an. 1706, 1710.

Mr. Mac Laurin has alſo treated the ſubject of *central forces* very fully in his Fluxions, from art. 416 to 493. where he gives a great variety of expreſſions for theſe *forces*, and ſeveral elegant methods of inveſtigating them.

Sir Iſaac Newton has demonſtrated[d] this fundamental theorem of *central forces*, that the areas which revolving bodies deſcribe by radii drawn to an immoveable center, lie in the ſame immoveable planes, and are proportional to the times in which they are deſcribed. — [[d] Princip. lib. i. prop. 1.]

A late eminent mathematician obſerves that this law, which is originally Kepler's, is the only general principle in the doctrine of *centripetal forces*; but ſince this law, as Sir Iſaac Newton himſelf has proved, cannot hold whenever a body has a gravity or *force* to any other than one and the ſame point, there ſeems to be wanting ſome law that may ſerve to explain the motions of the moon and ſatellites which have a gravity towards two different centers: the law he lays down for this purpoſe is,

That where a body is deflected by two *forces* tending conſtantly to two fixed points, it will deſcribe by lines drawn from the two fixed points, equal ſolids in equal times, about the line joining thoſe fixed points. See *Machin*, of the Laws of the Moon's Motion, in the poſtſcript. This ſhort treatiſe is publiſhed at the end of the Engliſh tranſlation of Sir Iſaac Newton's Principles.

Force, in practical mechanics. We have ſeveral curious as well as uſeful obſervations in Deſaguliers's Experimental Philoſophy, concerning the comparative *forces* of men and horſes, and the beſt way of applying them. An horſe draws with the greateſt advantage when the line of direction is level with his breaſt: in ſuch a ſituation, he is able to draw 200lb. eight hours a day, walking about two miles and an half an hour. And if the ſame horſe is made to draw 240lb. he can work but ſix hours a day, and cannot go quite ſo faſt. On a carriage, indeed, where friction alone is to be overcome, a middling horſe will draw 1000lb. But the beſt way to try a

horſe's

horſe's *force*, is by making him draw up out of a well, over a ſingle pully or roller; and in ſuch a caſe one horſe with another will draw 200lb. as already obſerved.

Five men are found to be equal in ſtrength to one horſe, and can, with as much eaſe, puſh round the horizontal beam of a mill, in a walk 40 feet wide; whereas three men will do it in a walk only 19 feet wide.

The worſt way of applying the *force* of a horſe, is to make him carry or draw up hill: for, if the hill be ſteep, three men will do more than a horſe, each man climbing up faſter with a burden of 100lb. weight, than a horſe that is loaded with 300lb. a difference which is owing to the poſition of the parts of the human body being better adapted to climb than thoſe of a horſe.

On the other hand, the beſt way of applying the *force* of a horſe, is in an horizontal direction, wherein a man can exert leaſt *force*; thus a man drawing a boat along, by means of a rope coming over his ſhoulders, cannot exert above one ſeventh part of the *force* of a horſe employed to the ſame purpoſe. The very beſt and moſt effectual poſture in a man, is that of rowing; wherein he not only acts with more muſcles at once for overcoming the reſiſtance, than in any other poſition; but as he pulls backwards, the weight of his body aſſiſts by way of leaver. *Deſaguliers*, Exp. Phil. vol. i. p. 241, *ſeq.* where we have ſeveral other obſervations relative to *force* acquired by certain poſitions of the body, from which that author accounts for moſt feats of ſtrength and activity. Ibid. p. 254. *ſeq.*

FORCER, in mechanics, is properly a piſton, without a valve. See the article PISTON, *Cycl.*

There are ſeveral ways of making *forcers*: the moſt common of all conſiſts of a braſs cylinder, a very little leſs in diameter, at its top and bottom, than the bore of the barrel of the pump, and turned ſtill leſs at the middle, in order to let in a leathern ring or collar (made of a thick leather put round the braſs cylinder) which makes it juſt equal to the bore of the barrel, ſo as to fit it quite when it is put into it.

The ſecond ſort of *forcers* conſiſts of three braſs cylinders which can be ſcrewed together. The middle one ought to be almoſt equal in diameter to the bore of the pipe, ſo as to ſlide in it without any friction. The upper cylinder and the lower muſt be a little leſs, and equal to one another. There are two leathers which muſt be put between them when they are unſcrewed: then it is evident, that if the cylinders be ſcrewed together, and the leathers, which ought to be a little bigger than the braſs cylinders, apply themſelves folding upwards round the upper cylinder, and downwards round the lower, they will become juſt equal to the bore of the barrel; and conſequently they will hinder any air from getting through the ſides of the *forcer*, when it moves up and down in the barrel. The uſe of the middle braſs cylinder is to hinder the leathers from turning themſelves back by the motion.

This kind of *forcer* has, above the other, the advantage of having a great deal leſs friction; and beſides, as the leathers, which are applied to it, may be thin ones, they are much ſmoother than thick ones, which are uſed in the other.

But the beſt way of making *forcers*, is, to have a plunger, or ſolid braſs cylinder, equal in length to the barrel of the pump, and a little leſs in the diameter than the bore; ſo that it may move freely in it without any friction. There muſt be two hollow, ſhort, braſs cylinders, or rather rings, at the top of the barrel, which can be ſcrewed together; the upper one muſt be equal in bore to the barrel, and the lower a little leſs: there are two leathers, both having in the middle a leſs hole than the bore of the pipe; the one muſt be applied between the barrel and the lower ring, and the other between the ſame ring and the upper one; and the whole muſt be ſcrewed together. Then if the ſolid cylinder or *forcer*, be put into it, and moved up and down, it is evident that the two before-mentioned leathers, which are applied the one to the barrel and the other to the inſide of the hollow cylinder or ring, will hinder any air from getting between them and the ſolid cylinder.

The advantage of this kind of *forcer*, is, that it has no other friction but at the top of the barrel, and that the inſide of the barrel need not be ſmooth, as in other kinds of pumps; but only the outſide of the *forcer* muſt be turned true and poliſhed, which can be done with much more eaſe. See *Deſaguliers*, Courſe of Experim. Philoſ. p. 161, 162.

FORCING *pump*. See the article PUMP, *Append.*

FORCING *pipe*. See the article PIPE, *Append.*

FORFICULA, the ear-wig, in zoology, the name of a genus of inſects, the tail of which forms a kind of forceps, capable of pinching; the exterior wings are very ſhort, but dimidiated; and the antennæ are ſetaceous. See the article EAR-*wig*, *Append.*

FORM (*Cycl.*) — FORM *of a ſeries*, in algebra, is uſed for that affection of an undeterminate ſeries, ſuch as,

$Ax^n + Bx^{n+r} + Cx^{n+2r} + Dx^{n+3r}$, &c. which ariſes from the different values of the indices of x.

Thus if $n=1$, and $r=1$, the ſeries will aſſume the *form*,

$Ax + Bx^2 + Cx^3 + Dx^4 +$, &c.

If $n=1$, and $r=2$, the *form* will be,

$Ax + Bx^3 + Cx^5 + Dx^7 +$, &c.

If $n=\frac{1}{2}$, and $r=1$, the *form* is,

$Ax^{\frac{1}{2}} + Bx^{\frac{3}{2}} + Cx^{\frac{5}{2}} + Dx^{\frac{7}{2}} +$, &c.

Again, if $n=0$, and $r=-1$, the *form* of the ſeries will be

$A + Bx^{-1} + Cx^{-2} + Dx^{-3} +$, &c.

When the value of a quantity cannot be found exactly, it is of uſe in algebra, as well as in common arithmetic, to ſeek an approximated value of that quantity ſufficient for practice. Thus in arithmetic, as the true value of the ſquare root of 2 cannot be aſſigned, a decimal fraction is found to a ſufficient degree of exactneſs in any particular caſe. And this decimal fraction is in reality no more than an infinite ſeries of fractions converging or approximating to the true value of the root required. For the expreſſion $\sqrt{2} = 1.41421356$, &c. is equivalent to this $\sqrt{2} = 1 + \frac{4}{10} + \frac{1}{100} + \frac{4}{1000} + \frac{2}{10000} + \frac{1}{100000} +$, &c. Or ſuppoſing

$$x = \tfrac{1}{10},\quad \sqrt{2} = 1 + \frac{4}{x} + \frac{1}{xx} + \frac{4}{x^3} + \frac{2}{x^4} + \frac{1}{x^5} +, \text{ \&c.}$$

$$= 1 + 4x^{-1} + x^{-2} + 4x^{-3} + 2x^{-4} + x^{-5} +,$$

&c. which laſt ſeries is a particular caſe of the general indeterminate ſeries $Ax^n + Bx^{n+r} + Cx^{n+2r} +$, &c. when $n=0$, $r=-1$, and the coefficient $A=1$, $B=4$, $C=1$, $D=4$, $E=2$, &c.

But the application of the notion of approximations in numbers, to ſpecies, or to algebra, is not ſo obvious. Sir Iſaac Newton, with his uſual ſagacity, took the hint, proſecuted it, and thereby diſcovered general methods in the doctrines of infinite ſeries, which before him had only been treated in a particular manner, though with great acuteneſs, by Dr. Wallis and a few others. See *Newton*'s Meth. of Fluxions and infinite Series, with Mr. Colſon's Comment; as alſo the Analyſis per æquationes numero terminorum infinitas, publiſhed by Mr. Jones, in 1711, and ſince tranſlated and explained by Mr. Stewart, together with Sir Iſaac's Quadrature of Curves, Lond. 1745, quarto. To theſe may be added Mr. *Mac Laurin*'s Algebra, part II. chap. x. p. 244. and *Cramer*'s Analyſe des Lignes Courbes Algebriques, ch. vii. p. 148.

Among the various methods for determining the value of a quantity by a converging ſeries, that ſeems, on many occaſions, preferable to the reſt, which conſiſts in aſſuming an indeterminate ſeries equal to the quantity, the value of which is ſought, and afterwards determining the values of the terms of this aſſumed ſeries.

For inſtance, ſuppoſe a logarithm being given, it were required to find its number.

Let the number be $=1+x$, and the given logarithm $=z$. Then, by the nature of logarithms and fluxions (ſee the article FLUXION and LOGARITHM, *Suppl.*) $\dot{z} = \frac{\dot{x}}{1+x}$, and $\dot{z} + x\dot{z} = \dot{x}$. Suppoſe,

$x = Az + Bz^2 + Cz^3 + Dz^4 +$, &c. conſequently,

$\dot{x} = A\dot{z} + 2Bz\dot{z} + 3Cz^2\dot{z} + 4Dz^3\dot{z} +$, &c. $= \dot{z} + x\dot{z}$
$= \dot{z} + Az\dot{z} + Bz^2\dot{z} + Cz^3\dot{z} + Dz^4\dot{z} +$, &c.

Now if the correſponding terms of theſe two equal ſeries's (each being $=\dot{x}$) be compared, we ſhall have

$A=1$, $B=\frac{1}{2}$, $C=\frac{1}{6}$, $D=\frac{1}{24}$, &c. which values being ſubſtituted in the ſeries $Az + Bz^2 + Cz^3 +$, &c. give,

$$x = z + \tfrac{1}{2}z^2 + \tfrac{1}{6}z^3 + \tfrac{1}{24}z^4 + \tfrac{1}{120}z^5 + \tfrac{1}{720}z^6 +, \text{ \&c.}$$

$$= z + \frac{1}{1.2}z^2 + \frac{1}{1.2.3}z^3 + \frac{1}{1.2.3.4}z^4 + \frac{1}{1.2.3.4.5}z^5$$

$+$, &c. And conſequently $1+x$, the number ſought, will be $= 1 + z + \frac{1}{1.2}z^2 +$, &c.

But the indeterminate ſeries $Az + Bzz + Cz^3 +$, &c. was here arbitrarily aſſumed, and will not ſucceed in all caſes.

For inſtance, if from an arc given it were required to find the tangent. Let $x=$ tangent, $v=$ arc, the radius $=1$. Then, from the nature of the circle, we ſhall have $\frac{\dot{x}}{1+xx} = \dot{v}$, or $\dot{x} = \dot{v} + xx\dot{v}$. Now if to find the value of x we ſuppoſe $x = Av + Bv^2 + Cv^3 +$, &c. and operate as before, we ſhall find all the coefficients B, D, F, of the even powers of v, each $=0$. Therefore the ſeries aſſumed is not of a proper *form*. But ſuppoſing $x = Av + Bv^3 + Cv^5 + Dv^7 +$, &c. we ſhall find $A=1$, $B=\frac{1}{3}$, $C=\frac{2}{15}$, $D=\frac{17}{315}+$, &c. and conſequently $x = v + \frac{1}{3}v^3 + \frac{2}{15}v^5 + \frac{17}{315}v^7 +$, &c.

Now to find a proper indeterminate ſeries in all caſes, tentatively, would often be very laborious, and often an impracticable work. Mathematicians have therefore endeavoured to find out a general rule for this purpoſe. But, till lately, the method has been but imperfectly underſtood and delivered. Moſt authors, indeed, have explained the manner of finding the coefficients A, B, C, D, &c. of the indeterminate ſeries $Ax^n + Bx^{n+r} + Cx^{n+2r} +$, &c. which is eaſy; but the values of n and r, wherein the main difficulty lies, have been aſſigned by many, as if they were ſelf-evident, or at leaſt diſcoverable by an eaſy trial or two, as in the laſt example.

Sir Iſaac Newton himſelf has ſhewn the method of determining the number n, by his rule for finding the firſt term of a converging ſeries, by the application of his parallelogram and ruler. For the particulars of this method, ſee the authors above cited. See alſo the article PARALLELOGRAM, *infra*.

Dr. Taylor, in his Methodus incrementorum, inveſtigates the

the number r; but, according to Mr. Stirling[a], the rule given by the doctor fails ſometimes. [[a] Lineæ tert. ordin. Newtonian. p. 28.]

Mr. Stirling found a correction of Dr. Taylor's rule, but ſays he cannot affirm it to be univerſal, having only found it by chance. 'S Graveſande obſerves, that though he thinks Mr. Stirling's rule never leads into error, yet that it is not perfect. See *'S Graveſande*, De determin. form. ſeriei infinit. printed at the end of his Matheſeos univerſalis elementa, Lugd. Bat. 1727. This learned profeſſor has endeavoured to rectify the rule. But Mr. Cramer has ſhewn it to be ſtill defective in ſeveral reſpects; and he himſelf, to avoid the inconveniences to which the methods of thoſe who wrote before him are ſubject, has aſcended to the firſt principles of the method of infinite ſeries, and has entered into a more exact and inſtructive detail of the whole method, than is to be met with elſewhere; for which, and for many other reaſons, his treatiſe deſerves to be particularly recommended to beginners.

But it muſt be obſerved, that in determining the value of a quantity by a converging ſeries, it is not always neceſſary to have recourſe to an indeterminate ſeries: for it is ſometimes more expeditious to find it by common diviſion, or by extraction of roots. See *Newton*, Meth. of Fluxions and inf. Series, above cited. Thus, if it were required to find the arc of a circle from its given tangent, that is, to find the value of v in the fluxional equation, $\dot{v} = \frac{\dot{x}}{1+xx}$, by an infinite ſeries: divide $\dot{x}$ by $1+xx$, the quotient will be the ſeries $\dot{x} - x^2\dot{x} + x^4\dot{x} - x^6\dot{x} +$, &c. And taking the fluents of each term, we ſhall have $v = x - \frac{1}{3}x^3 + \frac{1}{5}x^5 + \frac{1}{7}x^7 +$, &c. which is the ſeries often uſed for the quadrature of the circle. If x 1, that is, if x be the the tangent of 45°, then will $v = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} +$, &c. = the length of an arc of 45°, that is, $\frac{1}{8}$ of the circumference of a circle, whoſe radius $= 1$; or $\frac{1}{4}$ of the circumference, if the diameter $= 1$. Conſequenly, if 1 be the ſquare of the diameter, $1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} +$, &c. = the area of the circle: becauſe $\frac{1}{4}$ of the circumference multiplied by the diameter, gives the area of the circle. And this is Leibnitz's ſeries, as alſo James Gregory's.

FORMED *ſtones*, in natural hiſtory. See the article *Formed* STONES, *Suppl.*

FORMICA, among ſportſmen, the name of a diſeaſe incident to ſpaniels. See the article SPANIEL, *Suppl.*

FORMICATION *(Cycl.)* — This term is alſo uſed among builders, for an arching or vaulting.

FORMS, among ſportſmen, is ſaid of a hare when ſhe ſquats in any place. Dict. Ruſt. in voc.

FOUCADE. See the article FOUGADE, *Cycl.*

FOULDAGE, the ſame with foldage. See the article FOLDAGE, *Append.*

FOUNDATION *(Cycl.)* — Architects ought to uſe the utmoſt diligence in regard to *foundations*, ſince of all errors which may happen in building, an error in this point is moſt pernicious.

The ground fit for building upon is of various kinds; ſometimes it is ſo hard as ſcarce to be cut with iron; in other places it is ſtiff, blackiſh, or whitiſh. This laſt is reckoned the weakeſt; and, in general, that is the beſt which requires moſt labour in cutting or digging.

When the ground is very bad, you muſt get large oaken piles of ſuch a length as may reach the ſound ground, and whoſe diameter muſt be about one twelfth part of their length: theſe muſt be driven down with a machine, as cloſe to one another as poſſible, and that under the middle walls as well as the outer ones; and upon their tops large planks are to be pinned down. But if the ground be only faulty in ſome places, arches may be turned over them, by which means no part of the weight of the building will reſt upon them.

As to the rules neceſſary to be obſerved in conſtructing the ground-work, they are theſe: 1. That the bottom of the trench be made exactly level. 2. That the loweſt ledge or row be all of ſtone, laid cloſe together. 3. That the breadth of the ground-work be at leaſt double that of the wall that is to be raiſed on it. However, art ought always to give way to diſcretion, for the breadth may be regulated according to the goodneſs of the ground, and the weight of the intended edifice. 4. That the *foundation* be made to diminiſh as it riſes, only care muſt be taken that it do ſo equally on both ſides. 5. That you ought never to build upon the ruins of an old *foundation*, unleſs well aſſured of its depth and goodneſs. Build. Dict. in voc.

FOUNDATION *of bridges.* See the article BRIDGE, *Suppl.*

FOX, *vulpes*, in zoology, an animal of the dog-kind. See the articles CANIS and VULPES, *Suppl.*

FOX *tail-graſs*, in botany. See the article GRASS, *Append.*

FOYLING *of land*, among farmers, is the fallowing it in the ſummer or autumn. Dict. Ruſt. in voc.

FOYLING, among ſportſmen, a term uſed for the footſteps of a ſtag, on the graſs or leaves. Dict. Ruſt. in voc.

FRACTION *(Cycl.)* — *Infinite ſeries of* FRACTIONS. The ſums, or rather the limit of the ſums of infinite ſeries's of *fractions*, has been one of the principal objects of the modern methods of computation; and theſe ſums may often be found. Thus the ſum of $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} +$, &c. *ad infinitum*, or rather, the limit to which this ſum may approach nearer than by a given difference is 1. So likewiſe the limit of the ſum $\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \frac{1}{81} +$, &c. is $\frac{1}{2}$. And theſe and the like ſums of geometric progreſſions may be readily found, by applying the common rule for determining the ſum of geometric progreſſions from the firſt and laſt terms and the ratio given. For in theſe converging infinite geometric progreſſions, the laſt term muſt be conſidered as 0; ſo that the ſums of the antecedents of theſe progreſſions are conſidered as the ſum itſelf, becauſe they differ from the ſum of the progreſſion by leſs than any aſſigned quantity; but in every geometric progreſſion the ſum of the antecedents is to the ſum of the conſequents as one antecedent to one conſequent. Hence calling the ſum S, the firſt term a, and the ratio r, we ſhall have $S : S - a :: a : ar :: 1 : r$. Therefore $Sr = S - a$, or $S = \frac{a}{1-r}$. Thus if $a = \frac{1}{2}$, and $r = \frac{1}{2}$, S will $= \frac{1}{2}$ divided by $\frac{1}{2}$, or 1. And if $a = \frac{1}{3}$, and $r = \frac{1}{3}$, S will $= \frac{1}{3}$ divided by $\frac{2}{3}$, or $\frac{1}{2}$; and ſo of the reſt.

But the ſeries's of *fractions* that occur in the ſolution of problems are rarely reducible to geometric progreſſions; nor can any general rule, in caſes ſo infinitely various, be given. The art here, as in moſt other caſes, is only to be acquired by examples, and by a careful obſervation of the arts uſed by great authors in the inveſtigation of the ſeries's of *fractions* they have conſidered. And the general methods of infinite ſeries which have been carried ſo far by Mr. de Moivre[a], Mr. Stirling[b], and Mr. Euler[c], are often found neceſſary to determine the ſum of a very ſimple ſeries of *fractions*. — [[a] Miſcel. Analyt. paſſim. [b] Method. Differentialis. [c] Analyſ. infinitorum, & Act. Petropol. paſſim.]

The ſum of a ſeries of *fractions* decreaſing continually, is not always finite, but ſometimes infinite, that is, no limit can be aſſigned but what may be exceeded by the ſum of a certain number of the terms of the ſeries. This is the caſe of the ſeries $\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6}$, &c. called the harmonic ſeries, the ſum of which (as has been ſaid under the article PROGRESSION) exceeds any given number, and the analogy of this progreſſion with the ſpace comprehended between the Apollonian hyperbola and its aſymptote, ſhews this. But the ſame may be ſhewn independently of the hyperbola from the nature of progreſſions. See *Jac. Bernoulli*, De Seriebus infinit.

The foundation of Mr. Bernoulli's demonſtration is, that a number of terms, beginning from any part of the ſeries, may be found, the ſum of which ſhall always exceed unity, and conſequently the number of terms of the ſeries being ſuppoſed infinite, as many partial ſums as we pleaſe, each exceeding unity, may thus be taken out of the ſeries, which therefore may be continued till it exceed any given number.

But if the denominators of this harmonic ſeries, $\frac{1}{1}, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}$, &c. be ſquared, that is, if we form the ſeries $\frac{1}{1}, \frac{1}{4}, \frac{1}{9}$, &c. the common numerator of which is 1, and the denominators of which are the ſquares of the natural numbers 1, 2, 3, 4, &c. the ſum of this ſeries of *fractions* will not only be limited, as was ſaid under the head PROGRESSION, *Suppl.* but this ſum will be preciſely equal to the ſixth part of the number, which expreſſes the ratio of the ſquare of the circumference of a circle to the ſquare of its diameter. That is, if the circumference be 3.14159, &c. and the diameter 1, then will $\frac{1}{1} + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \frac{1}{25} +$, &c. $= \frac{\overline{3.14159, \&c.}^2}{6}$. This propoſition was firſt diſcovered by Mr. Euler, and his inveſtigation may be ſeen in the Acta Petropolit. vol. vii. Mr. Mac Laurin[a] has ſince obſerved, that this may eaſily be deduced from his Fluxions, art. 822. — [[a] Philoſ. Tranſ. N°. 469.]

It would require a treatiſe to enumerate the various kinds of ſeries's of *fractions* which may be ſummed. Sometimes the ſum or limit of the infinite ſeries cannot be aſſigned, either becauſe it is infinite, as in the harmonic ſeries $\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}$, &c. or although this ſum be finite, as in the ſeries $\frac{1}{1} + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} +$, &c. yet its ſum cannot be aſſigned in finite terms, or by the quadrature of the circle, or hyperbola, which was the caſe of this ſeries before Mr. Euler's diſcovery; but yet the ſum of any given number of the terms of the ſeries may be expeditiouſly found, and the whole ſum may be aſſigned by approximation, independently of the circle. See *Stirling*, Method. Different. and *De Moivre*, Miſcel. Anal.

Beſides the ſeries's of *fractions*, the ſums of which converge to a certain quantity, there ſometimes occur ſeries's of *fractions*, which converge by a continual multiplication. Of this kind is the ſeries found by Dr. Wallis[a], for the quadrature of the circle, which he expreſſes thus,

$\square = \frac{3 \times 3 \times 5 \times 5 \times 7 \times 7 \times 9 \times 9 \times \&c.}{2 \times 4 \times 4 \times 6 \times 6 \times 8 \times 8 \times 10 \times \&c.}$ where $\square$ ſignifies the ratio of the ſquare of the diameter to the area of the circle. Hence the denominator of this *fraction*, continued *ad infinitum*, is to its numerator as the circle is to the ſquare of its diameter. It may be obſerved, that this ſeries is equivalent to, $\frac{3 \times 3}{8} \times \frac{5 \times 5}{24} \times \frac{7 \times 7}{48} \times$, &c. or to $\frac{3^2}{3^2 - 1} \times \frac{5^2}{5^2 - 1} \times \frac{7^2}{7^2 - 1} \times$, &c. that is, the product of the ſquares of all the odd

odd numbers 3, 5, 7, 9, &c. is to the product of the ſame ſquares ſeverally diminiſhed by unity, as the ſquare of the diameter is to the area of the circle [b].—[[a] Arithmet. infinit. prop. cxci. Oper. vol. i. p. 469. [b] Id. Oper. vol. ii. p. 819.]

Theſe products of *fractions*, and the like quantities ariſing from the continued multiplication of certain factors, have been particularly conſidered by Mr. Euler, in his Analyſis infinit. vol. I. chap. xv. p. 221, *ſeq.*

Continued FRACTION is uſed for a *fraction* the denominator of which is a whole number with a *fraction*, the denominator of which is again a whole number and a *fraction*, and ſo on, whether this affection be continued *ad infinitum*, or whether the ſeries breaks off after a finite number of terms. Thus,

$$\cfrac{1}{2+\cfrac{1}{3+\cfrac{1}{4+\cfrac{1}{5+}}}}\text{, \&c.} \quad\text{or}\quad \cfrac{1}{2+\cfrac{2}{3+\cfrac{3}{4+\cfrac{4}{5+}}}}\text{, \&c. are}$$

continued fractions.

If we make uſe of letters inſtead of numbers, we ſhall have general expreſſions of theſe *fractions*, thus,

$$a+\cfrac{1}{b+\cfrac{1}{c+\cfrac{1}{d+\cfrac{1}{e+\cfrac{1}{f+}}}}}\text{, \&c.}$$

and

$$a+\cfrac{\alpha}{b+\cfrac{\beta}{c+\cfrac{\gamma}{d+\cfrac{\delta}{e+\cfrac{\varepsilon}{f+}}}}}\text{, \&c.}$$

The reduction of theſe *continued fractions* to thoſe of a common form, is not difficult by the uſual rules of arithmetic and algebra. Thus, to give an example, which may at the ſame time ſhew the uſe of theſe *continued fractions*, ſuppoſe the *continued fraction*

$$3+\cfrac{1}{7+\cfrac{1}{15+\cfrac{1}{1+\cfrac{1}{292+\cfrac{1}{1+\cfrac{1}{1+}}}}}}\text{, \&c.}$$

which expreſſes the circumference of a circle, when the diameter is one; if we ſtop at $\frac{1}{7}$, we ſhall have $3+\frac{1}{7}=\frac{21+1}{7}=\frac{22}{7}$. If we ſtop at $\frac{1}{15}$, we ſhall have

$$3+\cfrac{1}{7+\cfrac{1}{15}}=3+\cfrac{1}{\frac{106}{15}}=3+\frac{15}{106}=\frac{318+15}{106}=\frac{333}{106}$$

But if we ſtop at $\frac{1}{1}$, which is convenient on account of the ſmall *fraction* $\frac{1}{292}$, added to the laſt denominator 1, we ſhall then find, $3+\cfrac{1}{7+\cfrac{1}{15+\cfrac{1}{1}}}=\frac{355}{113}$. The firſt of the reductions gives the proportion of Archimedes, and the laſt that of Adrian Metius.

But as beginning at the laſt denominator of the *continued fraction* makes the computation ſomewhat tedious, ſhorter methods have been contrived for the reduction of theſe *fractions*, and for a continued approximation to their true value. And Mr. Cotes's method for the reduction of ratios to ſmaller terms, may be here applied. (See the article RATIO, *Suppl.*) For it is to be obſerved, that when the numerators of the *continued fraction* are each units, the denominators will be the quotients ariſing from the continued diviſions in Mr. Cotes's method; or in the common, for reducing *fractions* to a lower denomination, which is in effect the ſame as Euclid's method for finding the greateſt common meaſure of two magnitudes, lib. x. prop. 3.

But a detail of theſe things would lead us too far, we therefore refer the reader for a farther account of theſe *continued fractions* to Dr. *Wallis's* Arithmet. infinit. prop. 191. oper. vol. i. p. 469, *ſeq.* *Huygens*, Deſcript. automat. planetar. in oper. poſthum. p. 173, *ſeq.* edit. Amſtelod. 1728. and particularly to Mr. *Euler's* Analyſ. infinit. vol. I. cap. xviii. p. 295, *ſeq.* who has ſhewn the uſe and application of this doctrine in many inſtances.

Lord Brouncker ſeems to have been the firſt who conſidered *continued fractions*, or at leaſt who firſt applied them to the quadrature of curves. The hint ſeems uſeful, but has been pretty much neglected, excepting in approximations to *fractions* or ratios expreſſed in great numbers. See the article RATIO, *Suppl.* His ſeries for the quadrature of the circle, is

$$\square = 1\cfrac{1}{2\cfrac{9}{2\cfrac{25}{2\cfrac{49}{2\cfrac{81}{2}}}}}\text{, \&c.}$$

in his and Dr. Wallis's notation, which amounts to the ſame thing as

$$1+\cfrac{1}{2+\cfrac{9}{2+\cfrac{25}{2+}}}\text{, \&c.}$$

in the notation of Huygens and Euler.

The ſymbol $\square$ denotes, as before, the ratio of the ſquare of the diameter to the area of the circle.

Repetend of a decimal FRACTION, See the article REPETEND, *Append.*

FRAMBOISE, a name uſed by ſome for the *rubus*, or blackberry-buſh. See the article RUBUS, *Suppl.*

FRANK *(Cycl.)* — FRANK, among farmers, denotes a place to feed a boar in. Dict. Ruſt. in voc.

FRAY, among ſportſmen. A deer is ſaid to *fray* her head when ſhe rubs in againſt a tree to renew it, or cauſe the pills of her new horns to come off.

FREAM, among farmers, arable or ploughed land worn out of heart, and laid fallow till it recover.

FREAM, among ſportſmen, a term uſed for the noiſe of a boar in rutting time. Dict. Ruſt. in voc.

FRET, in muſic, is uſed for the ſtops uſed on ſome inſtruments, eſpecially baſs viols and lutes: it conſiſts of ſtrings tied round the neck of the inſtrument at ſuch diſtances, within which ſuch and ſuch notes are to be found. Theſe ſtrings or *frets* are ſometimes, yet ſeldom, put on the baſs violin for learners, and taken off again when they can find the notes without them. On lutes and viols they always remain. *Graſſin.* Muſ. Dict. in voc.

FRESCO *(Cycl.)* — The bruſhes and pencils for this work ought to be long and ſoft, otherwiſe they will rake and raiſe the painting. The colours ſhould be full, and flowing from the bruſh; and the deſign perfect: for, in this work, you cannot alter or add upon any colour.

FRIAR's *cowl*, in botany, a name by which ſome call the *ariſarum* of botanical authors. See the article ARISARUM, *Suppl.*

FRICTION *(Cycl.)* — It is hardly poſſible to give general and exact rules concerning *friction*, ſince it depends upon the ſtructure of bodies, the form of their prominent parts and cavities, and upon their rigidity, their elaſticity, their coherence, and other circumſtances. Some authors have made *friction* upon a horizontal plane equal to one third of the weight; but others have found that it was only one fourth of it, and ſometimes only $\frac{1}{6}$ or $\frac{1}{7}$ of it. Of late, authors have told us, that *friction* depends not on the ſurface of the body, but its weight only; but neither is this found to be accurately true. In leſſer velocities, the *friction* is nearly in the ſame ratio as the velocities; but in greater velocities the *friction* increaſes in higher proportion, whether the bodies are dry or oiled.

It being of great importance to diminiſh this *friction*, ſeveral contrivances have been invented for that purpoſe. In wheel-carriages, the *friction* is transferred from the circumference of the wheel (where it would act if the wheel did not turn round) to the circumference of the axis; and, conſequently, is diminiſhed in the proportion of the radius of the axis to the radius of the wheel. In theſe, therefore, the *friction* is always diminiſhed by diminiſhing the diameter of the axis, or by increaſing the diameter of the wheel. The *friction* is likewiſe diminiſhed by making the axis of an engine to reſt upon the circumferences of wheels that turn round with it, inſtead of reſting in fixed grooves that rub upon it; for, by this contrivance, the *friction* is transferred from the circumference of thoſe wheels to their pivots; and the *friction* may be ſtill diminiſhed farther, by making the axles of thoſe wheels reſt upon other *friction*-wheels that turn round with them.

Dr. Deſaguliers has treated fully of the *friction* of engines, carriages, &c. See his Courſe of Experim. Philoſ. vol. i. p. 133 to 138. and p. 182 to 254. ſee alſo p. 458 to 460.

FRIGERATORY, among builders, denotes a place deſigned to keep things cool in ſummer. Build. Dict. in voc.

FRILL, in falconry. When a hawk trembles or ſhivers, they ſay ſhe *frills*. Dict. Ruſt. in voc.

FRINGE-*tree*, the Engliſh name of a genus of plants called by botanical authors *chionanthus*. See the article CHIONANTHUS, *Append.*

FRINGILLA, in zoology, the name of a bird, known in Engliſh by the name of the chaffinch, and called *ſpina* by the antient naturaliſts.

The ſame word is alſo ſometimes uſed as the name of the brambling, a bird more frequently known by the name of the *montifringilla*, and called *oroſpina* by the old authors. See the article MONTIFRINGILLA, *Suppl.*

FRITTILLARIA *craſſa*, in botany, a name ſometimes given to the *aſclepias*, or ſwallow-wort. See the article ASCLEPIAS, *Suppl.*

FROG, among farriers, the ſame with fruſh. See the article FRUSH, *Append.*

FRONTALIS *verus muſculus*, in anatomy, a name given by Douglas, in his Myography, to one of the muſcles of the face, called alſo by himſelf, and, ſince his time, by Albinus, *corrugator ſupercilii*. See the article CORRUGATOR, *Suppl.*

FROUNCE, a diſeaſe in horſes, when ſmall warts or pimples ariſe in the midſt of the palate, which are very ſoft and ſore, and ſometimes breed in the lips and tongue.

This

This diſorder is occaſioned many ways; ſometimes by eating wet hay, whereon rats or other vermin have piſt; by drawing frozen duſt into his mouth among the graſs, &c.

As to the method of treatment, it conſiſts in letting him blood in the two largeſt veins under the tongue, and waſhing the ſore with vinegar and ſalt, or with ale and ſalt, till they bleed. Dict. Ruſt. in voc. *Camery.*

FROUNCE, in falconry, a diſeaſe incident to hawks, ariſing from moiſt and cold humours falling down to the palate and root of the tongue; by which means they loſe their appetite and cannot cloſe their clap. Waſhing with alum-water, lemon-juice, &c. is held good for it.

FROWEY, a term uſed by workmen for timber, which is evenly tempered, and works freely without tearing. Build. Dict. in voc.

FRUCTIFICATION *(Suppl.)* — The organs of *fructification* in plants are the *pointal*, generally contained in the middle of flowers; and the *threads*, which ſurround it, furniſhed at their extremities with little *heads*; theſe the botaniſts term, the firſt the *piſtillum*, the ſecond the *ſtamina*, and the third, or heads of the ſtamina, the *antheræ*, or *apices*. See the article FLOWER, *Suppl.*

The apices contain the *farina fœcundans*, a fine ſubtile matter analogous to the *ſemen maſculinum* in animals; the ſtamina ſerve only for their ſupport, and to convey nutrition to them; and the *piſtillum* is the part deſtined to receive this *farina*, and convey it to the ſeeds.

It is upon theſe principles that the excellent Linnæus has founded his ſyſtem of the vegetable world, and formed his claſſes. This author's work has been received by the learned world in all nations with the reſpect it merits; but has been too generally cenſured among the ſlighter proficients in botanical reſearches, as abſtruſe, difficult, and unintelligible. The viewing theſe things in a new light, and the neceſſity of making new words to convey new ideas, has indeed given this great attempt ſomething of the face of an abſtruſe piece; but premiſing a few general hints, it may not be difficult to vindicate the author from the heavy charges which have been laid againſt him, and give the Engliſh reader a clear and perfect view of his work.

From the ſtructure and uſe of the *piſtillum*, *ſtamina*, and *apices*, it is eaſy to conceive that the former muſt be accounted the *female*, and the two latter the *male parts* of flowers. This is the great baſis of his ſyſtem. To expreſs the different combinations of theſe in the different claſſes of plants, by formal deſcriptions to each, had been tedious, and an over burthen to the memory: to avoid this, he has excellently contrived the compriſing that deſcription, or general character, in one word. It is eaſy to conceive there could be no word already in uſe, that could expreſs what had never before been thought of; he was therefore neceſſitated to invent new ones for this purpoſe. He has ventured therefore to form twenty-four ſuch, for his claſſes, which are of that number, and has taken them from that language which all the learned have ever uſed on the ſame occaſion, the Greek; and this with the leaſt oſtentation or ſhew of learning imaginable: in ſhort, to underſtand all theſe, there is no need of knowing more Greek than that ἀνὴρ ſignifies a man, or any thing male; and γυνὴ, a woman, or female; that δύναμις is power or efficacy; ἀδελφὸς, a brother; and thence ἀδελφὰ, brotherhoods or communities; that σὺν is together; γένεσις, generation or origin; and οἶκος, a houſe, or habitation; that πολὺς ſignifies many; γάμος, marriage; and κρυπτὸς, hidden, or concealed: and that the numbers one, two, three, four, five, ſix, ſeven, eight, nine, ten, twelve, and twenty, or their derivatives, once, twice, &c. are expreſſed by the Greek words μόνος, δὶς, τρὶς, τέτρα, πέντε, ἕξ, ἑπτὰ, ὀκτὼ, ἐννέα, δεκὰς, δώδεκα, εἴκοσι: there needs, I ſay, no more knowledge of Greek than this, to underſtand perfectly the meaning of all the terms this author, to avoid tedious deſcriptions, has uſed as the characters of his claſſes. To begin with certainty and regularity;

He firſt divides the whole vegetable world into ſuch ſpecies as have their flowers viſible and obvious to the eyes, and ſuch as have them inviſible, or at the utmoſt ſcarce diſcernible.

Thoſe which have them viſible he then divides again into ſuch as have the *ſtamina*, *apices*, and *piſtillum*, that is the male and female parts of fructification in the ſame flower: Theſe he for that reaſon calls *hermaphrodite* flowers.

And ſuch as have the male and female parts of *fructification*, that is the *apices* and *piſtillum*, either in different flowers upon the ſame ſtalk, or upon different plants of the ſame ſpecies: theſe he calls the diſtinct male and female flowers.

Thoſe which have the different organs of *fructification* lodged in the ſame flower, he again divides into ſuch as have the ſtamina in no part growing together, or cohering to one another: and ſuch as have them either growing together or cohering together mutually in ſome part, either with one another, or with the *piſtillum*.

Thoſe which have them in no part cohering either with the *piſtillum* or with one another, he again ſubdivides into ſuch as obſerve no exact or accurate proportion of length one among another; and ſuch as have ever two of the ſtamina ſhorter than the reſt.

From theſe general diviſions he deſcends to his particular claſſes, of which he eſtabliſhes twenty-four.

The firſt thirteen are of the plants which have *hermaphrodite* flowers, with the organs of *fructification* disjunct, no where cohering with one another, and obſerving no exact proportion in length.

The firſt is the *monandria*: the word is derived from the Greek μόνος and ἀνὴρ, one male part, and ſignifies a flower that has only one ſuch. This claſs accordingly comprehends thoſe plants which have an *hermaphrodite* flower, and in it only one ſingle *ſtamen*: of this claſs are the *blite*, *turmeric*, &c.

The ſecond is of the *diandria*; the word, derived from the ſame ἀνὴρ and δὶς, twice, and ſignifying a flower that has two male parts, comprehends all thoſe plants which have *hermaphrodite* flowers with two *ſtamina* in each: of this claſs are the *jaſmine*, *phillerea*, *olive*, *roſemary*, *butterwort*, &c.

The third is of the *triandria*; the word, derived from the ſame ἀνὴρ and τρὶς, thrice, ſignifies a flower that has three male parts in it, and comprehends thoſe plants which have *hermaphrodite* flowers with three *ſtamina* in each: of this claſs are the *valerian*, *ſaffron*, many of the *graſſes*, &c.

The fourth is of the *tetrandria*; the word, derived from the ſame ἀνὴρ and τέτρας, four times, ſignifies a flower that has four male parts, and accordingly comprehends thoſe plants which have *hermaphrodite* flowers with four *ſtamina* in each; of this claſs are the *teaſel*, *madder*, *plantain*, &c.

The fifth is of the *pentandria*; the word derived, from the ſame ἀνὴρ and πέντε, five, ſignifies a flower with five male parts, and accordingly this claſs comprehends thoſe plants which have *hermaphrodite* flowers with five *ſtamina* in each; of this claſs are the *primroſe*, *willow-herb*, *bind-weed*, &c.

The ſixth is of the *hexandria*; the word, derived from the ſame ἀνὴρ and ἕξ, ſignifies a flower that has ſix male parts, and accordingly comprehends thoſe plants which have *hermaphrodite* flowers with ſix *ſtamina* in each; theſe *ſtamina*, the author obſerves, are either all equal in length, or alternately one ſhorter than another: of this claſs are *garlick*, *hyacinths*, *meadow-ſaffron*, &c.

The ſeventh is of the *heptandria*; the word, derived from the ſame ἀνὴρ and ἑπτὰ, ſeven, ſignifies a flower with ſeven male parts, and comprehends thoſe plants which have *hermaphrodite* flowers with ſeven *ſtamina* in each: of this claſs are the *horſe-cheſnut* and *trientalis*.

The eighth is of the *octandria*; the word, derived from the ſame ἀνὴρ and ὀκτὼ, eight, ſignifies a flower with eight male parts, and comprehends thoſe plants which have *hermaphrodite* flowers with eight *ſtamina* in each: of this claſs are the *maple*, *rue*, *heath*, &c.

The ninth claſs is of the *enneandria*; the word, derived from the ſame ἀνὴρ and ἐννέα, nine, ſignifies a flower that has nine male parts, and comprehends thoſe plants which have *hermaphrodite* flowers with nine *ſtamina* in each: of this claſs are the *bay*, *rhubarb*, &c.

The tenth claſs is of the *decandria*; the word, derived from the ſame ἀνὴρ and δεκὰς, ten, ſignifies a flower which has ten male parts, and comprehends all thoſe plants which have *hermaphrodite* flowers with ten *ſtamina* in each: of this claſs are the *Judas-tree*, *baſtard-dittany*, *caltrops*, &c.

The eleventh is of the *dodecandria*; the word, derived from the ſame ἀνὴρ and δώδεκα, twelve, ſignifies a flower which has twelve male parts in it, and comprehends thoſe plants which have *hermaphrodite* flowers with twelve *ſtamina* in each: of this claſs are the *aſarabacca*, *agrimony*, &c.

The twelfth is of the *icoſandria*; the word, derived from the ſame ἀνὴρ and εἴκοσι, twenty, ſignifies ſtrictly a flower with twenty male parts in it; the author however does not underſtand it in that ſtrict ſenſe, but uſing it as we frequently do words expreſſing large quantities, as indefinite and in an indeterminate ſenſe, defines it to mean only a larger number of *ſtamina* than are expreſſed under any other of the diſtinctions; and comprehends under it, in this claſs, all thoſe plants which have *hermaphrodite* flowers and more than twelve *ſtamina* in each; thoſe *ſtamina* alſo growing to the inner ſide of the cup of the flower, not to the receptacle of the future ſeeds: of this claſs is the *torch-thiſtle*, the *myrtle*, *ſtorax*, the *almond*, &c.

The thirteenth is of the *polyandria*; the word, derived from the ſame ἀνὴρ and πολὺς, many, ſignifies, in an exact ſenſe, no other than what he makes the *icoſandria*, the title of the laſt claſs, expreſs: theſe are, perhaps, the only two words in which his expreſſion is deficient, the name he has given the claſſes not at all importing their particular difference from one another: this, however, he has very acurately done in the character which follows them; and comprehends under this claſs thoſe plants which have *hermaphrodite* flowers with more than twelve *ſtamina* in each, but which grow in this to the receptacle of the future ſeed, not as in the other claſs to the inner ſide of the cup of the flower; of this claſs are the *water-lilly*, *poppy*, *celandine*, &c.

Theſe are the claſſes this accurate diſtinguiſher has eſtabliſhed among the *hermaphrodite* flowers, whoſe *ſtamina* have no regular

gular proportion of length, in regard to one another. To these he next subjoins two classes of such of them as have ever two of their *stamina* shorter than the rest.

The first of these (the fourteenth class of the general order) is of the *didynamia*: the word derived from the before-mentioned δὶς and δυνάμις, power or efficacy, signifies with him such flowers as have two of their male parts of more efficacy than the rest; and in this class he accordingly comprehends all those plants which have *hermaphrodite* flowers, two of whose *stamina* are longer, and of greater efficacy in the great work of fecundating the seeds, than the rest: of this class are the *thyme, lavender, basil, &c.*

The second of these (the fifteenth class in the general order) is of the *tetradynamia*: the word derived from the before-mentioned τέτρας and δυνάμις, signifies a flower with four of its male parts of more efficacy than the rest; and in this class he comprehends the plants with *hermaphrodite* flowers, four of the *stamina* of which are longer than the rest: of this class are the *scurvy-grass, radish, mustard, &c.*

From these he proceeds to those *hermaphrodite* flowers whose *stamina* cohere, either mutually among one another, in different manners; or with the *pistillum* of the flower: these coalitions of the *stamina* he calls brotherhoods, or communities, and according to the different state of these, and their conjunctions with the *pistillum*, he establishes five classes of them.

The first of these (the sixteenth in the general order) is of the *monadelphia*: the word derived from the before-mentioned μόνος, single, and ἀδελφά, brotherhoods, or communities, signifies with him a flower whose *stamina*, by means of the filaments running in among one another, are all formed into one body; and under this class he comprehends those plants with *hermaphrodite* flowers, whose *stamina*, or male parts, are all bound together in one body: of this class are the *crane's-bill, mallow, &c.*

The second of these (the seventeenth class in the general order) is of the *diadelphia*: the word derived from the before-mentioned δὶς and ἀδελφά, signifies with him a flower whose *stamina* are, by the conjunction of their filaments, formed into two bodies; and under this class he comprehends those plants which have *hermaphrodite* flowers, the *stamina* of which are so clustered together into two bodies: of this are the *fumitory, millwort, broom, &c.*

The third of these (the eighteenth in the general order) is of the *polyadelphia*: the word derived from the before-mentioned πολὺς and ἀδελφά, signifies with him a flower whose male parts are clustered into three or more separate bodies; and in this he comprehends those plants with *hermaphrodite* flowers, whose *stamina*, by the conjunction of their filaments, are formed into three or more clusters: of this class are the *orange, St. John's wort, &c.*

The fourth of these classes (the nineteenth in the general order) is of the *syngenesia*: the word derived from σὺν, together, and γένεσις, generation, origin, or formation, signifies with him such flowers as have their male parts naturally formed into a single regular congeries; and accordingly he comprehends under this class such plants as have *hermaphrodite* flowers, the *stamina* of which, by the junction of their *apices*, are formed into a single, regular, cylindric body: of this class are the *lettuce, succory, hawkweed, &c.*

The fifth of these classes (the twentieth in the general order) is of the *gynandria*: the word derived from γυνὴ, a woman, or female, and ἀνὴρ, male, signifies with this author a conjunction of the male and female parts of a flower at their origin; and he accordingly comprehends under this class those plants which have *hermaphrodite* flowers, the *stamina*, or male parts of which grow to the *pistillum*, or female part of the flower, and not to the receptacle of the seeds: of this class are the *barrenwort, passion-flower, birthwort, &c.*

Next after these he ranges those plants which have flowers not *hermaphrodite*, but regularly and distinctly male and female, as the sexes in animals are disposed; and after these such plants as have flowers irregularly of one, or the other, or sometimes of both sexes:

Of these he establishes only three classes.

The first of these (the twenty-first class in the general order) is of the *monoecia*: the word derived from the before-mentioned μόνος, and οἶκος, a habitation, signifies with this author such plants as have their distinct flowers on the same individual; and he comprehends accordingly under it those plants which have the male and female flowers distinct in themselves, but placed on the same plant, or the different stalks from the same root: of this class are the *alder, mulberry, amaranth, arrowhead, &c.*

The second of these (the twenty-second class in the general order) is of the *dioecia*: the word derived from the same οἶκος and δὶς, signifies with him plants which have their male and female flowers, not on the same individual; and accordingly comprehends under it such plants as have distinct male and female flowers, on different plants of the same species, either of which, the male and female plants, as they are hence called, might have arisen from the same seed: of this class are the *willow, misletoe, hemp,* and *spinach, &c.*

The third of these (the twenty-third in the general method) is of the *polygamia*: the word derived from πολὺς, many, and γάμος, marriage, signifies with this author plants which have a diversity of combinations and many ways of *fructification*, in the same species; and accordingly he comprehends under this class those plants which have, in the same species, some flowers male, others female, each distinct and perfect in its kind; and others mixed or *hermaphrodite*, with the male and female organs of *fructification* both in each: of this class are *pellitory of the wall, orrache, the ash, &c.*

After all these he places those plants whose flowers are either absolutely invisible, or scarce discernible by the eye: of these he makes only one, his twenty-fourth and last class, the *cryptogamia*: the word derived from κρυπτὸς, hidden, or concealed, and the before-mentioned γάμος, or marriage, signifies a set of plants, in which the *fructification* is concealed: and under this last class he comprehends those plants which either flower, as is generally supposed, within the fruit, or have the organs of their *fructification* so mingled as to escape our observation: of this class are the *ferns, mosses, liverworts,* and *mushrooms.*

These are the classes into which this author has regularly and certainly reduced the whole vegetable world; the characters of which are so expressive, and the parts they are founded upon so fixed and invariable in their nature and office, that there seems no reason hereafter to perplex the world with any new system.

As the classes are here all taken from the number, site and disposition of the male parts of the flower; so the orders which make their subdistinctions are, by this author, deduced from the differences of the female parts or *pistillum*; and as that is single, double, triple, and so on, they are on the same principles named *monogynia, digynia, trigynia, &c.*

It were to be wished indeed that the characters of the different genera of these classes were as perfect and accurate as the classes themselves: this, however was more than the work of one man; the author has fixed the general distinction, and led the way; and it is easy now for a much less genius to follow him.

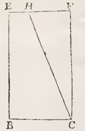
FROWEY, a term used by workmen for timber which is evenly tempered all the way, and works freely without tearing. Build. Dict. in voc.

FRUIT (*Suppl.*)—*Ripening of* FRUIT. For the method of forwarding this operation of nature, see the article RIPENING, *Append.*

FRUSH, or FROG, among farriers, that part of a horse's foot, which is placed from the middle of the sole towards the heel, upon both sides: it is more soft and higher raised than the rest of the sole. Dict. Ruff. in voc.

FRUSTUM (*Cycl.*) — FRUSTUM *of a cone.* The cylinder generated by the revolution of the rectangle EBCF (fig. I.) about one of its sides EB, which is the height of the *frustum* of a cone, the other side BC being the radius of its greatest base, is to the *frustum* generated by the revolution of the trapezium EBCH, as the square of BC is to the rectangle contained under BC and EH, added to one third part of the square of the difference of these lines. *Archimedes.*

Fig. I.



We have a general theorem in Mr. Mac Laurin's Treatise of Fluxions, concerning the *frustum* of a sphere, cone, spheroid, or conoid, terminated by parallel planes, when compared with a cylinder of the same altitude, on a base equal to the middle section of the *frustum* made by a parallel plane. The difference between the *frustum* and the cylinder is always the same in different parts of the same, or of similar solids, when the inclination of the planes to the axis, and the altitude of the *frustum* are given.

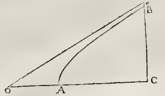
FRUSTUM *of a parabolic conoid.* In the parabolic conoid this difference vanishes, the *frustum* being always equal to a cylinder of the same height, upon the section of the conoid that bisects the altitude of the *frustum*, and is parallel to its bases.

FRUSTUM *of a sphere.* In a sphere the *frustum* is always less than the cylinder by one fourth part of a right angled cone, of the same height with the *frustum*, or by one half of a sphere of a diameter equal to that height; and this difference is always the same in all spheres, when the altitude of the *frustum* is given.

In the cone, the *frustum* always exceeds the cylinder by one fourth part of the content of a similar cone that has the same height with the *frustum*.

Frustum *of an hyperbolic conoid.* In the hyperbolic conoid this excefs is the fame as in the cone generated by the triangle OCe, (fig. II.) formed by the axis OC, the afymptote Oe, and the perpendicular Ce, the altitude of the *fruf-*

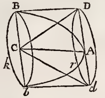
Fig. II.



tum and the inclination of the axis to their bafes being the fame in both.

Frustum *of a fpheroid.* In the fpheroid $ABkb$, (fig. III.) the cylinder exceeds the *fruftum*; and the difference between them is the fame as in the cone $CDrd$, the plane Drd, or Bkb, being fuppofed parallel to thofe which terminate the *fruftum.* In different inclinations of thofe planes, when the altitude of the *fruftum* is given, that difference is reciprocally as the cube of the diameter Bb, which is the conjugate of CA, the axis of the *fruftum.* But if the altitude of the *fruftum* be alfo varied fo as to be reciprocally proportional to the diameter Bb, then the difference between the *fruftum* and cylinder will be always of the fame magnitude in the fame fpheroid or conoid.

Fig. III.



When the inclination of the axis of the folid to the planes that terminate the *fruftum* is given, the difference between the *fruftum* and cylinder, in the fame, or in fimilar bodies, is as the cube of their common altitude. *Mac Laurin's* Fluxions, Introd. p. 24, 25.

Thefe propofitions concerning *fruftums* are of ufe in gauging. See the article Gauging, *Suppl.*

FUMAGE, a term ufed in fome parts of the kingdom for dung, or manuring with dung.

FUMER, in zoology, a name given to the pole-cat. See the article Putorius, *Suppl.*

FUMET, among fportfmen, a term ufed for the ordure or dung of harts, otherwife called fewmets.

FUNCTION *(Cycl.)* — The term *function* is ufed in algebra, for an analytical expreffion any way compounded of a variable quantity, and of numbers, or conftant quantities. Therefore every analytical expreffion, in which, befides a variable quantity x, there are conftant quantities, is a *function* of x. Thus $a+3x$, $ax-4xx$, $ax+b\sqrt{aa-xx}$, c^x, &c. are *functions* of x.

The difference of *functions* confifts in the manner in which they are compounded; and depends, therefore, upon the operations by which quantities may be compounded and mixed. Thefe operations are, addition, fubtraction, multiplication, and divifion, the raifing to powers, and extraction of roots, to which the refolution of equations ought to be referred. Befide thefe operations, which are called algebraical, there are other tranfcendental ones, fuch as exponential, logarithmic, and many others arifing from the inverfe method of fluxions.

Functions may arife from the moft fimple and analytical operations: thus we have the multiple *functions* $2z$, $3z$, $\frac{1}{2}z$, az, &c. and the powers of z, as z^2, z^3, $z^{\frac{1}{2}}$, z^{-1}, &c. are called *functions.*

Functions are divided into *algebraical* and *tranfcendental*: *algebraical* or *algebraic functions*, are thofe formed by algebraic operations only; fuch are thofe above fpecified, except c^x, which belongs to the following fpecies.

Tranfcendental functions are thofe formed by tranfcendental operations: fuch are exponential quantities or powers, the exponents of which are variable quantities; whereas in algebraic *functions* the exponents are always conftant quantities.

It is to be obferved as to *tranfcendental functions*, that thofe *functions* only of a variable quantity are to be deemed tranfcendental, which not only enter the compofition with, but alfo affect the variable quantity: thus if z fignifies a circular arc, or a logarithm, then will ca^z, and the like expreffions, be *tranfcendental functions* of z. But if the tranfcendental operation appertains only to conftant quantities, the *function* is no more than algebraic: thus if c denote the circumference of a circle, the radius of which is $=1$, c will be a tranfcendental quantity, and yet the expreffions $c+z$, cz^2, $4z^c$, are but algebraic *functions* of z. Some indeed have doubted whether z^c ought to be ranked among algebraic *functions*, or not; but the doubt is of fmall weight. And fome choofe to call the powers of z, the exponents of which are irrational numbers, *interfcendent functions*: thus $z^{\sqrt{2}}$ is an interfcendent *function* of z.

On the fubject of *functions*, their divifions, transformations, explication by infinite feries, &c. Mr. Euler fhould be confulted, who has treated this matter very fully in the firft chapter of his Analyf. infinitorum.

FURCA & *flagellum*, in our old writers, denotes the meaneft of all fervile tenures, when the bondman was at the difpofal of his lord for life and limb. — *Ipfe tenet in villenagio ad* furcam & flagellum *de domino fuo*, &c.

FURROW, among gardeners, denotes a ridge or fwelling on the fide of a tree, ftalk, fruit.

Furrow is alfo ufed for the deep trench left between ridges, to drain off the fuperfluous moifture.

FURZE, in botany, the Englifh name of a genus of plants called by authors *genifta fpartium.* See the article Genista *fpartium*, *Suppl.*

FUSTIC-*tree*, in botany. See the article Fustuc, *Suppl.*

G.

GABLOCKS, the name by which the artificial fpurs of game cocks are called. See the article Cock, *Suppl.*

GADDS, among miners. See the article Digging, *Suppl.*

GAFFS, a name fometimes ufed for the gablocks of cocks. See the article Gablock, *fupra.*

GALANGAL, the name by which the root of a genus of plants called by Linnæus *Kæmpferia*, is commonly known. See the article Kæmpferia, *Append.*

GALANTHUS, in the Linnæan fyftem of botany, the name of a diftinct genus of plants, which Tournefort makes only a fpecies of *Narciffo-leucoium.* See the article Narcisso-*leucoium*, *Suppl.*

GALE, in botany, the name of a genus of plants defcribed by Linnæus under that of *myrica.* See the article Myrica, *Append.*

GALL-*ficknefs*, a name fometimes given to bilious and intermitting fevers. See the article Bilious *fever*, *Append.*

GALLY, on fhip-board, a place in the cook-room, where the grates are put up, fires lighted, and the victuals boiled or roafted. *Blanckley*, Nav. Expofitor, p. 62.

GAMMER-*lamb.* See the article Gimmer-*lamb*, *Append.*

GAMMONING, on fhip-board, are feveral turns of rope taken round the bow-fprit, and reeved through holes in the knees of the head, for the greater fecurity of the bow-fprit. *Blanckley*, Nav. Exp. p. 62.

GANDER, the popular name for a male goofe: one of thefe will ferve five geefe.

GAR-*fifh*, in ichthyology, a name ufed in feveral parts of the kingdom for the *efox.* See the article Esox, *Suppl.*

GARGET, a difeafe of cattle, confifting in a fwelling of the throat and the neighbouring parts; to prevent which, bleeding in the fpring is recommended.

GARGIL, a diftemper in geefe, which by ftopping the head frequently proves mortal. Three or four cloves of garlick, beaten in a mortar with fweet butter, and made into little balls, and given the creature fafting, is the ordinary cure. Dict. Ruft. in voc.

GARLICK *(Suppl.)*—*Wild*-Garlick, a name by which fome call a fpecies of onion. See the article Onion, *Suppl.*

GASKETS, on fhip-board, the fmall cords ufed for faftening fails to the yards when furled up. *Blanckley*, Nav. Exp. p. 63.

GAST-

GAST-*hound*. See the article HOUND, *Append.*

GATE, among sportsmen, a term used for the footsteps of a hart. Dict. Rust. in voc.

GATTON-*tree*, a name sometimes given to the cornel-tree. See the article CORNUS, *Suppl.*

GAULE, in botany, a name used by some writers for the *myrica*, or sweet-willow. See the article MYRICA, *Append.*

GAZE-*hound*, or GAST-*hound*. See the article HOUND, *Append.*

GELDER-*rose*, the term by which some call the *opulus*, or water-elder. See the article OPULUS, *Suppl.*

GENERATION (*Cycl.* and *Suppl.*) — The antients believed that males and females were equally concerned in the work of *generation*, and that the fœtus was formed in the womb by a mixture of the seminal juices of both sexes; without pretending to know, or determine by any system, the manner of nature's operation.

Modern philosophers have thought that they saw farther than the antients, and have, at different times, adopted the two systems of *generation* mentioned in the *Cyclopædia* under this head.

But the late experiments of Monf. de Buffon, and of Mr. Needham, if they do not establish a new system, seem at least in a great measure to overturn the old ones.

Monf. de Buffon has endeavoured to prove that the ova in women and quadrupeds are chimeras, and that the spermatic animalcule cannot be the fœtus. He could never find any ova which had detached themselves from the ovary, and passed through the Fallopian tube into the matrix. But he discovered a glandular body on the female testicle, which anatomists had mistaken for one of these; which glandular body, at certain times, swelled, opened and discharged a liquor full of the same animalcules, which Lewenhoek took for living creatures in the semen of males. And Monf. de Buffon adds that he found bodies perfectly similar to these, not only in the semina of very different animals, but in the infusions of plants, of grains, and in the juices of flesh-meats, dressed and prepared by the fire so as to leave no creature living in them. From whence this ingenious gentleman concludes, that these pretended animalcules are not future animals of the species of the father: he does not even allow them to be true animals, but says they are something of an intermediate nature between brute matter and animals; parts organized and animated, the assemblage of which forms the fœtus. See Lettres de Monf. de Maupertuis, let. 17.

But the chief difficulty consists in conceiving how the fœtus is formed from these elements. Monf. de Buffon thinks that every part of the body in both sexes furnishes these organic moleculæ, the reservoirs of which are the seminal liquors of both sexes; that these liquors arrange and unite themselves by attraction, in certain internal moulds, in a manner which that learned author has endeavoured to explain at large; but which will not seem susceptible of any abridgment, to those who would not choose to run the risque of misrepresenting his sentiments on so obscure a subject; we therefore refer to the original, that is, to the Histoire Naturelle, printed at Paris, 1749, where the subject of the *generation* of animals takes up the greatest part of the second volume.

Monf. de Maupertuis's system, in his Venus Physique, has a near resemblance to that of Monf. de Buffon, and tends equally to overturn the systems of the ova, and of the spermatic animalcules, which have prevailed among modern physiologists. The former of these gentlemen, to confirm his own and Mr. de Buffon's opinion, adds an account of a sexdigitary family, as he calls it, at Berlin, many of which had a supernumerary finger or toe, and sometimes both. He says that this sexdigitism, or quality of having supernumerary fingers or toes, has been transmitted equally by the father and by the mother; that it was lost by alliances with those who had but the common number of fingers. He adds, that he does not believe that any one will ascribe the continuation of sexdigitism in a family, to chance; these supernumerary parts might have been accidental varieties at first, but if they be once established by a sufficient number of *generations*, where both sexes have had them, they then become a foundation for a distinct species; and perhaps all the different species discernible in animals of the same kind, have been multiplied in this way. What we may observe in other animals gives ground for these suspicions. See the Letter before cited.

GEODES, in natural history, a genus of crustated bodies formed into large and in great part empty cases, inclosing a small quantity of earthy, or arenaceous matter. See the article SIDEROCHITA. *Append.*

Of this genus are the following known species: 1. The cracked *geodes*, with ferrugineous brown and yellow crusts. 2. The wrinkled *geodes*, with ferrugineous reddish-brown and gold-yellow crusts. 3. The sparkling *geodes*, with ferrugineous purplish and orange-coloured crusts. 4. The long scabrous *geodes*, with a single purplish crust. 5. The long *geodes*, with a single blackish crust. *Hill*, Hist. Foss. p. 541.

GERMANDER-*tree*, in botany, the English name of a genus of plants known among authors by that of *teucrium*. See the article TEUCRIUM, *Suppl.*

GESSES, the same with *jesses*. See the article JESSES, *Append.*

GHERKINS. See the article GUERKINS, *Append.*

GIDDINESS, the popular name for the distemper called by physicians *vertigo*. See the article VERTIGO, *Cycl.*

Giddiness in horses is cured by a glyster and blood-letting, to be repeated after two days moderate exercise. Dict. Rust. in voc.

GIGG (*Cycl.*) — GIGGS, among farriers, small bladders or blisters on the inside of a horse's lips. They must be laid open; and cleansed with salt and vinegar, or alum-water. Dict. Rust. in voc.

GIGGE, in the manufacture of flax, denotes a hole made in the earth, where fire is made to dry the flax laid over it. Dict. Rust. in voc.

GILDER. See the article GUILDER, *Append.*

GILDING (*Cycl.* and *Suppl.*) - GILDING-*knife*, a slip of the hollow Spanish cane, cut up to a smooth and sharp edge, with a good pen-knife: this cane-knife cuts the gold-leaf better than one of steel, as it is apt to stick to this last.

GILDING-*pallet*, a flat piece of wood, about three inches long and an inch broad, covered with a piece of fine woollen cloth.

By breathing upon this pallet, to moisten the cloth a little, and then clapping it gently down upon the gold-leaf, this may be raised from the cushion, and conveyed to the work to be gilded.

GILL-*go-by-ground*, the name used by some writers for ground-ivy. See the article IVY, *Suppl.*

GILLIFLOWER, or JULY-*flower*, in botany, the English name given to several species of *caryophyllus*. See the article PINK, *Suppl.*

Queen's GILLIFLOWER, the name by which some call a distinct genus of plants, described by authors under that of *hesperis*. See the article HESPERIS, *Suppl.*

Stock GILLIFLOWERS, the name of another distinct genus of plants called by botanical writers *leucoium*. See the article LEUCOIUM, *Suppl.*

GIMMER-*lamb*, or GAMMER-*lamb*, a term used by country-people for a female or ewe lamb. Dict. Rust. in voc.

GINGER, the English name of a genus of plants called by authors *zinziber*. See the article ZINZIBER, *Suppl.*

GINGIDIUM, a name used by some botanists for a species of fennel. See the article FOENICULUM, *Suppl.*

GINSENG, in botany, the name given by the people of the East-Indies to the *panax* of botanical writers. See the article PANAX, *Append.*

GIRDLE (*Suppl.*) — GIRDLE-*wheel*, a small spinning-wheel made for hanging to a woman's girdle, or apron-string; so that she may spin with it, though walking about. Dict. Rust. in voc.

GIRKIN, among gardeners, denotes a small kind of cucumber, used for preserving, about the end of October. Rust. Dict. in voc.

GIRT, among builders, the same with fillet. See the article FILLET, *Cycl.*

GIRTHS *of a saddle*, the strong straps, made of a canvas stuff called *girth*-web; which being buckled under the horse's belly, serve to fix the saddle. Rust. Dict. in voc.

GLADDON, or GLADWIN, in botany, the name of a plant, otherwise called spurge-wort. Rust. Dict. in voc.

GLADE, in zoology. See the article GLEAD.

GLADE, in gardening, an open and light passage made through a wood, by lopping off the branches of trees. *Miller*, Gard. Dict. in voc.

GLADWIN, a name sometimes used for the *iris*, or *flower de luce*. See the aricle IRIS, *Suppl.*

GLANDULOUS *roots*, among botanists, such tuberose roots as are fastened together in large numbers by small fibres or threads. Rust. Dict. in voc.

GLASS-*wort*, is sometimes used as the name of a genus of plants described by Linnæus under that of *salicornia*. See the article SALICORNIA, *Append.*

GLASSES, *chemical*, how cæmented, when cracked. See the article CÆMENT, *Append.*

GLASTONBURY-*thorn*, a name sometimes given to the *mespilus*, or medlar. See the article MEDLAR, *Suppl.*

GLAUBER'S *salt*. See the article SAL *mirabile*, *Suppl.*

GLAZIER, an artificer who works or deals in glass.

GLEAD, or GLADE, a name used in the northern parts of the kingdom for the *milvus*, or kite. See the article KITE, *Append.*

GLEBA *alana*, a name by which some call the yellowish white *tripoli*. See the article TRIPOLI, *Cycl.* and *Suppl.*

GLEDE, in ornithology. See the article GLEAD, *Append.*

GLISTER. See the articles CLYSTER, *Cycl.* and ENEMA, *Suppl.*

GLOBE-*daisy*, the English name of a genus of plants called by authors *globularia*. See the article GLOBULARIA, *Suppl.*

GLOBE-*crow-foot*, a name sometimes given to the *helleborus*, or black hellebore. See the article HELLEBORUS, *Suppl.*

GLOBE-*amaranth*, the name of a genus of plants called by botanical writers *amaranthoides*. See the article AMARANTHOIDES, *Suppl.*

GLOBE-*fish*, in ichthyology, the name by which many species of the *ostracion* are called in English. See the article OSTRACION, *Suppl.*

GLOBE-*flower*, or GLOBE-*bottle*, names sometimes given to the *cyanus*, or blue-bottle. See the article CYANUS, *Suppl.*

GLOBE-*thistle*, in botany, the English name of the *echinopus*. See the article ECHINOPUS, *Suppl.*

GLORIOSA, *superb lilly*, in botany, the name of a distinct genus of plants, the characters of which are these: there is no cup: the flower consists of six oblong, lanceolated, undulated, and every way long petals, reflex nearly to the base; the stamina are six subulated filaments, patulous and shorter than the petals of the flower; the antheræ are incumbent; the germen of the pistil is globose; the style is filiform, inclined, and longer than the stamina; the stigma is simple and obtuse; the fruit is an oval pellucid capsule, consisting of three valves, and containing three cells; the seeds are numerous, globose, and disposed in a double series. *Linnæi* Gen. Plant. p. 144.

Tournefort, in the Memoirs of the Academy of Sciences, has called this genus *methonica*. Id. ibid.

GLUE (*Suppl.*) — *Bees* GLUE, a name used by some for crude or rough wax. See the article WAX, *Suppl.*

GLUT, among falconers, denotes the slimy substance that lies in a hawk's pannel. Dict. Rust. in voc.

GLUTTON, *gulo*, in zoology, a name sometimes given to the reddish brown *mustela*, with the middle of its back black. See the article MUSTELA, *Suppl.*

GNOMONIC (*Cycl.*) — GNOMONIC, or GNOMONICAL *projection*, that which represents the circles of an hemisphere, upon a plane touching it in the vertex, by lines or rays from the center of the hemisphere to all the points of the circles to be projected.

In this projection all the great circles of the sphere are projected into right lines. Any lesser circle parallel to the plane of projection is projected into a circle. And any lesser circle not parallel to the plane of projection, is projected into a conic section.

The *gnomonic projection* is also called the *horologiographic projection*, because it is the foundation of dialling. In other respects it is not much used, because the circles of the sphere are projected into conic sections, which are difficult to describe. However this projection has its conveniencies in the solution of some problems of the sphere, on account of the great circles being all projected into right lines.

Mr. Emerson, known by an ingenious treatise upon Fluxions, has given the theory and practice of the *gnomonic projection*, in his Treatise on the Projection of the Sphere, Lond. 1749, octavo. See also Mr. *Murdoch's* Newtoni Genesis Curvarum per Umbras, p. 46, *seq.*

GOAT's *rue*, in botany, the English name of a genus of plants called by authors *galega*. See the article GALEGA, *Suppl.*

GOAT's *stones*, in botany, a name sometimes given to the *orchis* of botanical writers. See the article ORCHIS, *Suppl.*

GODWIT, in zoology, the English name of the *ægocephalus*. See the article ÆGOCEPHALUS, *Suppl.*

GODWIT, in ornithology, the English name of a species of *tringa*. See the article TRINGA, *Suppl.*

GOLD *of pleasure*, in botany, a term by which some call the *myagrum* of botanical authors. See the article MYAGRUM, *Suppl.*

GOLD-*finch*, in ornithology, the name of a species of *fringilla*. See the article FRINGILLA, *Suppl.*

It is smaller than the common sparrow, but of a more elegant form; its colours are extremely beautiful and gay; there is a spot of red at the base of the beak; the top of the head is black, and its hinder part white; the neck and back are of a mixed colour, composed of grey and reddish brown; the belly is white; the ground colour of the wings and tail is black, but they are elegantly variegated with yellow and white; the legs are short, and the hinder toe is longer than any of the others.

GOLDEN *flower-gentle*, a name sometimes given to several species of the *amaranth*. See the article AMARANTH, *Suppl.*

GOLDEN-*cups*, a name by which some call the *ranunculus*, or *crow-foot*. See the article RANUNCULUS, *Suppl.*

GOLDEN-*head*, in ornithology, a water-fowl, otherwise called *anas arctica*. See the article DUCK, *Suppl.*

GOLDY-*locks*, the English name of a genus of plants, called by botanical writers *elichrysum*. See the article ELICHRYSUM, *Suppl.*

GOLF, or GOUF, the name of a diversion, or exercise, much used in Scotland, and played upon the lawns, or links, as they are there called.

It consists in driving a ball with clubs, between two goals or holes, half a mile or a mile asunder. He who can do this with the fewest strokes of his club is the conqueror.

GOMER, or HOMER, a Hebrew measure. See the article CORUS, *Suppl.*

GONDOLA-*shell*, a species of *dolium*. See the article DOLIUM.

GOOSE-*foot*, in botany, the English name of a genus of plants called by botanists *chenopodium*. See the article CHENOPODIUM, *Suppl.*

GOOSE-*grass*, in botany, a name sometimes given to the *aparine* of authors. See the article APARINE, *Suppl.*

GOOSEANDER, a name used in several parts of the kingdom for a species of *mergus*. See the articles MERGUS and MERGANSER, *Suppl.*

GOOSEBERRY *of Barbadoes*, a name by which some call the *pereskia* or *cactus* of botanical writers. See the article CACTUS, *Suppl.* and *Append.*

American GOOSEBERRY, the name of a genus of plants called by botanists *melastoma*. See the article MELASTOMA, *Suppl.*

GORCE, in botany, See the article GORSE, *Append.*

GOREING, or GORING, is said of a sail when cut slanting, so that it is broader at the clew than at the earing, as all topsails and top-gallant-sails are. *Blanckley*, Nav. Exp. p. 65.

GORSE, or GOSSE, in botany, a name sometimes used for furze. See the articles ULEX and GENISTA *spartium*, *Suppl.*

GOSLINGS, a term used to denote young geese. See the article GOOSE, *Suppl.*

GOSSYPIUM, the *cotton-plant*, in botany, the name of a genus of plants, the characters of which are these: the cup is double, the exterior one being composed of one leaf deeply divided into three segments, and the inner one slightly divided into five segments; the flower consists of five leaves adhering at the base, cordated at the top, plane, and patent; the stamina are numerous filaments, which by adhering together form a kind of cylinder at the base; the antheræ are kidney-shaped; the germen of the pistil is roundish; the style columnar, and of the length of the stamina; the stigmata are four, and pretty thick; the fruit is a roundish capsule, divided into four cells and containing numerous egg-shaped seeds, surrounded with a fine downy matter. Vide *Linnæi* Gen. Plant. p. 331.

GOUF, or GOLF. See the article GOLF, *Append.*

GOURD (*Suppl.*) — *Bitter* GOURD, a name sometimes given to the *colocynthis* of botanical writers. See the article COLOCYNTHIS, *Suppl.*

Indian tree-GOURD, a term by which the *cujete*, or *crescentia*, of botanical writers, is sometimes called. See the article CRESCENTIA, *Suppl.*

Sour GOURD, in botany, a name sometimes given to the *baobab*, or *baobob*. See the article BAOBAB, *Suppl.*

GOURD-*worm*, the English name of a species of worm found in the intestines of several animals. It has this name from its resembling the seed of the gourd in figure.

GOURDY *legs of horses*. See the article GREASE, *Cycl.*

GOUT-*wort*, a name sometimes given to a genus of plants called by botanists *angelica*. See the article ANGELICA, *Suppl.*

GRAIN (*Suppl.*) — *Oily* GRAIN, the name by which some call the *sesamum*, or *myagrum* of botanical writers. See the article MYAGRUM, *Suppl.*

Scarlet GRAIN, in botany, a term sometimes used to denote the *opuntia* and *ilex* of botanical writers. See the articles OPUNTIA and ILEX, *Suppl.*

GRAMEN, *grass*, in botany, the name by which botanists call a large genus of plants. See the article GRASS, *Append.*

GRAMEN *murorum, spica longissimâ*, the name given by Mr. Raymond to a genus of plants called by Linnæus *festuca*. See the article FESTUCA, *Suppl.*

GRAPE, the fruit of the vine. See the article VITIS, *Suppl.*

Sea-side GRAPE, in botany, a name by which some call the *guajabara*. See the article GUAJABARA, *Append.*

Hyacinth GRAPE, a name sometimes used for the *muscari*, a genus of plants. See the article MUSCARI, *Suppl.*

GRASS, *gramen*, in botany, the English name of a large genus of plants, the characters of which are these: the flower, which is disposed in fasciculi, has no petals, consisting wholly of a number of stamina, arising, for the most part, out of a squamose cup; the germen of the pistil finally becomes a roundish or oblong seed, inclosed in the cup itself, or in a distinct capsule, and containing very little farina or flour. See *Tournefort*, Inst. Bot. p. 516. See also the Article GRASS, *Suppl.*

Of this genus there are a vast multiplicity of species, enumerated by the above-mentioned author, whom the curious may consult on that head.

Canary-GRASS, the English name of a distinct genus of plants called by botanists *phalaris*. See the article PHALARIS, *Suppl.*

Capon's tail GRASS, the English name of a distinct genus of plants called by botanists *festuca*. See the article FESTUCA, *Suppl.*

Crested-GRASS, or *Cock's foot* GRASS, names given to a distinct genus of plants, called by Linnæus *cynosurus*. See the article CYNOSURUS, *Suppl.*

Couch-GRASS, a name given to the green-leav'd *triticum*, with a creeping root. See the article TRITICUM, *Suppl.*

Dog's GRASS, *gramen Caninum*, the name by which some call a species of *triticum*. See the article TRITICUM, *Suppl.*

Sea-dog's GRASS, a name sometimes given to the double-spiked *secale*, or rye. See the articles SECALE and RYE, *Suppl.*

Dog's-tail GRASS, the Engliſh name of a diſtinct genus of plants called by authors *cynoſurus*. See the article CYNOSURUS. *Suppl.*

Fox-tail GRASS, the Engliſh name of a diſtinct genus of plants known among botaniſts under that of *alopecurus*. See the article ALOPECURUS, *Suppl.*

Knot-GRASS, a name given to ſeveral diſtinct genera of plants. See the articles POLYGONUM and PARONYCHIA, *Suppl.*

Love-GRASS, a name ſometimes given to a ſpecies of *briza*, a diſtinct genus of plants. See the article BRIZA, *Suppl.*

Meadow-GRASS, the Engliſh name of a diſtinct genus of plants called by authors *poa*. See the article POA, *Suppl.*

Hard Meadow-GRASS, a name ſometimes given to a ſpecies of the *cynoſurus*, or *dog's-tail graſs*. See the article CYNOSURUS, *Suppl.*

Millet-GRASS, in botany. See the article MILIUM, *Suppl.*

Oat-GRASS, in botany, a name by which ſome call a ſpecies of *feſtuca*. See the article FESTUCA, *Suppl.*

Buſh-oat-GRASS, or *tall oat*-GRASS, names given to a diſtinct genus of plants, called by botaniſts *bromus*. See the article BROMUS, *Suppl.*

Quaking GRASS, *gramen tremulum*, the name by which ſome call a ſpecies of *briza*. See the article BRIZA, *Suppl.*

GRASS *of Parnaſſus*, the Engliſh name of a diſtinct genus of plants called by authors *Parnaſſia*. See the article PARNASSIA, *Suppl.*

Pudding-GRASS, a name ſometimes given to the *pulegium*, or penny-royal, a ſpecies of mint. See the articles MENTHRA and MINT, *Suppl.*

Rattle-GRASS, a name ſometimes uſed for the *pedicularis*, or louſe-wort. See the article PEDICULARIS, *Suppl.*

Scorpion-GRASS, the Engliſh name of a genus of plants called by botaniſts *ſcorpioides*. See the article SCORPIOIDES, *Suppl.*

Shave-GRASS the name uſed by ſome writers for the *equiſetum* of botaniſts. See the article EQUISETUM, *Suppl.*

Silk-GRASS, a name by which ſome call two very different genuſſes of plants, the aloe and dog's-bane. See the articles ALOE and DOG'*s-bane*, *Suppl.*

Sword-GRASS, a name ſometimes given to the *gladiolus* of botaniſts. Ruſt. Dict. in voc.

Trefoil-GRASS, or *three-leaved* GRASS, a diſtinct genus of plants. See the article TREFOIL, *Suppl.*

Vetch-GRASS, the Engliſh name of a diſtinct genus of plants called by authors *niſſolia*. See the article NISSOLIA, *Suppl.*

Viper's GRASS, a name by which ſome call the *ſcorzonera* of botanical writers. See the article SCORZONERA, *Suppl.*

GRAVING, in the ſea language, is the bringing a ſhip a-ground, and then burning off with furze, reed, or broom, all the filth and foulneſs that ſticks to her bottom without-board, in order to pay her new. *Blanckley*, Nav. Exp. p. 67.

GRAVITY *(Cycl.)* — To determine the ſpecific *gravity* of bodies accurately, requires ſo much care, and is liable to ſo many difficulties, that we need not be ſurprized when we find authors differing from one another. The lateſt we have on this ſubject, and the beſt, is Dr. Richard Davies, in the Philoſ. Tranſact. N°. 488. This gentleman has with great pains and judgment collected all the experiments of this kind, that have been made by the moſt accurate authors, ſhewing how widely they diſagree, and pointing out the cauſes of their differences; and he has alſo given us the ſpecific *gravities* of ſeveral ſubſtances from his own obſervations; to which we refer the curious.

GRAY, the Engliſh name of a ſpecies of duck, otherwiſe called gadwall. See the article GADWALL, *Suppl.*

GRAYMILL, in botany, a name ſometimes given to the *lithoſpermum* of authors, more uſually called gromwell. See the article LITHOSPERMUM, *Suppl.*

GREEN *(Suppl.)* — *Saxon* GREEN, an extremely beautiful *green* colour, the proceſs of dying which is this: the cloth or ſilk is firſt to be dyed a Saxon blue, in the following manner; having ground nine parts of indigo with twenty of red arſenic into a fine powder, add forty-eight parts of ſtrong ſpirit of vitriol; which mixture ſwells, grows hot, and emits a ſulphureous ſmell. After ſtanding in a moderate warmth for twenty-four hours, pour off the liquid part, which will be of an extremely deep blue. A ſmall quantity of this liquor, dropt into hot water, inſtantly ſpreads, tinges it of a fine light blue, and fits it for dying the prepared wool, cloth, or ſilk; and, by increaſing or diminiſhing the proportion of the blue compoſition, the colour may be rendered deeper or lighter.

The cloth or ſilk, thus dyed blue, is next to be dipt in the yellow decoction of weld or fuſtic, and the deſired colour will be obtained.

Or the ſubject may be died *green* at one operation, by boiling it for a little time in a mixture of the blue and yellow liquors.

By thus combining any blue and yellow dyes, in different proportions, all the ſhades of *green* may be produced, from the bluiſh *green* of the cabbage-leaf to the greeniſh yellow of the olive.

Winter-GREEN, the name of a diſtinct genus of plants called by authors *pyrola*. See the article PYROLA, *Suppl.*

GREEN-*finch*, the Engliſh name of a ſpecies of *fringilla*, which has a ſtrong tinge of *green* diffuſed over all its body; the wings and tail are black, but both variegated with a beautiful yellow. See the article FRINGILLA, *Suppl.*

GREENS, in diet. It is to be obſerved, that *greens* as well as fruit are but a flatulent diet, and therefore ought to be eaten with moderation in bilious diſorders. However, on account of their antiſeptic quality, they are eſteemed good for preventing putrid and contagious diſeaſes. *Pringle*, Obſerv. on the Diſeaſes of the Army, p. 210, 294.

GREY, or GRAY, in zoology. See the article GRAY, *Suppl.*

GREY *fly*, the name of a ſpecies of two-winged flies, called by zoologiſts *œſtrum*. See the article ŒSTRUM, *Suppl.*

GRICE, a term uſed by country people for a young wild boar. Dict. Ruſt. in voc.

GRIG, in ichthyology, a name frequently uſed for the ſand-eel or *ammodytes*. See the article AMMODYTES, *Suppl.*

GRIPES, in the dyſentery. See the article DYSENTERY.

GRISLEY *ſeeds*, among herbaliſts, denote thin, flat ſkinny ſeeds. Ruſt. Dict. in voc.

GROATS, a term uſed in many parts of the kingdom for culled oats or oat-meal only half ground. Dict. Ruſt. in voc.

GROOVE *(Suppl.)* — GROOVE, or GROVE, among joiners, denotes the channel that is made by their plough in the edge of a moulding, ſtyle, or rail.

GROOVE alſo denotes a gardener's tool for tranſplanting flowers. Dict. Ruſt. in voc.

GROTTO *(Cycl. and Suppl.)* — A cæment for artificial *grottos* may be made thus: take two parts of white roſin, melt it clear, and add to it four parts of bees wax; when melted together add two or three parts of the powder of the ſtone you deſign to cæment, or ſo much as will give the cæment the colour of the ſtone; to this add one part of flower of ſulphur: incorporate all together over a gentle fire, and afterwards knead them with your hands in warm water. With this cæment the ſtones, ſhells, &c. after being well dried before the fire, may be cæmented. *Smith*'s Laboratory, p. 169.

Artificial red coral branches, for the embelliſhmrnt of *grottos*, may be made in the following manner: take clear roſin, diſſolve it in a braſs pan; to every ounce of which add two drams of the fineſt vermillion: when you have ſtirred them well together, and have choſen your twigs and branches, peeled and dried, take a pencil and paint the branches all over whilſt the compoſition is warm; afterwards ſhape them in imitation of natural coral. This done, hold the branches over a gentle coal-fire, till all is ſmooth and even as if poliſhed.

In the ſame manner white coral may be prepared with white lead, and black coral with lamp-black.

A *grotto* may be built with little expence of glaſs, cinders, pebbles, pieces of large flint, ſhells, moſs, ſtones, counterfeit coral, pieces of chalk, &c. all bound or cæmented together with the above deſcribed cæment.

GROUND-*pine*, in botany. See the article CHAMÆPYTIS, *Suppl.*

Stinking GROUND-*pine*, the name by which ſome call the *polycnemum* and *camphorata* of botanical writers. See the articles POLYCNEMUM, *Append.* and CAMPHORATA, *Suppl.*

GROUND-*worm*, in the hiſtory of inſects. See the articles WORM and EARTH-*worm*, *Suppl.*

GROUNSEL, *ſenecio*, in botany. See the article SENECIO, *Suppl.*

African GROUNSEL, a name ſometimes given to a genus of plants called by Linnæus *kleinia*. See the article KLEINIA, *Append.*

GROWSE, in ornithology. See the article GROUSE, *Suppl.*

GRUB-*ax*, or GRUBBAGE, among gardeners, &c. a tool for grubbing up the roots of trees, weeds, &c. Ruſt. Dict. in voc. See GRUBBING, *Suppl.*

GUABANI, in botany, the name of a delicate fruit of the Weſt-Indies, cooling and of a ſweet taſte: it is about two hands breadth long, and has a white delicious pulp, containing a number of hard kernels or ſeeds.

GUAIACAN, in botany, a name by which ſome authors have called the tree whoſe wood is the *lignum vitæ*, or *guaiacum* of the ſhops.

GUAJABARA, the *ſea-ſide-grape*, the name of a genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, conſiſting of ſix petals; in the center ariſes the pointal, which afterwards becomes a pulpy fruit, incloſing one roundiſh ſtone terminating in a point.

The ſpecies of *guajabara* are theſe, 1. The *ſea-ſide-grape*, with oblong leaves. 2. The common *ſea-ſide-grape*, with roundiſh leaves. 3. The *ſea-ſide-grape*, with very broad leaves. 4. The *ſea-ſide-grape*, with ſmaller and longer leaves.

All theſe ſorts, which are natives of the Weſt-Indies, muſt be propagated by ſeeds, ſown in pots of light rich earth, and plunged into an hot-bed of tanner's bark: the plant muſt conſtantly remain in a ſtove, being too tender to live in the open air, even in our warmeſt weather; only in ſummer they may be frequently refreſhed with water, and have freſh air admitted to them. *Miller*'s Gard. Dict. in voc.

GUANA, in zoology, a ſpecies of lizard, otherwiſe called *iguana*. See the article IGUANA, *Suppl.*

GUARANTY, in politics, an engagement of mediatorial or neutral states, whereby they pledge their faith, that the articles of a particular treaty shall be inviolably observed on both sides.

This engagement implies, that the guarantees are obliged to assist the party invaded contrary to the treaty, against the injurious agressor; but not if the war is occasioned by any other causes than the violation of the articles of peace. *Puffendorff*, Law of Nature and Nations, book VIII. ch. viii. § 7.

GUAVA, a name sometimes given to the *guajava* of Tournefort. See the article GUAJAVA, *Suppl.*

GUERKINS, a kind of cucumbers for pickling, otherwise called gherkins. Dict. Rust. in voc.

GUERNSEY-*lilly*, a name used for a genus of plants, called by some *amaryllis*, and by others *lilio-narcissus*. See the article LILIO-NARCISSUS, *Suppl.*

GUILLEMITES, an order of monks in Flanders, whose habit resembles that of the Cistertians: they follow the rule of St. Augustine, and are governed by a superior, who does not take the title of provincial, and is elected every four years. See *Broughton's* Dict. Relig. in voc.

GUINEA-*henweed*, in botany, a name by which some call the *petiveria* of botanical writers. See the article PETIVERIA, *Suppl.*

GUINEA-*pepper*, the English name of a genus of plants, called by authors *capsicum*. See the article CAPSICUM, *Suppl.*

GUINEA-*wheat*, a name sometimes given to the maiz, or Indian corn, called by botanists *yucca*. See the article YUCCA, *Suppl.*

GUINEA-*worm*, in the history of insects, the same with what zoologists call *chætia*. See the article CHÆTIA, *Append.*

GULO, in zoology, a name sometimes given to a species of *mustela*. See the article GLUTTON, *Append.*

GUM *(Suppl.)* — Grew, in his Anatomy of Plants, makes the following remarks concerning the import of the word *gum*, and the distinction thereof both from a rosin and a mucilage.

A rosin, he observes, is originally a turpentine, or acidulous liquor, having an exceeding small quantity of watery parts mixed therewith; and which, for that reason, will not be dissolved in water, but only in oil: of this kind are mastic, benzoin, tacamahaca, commonly called *gums*, though, strictly speaking, they are all true rosins.

A *gum*, on the other hand, is originally a milky liquor, having a greater quantity of water mixed with its oily parts; and which, for that reason, dissolves either in water or oil: of this kind are sagapenum, opopanax, ammoniac, &c.

A third sort of *gum* is that which is unoily; and which, therefore, dissolves only in water, as *gum* arabic, the *gum* of the cherry-tree, &c.

These last substances, though commonly called *gums*, are only dried mucilages; being originally nothing else but the mucilaginous lymph issuing from the vessels of the tree, in the same manner as it does from comfrey, mallows, &c. and even from the cucumber; the vessels thereof, upon being cut across yielding a lymph which is plainly mucilaginous, and which being well dried at length becomes a kind of *gum*, or rather a hardened mucilage.

In like manner, the *gums* of the plumb-tree, cherry-tree, and the like, are nothing else but dried mucilages.

If we will take the word in its widest sense, all *gums* are originally either a terebinth, or a milk, or a mucilage. *Grew*, Anat. of Plants, book III. ch. iv. p. 134.

Gums, in medicine, should always be strained before they are used, as being seldom free from dross and other admixtures, which hinder their operation.

Dr. Pringle, in his Observations on the Diseases of the Army, tells us, that *gums* are all powerful antiseptics. See the article ANTISEPTICS, *Append.*

GUM-*succory*, in botany, a name by which the *chondrilla* of authors is sometimes called. See the article CHONDRILLA, *Suppl.*

GUNDELIA, in botany, a distinct genus of plants called *hacub* by Vaillant; the characters of which are these: there is scarcely any common cup, except the surrounding leaves; the flower is of the compound kind, uniformly tubulated, being made up of equal hermaphrodite floscules, consisting of a single clavated petal, divided into five segments at the edge; the stamina are five very short capillary filaments; and the antheræ cylindraceous, tubulated, and long: the germen of the pistil is ovated, immersed in the receptacle, crowned with very small squamæ, and placed at the bottom of each flosculе; the style is filiform, and longer than the flower-petals; the stigmata are two in number, and turned backwards; there is no pericarpium; the seeds, which are single, roundish, and acuminated, being concealed in the receptacle, which is of a conic figure. *Linnæi* Gen. Plant. p. 386.

GUNNERY *(Cycl.)* — Mr. Robins, from the experiments related in his New Principles of *Gunnery*, having concluded, that the force of fired gun-powder, at the instant of its explosion, is the same as that of an elastic fluid of a thousand times the density of the common air, and that the elasticity of this fluid, like that of air, is proportionable to its density, proposes the following problem:

The dimensions of any piece of artillery, the weight of its ball, and the quantity of its charge being given, to determine the velocity which the ball will acquire from the explosion, supposing the elasticity or force of the powder at the first instant of its firing to be given.

In the solution of this problem he assumes the two following principles: 1. That the action of the powder on the bullet ceases as soon as the bullet is got out of the piece. 2. That all the powder of the charge is fired, and converted into an elastic fluid, before the bullet is sensibly moved from its place.

These assumptions, and the conclusions before-mentioned, make the action of fired gun-powder to be entirely similar to that of air condensed a thousand times; and from thence it will not be difficult to determine the velocity of the ball arising from the explosion. For the force of the fired powder diminishing in proportion to its expansion, and ceasing when the ball is out of the piece; the total action of the powder may be represented by the area of a curve, the base of which represents the space through which the ball is accelerated; and the ordinates to which, represent the force of the powder at every point of that space. And these ordinates being in reciprocal proportion to their distance from the breech of the gun, because when the spaces occupied by the fired powder are as 1, 2, 3, 4, &c. the force of the powder, or the ordinates representing it, will be as, 1, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, &c. it appears that the curve will be a common hyperbola, and that the area intercepted between it, its asymptote, and the two ordinates representing the force of the powder at the first explosion and at the muzzle of the piece, will represent the total action of the powder on the ball. But if the ball were urged through the same space, by an uniform force equal to its gravity, the total action of this force would be represented by a rectangle, the base of which would be the base of the curve or intercepted portion of the asymptote before-mentioned, and the height of which would represent the uniform force of gravity. Hence the square of the velocity of the ball resulting from the action of the gunpowder, will be to the square of the velocity resulting from the action of gravity, as the area of the hyperbolic space is to the area of the rectangle [a]. But the velocity of the ball resulting from gravity is given, being the velocity it would acquire from a height equal to the space through which the powder accelerates it; and the proportion between the hyperbolic space and the rectangle is also given, from the analogy of hyperbolic spaces and logarithms [b]; therefore the velocity of the ball arising from the action of the fired gun-powder will be given. — [[a] By prop. 39. lib. i. of Newton's Principles. [b] See the article LOGARITHM, *Suppl.*]

To give an example of this, let us suppose the length of the barrel of a gun to be 45 inches, its diameter, or rather the diameter of the ball to be $\frac{3}{4}$ of an inch; and the space occupied by the powder to be $2\frac{5}{8}$ inches; to determine the velocity which will be communicated to a leaden bullet by the explosion, supposing the bullet laid at first with its surface contiguous to the powder.

By the theory here laid down it appears, that at the first instant of the explosion the flame will exert, on the ball lying close to it, a force one thousand times greater than the pressure of the atmosphere. But the medium pressure of the atmosphere is esteemed equal to that of a column of water 33 feet high; whence lead being to water as 11,345 to 1, this pressure will be equal to that of a column of lead 34,9 inches in height, whence multiplying this by 1000, a column of lead 34900 inches high would produce a pressure equal to what is exerted on the ball by the powder in the first instant of the explosion; and the leaden ball being $\frac{3}{4}$ of an inch in diameter, and consequently equal to a cylinder of lead on the same base $\frac{1}{2}$ an inch in height, the pressure at first acting on it will be equal to 34900×2, or 69800 times its weight; whence the force of gravity is to that of the powder at its first explosion, as 1 to 69800. Now an uniform force, as 1, accelerating the ball through a space of $45 - 2\frac{5}{8} = 42\frac{3}{8}$ inches, will give it a velocity of 15.07 feet in one second of time; for this is the velocity the ball would acquire in falling from a height of $42\frac{3}{8}$ inches. And an initial force, as 69800, but diminishing continually, as the hyperbolic ordinates, will, upon computation, be found to communicate a velocity to the ball, which will be to that communicated by gravity as 110.7 to 1. Therefore the velocity of the ball arising from the action of the gun-powder will be $= 110.7 \times 15.07 = 1668.249$ feet in one second of time; that is, the ball, when it first leaves the piece, will be carried at the rate of 1668 feet in one second.

As to the first of the principles here assumed, the author has observed, in the Philos. Transact. N° 469. p. 445, that it would be found erroneous, if examined with a geometrical rigour; since it cannot be questioned but the flame acts in some degree on the bullet after it is out of the piece: but in experiments no such accuracy is attainable; minute irregularities

ties are the neceffary concomitants of all complicated experiments: in the collifion of bodies, in the running or fpouting of water, even in fmall velocities, irregularities happen, not reconcileable to theory or to each other: what may not then be fuppofed to happen from the action of fo furious a power as gun-powder? From experiments it appears, that velocities of bullets fired from the fame piece, charged with the fame powder, and all other circumftances, as nearly as poffible, the fame, do yet differ from each other by fometimes more than $\frac{1}{20}$ part of the whole: but this is a fmall degree of inaccuracy in a cafe of this nature, and if the action of the flame on the bullet, after it is out of the piece, is fo fmall as to produce no greater effect than what may be deftroyed by the inevitable variations of the experiments, the neglecting it entirely is both convenient and a reafonable procedure. Now what gives ground to think that this poftulatum, though not rigoroufly true, may be fafely affumed, is the confideration of the fpreading of the flame by its own elafticity, as foon as it efcapes from the mouth of the piece; for by this it may be conceived that the part of it which impinges on the bullet may be neglected, although the impulfe of the flame be a very remarkable force.

With regard to the fecond affumed principle, that all the powder is fired before the bullet is fenfibly moved from its place; it is to be obferved, that this very pofition, having been examined by a committee of the Royal Society, was, after feveral experiments, determined in the negative; from whence many may be ready to conclude, that the whole theory muft be overturned. But this requires a farther difcuffion, and it will appear that though this principle be not rigoroufly true, no more than the former, yet it feems alfo that it may be fafely admitted in inveftigating the effects of powder, fince, even in fhort barrels, where the fpace the bullet was impelled thro' was not five inches, and where of courfe the deficiency of velocity was greateft, it cannot amount to one thirtieth of the whole. This will appear from the experiments made by the committee; for when the barrel was fo fhortned, that the bullet being placed clofe to the wad, lay with its outer furface nearly level with the mouth of the piece; yet even in this fhort tranfit of the bullet but $\frac{1}{8}$ of the whole charge, at a medium, was collected unfired; which $\frac{1}{8}$, properly reduced, amounts to but $\frac{1}{12}$ of the charge. This reduction is founded on thefe confiderations, that the powder ufed by the committee being unequally grained, when the fmaller grains, collected by fifting, were ufed, the quantity remaining unfired was lefs at a medium in the ratio of 5 to 3, than when it was ufed without fifting. Alfo, by extracting the falt-petre from the powder collected unfired, there was lefs falt-petre contained in it than in real powder, nearly in the ratio of 9 to 7. Now thefe two proportions compounded, make the proportion of 15 to 7, in which proportion muft the quantities of powder unfired be reduced, in order to determine the quantity of fine good powder that might be fuppofed to remain unfired in the experiments brought to confirm the aforefaid theory.

Now it appears by experiments, that the velocities of bullets placed in the fame fituation are in the fubduplicate proportion of the charges: confequently the deficiency of velocity arifing from the lofs of $\frac{1}{12}$ of the charge will be about $\frac{1}{24}$ of the velocity only. And in the experiments made with a barrel $5\frac{1}{5}$ inches in length, where the ball had not three inches to move, the quantity of real powder collected unfired from a charge of 12dwt. would have been no more than 16 grains, at a medium, or $\frac{1}{18}$ of the whole charge, which would produce a deficiency of $\frac{1}{36}$ of the velocity only: a difference lefs than what frequently occurs in the exacteft repetition of the fame experiments.

This, it is thought, is fully fufficient to juftify the principle in queftion; efpecially as in all cafes of real ufe the length of the barrel, in proportion to the quantity of the charge, will be much greater than in the inftances here mentioned. See Phil. Tranf. N°. 469, p. 450, 452, &c. and fee the Experiments of the committee in the Tranfactions, N°. 465, p. 172, 173, &c.

The greateft part of thofe who have written on the manner in which powder takes fire, have fuppofed it to be done by regular degrees; the firft grains firing thofe contiguous, and they the next fucceffively; and it has been generally thought, that a confiderable time was employed in thefe various communications: for Mr. Daniel Bernoulli, in his *Hydro-dynamica*, has concluded from fome experiments made at Peterfburg, that the greateft part of the charge efcapes out of the piece unfired, and that the fmall part which is fired, does not take fire 'till it is near the mouth. Many theories too have been compofed on the time of the progrefs of the fire amongft the grains, and the different modifications which the force of powder did thence receive; and it has been generally conceived, that the proper lengths of pieces were determinable from this principle; that they fhould be long enough to give time for all the powder to fire.

But no fuch regular and progreffive fteps feem obfervable in the explofion. For confidering that by loading with a greater weight of bullet, and thereby almoft doubling the time of the continuance of the powder in the barrel, its force receives but an inconfiderable augmentation; and that doubling and trebling the ufual charge, the powder thus added always produces a correfpondent effect in the velocity of the bullet; likewife, that in a piece near four feet in length, charged with an ufual charge of powder, the velocity communicated to the bullet, during the firft three inches of its motion, is full half the velocity acquired in its whole paffage thro' the barrel; and confidering alfo that the elafticity or force of the powder, in the three firft inches of its expanfion, is at a medium near eight times greater than in the laft two feet of the barrel; it may be concluded from all thefe circumftances, that the time employed by the powder in taking fire was not neceffary to be attended to in thefe computations; but that the whole mafs might be fuppofed to be kindled, before the bullet was fenfibly moved from its place.

And the experiments reported by the committee of the Royal Society, in the Tranfaction, N°. 465, before-mentioned, are ftrong proofs that the powder is not fired in the progreffive manner ufually fuppofed; for when the fhort barrel was charged with 12 penny-weight and fix penny-weight refpectively, the quantity of powder which was collected unfired from 12 penny-weight, did not exceed by three grains, at a medium, what was collected from fix penny-weight, although the bullet was a lefs time in paffing thro' the barrel with 12 penny-weight than with fix, it having a lefs way to move; confequently the quantity remaining unfired of the fix penny-weight, did not continue unfired for want of time; fince when the piece was charged with 12 penny-weight, the additional fix penny-weight was confumed in a fhorter time. See Phil. Tranf. N°. 469. p. 450.

Mr. Robins has alfo given us an ingenious way of determining, by experiments, the velocity which any ball moves with, at any diftance of the piece it is difcharged from.

This may be effected by means of a pendulum made of iron, having a broad part at bottom, covered with a thick piece of wood, which is faftened to the iron by fcrews. Then having three poles joined together by their tops and fpreading at bottom, fuch as are vulgarly ufed in weighing and lifting heavy bodies, and called by workmen triangles, on two of thefe poles, towards their tops, are fcrewed on fockets, on which the pendulum is hung by means of a crofs piece, which becomes its axis of fufpenfion, and on which it ought to vibrate with great freedom. Something lower than the bottom of the pendulum there fhould be a brace, joining the two poles to which the pendulum is fufpended; and to this brace there is faftened a contrivance made with two edges of fteel, fomething in the manner of a drawing pen; the ftrength with which thefe edges prefs on each other being diminifhed or increafed at pleafure, by means of a fcrew. To the bottom of the pendulum fhould be faftened a narrow ribbon, which paffing between the fteel edges, may hang loofely down by means of an opening cut in the lower piece of fteel.

The inftrument being thus fitted, if the weight of the pendulum, the refpective diftances of its center of gravity, and of its center of ofcillation, from its axis of fufpenfion, be known, it may from thence be found, what motion will be communicated to this pendulum by the percuffion of a body of a known weight moving with a known degree of velocity, and ftriking it in a given point; that is, if the pendulum be fuppofed at reft before the percuffion, it will be known what vibration it ought to make in confequence of fuch a blow; and if the pendulum being at reft, is ftruck by a body of a known weight, and the vibration which the pendulum makes after the blow is known, the velocity of the ftriking body may from thence be determined.

Now the extent of the vibration, made by the pendulum, may be meafured by the ribbon. For if the preffure of the fteel edges on the ribbon be regulated by the fcrew, fo as to be free and eafy, tho' with fome minute refiftance to hinder its flipping of itfelf: then fetting the pendulum at reft, let the part of the ribbon between the pendulum and the fteel edges be drawn ftrait, but not ftrained, and fixing a pin in the part of the ribbon contiguous to the edges, the pendulum fwinging back by the impulfe of the ball, will draw out the ribbon to the juft extent of its vibration, which will be determined by the interval on the ribbon between the edges and the place of the pin.

The computation by which the velocity of the ball is determined, from the vibration of the pendulum after the ftroke, is founded on this principle of mechanics; That if a body in motion ftrikes on another at reft, and they are not feparated after the ftroke, but move on with one common motion, then that common motion is equal to the motion with which the firft body moved before the ftroke: whence, if that common motion and the maffes of the two bodies are known, the motion of the firft body before the ftroke is thence determined. On this principle it follows, that the velocity of a bullet may be diminifhed in any given ratio, by its being made to impinge on a body of a weight properly proportioned to it; and hereby the moft violent motions, which would otherwife efcape our examination, are eafily determined by the retarded motions which have a given relation to them.

 See

See New Princip. of Gunnery, p. 28, 29, &c. See alſo the Phil. Tranſ. N. 469, p. 444. where a ſmall correction, relating to a number in Mr. Robins's 8th propoſition, is mentioned.

It is to be obſerved, that the length to which the ribbon is drawn, is always nearly the chord of the arch deſcribed by the aſcent; it being ſo placed, as to differ inſenſibly from thoſe chords which moſt frequently occur; and theſe chords are known to be in the proportion of the velocities of the pendulum acquired from the ſtroke. Hence it follows, that the proportion between the lengths of ribbon drawn out at different times, will be the ſame with that of the velocities of the impinging bullets.

Now from the computations delivered by Mr. Robins, it appears, that the velocity of the bullet was 1641 feet in one ſecond of time, when the chord of the arch deſcribed by the aſcent of the pendulum, in conſequence of the blow, was $17\frac{1}{4}$ inches. Therefore, by the proportion of any other lengths of ribbon drawn out, by any percuſſion, to $17\frac{1}{4}$, the proportion of the velocity with which the bullets impinge, to the known velocity of 1641 feet in 1″, will be determined.

As experiments of this kind are often attended with danger and difficulty, thoſe who may be diſpoſed to make any, will find ſeveral uſeful practical cautions, in p. 31, 32 and 33 of the ſaid Treatiſe.

By the experiments recited at large, in Propoſition IX. of the ſame Treatiſe, it appears, that the computations from Mr. Robins's theory, compared with thoſe experiments, which were made with barrels of various lengths, from ſeven inches to forty-five, and with different quantities of powder, from ſix penny-weight to thirty-ſix, have a remarkable coincidence, and ſuch as occurs but in few philoſophical ſubjects of ſo complicated a nature.

Suppoſing, for inſtance, the length of a barrel to be 45 inches, the quantity of powder 12 penny-weight, and the ball $\frac{3}{4}$ inch diameter, weighing $1\frac{1}{2}$ ounce, or $\frac{1}{12}$ of a pound averdupoiſe, and the windage or exceſs of the diameter of the barrel above that of the bullet about $\frac{1}{20}$ of an inch; the velocity of the bullet will, by theory, be about 1670 feet in one ſecond: and this velocity is found in theſe experiments, to be the mean velocity which the ball really receives in thoſe circumſtances. Hence we may determine the velocities with which muſket and cannon ſhot are diſcharged from their reſpective pieces by their uſual allotment of powder.

For as a leaden ball of $\frac{3}{4}$ inch diameter, and weighing nearly $1\frac{1}{2}$ ounce averdupoiſe, being fired from a barrel of 45 inches in length with half its weight of powder, will have a velocity at its iſſuing from the piece, which, if uniformly continued, would carry it near 1700 feet in 1″: ſo if inſtead of a leaden ball an iron one of the ſame diameter was placed in the ſame ſituation in the ſame piece, and was impelled by the ſame quantity of powder, the velocity of ſuch an iron bullet would be greater than that of the leaden one, in the ſubduplicate ratio of the ſpecific gravities of lead and iron; and ſuppoſing that ratio to be as 3 to 2, and computing on the foregoing principles, it will appear, that an iron bullet of 24 lb. weight, ſhot from a piece of 10 feet in length, with 16 lb. of powder, will acquire from the exploſion a velocity which, if uniformly continued, would carry it nearly 1650 feet in 1″. But if inſtead of this full charge weighing two thirds of the ball, we ſuppoſe the charge to be only half that weight, then its velocity will be no more than at the rate of 1490 feet in 1″; and the ſame would be the velocities of every leſſer bullet, fired with the ſame proportions of powder, if the lengths of all pieces were conſtantly in the ſame ratio with the diameters of their bore: and tho' this proportion does not always hold, yet the difference is not conſiderable enough to occaſion a very great variation from the velocities here aſſigned. But in theſe determinations, the windage is ſuppoſed to be no more than is juſt neceſſary for the eaſy putting down the bullet; whereas in real ſervice, either thro' negligence or unſkilfulneſs, it often happens, that the diameter of the bore ſo much exceeds the diameter of the bullet, that great part of the inflamed fluid eſcapes by its ſide; whence the velocity of the ſhot may, in this caſe, be conſiderably leſs than what is here aſſigned: however, part of this may poſſibly be compenſated by the greater heat which in all probability attends the firing of theſe large quantities of powder.

The theory here eſtabliſhed ſuppoſes what is ſaid under the head GUN-POWDER, that the powder when fired is equally hot with iron at the beginning of its white heat; but in very ſmall quantities of powder the heat is probably leſs, and conſequently the elaſticity leſs than what ariſes from this ſuppoſition. Now this decreaſe of elaſticity in ſmall quantities of powder has been found in many trials actually to take place. For inſtance, according to the theory before laid down, the velocity given the ball by the action of the powder is in round numbers 1670 feet in 1″; and this, as has been ſaid, is confirmed by the experiments taken at a medium. If now the barrel and poſition of the ball remaining the ſame, there be placed in the ſpace that contained 12 penny-weight of powder there mentioned, only one penny-weight; it follows, that if the elaſticity of the ſmaller charge be the ſame in proportion to its quantity with that of the larger, then the velocity of the bullet, when impelled by the exploſion of the ſmaller charge, will be to the velocity of a bullet impelled by a greater charge in the ſubduplicate ratio of the quantities of the reſpective charges, that is, in the ſubduplicate ratio of 1 to 12. Conſequently the velocity communicated by 12 penny-weight being known to be that of 1670 feet in 1″, the velocity communicated by one penny-weight would be that of 482 feet in 1″ nearly; but by repeated trials differing little from each other, it has been found, that the real velocity acquired by the ball in this caſe, from the exploſion of one penny-weight, was rather leſs than that of 400 feet in 1″. Whence it is evident, that the elaſticity of one penny-weight of powder, when fired, is leſs in proportion to its quantity than that of 12 penny-weight, as it ought to be by the theory.

So if three penny-weight of powder be placed in the ſame manner with the one penny-weight laſt mentioned, the real velocity the ball will acquire from the exploſion, will be from 740 to 720 feet in 1″. Whereas, ſuppoſing the elaſticity of three penny-weight, when fired, to be in ſimilar circumſtances the ſame with that of 12 penny-weight, the velocity acquired by the ball ſhould be 835 feet in 1″.

It is farther to be obſerved, that the theory eſtabliſhed under the head GUN-POWDER, ſuppoſes that in the firing of gunpowder about $\frac{3}{10}$ of its ſubſtance is converted by the ſudden inflammation into a permanent elaſtic fluid, the elaſticity of which, in proportion to its heat and denſity, is the ſame with that of the common air in the like circumſtances: it farther ſuppoſes, that all the force exerted by gun-powder in its moſt violent operations, is no more than the action of the elaſticity of the fluid thus generated; and theſe principles enable us to determine the velocities of bullets impelled from fire arms of all kinds.

From this theory appears the inconcluſiveneſs of what ſome authors have advanced relating to the advantages of particular forms, for the chambers of mortars and cannon; for all their laboured ſpeculations on this head are evidently founded on very erroneous opinions about the actions of fired powder. See lib. cit. p. 41.

But it muſt not be diſſembled, that however probable this theory may be from the experiments and reaſons on which it is founded, there ſtill remains a difficulty which ſeems not yet fully accounted for. The doubt ariſes from ſome experiments made before a committee of the royal ſociety, who hereupon gave it as their opinion, that the change of the form in the chamber will produce a change of the diſtance to which the bullet is thrown. The experiments upon which this opinion was founded, were as follows:

Three braſs chambers were made, whoſe depths were reſpectively three inches, $1\frac{1}{2}$ inch and $\frac{3}{4}$ inch; ſo turned as to fit the chamber of a braſs mortar exactly; each of theſe chambers contained, when full, one ounce troy of powder. The ball was of braſs, weighing nearly 356 ounces troy. The ball touched the powder of the charge in all theſe experiments. With the firſt chamber of three inches deep, the elevation of the mortar being 45, the range taken at a medium of three ſhot was 741 feet: and the mean diſtance to which the ball was thrown with the chamber of $\frac{3}{4}$ inch deep, was but 464 feet. As to the chamber of $1\frac{1}{2}$ inch, it not fitting the chamber of the mortar exactly, the ranges were very irregular; but the leaſt range, tho' fired late in the damp of the evening, exceeded the fartheſt range of the $\frac{3}{4}$ inch chamber, and the fartheſt range extended to 686 feet; ſo that the committee ſeem well warranted in their opinion. The difficulty is to reconcile this with the foregoing theory. Its ingenious author has, in general obſerved, in the account of his book given in the Phil. Tranſ. N°. 469, p. 455, that when the charge is much ſmaller than the uſual allotment of powder, there are ſome irregularities, as thoſe ariſing from the different heat of ſmall and large quantities of powder, to which head too perhaps muſt be referred the experiments made by the committee on the effect of different ſmall chambers; but in cuſtomary charges, the velocities of bullets reſulting from all the experiments hitherto made, are really ſuch as the theory requires. And it appears, that theſe velocities are much greater than what they have been hitherto accounted; and there are reaſons from the theory to believe, that in cannon ſhot the velocities may ſtill exceed the foregoing computation. See Phil. Tranſ. N°. 465.

If a bullet be laid at a conſiderable diſtance from the charge, the principles before laid down cannot then be applied to determine the velocity of the ball; they being only applicable in caſes where the bullet is contiguous to the charge, or nearly ſo. For by what is ſhewn under the head GUN-POWDER, when the ſurface of fired powder is not confined by a heavy body, which it is obliged to impel before it, the flame dilates itſelf with a velocity much beyond what it can at any time communicate to a bullet by its continued preſſure; becauſe the powder having acquired a conſiderable degree of velocity of expanſion, the firſt motion of the ball will not be

be produced by the continued preffure of the powder, but by the percuffion of the flame. From whence it follows, that the velocity of a bullet, laid a confiderable diftance before the charge, ought to be greater than what would be communicated to it by the preffure of the powder acting as before-mentioned in this article. And this deduction from theory is confirmed from experience, by which it was found that a ball laid in a barrel, at the diftance of 11$\frac{1}{4}$ inches from the breech, and impelled by 12 penny-weight of powder, acquired in its difcharge a velocity of about 1400 feet in 1″; whereas if it had been acted on by the preffure of the flame only, it would not have acquired a velocity of 1200 feet in 1″. The fame was found to hold true in all other greater diftances (and alfo in leffer, tho' not in the fame degree) and in all quantities of powder. And from hence arifes a confideration of confequence in practice, which is, that no bullet fhould at any time be placed at any confiderable diftance before the charge, unlefs the piece be extremely well fortified: for a moderate charge of powder, when it has expanded itfelf thro' the vacant fpace, and reaches the ball, will, by the velocity each part has acquired, accumulate itfelf behind the ball, and be thereby prodigioufly condenfed; whence if the barrel be not extraordinary ftrong, it muft burft. This is confirmed by the experience of an exceeding good tower mufket of very tough iron, which being charged with 12 dwt. of powder, and the ball being placed 16 inches from the breech; upon firing the piece, part of the barrel, juft behind the bullet, was fwelled out to double its diameter, and two large pieces burft out of it. If the powder be not placed together at the breech, but fcattered uniformly thro' the whole cavity left behind the bullet, the progreffive motion of the flame may hence be fuppofed to be prevented by the expanfion of the neighbouring parts. And it was found that the ball being laid as before, 11$\frac{1}{4}$ inches from the breech, its velocity, in this cafe, inftead of 1400 feet in 1″, was only 1100 feet. See New Princip. of Gunnery, Part I. Prop. xii.

It appears from experience, that bullets of the fame diameter and denfity impinging on the fame folid fubftance with different velocities, will penetrate that fubftance to different depths, which will be in the duplicate ratio of thofe velocities nearly. Thus a leaden bullet of $\frac{3}{4}$ of an inch in diameter, being fired againft a folid block of elm with different velocities, as of 1700 feet, 730, and 400 feet in 1″; the cavities were found to be as 55, 10 and 3 refpectively; which are nearly in the duplicate proportion of thofe velocities: perfect regularity in cafes of this nature cannot be expected, when the unequal texture of the fame piece of wood, and the change of the form, and the bullet by the ftroke, are confidered.

From the penetration being in the duplicate proportion of the velocity of the impinging body, it follows, that the refiftance of the wood, like that of gravity, is uniform. See New Princip. of Gunnery, p. 94, 95.

GUN-POWDER *(Cycl.)* — *Gun-powder*, fired either in a vacuum or in air, produces by its explofion, a permanent elaftic fluid.

If a red-hot iron be included in a receiver, and the receiver be exhaufted, and *gun-powder* be then let fall on the iron, the powder will take fire, and the mercurial gage will fuddenly defcend upon the explofion; and, tho' it immediately afcends again, yet it will never rife to the height it firft ftood at, but will continue depreffed by a fpace proportioned to the quantity of *gun-powder* which was let fall on the iron. By this means (firing fmall quantities at a time) the mercurial gage may be reduced from 29$\frac{1}{2}$ inches to 12$\frac{3}{4}$. Now this experiment, which has been often repeated, proves the propofition with refpect to the production of a permanent elaftic fluid in a vacuum; for the defcent of the gage could only be effected by the preffure of fome new generated fluid in the receiver, ballancing in part the preffure of the external air. That this fluid, or fome part of it at leaft was permanent, appears from thence, that tho' in thefe experiments the quickfilver afcended after the operation, yet next day it had afcended no higher than to 22$\frac{1}{2}$, at which place it feemed to continue fixed. And, that this fluid is elaftic, is proved from the defcent of the mercurial gage: fince the quantity of matter contained in this fluid, could not by its gravity alone have funk the quickfilver by the leaft fenfible quantity; alfo from its extending itfelf through any fpace, however great, the experiment fucceeding in either a large or fmall receiver, only the larger the receiver the lefs will be the defcent of the mercurial gage to the fame quantity of powder; the preffure of the generated fluid diminifhing as its denfity diminifhes. See Phil. Tranf. N°. 295.

The fame production likewife takes place, when *gun-powder* is fired in the air [a]; for if a fmall quantity of *powder* be placed in the upper part of a glafs tube, and the lower part of the tube be immerged in water, and the water be made to rife fo near the top that only a fmall portion of air is left in that part where the *gun-powder* is placed; if in this fituation the communication of the upper part of the tube with the external air be clofed, and the *gun-powder* be fired, (which may eafily be done by a burning-glafs) the water will, in this experiment, defcend on the explofion, as the quickfilver did in the laft, and will always continue depreffed below the place, at which it ftood before the explofion, and the quantity of this depreffion will be greater, if the quantity of *powder* be increafed, or the diameter of the tube be diminifhed. From whence it is proved, that as well in air as in a vacuum, the explofion of fired *powder* produces a permanent elaftic fluid [b]. — [[a] *Haukfbee*, Phyf. Mechan. Exp. p. 81. [b] *Robins*'s New Prin. of Gunnery, Prop. I.]

It alfo appears from experiment, that the elafticity or preffure of the fluid produced by the firing of *gun-powder*, is *cæteris paribus*, directly as its denfity. This follows from hence, that, if in the fame receiver a double quantity of *powder* be let fall, the mercury will fubfide twice as much as in the firing of a fingle quantity. For the vapour produced from the double quantity, being contained in the fame receiver, will be of double the denfity of that produced from the fingle quantity; whence the elafticity or preffure, eftimated by the defcent of the mercury being likewife double, the preffure is directly as its denfity. Alfo the defcents of the mercury, when equal quantities of *powder* are fired in different receivers, are reciprocally as the capacities of thofe receivers; and confequently as the denfity of the produced fluid in each.

To determine the elafticity and quantity of this elaftic fluid, produced from the explofion of a given quantity of *gun-powder*, Mr. Robins premifes, that the elafticity of this fluid increafes by heat, and diminifhes by cold, in the fame manner as that of the air; and that the denfity of this fluid, and confequently its weight, is the fame with the weight of an equal bulk of air, having the fame elafticity and the fame temperature. From thefe principles, and from his experiments, for a detail of which we muft refer to the book itfelf, he concludes, that the fluid produced by the firing of *gun-powder* will be $\frac{3}{10}$ of the weight of the *gun-powder*; and the ratio of the refpective bulks of the *powder*, and the fluid produced from it, will be, in round numbers, 1 to 244. See New Princip. of Gunnery, Scholium to Prop. II.

Hence we are certain, that any quantity of *powder* fired in any confined fpace, which it adequately fills, exerts at the inftant of its explofion againft the fides of the veffel containing it, and the bodies it impells before it, a force at leaft 244 times greater than the elafticity of common air, or, which is the fame thing, than the preffure of the atmofphere; and this without confidering the great addition which this force will receive from the violent degree of heat with which it is endued at that time; the quantity of which augmentation is the next head of Mr. Robins's enquiry. He determines that the elafticity of the air is augmented, when heated to the extremeft heat of red-hot iron, in the proportion of 796 to 194$\frac{1}{3}$; and fuppofing that the flame of fired *gun-powder* is not lefs hot than red-hot iron, and the elafticity of the air, and confequently of the fluid generated by the explofion, being augmented by the extremity of this heat in the ratio of 796 to 194$\frac{1}{3}$, it follows, that if 244 be augmented in this ratio, the refulting number, which is 999$\frac{1}{3}$, will determine how many times the elafticity of the flame of fired *powder* exceeds the elafticity of common air, fuppofing it to be confined in the fame fpace which the *powder* filled before it was fired.

Hence then the abfolute quantity of the preffure exerted by *gun-powder* at the moment of its explofion, may be affigned; for fince the fluid then generated, has an elafticity 999$\frac{1}{3}$, or in round numbers, 1000 times greater than common air; and fince common air, by its elafticity, exerts a preffure on any given furface equal to the weight of the incumbent atmofphere, with which it is in equilibrio, the preffure exerted by fired *powder*, before it has dilated itfelf, is 1000 times greater than the preffure of the atmofphere, and confequently the quantity of this force, on a furface of an inch fquare, amounts to above fix tun weight; which force, however, diminifhes, as the fluid dilates itfelf.

Tho' it has here been fuppofed, that the heat of *gun-powder*, when fired in any confiderable quantity, is the fame with iron heated to the extremity of a red heat, or to the beginning of a white heat, yet it cannot be doubted but that the fire produced in the explofion is fomewhat varied (like all other fires) by a greater or lefs quantity of fuel; and it may be prefumed, that according to the quantity of *powder* fired together, the flame may have all the different degrees from that of a languid red heat to the heat fufficient for the vitrification of metals; but as the quantity of *powder* requifite for the production of this laft mentioned heat, is certainly greater than what is ever fired together for any military purpofe, we fhall not be far from our fcope, if we fuppofe the heat of fuch quantities as come more frequently in ufe to be, when fired, nearly the fame with the ftrongeft heat of red-hot iron; allowing a gradual augmentation to this heat in larger quantities, and diminifhing it when the quantities are very fmall.

Some authors have attributed the force of *gun-powder*, or at leaft a confiderable part of it, to the action of the air con-

tained

tained either in the *powder* or between the intervals of the grains. They have supposed that air to exist in its natural elastic state, and to receive all its addition of force from the heat of the explosion; but from what was said before, relating to the increase of the elasticity of the air by heat, we may conclude, that the heat of the explosion cannot augment the elasticity to five times its common quantity; consequently, the force arising from this cause only, cannot amount to more than the 200th part of the real force exerted on this occasion. Ibid. p. 43.

We must here observe, that the experiment of firing *gun-powder*, in the top of a tube, by means of a burning-glass, and thereby making the water descend, and hence deducing that there is a permanent air or elastic fluid contained in *gun-powder*, and that those who pretend to account for the effects of *gun-powder*, from the rarefaction of the natural air, alledge an insufficient cause; this, I say, was so long ago as the year 1690, shewn by Mr. John Bernoulli in his dissertation *De effervescentia et fermentatione*. But as the experiment of this ingenious author was made with so very small a quantity of *powder* as four grains or corns *(granulæ)* and that the space the water subsided was not exactly measured; it is no wonder that he should conclude this factitious air to be only something more than 100 times *(centies et amplius)* denser than the natural air. See *Jo. Bernoulli*, Oper. vol. i. p. 35, 36.

But if this gentleman has supposed the force of *gun-powder* too little, his son Mr. Daniel Bernoulli, in his *Hydrodynamica*, has on the other hand supposed it a great deal too much, making its elasticity not less than 10000 times greater than that of the air. His reasons are founded, chiefly, on the great quantity of *powder* that escapes unfired from guns. But that this quantity of unfired *powder* is not very considerable, seems to be fully proved under the head GUNNERY.

The variations of the density of the atmosphere does not any way alter the action of *powder*. By comparing several trials, made at noon in the hottest summer sun, with those made in the freshness of the morning and the evening, no certain difference could be perceived; and it was the same with those made in the night and in winter. Indeed, considering that the same quantity of that elastic fluid in which the force of *powder* consists, is generated in a vacuum and in common air, it is difficult to conceive how this force can be affected by the greater or less density of the atmosphere.

But the moisture of the air has a very great influence on the force of *powder*, for that quantity which in a dry season would communicate to a bullet a velocity of 1700 feet in one second, will not in damp weather communicate a velocity of more than 12 or 1300 feet in a second, or even less, if the *powder* be had and negligently kept. New Princip. of Gunnery, p. 43, 44.

This agrees with an experiment made before a committee of the Royal Society, where *powder* having been dried by being put into a phial placed in boiling water, threw a ball out of a mortar twice as far as the same quantity of *powder* taken out of the same barrel before it was dried. Now the ranges under the same circumstances of charge, elevation, &c. being as the squares of the velocities of the ball, these velocities, in this experiment, will be to each other nearly as 17 to 12, which gives ranges as 289 to 144. Phil. Trans. N. 465, p. 182, 183.

If *powder* be damp, shot made with equal quantities of it out of the same parcel, will differ considerably from each other, perhaps ten times more than if the *powder* was in good order. A small charge seems to lose a greater part of its force than a larger, each being equally damp. Another circumstance attending damp *powder* is, a remarkable foulness in the piece, after firing, much beyond what arises from an equal quantity of dry *powder*. New Princip. of Gunnery, p. 44.

That *powder* will imbibe moisture from the air, and thereby increase in weight, is certain. A parcel of very good *powder* being placed on a white paper, pierced with a great number of fine holes, and held over the steam of hot water; the *powder* in half a minute was increased about $\frac{1}{70}$ in weight. Another parcel continuing longer in the steam was increased by $\frac{1}{27}$ part. That the moisture of the atmosphere has a like effect, appears from this; that an ounce of *powder* kept for some time in a room having a fire in it every day, being dried before the fire, lost above $\frac{1}{100}$ part of its weight; one third of which it regained in less than two hours, by being removed to a part of the room distant from the fire. And as the air is often much moister than when this experiment was tried, and that the open air is more moist than a room with a fire; it cannot be doubted but that the twentieth or thirtieth part of the substance of the best *powder* is water. Now as a certain quantity of water mixed with *powder* will prevent its firing at all, it cannot be doubted but every degree of moisture must abate the violence of the explosion; and hence the effects of damp *powder* are not hard to account for.

It is to be observed, that the moisture imbibed by *powder* does not render it less active when dried again. Indeed, if *powder* be exposed to the greatest damps without any caution, or if common salt abounds in it, as often happens thro' negligence in refining the nitre, the moisture it imbibes may, in such cases, be perhaps sufficient to dissolve some part of the nitre, which is a lasting damage that no drying can retrieve. But when tolerable care is taken in preserving *powder*, and the nitre it is composed of has been well purged from common salt, it will retain its force much longer than is usually supposed; and it is said that *powder* has been known to have been preserved for 50 years, without any apparent damage from its age.

Some care is necessary in the drying of damp *gun-powder*; for there is a degree of heat, which tho' not sufficient to fire the *powder*, will yet melt the brimstone, and destroy the texture of the grains. Nay more, there is a heat with which the brimstone will flame and burn away gradually, and yet the *powder* will not explode; of this any one may satisfy himself by heating a piece of iron red-hot, and then throwing a few grains of *powder* on it at different intervals, during the time of its cooling, for by this means he will find, that at a certain time the separate grains that fall on the iron will not explode, but will burn with a small blue flame for some space of time, the grain still remaining unconsumed. Indeed, when it has begun to burn in this manner, it sometimes ends with exploding, but this more commonly happens when a number of grains lie near together, for then tho' each separate flame is not sufficient to explode its respective grain, yet the whole fire made by them all together grows strong enough at last to end in a general explosion; however, by attending to the proper temperature of the iron, and spreading the grains, two or three inches square may be covered with a blue lambent flame, which will last a considerable time without any explosion, and the grains afterwards will not apparently have lost either their colour or their shape. Now since these grains, when the brimstone is thus burnt or even melted out of them, will no longer act as *powder*, it is evident that *powder* may be spoiled by being dried with too violent a heat. Ibid. Schol. to Prop. x.

The velocity of expansion of the flame of *gun-powder*, when fired in a piece of artillery without either bullet or other body before it, is prodigious. By the experiments of the author so often quoted, it seems this velocity cannot be much less than 7000 feet in a second. This however must be understood of the most active part of the flame. For, as was observed before, the elastic fluid in which the activity of *gun-powder* consists, is only $\frac{3}{10}$ of the substance of the powder, the remaining $\frac{7}{10}$ will in the explosion be mixed with the elastic part, and will by its weight retard the activity of the explosion; and yet they will be so completely united as to move with one common motion, but the unelastic part will be less accelerated than the rest, and some of it will not even be carried out of the barrel, as appears by the considerable quantity of unctuous matter, which adheres to the inside of all fire-arms after they have been used. These inequalities in the expansive motion of the flame, render it impracticable to determine its velocity otherwise than from experiments. The foundation of which determination is, that a barrel being fixed in a proper situation on a pendulum, such as described under the head GUNNERY, and being charged with 12 dwt. of powder, without either ball or wad, the powder being only put together by the rammer; on the discharge the pendulum ascended through an arch whose chord was 10 or $10\frac{1}{10}$ inches. Now if the piece be again loaded with the same quantity of powder, rammed down by a wad of tow weighing 1 dwt. it may be supposed, that this wad being very light, will presently acquire that velocity, with which the elastic part of the fluid will expand itself when uncompressed; and it was accordingly found, that the chord of the ascending arch was by this means augmented to 12 inches; so that by the additional weight of 1dwt. of matter moving with the velocity of the swiftest part of the vapour, the pendulum ascended through an arch whose chord was two inches longer than before. And by calculating upon these facts and the principles laid down in his book, Mr. Robins determines that the velocity with which this 1 dwt. of matter moved, must be about 7000 feet in one second. Ibid. prop. xi.

It is this prodigious celerity of expansion of the flame of fired *gun-powder*, which is its peculiar excellence, and the circumstance in which it so eminently surpasses all other inventions, either antient or modern, for the purpose of military projections: for as to the quantity of motion of these projectiles only, many of the warlike machines of the antients produced this in a degree far surpassing that of our heaviest cannon-shot or shells; but the great celerity given to these bodies cannot be in the least approached by any other means than by the flame of powder. The reason of this difference is, that the antients could by weights, or the elasticity of springs and stretched cords, augment their powers to any degree desired; but then each addition of power brought with it a proportional addition of matter to be moved: so that as the power increased, those parts of the machine which were to communicate motion to the projectile and were consequently to

to move with it, were likewise increased; and thence it necessarily happened, that the action of the power was not solely employed in giving motion to the impelled body, but much the greatest part of it was spent in accelerating those parts of the machine in which the power resided, to enable them to pursue the body to be projected with perpetual impulse, during its whole passage through the extent of their activity. Hence then it came to pass, that, though these antient machines could throw enormous weights, they could project them but with small degrees of celerity, compared with what we can communicate to our cannon and musket-shot; whence in all operations, where these great velocities are useful, our machines are infinitely superior to those of antiquity; although, in more confined and shorter projections, these last have some advantage which may yet render them worthy of the attention of those military geniuses, who have capacity enough to consider each part of the profession according to its true and genuine value, independent of the partial estimation of the times they live in. Ibid. p. 55.

Powder being a mixture of sulphur and charcoal, which are very inflammable substances, with salt-petre, which in itself is not, if the salt-petre be too much in quantity, when compared with the other two, their burning may not be sufficient to consume the whole of the salt-petre; whence the fire may be less violent, and consequently the powder less vigorous, than if some of the salt-peter was taken away, and a like quantity of the other materials were added in its stead. On the other hand, if the salt-petre in the composition be less than what the burning of the other two substances can easily consume, the fire will be less active than it ought to be, because it is not augmented so much as it would be if a large quantity of salt-petre had been added to the composition.

Hence it appears that the goodness of powder is not to be estimated only from the quantity of salt-petre contained in it, although that substance seems to be the basis of the elastic fluid, in which its force consists. For since the converting of the salt-petre into that fluid, and the elasticity of the fluid, afterwards, depend in some measure on the violence of the fire produced at the explosion, it is plain that there is a certain proportion in the mixture of the materials, which will best contribute to this purpose, and consequently to the perfection of the powder.

What this proportion is, has been ascertained by experience, and it seems now to be generally agreed, that in any quantity of powder $\frac{3}{4}$ of it should be salt-petre, the remaing $\frac{1}{4}$ consisting of equal quantities of sulphur and charcoal. This is the proportion followed by the French, and by most nations in Europe: we, indeed, pretend to a greater degree of nicety in our proportions; though, it is said, they do not greatly differ from what is here mentioned; nor is it certain that they are preferable: this however may be depended on, that no methods of proving powder, hitherto generally practised in England, could at all ascertain the difference; and other powders made with the usual proportions, are nothing inferior to ours. Ibid. p. 62.

But it is not the due proportion of the materials only, which is necessary to the making of good powder; another circumstance, not less essential, is the mixing them well together; if this be not effectually done, some parts of the composition will have too much salt-petre in them, and others too little; and in either case there will be a loss of strength in the powder.

As the excellence of powder then depends on so many particulars, in the quality and quantity of the materials, and in the working them together, it is, doubtless, of great importance, that those who receive the public stores should have it in their power to satisfy themselves about the goodness of what is delivered to them. The method most commonly followed for this purpose, here with us, says the author above quoted, is to fire a small heap of it on a clean board, and to attend nicely to the flame and smoke it produces, as likewise to the marks it leaves behind it on the table; from all which instructive particulars the merit of the powder is ascertained with great accuracy, as is pretended; but besides this uncertain method, which, how much soever it may be practised, none will undertake seriously to defend, there are, on particular occasions, other contrivances made use of, all which bear some analogy to the common powder-triers, sold at the shops: only they are more artfully fabricated, and instead of a spring they move a weight, which is a more certain and equable power.

But these machines, though more perfect than the common powder-triers, are yet liable to great irregularities; for as they are all moved by the instantaneous stroke of the flame, and not by its continued pressure, they do not determine the force of the fired powder with that certainty and uniformity which were to be desired in these kinds of trials: and therefore, the method followed by the French, in the receiving of powders from the makers, seems to be much better. Their practice is thus:

They have, in each magazine, a small mortar cast with its bed, according to a determined pattern, which is the same throughout the kingdom: this mortar is always pointed at 45°, and it contains just three ounces of powder; and it is a standing maxim, that no powder can be received into their stores, unless three ounces of it, placed in the chamber of this mortar, throws a solid ball of $7\frac{1}{2}$ inches diameter to the distance of at least 55 French fathom. But if each barrel of powder was to be proved in this manner, the trouble of charging the mortar, *&c.* would be intolerable, and the delay so great, that no business of this kind could ever be finished. The method by firing against a pendulum, in the manner mentioned under the head GUNNERY, seems a readier way; but still it requires some nicety and time, which it were to be wished could be obviated. Ibid. p. 63.

It has been observed that a heap of *gun-powder* of a certain diameter being fired, will always set fire to another heap not distant from the former above eight times its diameter.

Persons keeping more than 200lb. weight of *gun-powder* at one time, within the cities of London and Westminster, or their suburbs, *&c.* are liable to forfeitures if it be not removed; and justices of peace may issue warrants to search for, seize, and remove the same, 5 and 11 Geo. I. and 5 Geo. II. cap. 20.

GURGIPTING, in falconry, a term used when a hawk is stiff and choaked up. Rust. Dict. in voc.

GUTTA *rosacea*, in medicine, denotes a red or pimpled face; a distemper, which, tho' not always owing its original to hard drinking, is nevertheless most incident to tiplers of strong beer, wines, spirits, *&c.*

As to the cure, besides making a revulsion by bleeding, blistering, cupping, issues, *&c.* the diet ought to be moistening and cooling, as lettuce, purslain, sorrel and spinach: the drink may be an emulsion of the cold seeds, milk and water, clarified whey, *&c.*

In the use, however, of this cooling regimen, great caution is necessary; for if a person be taken off at once from his strong liquors, and allowed nothing but whey, or milk and water, it may cost him his life, by hastening a sudden decay of heat, palling his appetite, and bringing on a leucophlegmatia, or dropsy. *James*'s Medicinal Dictionary, in voc.

As for what concerns topics, much caution is likewise to be used. If there be only redness without pimples, and the disease recent, refrigerants and repellants take place: but if pustules appear, discutients must be mixed; and if these pustules seem hard, and the disease be of long standing, there may be reason for emollients to ripen and digest the tough and viscid matter, which is afterwards to be let out. Id. ibid.

If the disease be stubborn, and the tubercles grown hard, we are to begin with emollients, both fotus and ointment: such are the decoction of mallows, vervain, solomon's seal, and linseed; also a cerate of sperma ceti, or Bate's white cerate. Id. ibid.

GUTTER (*Cycl.*) — *Gutters* are either parallel to the horizon, or vertical. The former should be made with a proper descent, that there may be a good current, as the workmen term it; for if laid too level, the water will be apt to stand in plashes.

As to the vertical *gutters*, or those formed by two roofs meeting at right angles to each other, or by the end of one roof joining to the side of another, they are either made of lead, or tiles, which are either plain or concave; these last are called *gutter*-tiles, and may be easily laid. But in laying on the plain tiles the workman begins at one side of the *gutter*, and so works across, as if it were plain work, and then brings the next row of tiles back again; so that he works forth and back, to and fro, from right to left. By this means the *gutters* laid after this manner are not angular, but of a kind of distorted curvilinear form, which prevents the mortar from being washed away with the rain. Build. Dict. in voc.

GWAYF, or WAIF. See WAIF, *Cycl.*

GYMNARTHRIDIA, in the history of insects, a series or class of insects, which have soft and naked bodies, furnished with limbs. See INSECT, *Append.*

These have been generally called *zoophytes*, a term expressing creatures partly of an animal, and partly of a vegetable nature; but as it is now well known that there are none such, it is proper the term *zoophyte* should no longer be retained.

Under this class are comprehended the *limax*, or the naked snail, the *lernea*, *medusa*, *aphrodita*, *amphitrite*, *&c.* *Hill*, Hist. Anim. p. 87. See the articles LIMAX, LERNEA, *&c.* *Append.*

GYMNOSOPHISTS (*Cycl.*) — There were likewise African *gymnosophists*, who dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of house or cell. These did not form themselves into societies, like those of India; but each had his private retirement. where he studied and performed his devotions by himself. If any person had killed another by chance, he applied to these sages for absolution, and submitted to whatever penances they enjoyned. They pretended to an extraordinary frugality, and lived only upon the fruits of the earth. Lucian ascribes to these philosophers several new discoveries in astronomy. *Broughton*, Dict. Relig. in voc.

GYMNIA, in zoology, a new eſtabliſhed claſs of animalcules, containing ſuch as have neither tail, nor any viſible limbs. See the article ANIMALCULE, *Append.*

GYPSUM *(Suppl.)* — GYPSUM *ſtriatum*, *ſtriated plaſter-ſtone*, in natural hiſtory, the name commonly uſed for the whitiſh leſs gloſſy *tricheria*, with ſhort thick filaments. See the article TRICHERIA, *Suppl.*

It is of a rude, irregular and unequal ſurface, and lax, friable texture, found in maſſes of various ſizes, from one to twelve or eighteen inches over, but always broad and flat; its thickneſs being uſually but an inch and an half, and in the broadeſt pieces ſeldom much more than two inches: it is compoſed of conſiderably large and coarſe longitudinal filaments, running uſually very evenly through the maſs: it is eaſily fiſſile in a perpendicular direction, that is parallelly to the arrangement of theſe filaments: it is of a dull whitiſh colour, and its filaments, when examined ſingly, have a ſlight ſhare of tranſparency.

It will not at all give fire with ſteel, nor ferment with *aqua fortis*, but very readily calcines to a perfectly white ſubſtance. It is found in clay and marle pits, among the ſtrata of gravel, and in the fiſſures of ſtone, and is common in Yorkſhire and other parts of the kingdom.

The Germans uſe it in the fluxing the ſulphureous ores of metals; and our druggiſts ſell it under the name of Engliſh talc, for cleaning of ſilver lace. See *Hill's* Hiſt. Foſſ. p. 89.

Tymphacian GYPSUM, a name given by the antients to the hard, fungous, alkaline, white marle, otherwiſe called *calx nativa*, or native lime. See the article CALX, *Suppl.*

GYRINUS, in zoology, the name ſometimes uſed for a ſpecies of *mordella*. See the article MORDELLA, *Suppl.*

GYRLE, among ſportſmen, See the article GIRLE, *Append.*

GYROVAGI, in eccleſiaſtical writers, monks who leaving their monaſteries, under the pretence of piety, wandered about from one religious houſe to another. *Du Cange*, Gloſſ. Lat. tom. ii. p. 683.

The ſame appellation was alſo given to prieſts, who left their pariſhes. Id. ibid.

H.

H.

HÆMATOPUS, the *Sea Pye*, in Ornithology, a genus of birds of the order of the Scolopaces.

Its beak is of a compreſſed form, ending in a cuneiform figure, and the upper and under chaps are equal in length.

Authors deſcribe it under different names, ſome calling it the *Pica Marina*, others *Himantopus*; but *Hæmatopus* ſeems the moſt proper. See the articles HIMANTOPUS, and PICA *marina*, *Suppl.*

HAIR-*Bell*, in botany, the name by which ſome call the *Hyacinth*. See the article HYACINTH, *Suppl.*

HAIR-*Worm*, the Engliſh name of a ſpecies of worms, called by zoologiſts *Chætia*. See the article CHÆTIA, *Append.*

HAKEL, or HATCHEL. See HATCHEL, *Append.*

HALIOTIS, in the natural hiſtory of ſhells, the name of a large genus, called in Engliſh *Ear-ſhells*. See the article EAR-*Shells*, *Suppl.*

HALL (*Cycl.*) — The length of a *Hall* ſhould be at leaſt twice and a quarter its breadth, and in great buildings three times its breadth. As to the height of *Halls*, it may be two thirds of the breadth; and if made with an arched ceiling, it will be rendered much handſomer, and leſs ſubject to fire. In this caſe its height is found by dividing its breadth into ſix parts, five of which will be the height from the floor to the under ſide of the key of the arch. Build. Dict. in voc.

HALM. See the article HAUM, *Append.*

HAMMER-*headed-ſhark*, the Engliſh name of the *Zygæna*. See the article ZYGÆNA, *Suppl.*

HARDBEAM, or HORNBEAM, in botany, the name by which ſome call the *Carpinus* of authors. See the article CARPINUS, *Suppl.*

HARE.(*Suppl.*)—*Sea*-HARE, the Engliſh name of a genus of inſects, called by Dr. Hill *Lernea*. See the article LERNEA, *App.*

HARE's-*foot Trefoil*, in botany. See the articles TRIFOLIUM and TREFOIL, *Suppl.*

HARE's *Lettuce*, in botany, the name by which ſome call the *Sonchus*, or Sow-thiſtle. See the article SONCHUS, *Suppl.*

HARE's-*Strong*, in botany, the name by which the *Peucedanum* or Hog's-fennel, is ſometimes called. See the article PEUCEDANUM, *Suppl.*

HARLE, a name uſed in ſome parts of the kingdom for the *Merganſer*. See the Article MERGANSER, *Suppl.*

HARP-*Shell*, a ſpecies of *Dolium*. See DOLIUM.

HARIOT. See the article HARIOT, *Cycl.*

HART-*wort*, in botany, a name ſometimes given to the *Tordylium* of authors. See the article TORDYLIUM, *Suppl.*

Ethiopian HART-*wort*, the name by which ſome call the *Peucedanum*, or Hog's-fennel. See the article PEUCEDANUM, *Suppl.*

HART's-*horn*, in botany, the name of a genus of plants, otherwiſe called *Buck's-horn*, and by botaniſts *Coronopus*. See the article CORONOPUS, *Suppl.*

HASEL, or HASLE, in botany. See the article HAZLE, *Suppl.*

HATCHEL, or HITCHEL, in the manufactory of flax, hemp, *&c.* a tool, not unlike a card, for dreſſing and combing them into fine hairs. See the article CARD, *Cycl.*

They conſiſt of ſharp pointed iron-pins, or teeth, ſet orderly in a board. Dict. Ruſt. in voc.

Of theſe there are ſeveral ſorts, ſome with finer and ſhorter teeth, others with them coarſer and longer.

HATCHET-*Vetch*, in botany, the name by which the *Securidaca*, a diſtinct genus of plants, is ſometimes called. See the article SECURIDACA, *Suppl.*

HATCHING (*Cycl.*)—The artificial method of *hatchings* eggs, as practiſed in Egypt, has been mentioned in the Cyclopædia; and Mr. Reaumur has diſcovered, that the heat neceſſary for this purpoſe, is nearly the ſame with that mark'd 32, upon his thermometer, or that mark'd 96 on Fahrenheit's. If, therefore, eggs be kept in this degree of heat, they will as certainly *hatch*, as if the parent hen had ſat upon them; and, indeed, it is impoſſible it ſhould be otherwiſe, ſince this heat anſwers nearly to that of the ſkin of the hen, or even of mankind; ſo that the empreſs Livia, as Pliny relates, might truly *hatch* a chicken in her boſom, if ſhe had but the patience to keep an egg there, for the ſame number of days that it ought to have continued under a hen.

After many experiments, Mr. Reaumur found, that ſtoves, heated by means of a baker's oven, ſucceeded equally well with thoſe made hot by layers of dung. The furnaces of glaſs-houſes, and thoſe of the melters of metals, might, no doubt, be made to anſwer the ſame purpoſe. If, therefore, an eaſy method could be found to regulate the heat of the ſtove, it would be extremely convenient for bakers or paſtry-cooks to *hatch*, with little or no expence, a very great number of chickens; which they might diſpoſe of to the country people, to be reared up till marketable. Should a thermometer be judged neceſſary for this purpoſe, it will be ſufficient to mark on it only ſuch degrees as are abſolutely neceſſary; by which means the inſtrument will not only come cheaper, but be more readily underſtood by the ignorant people, for whoſe uſe it is deſigned.

Such an inſtrument, however, may be wholly diſpenſed with; a lump of butter, of the ſize of a walnut, melted with half as much tallow, ſerving to indicate the heat of the ſtove with ſufficient exactneſs. When the heat is too great, this mixture, which is to be kept in a phial, will become as liquid as oil; and when the heat is too ſmall, it will remain fixed in a lump; but it will flow like thick ſyrup, upon inclining the bottle, if the ſtove be of a right temper. Great attention, therefore, ſhould be given to keep the heat always at this degree, by letting in freſh air, if it be too great, or ſhutting the ſtove more cloſe, if it be too ſmall.

But this is not all. That all the eggs in the ſtove may equally ſhare the irregularities of the heat, it will be neceſſary to ſhift them from the ſides to the center, and *vice verſa*; thereby imitating what the hens themſelves do by thoſe upon which they ſit; for hens are frequently ſeen to make uſe of their bills, to puſh to the outer parts thoſe eggs that were neareſt to the middle part of their neſts, and to bring into that middle part ſuch as before lay neareſt to the ſides of the ſame.

As to the form of the ſtoves, no great nicety is neceſſary. A chamber over an oven will do very well; only in order to aſcertain the due degree of heat, it will be neceſſary to have phials of butter, as directed above, in ſeveral parts of the room; and when the heat wants to be either increaſed or diminiſhed, it is ſufficient to diminiſh or increaſe the communication between the air in the room and that abroad, by opening or ſhutting ſome of the openings made in the wall for that purpoſe.

In order to cheriſh the new hatch'd chickens, capons may be taught to tend them in the ſame manner as hens do. Mr. Reaumur tells us, that he has ſeen above two hundred chickens at once, all led about and defended by only three or four ſuch capons; which clucked like hens, to call in the chickens that had ſtrayed too far off; and even redoubled their call, when they found any nice bits, to invite the young brood to come and pick them up. Nay cocks may be taught to do the ſame office, which they, as well as the capons, will continue to do all their lives afterwards.

But Mr. Reaumur, not ſatisfied with the aſſiſtance he could thus procure from cocks and capons, has invented a ſort of low boxes without bottoms, and lined with furs. Theſe, which he calls artificial parents, not only ſhelter the chickens from the injuries of the air, but afford a kindly warmth; ſo that they preſently grow fond of them, and take the benefit of their ſhelter as readily as they would have done under the wings of a hen.

For a few weeks after *hatching*, it will be neceſſary to keep the chickens in a room artificially heated, and furniſhed with theſe boxes; but afterwards they may be ſafely expoſed to the air in the court-yard, in which it may not be amiſs to place one of theſe artificial parents to ſhelter them, ſhould there be any occaſion.

As to the manner of feeding the young brood, they are generally a whole day after being *hatched*, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, or millet-ſeeds mixed with the crumbs; after which they will begin to pick up inſects and graſs for themſelves.

People in the country, who have plenty of conveniencies for the raiſing of poultry, will hardly give themſelves the trouble to *hatch* chickens in this artificial manner. It is in villages near great towns, and principally in the neighbourhood of the capital city, that it would be of the greateſt importance to promote the eſtabliſhment of this kind of ſtoves. Vid. Mr. *Trembley*'s Abſtract of the Art of Hatching domeſtic fowls, tranſlated from the original treatiſe of Mr. Reaumur, where he explains every difficulty.

HATCHING *of Bees*. See the article *Bee*-WORM, *Suppl.*

HATCHING, among miners. See the article DIGGING, *Suppl.*

HAVER, a word uſed in ſome parts of the kingdom for oats. Dict. Ruſt. in voc.

HAUGH, the ſame with HAW. See the article HAW, *Suppl.*

HAUM, HALM, or HAWM, among farmers, denotes the ſtem or ſtalk of corn, peaſe, beans, &c. from the root to the ear. Dict. Ruſt. in voc.

HAWK (*Suppl.*)—*Make* HAWK, in falconry, a name given to an old ſtanch hawk; which, being uſed to fly, will teach a young one. Ruſt. Dict. in voc.

HAW-*thorn*, the Engliſh name of ſeveral ſpecies of Meſpilus, or Medlar. See the article MESPILUS, *Suppl.*

HAWM. See the article HAUM, *Append.*

HAZLE, or HAZEL (*Suppl.*)—*Witch*-HAZLE, a name sometimes used for the *Ulmus*, or Elm. See the articles ULMUS and ELM, *Suppl.*

HEART-*burn*. In surfeits, or upon swallowing without due mastication; when meats are eat tough and fat, or with farinaceous substances unfermented; or when by any accident the saliva is vitiated, too scanty, or not intimately mixed with the food, the fermentation becomes tumultuous, the stomach swells with air, and this extraordinary commotion being attended with an unusual heat, brings on the uneasiness called the *heart-burn*; which is remedied by whatever promotes a greater secretion of salvia, or helps to mix it with our aliment. *Pringle*, Observ. on the diseases of the army, p. 168. See the article FERMENTATION, *Append.*

HEART's-*ease*, a name sometimes used for a species of violet, otherwise called *Pansay*. See the article VIOLET, *Suppl.* It is said to be good for ruptures and the falling sickness. Rust. Dict. in voc.

HEAT (*Suppl.*) — *Heat* is found to expand and dilate metals considerably, as appears from an experiment of Muschenbroek, who tells us, that having prepared cylindric rods of iron, steel, copper, brass, tin, and lead, he exposed them first to a pyrometer with two flames; then successively to one with three, four, and five flames. But previous to this trial, he took care to cool them equally, by exposing them some time upon the same stone; when it began to freeze, and Fahrenheyt's thermometer was at 32 degrees. The effects of which experiment are digested in the following table, where the degrees of expansion are marked in parts equal to the $\frac{1}{12500}$ part of an inch.

Expansion of	Iron	Steel	Copper	Brass	Tin	Lead
By one flame	80	85	89	110	153	155
By two flames, placed close together	117	123	115	220		274
By two flames 2 $\frac{1}{2}$ inches distant	109	94	92	141	219	263
By three flames placed close together	142	168	193	275		
By four flames placed close together	211	270	361			
By five flames	230	310	310	377		

It is to be observed of tin, that it will easily melt, when heated by two flames placed together. Lead commonly melts with three flames, placed together, especially if they burn long.

From these experiments it appears at first view, that iron is the least rarified of any of these metals, whether it be heated by one or more flames; and therefore is most proper for making machines, or instruments, which we would have free from any alterations by heat or cold, as the rods of pendulums for clocks, &c. So likewise the measures of yards or feet should be made of iron, that their length may be as nearly as possible the same, summer and winter.

The expansion of lead and tin, by only one flame, is nearly the same; that is, almost double of the expansion of iron. It is likewise observable, that the flames, placed together, cause a greater rarefaction, than when they have a sensible interval between them; iron, in the former case, being expanded 117 degrees, and only 109 in the latter; the reason of which difference is obvious.

By comparing the expansions of the same metal, produced by one, two, three, or more flames, it appears, that two flames do not cause double the expansion of one; nor three flames three times that expansion, but always less; and these expansions differ so much the more from the ratio of the number of flames, as there are more flames acting at the same time.

It is also observable, that metals are not expanded equally, at the time of their melting, but some more, some less: Thus tin began to run, when rarified 219 degrees; whereas brass was expanded 377 degrees, and yet was far from melting. *Desagul.* vol. 1. p. 423, *seqq.*

HEAT, in Medicine. Great *Heats* are not so much the immediate, as the remote cause of a general sickness, by relaxing the fibres, and disposing the fibres to putrefaction; especially among soldiers, and persons exposed the whole day to the sun; for the greatest *heats* are seldom found to produce epidemic diseases, till the perspiration is stopped by wet cloaths, fogs, dews, damps, &c. and then some bilious or putrid distemper is the certain consequence, as fluxes, and ardent intermitting fevers. Nevertheless, it must be allow'd, that *heats* have sometimes been so great, as to prove the more immediate cause of particular disorders. As when centinels have been placed without cover, or frequent reliefs, in scorching *heats*; or when troops march, or are exercised in the *heat* of the day: or when people imprudently lie down and sleep in the sun: All these circumstances are apt to bring on distempers, varying according to the season of the year. In the beginning of summer, these errors produce inflammatory fevers; and, in the end of it, or in the beginning of autumn, a remitting fever, or dysentery. *Pringle*, Observ. on the Diseas. of the army, p. 79, *seqq.*

To prevent, therefore, the effects of intemperate *heat*, commanders have found it expedient so to order the marches, that the men come to their ground before the heat of the day; and to give strict orders, that none of them sleep out of their tents; which in fixed encampments may be covered with boughs, to shade them from the sun. It is likewise a rule of great importance to have the soldiers exercised before the cool of the morning is over; for, by that means, not only the sultry *heats* are avoided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the heat of the day. Lastly, in very hot weather, it has been found proper to shorten the centinels duty, when obliged to stand in the sun. Id. ibid. p. 95.

HEATH (*Suppl.*) — *Mountain*-HEATH, a name sometimes given to the *Saxifrage* of botanical writers. See the article SAXIFRAGE, *Suppl.*

Berry-bearing HEATH, a name sometimes given to a genus of plants, called by botanists *Empetrum*. See the article EMPETRUM, *Suppl.*

Low-pine HEATH, the name of a distinct genus of plants, called by botanists *Coris*. See the article CORIS, *Suppl.*

HECKLE, among hemp-dressers. See HATCHEL, *supra.*

HECTIC. See the article CONSUMPTION, *Append.*

HEDERA (*Suppl.*) —*Virginian*-HEDERA, the name by which Plukenet calls the *Menispermum* of Linnæus. See the article MENSPERMUM, *Append.*

HEDGE-*hog*, in zoology, the English name of a genus of animals, called by zoologists *Erinaceus*. See the article ERINACEUS, *Suppl.*

HEDGE-*hog*, in botany, the English name of a genus of plants, called by botanists *Erinacea*, See the article ERINACEA, *Suppl.*

Sea HEDGE-*hog*, the English name of a series of shell-fish, called by different authors *Centronia*, *Echini marini*, *Echinodermata*, &c. See CENTRONIA, *Append.* and ECHINODERMA, *Suppl.*

HEDGE-*hog-Medica*, the name by which some call several species of *Medica*, or lucerne. See the article MEDICA, *Suppl.*

HEDGE-*hog-thistle*, a name sometimes given to a distinct genus of plants, called by authors *Cactus*. See the article CACTUS, *Append.*

HEDGE-*hyssop*, a name sometimes given to a distinct genus of plants, called by botanists *Digitalis*. See the article DIGITALIS, *Suppl.*

HEDGE-*mustard*, the name of a genus of plants, known among botanists by that of *Erysimum*. See the article ERYSIMUM, *Suppl.*

HEDGE-*nettle*, a name sometimes given to a genus of plants, called by botanists *Galeopsis*. See the article GALEOPSIS, *Suppl.*

HEDGE-*nettle-shrub*, a name by which some call the *Prasium*, a distinct genus of plants. See the article PRASIUM, *Suppl.*

HEDGE-*sparrow*, the English name of a species of *Motacilla*, See the article MOTACILLA, *Suppl.*

HEDIUNDA, in botany, a name used by some writers for the *Cestrum* of Linnæus. See the article CESTRUM, *Append.*

HEDYSARUM, in the Linnæan system of botany, the name of a large genus of plants; which that author makes to comprehend the *Hedysarum*, *Onobrychis*, and *Alhagi* of Tournefort. See the articles HEDYSARUM and ONOBRYCHIS, *Suppl.* and ALHAGE, *Append.*

HEEL, among carpenters, denotes an inverted *Ogee*. See the article OGEE, *Cycl.*

HEINASE, among sportsmen, a roe-buck of the fourth year. Rust. Dict. in voc.

HELEGUG, in zoology, a name given to the *Anas arctica*. See the article DUCK, *Suppl.*

HELENIUM, in botany, the name used by some for several species of *Aster*, or star-wort. See the article STAR-WORT, *Suppl.*

HELIANTHUS, in the Linnæan system of botany, the name by which that author calls the *Corona solis*, or great *sun-flower*. See the article SUN-*flower*, *Suppl.*

HELICHRYSUM, in botany, a name used by some authors for the *Gnaphalium*, or cudweed. See the article GNAPHALIUM, *Suppl.*

HELIOTROPE, in botany, the name by which some call the turnsol, a distinct genus of plants. See the article HELIOTROPIUM, *Suppl.*

HELIOTROPIUM is also a name used by some for a species of *Ricinoides*. See the article RICINOIDES, *Suppl.*

HELIOTROPIUM is likewise used by some for the *Helianthus*, *Corona solis*, or great sun flower. See the article SUN-*flower*, *Suppl.*

HELLEBORE, in botany, the English name of a distinct genus of plants. See the article HELLEBORUS, *Suppl.*

 Bastard-

Bastard-HELLEBORE, the name of a genus of plants, called by authors *Helleborine*. See the article HELLEBORINE, *Suppl.*

White-HELLEBORE, the name of a genus of plants, otherwise called *Veratrum*. See the article VERATRUM, *Suppl.*

HELM, (*Cycl.*) a term used by country people for wheat or rye-straw, bruised by thrashing, or otherwise, and usually bound up in bundles for thatching. See THATCHING, *Append.*

HELMET-*flower*, in botany, a name by which some call the *Scutellaria*, or *Cassida* of authors. See the article CASSIDA, *Suppl.*

HEMANDIA, (*Suppl.*) This is an error of the press, for HERNANDIA See HERNANDIA, *Append.*

HEMEROBIUS, in zoology, a name used by some for the fly, called *Golden-eye*, and *Chrysopis*. See the article CHRYSOPIS, *Suppl.*

HEMLOCK, in botany, the English name of a genus of plants, called by botanists *Cicuta*. See the article CICUTA, *Suppl.*

Bastard-HEMLOCK, the name by which some call a distinct genus of plants, known among botanists by that of *Cicutaria*. See the article CICUTARIA, *Suppl.*

HEMP, in botany, the English name of a distinct genus of plants, called by botanical writers *Cannabis*. See the article CANNABIS, *Suppl.*

Bastard-HEMP, the English name of a genus of plants, called by Tournefort *Cannabina*. See the article CANNABINA, *Suppl.*

Water-HEMP, a name sometimes used for a genus of plants, called by botanical writers, *Bidens*. See the article BIDENS, *Suppl.*

HEMP-*Agrimony*, a name sometimes given to a distinct genus of plants, called by botanists *Eupatorium*. See the article EUPATORIUM, *Suppl.*

HEN (*Suppl.*) — HEN-*house*, a place or building, made for sheltering or confining poultry. Dict. Rust. in voc.

HENBANE, (*Suppl.*) — *Yellow*-HENBANE, a name by which some call the *Nicotiana* of botanical authors. See the article NICOTIANA, *Suppl.*

HEPS, in botany, the same with *hips*. See the article HIPS, *Append.*

HERB-*Bennet*, *herba benedicta*, a name sometimes given to a distinct genus of plants, called by authors *Caryophyllata*. See the article CARYOPHYLLATA, *Suppl.*

HERB-*Christopher*, *herba Christophoriana*, in botany, the name of a distinct genus of plants. See the article CHRISTOPHORIANA, *Suppl.*

HERB-*Gerard*, in botany, a name sometimes given to a distinct genus of plants, otherwise called *Angelica*. See the article ANGELICA, *Suppl.*

HERB *of grace*, a name by which some call rue. See the article RUTA, *Suppl.*

HERB-*Robert*, a name sometimes used for the *geranium*, or crane's bill. See the article GERANIUM, *Suppl.*

HERB-*Trefoil*, in botany, See the articles TREFOIL and TRIFOLIUM, *Suppl.*

HERB-*Trinity*, in botany, a name sometimes given to the violet. See the article VIOLA, *Suppl.*

HERB-*True-love*, the name by which the *Herb-Paris* is sometimes called. See the article HERBA-*Paris*, *Suppl.*

HERB-*Twopence*, the name of a distinct genus of plants, called otherwise *Lysimachia*, or *Summularia*. See the article LYSIMACHIA, *Suppl.*

HERB-*Willow*, or *Willow-herb*, a name sometimes given to two distinct genuses of plants, the *Lysimachia* and *Chamænerium*. See the articles CHAMÆNERIUM, and LYSIMACHIA, *Suppl.*

HERCULES's *Alheal*, the name of a distinct genus of plants, described by Linnæus under that of *Panax*. See the article PANAX, *Append.*

HEMISPHÆRIA, a name by which Dr. Hill calls the genus of flies, known in English by that of *Lady-Cow*.

Ray, and other writers, have described these among the Beetles. See the article SCARABÆUS, *Suppl.*

HERMIT-*fish*, the name by which some call the long-tailed Squilla, with a soft tail, and the right claw the larger. See the article SQUILLA, *Append.*

HERMODACTYLE, *Hermodactylus*, in botany, a name improperly used by some for the *Iris*, or flower-de-luce of botanists. See the article IRIS, *Suppl.*

The true *Hermodactyle* is the root of a species of *Colchicum*, or *Meadow-saffron*. See the article MEADOW-*saffron*, *Suppl.*

HERN, the same with *Heron*. See the article HERON, *Suppl.* A *Hern* at siege, among sportsmen, is one standing at the water-side, watching for prey. Dict. Rust. in voc.

HERN-*shaw*, or HERNERY, a place where the Herons breed. Id. ibid.

HERNANDIA, in botany, the name of a distinct genus of plants, the characters of which are these: The petals of the flower are multifid, and placed in a circular order; the male and female flowers stand on distinct plants. There is no pericarpium; but the cup of the flower is very large, swelled, and roundish; containing a plicated oval nut, with only one cell, and a globose nucleus. *Linnæi* Gen. Plant. p. 516.

We know only one species of this genus, which is the *hernandia*, with a large umbilicated ivy-like leaf, commonly called in the West-Indies *Jack in a box*.

It is a native of Jamaica, Barbadoes, and other parts of the West-Indies; and is propagated among us in the gardens of the curious, by only sowing the seed in a hot-bed in the spring. They must be constantly kept in the back stove. Vid. *Miller*'s Gard. Dict. in voc.

HERRIOT. See HARIOT, *Cycl.*

HETEROPYRÆ, in natural history, the name of a genus of ferrugineous fossils, composed of several coats, inclosing a nucleus of a different substance from themselves, and often loose, and rattling in them. See the article SIDEROCHITA. *Append.* Of this genus there are the following species: 1. The hard *heteropyra*, with brown and purplish crusts, and a whitish-green nucleus. 2. The rough, purplish *heteropyra*. 3. The mis-shapen *heteropyra*, with ferrugineous, red, and dusky yellow crusts, and a greenish-white nucleus. 4. The yellow, brown, and black *heteropyra*, with a whitish nucleus. 5. The yellow, ferrugineous, and purplish-crested *heteropyra*, with a pale-yellow nucleus. 6. The coarse, yellow, and brown-crusted *heteropyra*, with a brownish-yellow nucleus. 7. The coarse *heteropyra*, with brown, black, and orange-colour'd crusts, and a yellow nucleus. *Hill.* Hist. Foss. p. 536.

HIGH-*taper*, in botany, a name by which some call the *Verbascum* of botanists. See the article VERBASCUM, *Suppl.*

HILL, in the natural history of the Earth, &c. See the article MOUNTAIN, *Suppl.* and *Append.*

HINNULARIA, in zoology, a name given by some authors to a species of Eagle. See the article PYGARGUS, *Suppl.*

HIPPO, in zoology, the name of a species of *Coluber*, the scuta of whose abdomen are one hundred and sixty, and the squamæ of the tail one hundred. See the article COLUBER, *Append.*

HIPPURIS (*Suppl.*)—Pliny has made a great confusion of plants under this name. The antients called the *Hippuris*, or horse-tail, *Polygonum*, on account of its having so many joints in its stalks and branches; this name confounded it with the knot-grass and Pliny has made a description from the accounts of different authors, which has the characters and qualities of both, and therefore suits neither.

It is easy however to trace his errors; where he speaks of the stalks being naked, rush-like, and brittle, it is plain that he is speaking of the *Horse-tail*; and where he gives it small oval and pointed leaves, it is equally certain that he means this of the knot-grass; but he adds in one place, that it has a large spreading root, that it grows in woods and shady places, and that it bears a round fruit like a coriander-seed. These are characters belonging neither to the horse-tail nor knot-grass; and might seem to bespeak this *Hippuris* a plant different from both; but it rather appears, that Pliny has brought in by an error of his own a third plant, to perplex the case, and is here transcribing some author's account of the Solomon's-seal, or polygonatum, a name sounding like the word polygonum, and easily mistaken for the same word, by so hasty a writer as this author appears to have been. He had before err'd in his opinion, that the polygonum and horse-tail were the same plant; and here taking the polygonatum to be the same plant with the polygonum, he has not scrupled to attribute to the horse-tail whatever he found recorded of the polygonatum.

HIPPURIS is also a name given by Dillenius to the *Chara* of Linnæus, a distinct genus of plants. See the article CHARA, *Suppl.*

HIND-*calf*, a female hart of the first year. She fawns in April and May. Her flesh is softer than that of a hart, but not so savoury, and is drest after the same manner. If it be roasted, it ought to be larded, dipt in a marinade or pickle, and moistened while it is roasting.

HITCHEL, the same with *Hatchel*. See HATCHEL, *Append.*

HITCHING, in horsemanship, is to wriggle or move forwards by degrees, or to knock the legs together in walking. Dict. Rust. in voc.

HIVE-*dross*, a name sometimes given to crude or rough wax. See the article WAX, *Suppl.*

HOCK, the same with *Ham*. See HAM, *Cycl.*

HOG's-*fennel*, in botany, the English name of a genus of plants, called by botanists *Peucedanum*. See the article PEUCEDANUM, *Suppl.*

HOG-*plum*, the name of a distinct genus of plants, called by authors *Spondias*. See the article SPONDIAS, *Suppl.*

HOG-*weed*, the name of a distinct genus of plants, called by Linnæus *Boerhaavia*. See the article BOERHAAVIA, *Suppl.*

HOLIBUT, or HOLYBUT, in ichthyology, a name given by the people of some parts of England to the Turbott in general; but in other parts, only to the larger fishes of that species.

HOLLI, the Indian name for what the Spaniards call *ulli*; a resinous liquor, which flows spontaneously from the tree *Holquaghuytl*, or *Chilli*. It is often mixed with chocolate in the making, in the proportion of one fourth part: it gives the chocolate in this case no very disagreeable flavour; and it becomes a very powerful medicine in dysenteries. It is usual, however, before the making it, to mix the cacao and *Holli* on an iron plate, and torrify them thoroughly together. *Ray*'s Hist. Plants.

HOLLOW-*root*, in botany, a name fometimes given to the *fumaria*, or fumitory. See the article FUMARIA, *Suppl.*

HOLLY (*Suppl.*)—The timber of *holly* is the whiteft of all hard wood, and therefore ufed by the inlayers. See the article MARQUETRY, *Cycl.*

It is alfo fit for all fturdy ufes, and therefore preferred to all others by the mill-wright, turner, and engraver. It makes the beft handles and ftocks for tools, flails, cart-whips, bowls, fhivers, and pins for blocks; and is excelnt for door-bars, &c.

Knee-HOLLY, a name fometimes given to the *Rufcus*, or butchers broom. See the article RUSCUS, *Suppl.*

Sea-HOLLY, the name by which fome call the *eryngium* of botanical writers. See the article ERYNGIUM, *Suppl.*

HOLY-*thiftle*, or BLESSED *Thiftle*, a name fometimes given to the *Cnicus*, or faffron-flower of botanifts. See the article CNICUS, *Suppl.*

HOLY-*Rofe*, or *Rock-Rofe*, names given to a diftinct genus of plants, called by botanifts *Ciftus*. See the article CISTUS, *Suppl.*

HOMO, *Man*, in zoology. See the articles MAN, *Append.* and ANTHROPOMORPHA, *Suppl.*

HONE-*wort*, *Sium*, in botany, the name of a diftinct genus of plants. See the article SIUM, *Suppl.*

HONESTY, in botany, a name fometimes ufed for the *Lunaria*, or moon-wort. See the article LUNARIA, *Suppl.*

HONEY-*flower*, a name by which the *Melianthus*, a diftinct genus of plants, is called in Englifh. See the article MELIANTHUS, *Suppl.*

HONEY-*fuckle*, *French* HONEY-*fuckle*, a name fometimes ufed for the *Hedyfarum* of botanical writers. See the article HEDYSARUM, *Suppl.*

Trumpet HONEY-*fuckle*, the name by which fome call the *Periclymenum* of Tournefort. See the article PERICLYMENUM, *Suppl.*

Upright HONEY-*fuckle*, the name of a genus of plants, called by Linnæus *Lonicera*. See the article LONICERA, *Suppl.*

HOOD, (*Cycl.*) — HOOD, on fhip-board, is a copper-frame, made to go on the top of the chimney, and to fhift as the wind does, that the fmoke may always fly to leeward. *Blanckly*, Nov. Expofitor, p. 78.

HOOK-*land*, or OPE-*land*, among farmers, land ploughed and fowed every year. Dict. Ruft. in voc.

HOOPOE, in ornithology, the Englifh name of the *Upupa*, See the article UPUPA, *Suppl.*

HOP-*hornbeam*, a name fometimes given to the *Carpinus* of botanifts. See the article CARPINUS, *Suppl.*

Wild-HOP, a name fometimes given to the *Dodonæa*, a diftinct genus of plants. See the article DODONÆA, *Suppl.*

HOREHOUND. (*Suppl.*)—*Black* or *ftinking* HOREHOUND, in botany, the Englifh name of a genus of plants, called by botanical writers *Ballote*. See the article BALLOTE, *Suppl.*

Bafe-HOREHOUND, a name by which fome call the *Stachys* of botanifts. See the article STACHYS, *Suppl.*

Baftard-HOREHOUND, the Englifh name of a genus of plants, called by botanifts *Marrubiaftrum*. See the article MARRUBIASTRUM, *Suppl.*

Water-HOREHOUND, the Englifh name of a diftinct genus of plants, called by botanifts *Lycopus*. See the article LYCOPUS, *Suppl.*

HORNS-*and Hedge-hog*, the name of a genus of plants, called by botanifts *Medica*. See the article MEDICA, *Suppl.*

HORNBEAM, in botany, the Englifh name of a genus of plants, called by botanifts *Carpinus*. See the article CARPINUS, *Suppl.*

HORNED-*Poppy*, in botany. See the article POPPY, *App.*

HORSE (*Suppl.*)—HORSE-*dung* is ufed by gardeners for making hot-beds, being efteemed fitter than any other for this purpofe; but it is to be obferved, that it is fo much the better, the higher the *Horfe* is fed. Ruft. Dict. in voc.

HORSE-*Chefnut*, a name given by fome to the *Hippocaftanum* of botanical writers. See the article HIPPOCASTANUM, *Suppl.*

Scarlet HORSE-*Chefnut*, the Englifh name of a diftinct genus of plants, called by botanifts *Pavia*. See the article PAVIA, *Suppl.*

HORSE-*heal*, a name fometimes ufed for Elecampane, or *Helenium*. See the article HELENIUM, *Suppl.*

HORSE-*hoeing*, in *Hufbandry*. See the article HUSBANDRY *Suppl.*

HORSE-*Mint*, the Englifh name given to a fpecies of *Mint*. See the articles MINT and MENTHA, *Suppl.*

HORSE-*Radifh*, the name of a diftinct genus of plants, called by botanifts *Cochlearia*, or Scurvy-grafs. See the article COCHLEARIA, *Suppl.*

HORSE-*fhoe-vetch*, the Englifh name of a diftinct genus of plants, called by botanifts *Hippocrepis*, or *Ferrum equinum*. See the article FERRUM *equinum*, *Suppl.*

HOSE-*in-Hofe*, a name given to a genus of plants, called by botanifts *Primula veris*. See the article PRIMULA, *Suppl.*

HOSPITAL (*Cycl.*)—Camp *Hofpitals* are either general or regimental.

The general *hofpitals* are of two kinds, *viz.* the flying *hofpital*, attending the camp at fome convenient diftance, and the ftationary *hofpital*, which is fixed to one place. In the choice of both, it will be better to have them in towns than villages, as the former will afford larger wards, befides more of other conveniencies: Thefe wards fhould be as airy as poffible.

As to the difpofition of *hofpitals*, in regard to preferving the purity of the air, the beft rule is to admit but few patients into each ward. It will alfo be found a good expedient, when the ceilings are low, to remove fome part of them, and to open the garret ftory. The doors and windows may likewife be opened, and ventilators ufed to purify the air of every ward. In winter *hofpitals*, the wards are to be warmed with chimneys, and never by ftoves; for, though the latter may warm a large ward better, and at a lefs expence, yet by fcarce making any draught of air, they will be apt to increafe its putrid quality; whereas a fire, kept up in a chimney, acts like a conftant ventilator.

The general *hofpital* fhould receive only fuch fick as the regimental ones cannot conveniently contain, together with thofe who cannot be moved with the army. Without this difperfion of the fick, the general *hofpital*, in bad feafons, would have a greater number, than could be well attended; and what is equally, if not more pernicious, it would be too much crouded, by which means the contagion would fpread, and the mortality be rendered more general.

Regimental *hofpitals* are of the greateft importance, and therefore fhould be fupplied with blankets and medicines from the public ftores, with an allowance alfo for nurfes and other neceffaries. Nor are they to be maintained in the field only, but alfo in winter-quarters, as there will always be a great many more fick, than can be taken care of in the general *hofpital*.

Barns, ftables, grannaries, and other out-houfes, but above all, churches, make the beft *hofpitals*, from the beginning of June to October: for as the greateft danger arifes from foul air, which cannot be compenfated by diet or medicine, we may lay it down as a rule, that the more airy and large the *hofpitals* are, the lefs danger there is of the ficknefs fpreading. *Pringle* Obferv. on the Difeafes of the Army, p. 104, *feqq.*

HOSPITAL-*fever*, a name given to the *malignant catarrhal fever*, as being frequent in hofpitals. See the article FEVER, *Suppl.*

Dr. Pringle has given us an elaborate account of the rife, fymptoms, and cure of this terrible difeafe, in his obfervations on the difeafes of the army. It may be owing to a great many concurring caufes, but the principal are foul and putrid air, occafioned by filth and impurity of any kind. Hence it is no wonder that it prevails in marfhy countries after hot feafons, and in populous cities; efpecially if low, and ill-aired, unprovided with common fhores, or where the ftreets are narrow and foul, the houfes dirty, water fcarce, and where jails or hofpitals are crouded, and not ventilated and kept clean; when in fickly times the burials are within the towns, and the bodies not laid deep; when flaughter-houfes are alfo within the walls; or when dead animals or offals are left to rot in the kennels, or on dunghils; when drains are not provided, to carry off any large body of ftagnating or corrupted water, in the neighbourhood; when flefh-meats make the greateft part of the diet, without a proper mixture of bread, greens, wine, or other fermented liquors; from the ufe of old and mufty grain, or what has been damaged by a wet feafon; or, laftly, when the fibres are relaxed by immoderate warm bathing.

When the difeafe comes on flowly, the fymptoms are fmall interchanges of heats and cold, trembling of the hands, interrupted fleep, &c. But when it advances faft, the above fymptoms are all in a higher degree; and befides thefe, the patient is afflicted with great laffitude, a naufea, pains in the back, a conftant pain and confufion in the head, a dejection of fpirits, and an uncommon tremor of the hands. If the fick lie warm, and have had no preceding flux, the body is generally coftive; but when they lie cold, as they often do in field-hofpitals, the pores of the fkin being fhut, a diarrhœa is a common fymptom: in the worft cafes, a flux appears in the laft ftage; when the ftools are involuntary, colliquative, ichorous, or bloody, and of a cadaverous fmell; which are the effects of a mortification of the bowels, and the figns of approaching death: fome are never delirious, but all are under a great ftupor or confufion. The petechiæ are the frequent, but not infeparable attendants of the fever; they are fometimes of a brighter or paler red, at other times of a livid colour, but are never raifed above the fkin. For the moft part, thefe fpots are fo little confpicuous, that unlefs looked for attentively, they may efcape notice. They are thickeft on the breaft and back, lefs on the legs and arms, and the Dr. never remembers to have feen any upon the face. This fever, tho' of the continued kind, has often exacerbations at night, with remiffions, and partial fweats next day; and, after a long continuance, is apt to change into a hectic, a remitting, or intermitting form.

Prognoftics in it. To have a little dilirium, the ftrength little impaired, turbid urine in the decline of the difeafe, and at the fame time a gentle fweat or moifture diffufed over the body, are reckoned good figns; and it feems peculiar to malignant fevers, that deafnefs is rather a good fign.

Method of cure. This varies according to the ftate of the difeafe, which may be diftinguifhed into three periods; the firft continuing as long as the perfon is able to go about; the fecond beginning with his confinement, and the third when the pulfe finks, and a ftupor comes on.

In the firft, as well as in the other periods, the cure is principally to be aimed at by removing the patient out of the foul air. When this cannot be done, the ward or room fhould be purified by making a fucceffion of air by means of fires, or letting it in by doors and winduws, or diffufing the fteams of vinegar.

The next thing to be done, is to promote a diaphorefis, which, in this period, fhould only be attempted by mild fudorifics, as the *fpiritus Mindereri*.

When the fever is confirmed, contrayerva-powders, with nitre, camphor, the common ptifan acidulated, and fuch medicines as are good in inflammatory cafes, ought to be given. Coftivenefs is to be prevented by emollient clyfters. But opiates are dangerous, both in this and the third ftage, in which the pulfe finks, and ftupor is greater, a delirium impends, and petechiæ often appear. When this is obferved to be the cafe, the nitre and diaphoretic medicines are to make room for a decoction of fnake-root, to which a fmall quantity of ftrong water may be added. It may alfo be given in fubftance from two to four fcruples a day, with fenfible good effects. Towards the decline of the fever, an equal quantity of peruvian bark may be joined with the root. Wine is alfo an excellent cordial at this period, and may be given either made into Whey, or added to the panado, which was the only food allowed to the fick. It may be taken from half a pint to a quart a day, according to the ftrength of the patient. Perhaps there is no rule of more importance, than to give ftrict charge to the attendants of the fick, never to let the patient, when low, remain above two or three hours without taking fomething cordial and nourifhing. But however neceffary wine, volatiles, and other cordials are in this low ftate of the fever, it ought to be remembered, that they muft never be given with an intention to force a fweat, but only as antifeptics, and to fupport the *vis vitæ*. If there be danger of a phrenitis coming on, it will be proper to call in the affiftance of epifpaftics. Sinapifms too may be ufed when the pulfe is greatly funk. If a diarrhœa comes on in the decline of the fever, it is to be moderated, by adding a few drops of the tinctura thebaica, to the full quantity of the alexipharmic decoction; or by giving a fpoonful or two of an aftringent mixture. In proportion, however, to the putrid nature of the ftools, aftringents are to be ufed with the more caution. When the fever is over, there are few but complain of a vertigo, and want of reft, a continuation of the deafnefs, and other nervous fymptoms, are frequently the confequence of great lownefs; in which cafe, the pillulæ Matthæi are to be given at night, with analeptics and medicines of the ftrengthening kind. Vid. *Pringle's* Obferv. on difeaf. of army. p. 243—278.

HOSPITAL - *Ventilator*. See the article VENTILATOR, *Append.*

HOVEL, properly fignifies a covering, or fhelter for cattle, made of huroles, or the like; but is alfo ufed for any other mean building. Ruft. Dict. in voc.

HOUND(*Suppl.*)—*Gaze*-HOUND, or *Gaft*-HOUND, one who makes more ufe of his fight than fmell, from the word *gaze*, to ftare at.

Thefe dogs make excellent fport with the fox and hare, and are much ufed in the north of England, and on champaign ground, rather than bufhy and woody places. Dict. Ruft. in voc.

HOUSE (*Cycl.* and *Suppl.*) — *Summer*-HOUSE, a little edifice erected at the corner of a garden, and contrived fo as to let in air on all fides; or to exclude it, as you find proper. Build. Dict. in voc. *Summer*.

HOUSING (*Cycl.*) — HOUSING, among brick-layers, a term ufed for a brick which is warped, or is caft crooked or hollow in burning; in fuch a cafe, they fay it is *houfing*. Build. Dict. in voc.

HUMBLE-*bee-fly* is a fpecies of *Culex*; it is lanigerous, and has fomewhat obfcure wings. See the articles HUMBLE, *Suppl.* and CULEX, *Append.*

HUMBLE-*plant*, a name fometimes given to the *mimofa*, or fenfitive plant. See the articles MIMOSA and SENSITIVE, *Suppl.*

HUNGARICUS *morbus*, a difeafe fo called from its being firft obferved in the imperial army in Hungary, in the year 1566; from whence it fpread over a great part of Europe.

It is defcribed as a malignant fever, attended with ficknefs at the ftomach, a pain and hardnefs about the epigaftric region, great thirft from the beginning, a parched tongue, and a conftant head-ach, ending in a delirium. It was highly contagious and mortal, and is fuppofed to have been a compound of the bilious and hofpital fever, taking its rife firft in the camp, but acquiring that high degree of malignity from the foul air of the places in which the fick were crouded. *Pringle*, Obferv. on the difeafes of the army, p. 118, feq. See the articles BILIOUS and HOSPITAL-*fever*, *Append.*

HUNGRY *Evil* (*Cycl.*) — Nothing is better in this diftemper, than to feed the horfe feveral times a day with wholefome bean-bread well baked, or oats well dried and fifted. Dict. Ruft. in voc.

HUTCH, among farmers, denotes a veffel or particular place in which to lay corn; alfo a kind of hollow trap for the taking of weefels, or other vermin, alive. Dict. Ruft. in voc.

HYACINTH (*Suppl.*) — *Grape* HYACINTH, or *Mufk* HYACINTH, the Englifh name of a genus of plants, called by botanical writers *Mufcari*. See the article MUSCARI, *Suppl.*

HYACINTH *of Peru*, or the *Starry* HYACINTH, names fometimes given to a diftinct genus of plants, known among authors, by that of *Ornithogalum*, and called in Englifh Star of Bethlehem. See the article ORNITHOGALUM, *Suppl.*

Tuberofe HYACINTH, the name by which fome call the *Polyanthes* of Linnæus. See the article POLYANTHES, *Append.*

HYDRA, or HYDRUS, in zoology, names given to the water-fnake, called by authors *Natrix*. See the article NATRIX, *Suppl.*

HYDRA, is alfo the name by which Linnæus calls the *Polype*. See the articles POLYPE, *Suppl.* and BIOTA, *Append.*

HYDROCANTHARUS, the name by which fome call the water-beetle. See the article DYTISCUS, fupra.

HYDROCORAX, in ornithology, the name by which Barrelier calls the Indian-raven. See the article CORVUS *Indicus*, *Suppl.* and BUCEROS, *Append.*

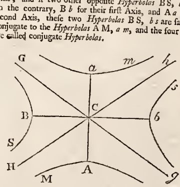
HYDROMETER (*Suppl.*) — We have feveral new improvements of this inftrument, in Defaguliers, Experim. Philofoph. vol. 2. p. 233, feq.

HYDROPHOBIA (*Cycl.*) — Vinegar is recommended by Dr. Kramer, as a fpecific againft the *Hydrophobia*, efpecially, if fome powder of Cantharides is mixed with it. The Receipt given by him is, to boil from four to ten grains of the fine powder of Cantharides, in an ounce and an half, or two ounces, of the beft vinegar, which is to be given warm to the patient. Commerc. Norimb. 1735, hebd. 1183.

HYDROPIPER, a name ufed by fome for the *Perficaria*, or arfmart, of other botannical writers. See the article PERSICARIA, *Suppl.*

HYPERBOLA (*Cycl.*) — *Conjugate* HYPERBOLAS, a name given to four *Hyperbolas*, when the firft and fecond Axes of two oppofite *Hyperbolas* are the fecond and firft Axes of two other oppofite *Hyperbolas*.

Thus if two oppofite *Hyperbolas* A M, *a m* have the line A *a*, for their firft Axis, and the line B *b*, for their fecond Axis; and if two other oppofite *Hyperbolas* BS, *b s*, have on the contrary, B *b* for their firft Axis, and A *a* for their fecond Axis, thefe two *Hyperbolas* B S, *b s* are faid to be conjugate to the *Hyperbolas* A M, *a m*, and the four together are called conjugate *Hyperbolas*.



The Afymptotes H C *h*, G C *g*, of the *Hyperbolas* A M, *a m*, will alfo be the Afymptotes to the *Hyperbolas* B S, *b s*. See *L' Hopital*, Sect. Coniq. Art. 132.

HYPERICOIDES, in botany, the name by which Plumier calls the *Afcyrum* of Linnæus, a diftinct genus of plants. See the article ASCYRUM, *Append.*

HYPERICUM, in the Linnæan fyftem of botany, a large genus of plants; which, according to that author, comprehends the *Androfæmum* and *Hypericum* of Tournefort. See the articles ANDROSEMUM and HYPÆRICUM, *Suppl.*

HYPETHRE, in antient architecture, two rows of pillars all about, and ten at each face of any temple, &c. with a Periftyle within of fix columns.

I.

JACEA, *Knapweed*, is comprehended by Linnæus among the *Centauria*. See the article Centauria, *Append.*

JACINTH, in botany, a name ufed by fome for the *hyacinth*. See the article Hyacinth, *Suppl.*

JACK (*Suppl.*)—Jack is alfo ufed for a well known engine to turn a fpit; for a horfe or wooden frame to faw timber upon; for an inftrument to pull off a pair of boots; for a great leathern pitcher to carry drink in; for a fmall bowl that ferves as a mark at the exercife of bowling; and for a young pike. Dict. Ruft. in voc.

Jack *by the hedge*, a name fometimes given to the *Thlafpi* of botanical writers. See the article Thlaspi, *Suppl.*

Jack *by the hedge* is alfo ufed as the name of a fpecies of *Hefperis*. See the article Hesperis, *Suppl.*

Jack *in a box*, the name by which fome call a diftinct genus of plants, called by botanifts *Hernandia*. See the article Hernandia, *Append.*

JACOB's *Ladder*, a name ufed by fome for the *Polemonium* of botanical writers. See the article Polemonium, *Suppl.*

JACOBÆOIDES, in botany, the name of a genus of plants, according to Vaillant, but comprehended under the *Solidago* by Linnæus. See the article Solidago, *Append.*

JAIL-*fever*, a name given to the *malignant catarrhal fever*, as being frequent in jails; it is likewife call'd the *hofpital fever*, for a like reafon. See the articles Fever and Hospital-*fever*, *Append.*

JALAP, a name fometimes given to the *Convolvulus*, or bind-weed of botanifts. See the article Convolvulus, *Suppl.*

JAMBS, among carpenters and bricklayers. See the article Jaums, *Append.*

JANNOCK, a kind of oaten bread, much ufed in the northern parts of England, and made of four leaven. Dict. Ruft. in voc.

JASMINE (*Suppl.*) *Ilex-leaved* Jasmine, the name by which the *Lantana*, a diftinct genus of plants, is fometimes called. See the article Lantana, *Suppl.*

Arabian, or *Indian* Jasmine, the Englifh name of a genus of plants, called by Linnæus *Nyctanthes*. See the article Nyctanthes, *Append.*

Scarlet Jasmine, a name fometimes given to the *Bignonia*, or trumpet flower. See the article Trumpet *flower*, *Suppl.*

Red-Jasmine, a name given to the *Plumeria* of botanical writers. See the article Plumeria, *Suppl.*

Perfian-Jasmine, the name by which fome call *Lilac*. See the article Lilac, *Suppl.*

Fennel-leaved Jasmine, a name fometimes given to *Quamoclit*. See the article Quamoclit, *Suppl.*

JASMINOIDES, in botany, the name by which Dillenius calls the *Lycium*, of other botanifts. See the article Lycium, *Suppl.* and *Append.*

Jasminoidis *fpecies*, the name improperly given by Dillenius to a diftinct genus of plants, called by Linnæus *Ceftrum*. See the article Cestrum, *Append.*

JASPER, *Jafpis*, (*Suppl.*) in natural hiftory, a genus of ftones of the *Scrupi*-kind, greatly refembling the finer marbles, or femi-pellucid gems. See the article Scrupi, *Append.*

Jafpers, though commonly reckoned among the precious ftones, undoubtedly belong to the clafs of foffils above referred to; being only detached opake maffes of various forms and fizes, and compofed of a cryftalline matter, debafed with an earthy admixture. It is to this laft ingredient of their compofition, that they owe all that variety of colours, and difference of opacity, whence naturalifts have fubdivided them into no lefs than feven orders, containing the white, the green, the red, &c. *Jafpers*.

Of the white *Jafpers*, there is only one known fpecies, the hard, fhining, white, marbly *Jafper*, commonly called the *Nephritic ftone*, on account of its fuppofed virtue in cafes of the ftone and gravel. It is found in many parts of America, particularly the great river of the Amazons, and worn by the natives as an amulet. As to its medical virtues, they are too ridiculous to deferve a ferious refutation; but its other ufes merit the attention of lapidaries, fince it is capable of being fafhioned into cups and vafes of a beautiful polifh, and great brightnefs.

Of the green and greenifh *Jafpers*, we have the following fpecies: 1. The hard, fine green *Jafper*. This is found in many parts of the world, as Egypt, Tartary, China, &c. and worn as an amulet againft fluxes, hæmorrhages, &c. 2. The foft dufky green *Jafper*. This ftone, which is of much lefs beauty and value than the foregoing fpecies, is very common in Germany, Italy, France, England, &c. 3. The hard bluifh green *Jafper*, with red variegations. This is the *heliotrope* of the antients, and *blood-ftone* of the moderns. It is common in Africa, Egypt, and the Eaft-Indies; and is worked into cups, vafes and fnuff-boxes. 4. The hard whitifh-green *Jafper*, which is the nephritic ftone of authors. It is found in many parts of America, where the natives fafhion it into figures of birds, beafts, fifhes, and other forms; and formerly ufed to wear it hung to their lower lips. A thoufand amazing ftories are told, by very grave authors, of the nephritic qualities of this ftone. 5. The hard, yellowifh-green *Jafper*, celebrated likewife for its nephritic virtues. It is found in feveral parts of America, as alfo in Germany, Bohemia, and fome other countries of Europe. 6. The bluifh-green, marbly *Jafper*, variegated with grey and black. 7. The hard, greyifh-green *Jafper*, called by authors the *Jade*, or *Lapis divinus*, the divine ftone. 8. The dull, deep green *Jafper*, called by different authors *Molochite*, *Molochites*, and *Malachites*. 9. The bluifh-green, fofter, dull *Jafper*. This is the *borea*, or fky-coloured *Jafper* of the antients, and makes a very beautiful appearance in cups, vafes, and other ornamental things. 10. The dufky-green *Jafper*, variegated with white and flefh colour; this, tho' a coarfer fpecies than the preceding one, is not without its beauty.

Of the red *Jafpers*, we know only four fpecies: 1. The hard, variegated, purple *Jafper*: This is the rofe-coloured *Jafper* of authors. It is a very beautiful ftone, and capable of a high polifh. It is found in the Eaft and Weft-Indies, as alfo in Germany, Bohemia, and Spain, but of a coarfer kind. 2. The bright red *Jafper*, variegated with white. America and Europe both afford this fpecies; but thofe from the former are the fineft. 3. The dull, purple and white *Jafper*. This, tho' of a coarfe and irregular ftructure, is not unfrequently found manufactured into handles of knives, and other toys, both in England, Italy, and Germany. 4. The hard, dull, flefh-coloured *Jafper*. It is of an extremely pale whitifh red, generally throughout.

The fourth order of *Jafpers* contains thofe of a brown colour, of which we have only one fpecies, the pale-brown, hard *Jafper*, with purple veins. It is common on the Yorkfhire and Suffex fhores, and alfo in many of our gravel-pits.

The fifth order contains the yellowifh *Jafpers*, of which there is only one known fpecies, the yellowifh, hard, variegated *Jafper*. This is the turpentine-coloured *Jafper* of the antients. It is very common in the Eaft-Indies; and we have it alfo in Germany, Bohemia, and other parts of Europe, but inferior to the oriental ones.

The bluifh *Jafpers* conftitute a fixth order; and of thefe there are only two fpecies: 1. The pale bluifh *Jafper*, with black veins and clouds; called by the antients the fmoaky *Jafper*. 2. The bluifh, marbly *Jafper*, variegated with white.

The feventh and laft order of *Jafpers* contains the black ones, whereof there are only two fpecies: 1. The black, marbly *Jafper*, variegated with white. 2. The black, marbly *Jafper*, variegated with yellow. *Hill*, Hift. Fofs. p. 573—592.

JAUMS, among carpenters, denote the door-pofts, as alfo the upright pofts at the ends of window-frames. Build. Dict. in voc.

Jaums, among bricklayers, &c. the upright fides of chimneys, from the hearth to the mantle-tree. Id. ibid.

JAY, in zoology, the Englifh name of a fpecies of *Corvus*, with the upper feathers of the wings blue, variegated with black and white. See Corvus, *Suppl.*

IBERIS (*Suppl.*) is alfo the name ufed by fome writers for a fpecies of *Lepidium*, or dittander. See the article Lepidium, *Suppl.*

ICE-*houfe*, a building defigned to preferve *Ice*, for the ufe of families in the fummer feafon.

Thefe are more generally ufed in warm countries, than with us; particularly in Italy, where the meaneft perfon, who rents a houfe, is not without his vault or cellar for keeping of *Ice*.

Ice-houfes being much more ufed with us than formerly, it may not be amifs to give fome general directions for the choice of the fituation, and ftructure of them; as alfo for the management of the *Ice*.

The fituation, then, fhould be upon a dry fpot of ground; becaufe wherever there is moifture, the *Ice* will melt: for which reafon, too much care cannot be taken to make drains all round them. The place fhould likewife be elevated, and as much expofed to the fun and air as poffible.

As to the figure of the building itfelf, the proprietor may choofe fuch as pleafes his own fancy; but a circular form is the beft for the well where the *Ice* is to be preferved, which fhould be large in proportion to the quantity to be kept.—It is beft to have as much as may ferve two or three years, in cafe of a mild winter, when little or no *Ice* is to be got. At

the bottom of the well, there should be a space of about two feet deep left to receive any moisture which may drain from the *Ice*; and a small drain under ground should be laid from this, to carry off the wet. Over this space of two feet should be placed a strong grate of wood; and the sides of the well should be built of brick, at least two bricks thick; for the thicker it is, the less danger there will be of the well being affected by any external cause.

When the well is brought up within three feet of the surface, there must be another outer arch or wall begun, which must be carried up to the height of the intended arch of the well; and if there is another arch turned over from this wall, it will add to the goodness of the house. The roof must be high enough above the inner arch, to admit of a door-way to get out the *Ice*. If the building is to be covered with slates, or tiles, reads should be placed considerably thick under them, to keep out the sun and external air; the thickness of six or eight inches, with a plastering of hair and lime, will be sufficient to prevent all danger.

The external wall needs not be built circular, but of what figure the proprietor pleases. Sometimes the *Ice-house* is so contrived as to have an handsome alcove seat in its front.

Two feet diameter is sufficient for the aperture of the mouth of the well; which should have a stone, so contrived, as to stop it up in the exactest manner; and all the vacant space between this aperture and the outer door, should be filled up with barley-straw; and this last is to be always shut, before the inner door is opened. The building thus finished, should have time to dry, before the *Ice* is put into it.

If a layer of reads be placed smooth over the grate at the bottom of the well, on which to lay the *Ice*, it will do better than straw, which is commonly used; and as to the choice of the *Ice*, the thinner it is, the easier it may be broken to powder: for the smaller it is broken, the better it will unite, when put into the well. In putting it in, care must be taken to ram it as close as possible; as also to allow a vacancy of about two inches all round next the side of the well, to give passage to any moisture occasioned by the melting of some of the *Ice*.

When the *Ice* is put into the well, if a little salt-petre be mixed with it at every ten inches, or foot thickness, it will cause the *Ice* to join more closely into a solid mass. *Miller's* Gard. Dict.

JEAN-Capelle, in ichthyology, a name given by Ruysch, and some others, to the fish called by authors, the *Faber Indicus*, or Indian Doree; and more expressively named by Artedi, the Zeus with a forked tail. See the article Zeus, *Suppl.*

JEMBUT, in the materia medica, a name used by Avisenna and others, to express the seeds in the pods of the carob tree, or siliqua dulcis; which they call *Charub* or *Charnub*, and the Greeks *Ceratium*. These seeds contained in the pods of this tree, when carefully dryed, served the antient physicians as weights; and hence is derived the Greek word Ceration for a weight which expresses one of these seeds. The Arabian writers mention two kinds of this tree Charnub: The one they call Alscemi, and the other Alnabati. These are translated Syriaca and Nabathæa siliqua. Pliny, Columella, and all the other antients who have written on these subjects, mention the Syrian siliqua, or Charnub. This is called Scemi or Xami; and they have also mentioned the siliqua Græca, which is the common siliqua. The distinction Avisenna makes between the Syrian and Nabathæan siliqua or Charnub is, that the first was a purgative, and gave relief in colics, and other pains in the bowels; and that the other was an astringent, and was very successful in the cure of fluxes of blood, particularly in profluvia of the menses; and that it was for this purpose both eaten and put up as a pessary.

JERGUER, in the Custom-house, an officer who oversees the actions and accounts of the waiters. Dict. Rust. in voc.

JERSEY, among wool-combers, denotes the finest wool taken out of other sorts, by dressing it with a *Jersey-comb*. Dict. Rust. in voc.

JERUSALEM-*cowslip*, a name by which some call the *Pulmonaria* of botanists. See the article Pulmonaria, *Suppl.*

Jerusalem-*sage*, a name sometimes given to two distinct genuses of plants, the *Pulmonaria* and *Phlomis*. See the articles Phlomis and Pulmonaria, *Suppl.*

JESSES denote the ribbons hanging down from garlands and crowns; also the short straps of leather fastened to a hawk's legs, and so to the vervels. Dict. Rust. in voc.

JESSAMIN, or JESSAMY, in botany, the same with *Jasmine*. See Jasmine, *Suppl.*

JESUITS *Bark*, the name of a medicinal drug, otherwise called *cortex peruvianus*, and *quinquina*, or *quinaquina*. See the articles Quinquina, *Cycl.* and Peruvian, *Cycl.* and *Suppl.*

False Jesuit's-*Bark*, a name sometimes given to the *Balsamita* of botanists. See the article Balsamita, *Append.*

JETAIBA, in botany, a name used by some authors for the tree which affords the Gum Anime of the shops. *Piso*, p. 60.

JEWS *Mallow*, a name by which the *corchorus*, a distinct genus of plants, is sometimes called. See the article Corchorus, *Append.*

INCENDIARY, *Incendiarius*, is applied to one who is guilty of maliciously setting fire to another's house. This offence is called *Arson* in our law.

Among the antients, criminals of this kind were to be burnt. *Qui ædes, acervumque frumenti juxta domum positum sciens, prudensque dolo malo combusserit, vinctus, igni necatur. Pitisc.* Lex. Ant. in voc.

INCINERATED *Salts*, in Chemistry, the same with lixivial salts. See Incineration and Lixivious, *Cycl.* and Salts, *Suppl.*

INDEX *of Relation*, in Algebra, the same as *Scale of Relation*. See Scale *of Relation* and Series, *Append.*

INDIAN-*arrow-root*, in botany, a name sometimes given to the *Maranta* of botanists. See the article Maranta, *Ap.*

Indian-*fig*, the name by which some call the *Opuntia* of botanists. See the article Opuntia, *Suppl.*

Indian *god-tree*, the name given by some to a species of fig-tree. See the article Ficus, *Suppl.*

Indian-*reed*, a name given to the *Cannacorus* of botanical writers. See the article Cannacorus, *Suppl.*

INFARCTION of the Liver. See Hepatis *infarctus*, *Sup.*

INFLAMMATION *of the Eyes*, the same with what physicians call *Ophthalmia*. See the article Ophthalmia, *Cycl.*

INFLAMMATORY *Diseases*. To these are to be referred coughs, pleurisies, peripneumonies, acute rheumatisms, *Inflammations* of the brain, bowels, and other parts, attended with a fever; also lesser *Inflammations* without a fever, and fevers of an *inflammatory* kind, where no part is so peculiarly affected as to give name to the disease. And, lastly, all chronic disorders arising from *Inflammations*, whereof the chief are old coughs, consumptions, and the rheumatism without a fever.

All these diseases are the consequences of catching colds, and are prevented by the same means as colds. See the article Cold, *Append.*

Bleeding is the most indispensible remedy in the cure of all *inflammatory* diseases, and therefore to the delaying this too long, or not repeating it, it is owing, that colds end in dangerous fevers, rheumatisms, or consumptions. See the article Bleeding, *Append.*

In all *inflammatory* disorders, the principal intention of cure is to diminish the force of the blood, to thin it, and to relax the fibres; on which account, bleeding, attenuants, and diaphoretics, are the chief remedies. An early sweat tends also to prevent an *inflammatory* fever; for which purpose, the diaphoretic draught of the Edinburgh dispensatory is recommended; or, instead of it, a spoonful of the plain Spiritus Mindereri may be given every two hours, till a sweat breaks out; or two scruples of the salt of hartshorn, saturated with about three spoonfuls of common vinegar, may be given in one draught at bed-time. *Pringle*, Observ. on the Diseases of the army, p. 73, 77, 127, seq.

Inflammatory *fevers*. These may be distinguished into two stages; the first whilst the pulse continues hard, in which it is proper to bleed; and the second, when the *inflammatory* symptoms still remaining, the pulse is too low for that evacuation. In this last state, blisters are the chief remedy, and which, except in a few singular cases, are not to be used sooner. If the blisters are large, it is better to apply them gradually, than many at a time. It is usual to begin with the back, and, if necessary, to apply them next to the legs or thighs, reserving the arms last, that the patient may be so much the longer conveniently moved. In great lowness, attended with a delirium, sinapisms applied to the soles of the feet, have frequently more efficacy than blisters, in raising the pulse, and relieving the head.

If the body has been costive before the disease, it is proper to open it by a laxative, after bleeding; and after recovery, some lenient physic is generally requisite, for preventing a too hasty repletion incident to convalescents, upon indulging their appetites. *Pringle*, Observ. on the Dis. of the army, p. 134.

There is no caution more necessary to a young physician, than to abstain from all opiates throughout these fevers, however much the patient may complain of pain or watchfulness. Indeed, if the fever be accompanied with a diarrhœa, which is not critical, the looseness is to be gradually checked by diascordium, after giving rhubarb, and endeavouring to turn the humours to the skin by the use of diaphoretics, (omitting the nitre) with the use of the white decoction for common drink. Id. ibid. 136.

INK-*fish*, the same with the *Sepia*, or cuttle-fish. This animal, when it is in danger of being taken, emits a black liquor like ink, out of its mouth in considerable quantities, whereby the water being obscured, it finds an opportunity of escaping; and from this property it has got the name of the *Ink-fish*. See the article Sepia, *Append.*

INSECTS. (*Suppl.* — Dr. Hill, in his history of animals, has established a new system of *Insects*; which is this:

He first subdivides them into three general series, each whereof comprehends under it several classes, and those again many distinct genera.

The first series of *Insects* is called *Apteria*; because under it are comprehended all *Insects* of what kind soever, having neither wings nor limbs.

Of this series there are two classes, the *Anarthra* and *Podaria*. See the articles Anarthra and Podaria, *Append.*
The second series of *Insects* is called *Pteraria*, as comprehending all the winged kinds.
Of this series there are likewise two orders or subdivisions: 1. The *Pteraria Diptera*, or *Insects* with two wings. 2. The *Pteraria Tetraptera*, or those with four wings. See the article Pteraria, &c. *Append.*
The third and last series of *Insects* is called *Gymnarthridia*, and comprehends all those *Insects* which have soft and naked bodies, furnished with limbs. See Gymnarthridia.

INTERCALATION. See the article Interpolation, *infra.*

INTERMITTING *fever*. See the article Bilious *fever*, *Append.*

INTERPOLATION, *(Cycl.)* in algebra, is used, for the finding an intermediate term of a series, its place in the series being given. This is also called *Intercalation.*
The method of doing this is called the *Method of Interpolations*, or *Intercalations.*
When the algebraic equation of the series is given, the term required, whether it be a primary or intermediate term, may be found by the resolution of affected equations; but when this equation is not given, as it often happens, the value of the term sought must be exhibited by a converging series, or by the quadrature of curves. See *Stirling*, Method. Different. p. 86. seq. *Meier*, in act. petrop. Tom. II. p. 180, seq.
When the first, second, or other successive differences of the terms of a series become at last equal, the *interpolation* of any term of such a series may be found by Sir Isaac Newton's Differential Method. See Differential *Method*, *App.*

INTERSCENDENT, in Algebra, is applied to quantities, when the exponents of their powers are radical quantities. Thus $Z^{\sqrt{2}}$, $z^{\sqrt{m}}$, &c. are *interscendent* quantities. *Euler*, introduct. ad Analyf. infinit. Vol. I. pag. 6. Hence, an *interscendent* Series or Function is easily understood. See the article Function, *Append.*

IN-TURN, among wrestlers, is when one puts his thigh between those of his adversary, and lifts up his thigh. Dict. Rust. in voc.

JOCKEY, in the management of horses, the person who trims up, and rides about horses for sale. Rust. Dict. in voc.

JOCKLET, or YOCLET, a term used in some parts of Kent for a little farm which requires but one yoke of oxen to till it. Dict. Rust. in voc.

JOHN's *bread*, or St. John's *bread*, a name sometimes given to the *ceratonia*, or carob-tree, called by Tournefort *Siliqua*, See the article Siliqua, *Suppl.*

John's, or *Sweet* John's, a name sometimes given to the *Caryophyllus*, or pink. See the article Pink, *Suppl.*

JOINT-*Clerks of the Acatery*. See the article Acatery, *Cycl.*

JOKY. See the article Jockey, *Append.*

JONQUIL, a name given by some to the *Narcissus* of botanists. See the article Narcissus, *Suppl.*

JOVIS *barba*, in botany, the name of a distinct genus of plants. See the article Barba *Jovis*, *Suppl.*

IRON *(Suppl.)* — For the expansion of *Iron* by heat. See the article Heat, *Append.*

Iron-*wood*, in botany, the name of a genus of plants, called by botanists *Sideroxylum.* See the article Sideroxylum, *Append.*

Filings of Iron, in medicine, when reduced to an impalpable powder, is an excellent form to be given in female disorders, in which the body is weak, languid, and full of acidities; the juices are themselves the best menstruum in the world for it, as appears from its producing eructations of the smell of garlick, and by its tinging the excrements as black as ink. The natural heat, before wanting, is always excited by this means.

IRRIGATION, *Irrigatio*, denotes the watering of a meadow, garden, &c. Dict. Rust. in voc.

ISARUS, in zoology, a name given by the antients to the chamoy-goat. See the article Rupicapra, *Suppl.*

ISOPERIMETRICAL *(Cycl.)* — *Isoperimetrical* lines and figures have greatly engaged the attention of mathematicians since the invention of fluxions. The analysis of the general problem concerning figures, that among all those of the same perimeter produce maxima and minima, was given by Mr. James Bernoulli, from computations that involve second and third fluxions.[a] And several inquiries of this nature have been since prosecuted in like manner, but not always with equal success. Mr. Mac Laurin, to vindicate the doctrine of fluxions from the imputation of uncertainty, or obscurity, has illustrated this subject, which is commonly considered as one of the most abstruse parts of this doctrine, by giving the resolution and composition of these problems by first fluxions only; and in a manner that suggests a synthetic demonstration, serving to verify the solution[b]. [[a] *Analysis magni problematis isoperimetrici*, Act. erudit. Lips. 1701. p. 213, seq. [b] See *Mac Laurin's* Fluxions, B. I. chap. 13. p. 486, seq. See also Mem. Acad. Scienc. 1706. 1718. and *Jo. Bernoulli*, oper. Tom. I. p. 202, 208, 424, seq. Tom. II. p. 235, seq.]

ISSUES *(Suppl.)* — *Issues* above the shoulder-blades are good in asthmatic cases; and Dr. Mead thinks that their benefit in this and some other distempers, lies not only in giving vent to the humours, but likewise in lessening the over great tension of the nerves. Monit. et Pract. medic. cap. v.
The use of *Issues* or setons, made in the side on the part most affected, is recommended instead of bleeding in consumptive cases. See the article Consumption, *Append.* and Issue, *Suppl.*

ITCH *(Cycl.)* — Sulphur is specific in this disorder, being both more safe and more efficacious than mercury. For unless a mercurial ointment were to touch every part of the skin, there can be no dependance on it; whereas by a sulphureous one, a cure may be procured only by partial unctions.
It would seem, as if the *Itch*-insects, like other animals, were killed by the steams of brimstone, though only raised by the heat of the body.
As to the internal use of mercury, which some have accounted specific, there are many instances of people who have undergone a complete salivation for the cure of the venereal disease, without curing the *Itch*.
A pot of sulphureous ointment may be prepared thus: take of common sulphur one ounce; of the root of white hellebore, two drams; or one dram of crude sal ammoniac; make them into an ointment with two ounces and an half of hog's lard. This quantity will serve for four unctions, once every night. But to prevent any disorder that might arise from stopping too many pores at once, it will be proper to anoint only one fourth of the body at one time.
Though the *Itch* may be thus removed by one pot of ointment, it will be proper to renew the application, and to touch the parts most affected, for a few nights longer, till a second quantity, equal to the first, is also exhausted; and, in the worst cases, to subjoin the internal use of sulphur. Now, as the fumes of the sulphur may heat the blood, at a time when the perspiration is so much impeded, the patient should live all the while on a cool diet, and guard against cold. If he be of a full habit, or in any degree feverish, it will be proper to bleed and take physic; otherwise, neither of the two evacuations is necessary. See the article Scabies, *Suppl.*

Itch-*animal*, a creature found in the pustules of the *Itch*; it is a species of *Acarus*. See the article Acarus, *Append.*

JUCCA, in botany, the name of a distinct genus of plants, otherwise called *Yucca*. See the article Yucca, *Suppl.*

JUCKING, the notes of a cock-partridge, inviting the hen to come to him. These serve the sportsman in good stead for finding the places where they are. Rust. Dict. in voc.

JUCURUTA, a very beautiful species of owl, found in the Brazils, and variegated with black and yellow.

JUFFERS, among carpenters, a term used for pieces of wood, about four or five inches square, and of several lengths.

JUGLANS, in the Linnæan system of botany, the name of a distinct genus of plants, called by Tournefort simply *Nux*; and in English the *Walnut-tree*. See the article Nux, *Suppl.*

JUJUBE-*tree*, the English name of a distinct genus of plants, called by authors *Ziziphus*. See the article Ziziphus, *Suppl.*

JULIANS, the name of a distinct genus of plants, called by botanists *Hesperis*. See the article Hesperis, *Suppl.*

JULY-*flowers*, the English name for several species of *Caryophyllus*, or pink. See the article Pink, *Suppl.*

JUNCUS *odoratus*, *aromaticus*, and *rotundus*, in botany, names given to the *Schænanth*. See the article Schænanth, *Suppl.*

IVORY *(Cycl.* and *Suppl.)*—*Staining or Dying of* Ivory. To stain *Ivory* of a fine green colour, take to two parts of verdigrease one part of sal armoniac.

JUTTY-*heads*, in the sea-language, platforms standing on piles, near the docks, and projecting without the wharfs for the more convenient docking and undocking ships. *Blanckley*, Nav. Expositor, p. 84.

JUG, a sort of earthen pot, or pitcher, to hold drink; also a term used in many parts for a common, pasture, or meadow. Rust. Dict. in voc.

JUNAMES, in husbandry, denotes land sown with the same grain, as it had been the preceding year.

JUPITER's-*beard*, the English name of a distinct genus of plants, called by Tournefort *Barba Jovis*. See the article Barba *Jovis*, *Suppl.*

IVY *(Suppl.)* — *Ground*-Ivy, *Hedera terrestria*, the name of a genus of plants, the characters of which are these; the cup is a one-leaved perianthium, tubulated, cylindric, striated, very small, and permanent; with its mouth divided into five acuminated, unequal segments. The flower is monopetalous, and ringent; the tube is slender and compressed, the upper lip being erect, obtuse, and semibifid; the under one patent, large, obtuse, and trifid. The stamina are four, standing under the upper lip of the flower; each of the two pair of antheræ is arranged in the form of a cross. The germen of the pistil is quadrifid; the style is filiform, and inclinated; the stigma bifid and acute. There is no pericarpium beside the cup; the seeds, which are ovated, and four in number, being contained in it. *Linnæi* Gen Plant. p. 269.

Virginian-Ivy, a name used by some writers for the *Menispermum*, a distinct genus of plants. See the article Menispermum, *Append.*

K.

KAB, in Jewish antiquity. See the article CAB, *Suppl.*

KÆMPFERIA, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: The cup is a simple spatha, consisting only of one leaf, and opening on one side. The flower consists of a single petal; the tube is long and thin, the limb is plane, and divided into six parts, three of the segments being alternately lanceolated in figure, and equal in size; two other of the segments are of an ovated form, and the single lower one is divided into five parts, which are each vertically cordated; all the segments are equal in length. The stamen is a single filament, of a membranaceous structure, and somewhat ovated figure, and is emarginated. The anthera is of a lineal figure, it grows to the filament all its length, and scarce emerges out of the tube of the corolla. The germen of the pistil is roundish; the style is of the length of the tube, and the stigma is obtuse. The fruit is a roundish, and somewhat trigonal capsule, composed of three valves, and containing three cells, in each of which there are a great number of seeds. Vid. *Linnæi* Gen. Plant. p. 4.

The root of the *Kæmpferia*, of which there is only one known species, is the *Galangal* of the shops. See the article GALANGAL, *Suppl.*

KAHIASEE, in the turkish court, an officer of state, answering to our master of the ceremonies.

KANTREF, or KANTREV. See the article CANTRED, *Suppl.*

KARFE, a kind of Cinnamon. See the article CINNAMUM, *Suppl.*

KARLE *(Cycl.)* — KARLE-*hemp*, a term used by country people for the latter green hemp. Dict. Rust. in voc.

KASTRIL, in zoology, the same with *Kestril*, a bird of the hawk-kind. See the article KESTRIL, *Suppl.*

KATKIN. See the article CATKIN, *Suppl.*

KEELERS, in the sea language, small tubs for holding stuff to grave a ship's bottom. *Blanckley*, Nav. Expos. p. 85.

KEEVE, or KEEVER, a large tub, or brewing vessel, in which ale or beer ferments before it is tunned. Dict. Rust. in voc.

KENNEL, a term used indifferently for a puddle, a watercourse in the streets, a house for a pack of hounds, and the pack or cry of hounds themselves. Dict. Rust. in voc.

Among sportsmen, a fox is said to *kennel*, when he lies close in his hole. Id. ibid.

KERSEY, a kind of coarse woollen cloth, made chiefly in Kent and Devonshire. Dict. Rust. in voc.

KESITAH. This word is to be met with in Genesis [a], and in Job [b]; and is translated in the septuagint and vulgate Sheep or Lambs. But the Rabbins and modern interpreters are generally of opinion, that *Kesitah* signifies rather a piece of money. Bochart and Eugubinus are of opinion the septuagint meant *Minæ*, and not *Lambs*; in Greek *hecatonmnon*, ἑκατονμνων instead of ἑκατον ἀμνων. Now a Mina was worth sixty Hebrew shekels, and consequently six pounds sixteen shillings and ten pence halfpenny sterling [c]. M. de Pelletier of Rouen, is of opinion, that *Kesitah* was a Persian coin, stamped on one side with an archer (*Kesitah*, or *Keseth*, in Hebrew, signifying a Bow) and on the other with a Lamb; that this was a gold coin known in the east by the name of a Daric [d], and was in value about twelve livres and ten pence French money. Several learned men, without mentioning the value of the *Kesitah*, say it was a silver coin, the impression whereof was a sheep; for which reason the septuagint and vulgate translate it by this name. Calmet is of opinion, that *Kesitah* was a purse of gold or silver. In the east they reckon at present by purses. The word *Kista* in Chaldee signifies a measure, a vessel. And *Eustathius* says, that *Kista* is a Persian measure. Jonathan and the *Targum* of *Jerusalem* translate *Kesitah* a pearl [e].

[[a] Gen. XXXIII. 19.— [b] Job XLII. 11.—Or Nine pounds *English*, supposing, as Dr. *Prideaux* does, that a shekel is worth three shillings.— [d] A Daric is a piece of gold, worth, as Dr. *Prideaux* says, five and twenty shillings *English*. See his Connect. P. I. p. 101.— [e] See *Calmet* Comment. upon Gen. XXXIII. 19. Gen. XXV. 12, &c. and Dict. Bibl.]

KEY *(Suppl.)* — KEYS, a name commonly given to the seeds of ash-trees. Dict. Rust. in voc.

KID, in zoology, the English name of the young of goats. See the article GOAT, *Suppl.*

KIDNEYS *(Cycl.)* — The lymphatic vessels of the *Kidneys* appear upon blowing by the ureter into the pelvis of the *Kidney*. See Hist. de l'Acad. des Sciences, 1733.

KIDNEY-*bean-tree*, the name by which some call the *Glycine*. See the article GLYCINE, *Suppl.*

KIDNEY-*wort*, in botany, a name promiscuously used for two distinct genuses of plants, called by botanists *Geum*, and *Cotyledon*. See the articles GEUM and COTYLEDON, *Suppl.*

KILLOS, a name given by the miners of Cornwall to a stone of the slate kind, found in the mines there. See the article GROWAN, *Suppl.*

KINE, in zoology. See the articles COW and BO, *Suppl.*

KING-*fisher*, the English name of a genus of birds, called by zoologists *Ispida*. See the article ISPIDA, *Suppl.*

KING's-*spear*, a name sometimes used for the *Asphodelus* of botanists. See the article ASPHODELUS, *Suppl.*

KINKS, in the sea language. When ropes are new, or too hard laid, they are apt in folding, to make turns, which are called *Kinks*. *Blanckley*, Nav. Expos. p. 16.

KIPE, a kind of osier basket, wide in the middle, and narrow at both ends, used for taking fish. Rust. Dict. in voc.

KIPE is also the name of a game, which consists in throwing something into a hole, called the *Kipe*-hole.

KIRTLE, a term used for a short jacket; also for a quantity of flax, about an hundred weight. Rust. Dict. in voc.

KITE, in ornithology, the English name of a bird of the hawk-kind, with a brown body, and a white head; its tail is forked, and the wings are immoderately long and large, measuring nearly three times the length of the body. See the article MILVUS, *Suppl.*

KLEINIA, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: The cup is cylindric, and covered with squamæ; the compound flower is tubulose; the proper one infundibuliform, insensibly terminating in a tube; the stamina are five very short capillary filaments; the antheræ are cylindraceo-tubulose; the germen of the pistil is coronated; the style is filiform, and of the length of the stamina; the stigmata are two, oblong, and revolute. There is no pericarpium. The seeds are solitary, oblong, and covered with very long capillary down. The receptacle is naked, plane, and punctated. *Linnæi* Gen. Plant. p. 394.

Linnæus queries whether this genus be not the same with the *Tithymaloides* of Tournefort. See the article TITHYMALOIDES, *Suppl.*

KNAG, a term used by country people for a knot in wood; also for the branches which grow out in the hart's-horns, near the forehead. Rust. Dict. in voc.

KNEE-*holm*, or KNEE-*holly*, the name by which some call the *Ruscus*, or Butcher's-broom. See the article RUSCUS, *Suppl.*

KNIGHT's *Cross*, a name sometimes used for the *Lychnis*, a distinct genus of plants. See the article LYCHNIS, *Suppl.*

KNOLL, a term used in many parts of the kingdom for the top of a small hill, or for the hill itself. Rust. Dict. in voc.

KNOT-*berries*, in botany, the name by which some call the *Rubus*. See the article RUBUS, *Suppl.*

KNOT-*grass*, *(Suppl.)*—*Mountain* KNOT-*grass*, or *single* KNOT-*grass*, the name sometimes given to a distinct genus of plants, called by botanists *Paronychia*. See the article PARONYCHIA, *Suppl.*

L.

LABURNUM, in botany, the name used by Rivinus, for the cytisus of other botanists. See the article CYTISUS, *Suppl.*

LACRYMA *Jobi*, in botany, the name of a genus of plants, the characters of which are these: The male flowers are formed into a lax spike; the female ones are fewer in number, and are situate at the base of the male spike on the same plant. In the male flowers the cup is a glume, containing two flowers, and has no awns; the corolla is also a glume, without any aristæ or awns. The stamina are three capillary filaments; the antheræ are oblong, and quadrangular. In the female flowers, the cup is also a glume, containing two flowers, as is the corolla, both being without any awns. The germen of the pistil is of an oval form; the style is short, and divided into two parts. The stigmata are two in number, corniculated, and longer than the flower. The seed, which is single and roundish, is covered by the indurated cup. Vid. *Linnæi* Gen. Plant. p. 445.

LADDER *to heaven*, the name by which some call the *Polygonatum*, a distinct genus of plants. See the article POLYGONATUM, *Suppl.*

LADIES *bed-straw*, in botany, the English name of a distinct genus of plants, called by botanists *Gallium*. See the article GALLIUM, *Suppl.*

LADIES *bower*, or *Virgin's bower*, names given to a distinct genus of plants, called by botanists *Clematitis*. See the article VIRGIN'S *bower*, *Suppl.*

LADIES *comb*, or VENUS'S *comb*, in botany, the name of a distinct genus of plants, called by botanists *Scandix*. See the article SCANDIX, *Suppl.*

LADLE (*Suppl.*) — LADLE-*boards*, those boards disposed on the circumference of the water-wheels of over-shot mills; forming hollows, or receptacles not unlike ladles to receive the water that falls upon the wheel. See the article *Water*-WHEEL, *Append.*

LADIES *finger*, the name by which some call a species of *Vulneraria*. See the article VULNERARIA, *Suppl.*

LADIES *mantle*, in botany, the name of a genus of plants, known among authors by that of *Alchimilla*. See the article ALCHIMILLA, *Suppl.*

LADIES *seal*, a name sometimes given to a distinct genus of plants, called by botanists *Tamnus*. See the article TAMNUS, *Suppl.*

LADIES *traces*, a name sometimes used for the *Orchis*, a distinct genus of plants. See the article ORCHIS, *Suppl.*

LADY *cow*, the English name of a genus of beetles, called by some *Hemisphæria*. See the articles SCARABÆUS, *Suppl.* and HEMISPHÆRIA, *Append.*

LAKE-*weed*, in botany, a name sometimes used for the *Persicaria*, or arsmart. See the article PERSICARIA, *Suppl.*

LAMB'S *Lettuce*, a name by which some call the *Valerianella*, a distinct genus of plants. See the article VALERIANELLA, *Suppl.*

LAMPADIAS is used by some authors for a kind of bearded comet, which, as they pretend, resembles a burning lamp, being of several shapes; its flame or blaze tapering upward sometimes like unto a sword, and being at others double or triple pointed.

LANIARDS. See the article LANNIERS, *Suppl.*

LANIO, in ornithology, the name used by Linnæus for the butcher-bird. See the article LANIUS, *Suppl.*

LANNAR, in ornithology, a bird of the hawk-kind. See the article LANNARIUS, *Suppl.*

LANYARDS. See the article LANNIERS, *Suppl.*

LAPIS *Calaminaris*, in natural history. See the article CALAMINARIS *Lapis*, *Suppl.*

LAPPA, in botany, a name used by some for the *Xanthium*, or burdock. See the article XANTHIUM, *Suppl.*

LAPWING, in ornithology, the English name of the black-breasted *Tringa*, with a hanging crest. See the article TRINGA, *Suppl.*

Were the *Lapwing* less common, it would be highly esteemed for its beauty. It is very frequent in our fenny countries, and in the wet places of most other parts of Europe.

Authors have described it under the names *Vanellus*, *Capra*, and *Capella*. See the article CAPELLA, *Suppl.*

LARCH-*tree*, in botany, the English name of a distinct genus of plants, called by botanists *Larix*. See the article LARIX, *Suppl.*

LASER-*wort*, in botany, the name of a distinct genus of plants, See the article LASERPITIUM, *Suppl.*

LASK, a term used by farriers for a looseness in horses, frequently fatal to them. Ruft. Dict. in voc.

LATCHETS, the same with *Laskets*. See the article LASKETS, *Suppl.*

LATHYRUS is also a name used by some for the *Nissolia* of others. See the articles LATHYRUS and NISSOLIA, *Suppl.*

LAVENDER, the English name of a distinct genus of plants, called by authors *Lavendula*. See the article LAVENDULA, *Suppl.*

Cotton LAVENDER, the name by which some call the *Santolina* of botanists, a distinct genus of plants. See the article SANTOLINA, *Suppl.*

French LAVENDER, a name sometimes given to a distinct genus of plants, called by authors *Stoechas*. See the article STOECHAS, *Append.*

Hollow-leaved Sea LAVENDER, a name sometimes used for a species of *Sarracena*. See the article SARRACENA, *Suppl.*

Sea LAVENDER, the English name of a distinct genus of plants, known among botanists by that of LIMONIUM. See the article LIMONIUM, *Suppl.*

LAVER, in botany, the English name of a genus of plants, called by botanists *Tremella*. See the article TREMELLA, *Suppl.*

LAUREL, *Laurus*, in botany, the name given by Linnæus to a large genus of plants. See the article LAURUS, *Append.*

Alexandrian LAUREL, a name sometimes given to the *Ruscus*, or butcher's broom. See the article RUSCUS, *Suppl.*

Dwarf LAUREL, or *spurge* LAUREL, names sometimes given to the *Thymelæa* of botanists. See the article THYMELÆA, *Suppl.*

Portugal LAUREL, the name of a distinct genus of plants, called by authors *Padus*, or *Lauro-Cerasus*. See the article LAURO-*Cerasus*, *Suppl.*

Sea-side LAUREL, a name sometimes given to the *Phyllanthus*, a distinct genus of plants. See the article PHYLLANTHUS, *Suppl.*

LAUROTAXA, in botany. See the article RUSCUS, *Suppl.*

LAURUS, in the Linnæan system of botany, the name of a large genus of plants, comprehending the *Laurus*, or common bay-tree, of Tournefort; the *Cinnamon-tree*, the *Camphor-tree*, and the *Persea*, *Borbonia*, *Benzoe*, and *Sassafrass* of others.

The characters of this genus are these: There is no calyx, the corolla much resembles a calyx, and has been mistaken for one; it consists of six erect, hollow, ovo-acuminated petals, alternately exterior; the nectarium is composed of three coloured, acuminated turbercles, terminating each in two hairs, and standing round the germen; the stamina are nine filaments, shorter than the corolla, compressed, obtuse, and placed in threes; the antheræ adhere to the edge of the upper part of the filaments on each side; and there are two globose corpuscles, affixed, by a very short filament, to each of the stamina of the inner series, near the base; the germen is oval; the style is simple, equal, and of the length of the stamina; the stigma is obtuse and oblique; the fruit is a drupe of an oval, acuminated figure, containing only one cell, and contained in the corolla; the seed is a single ovato-acuminated nut; its kernel is of the same shape.

The greater number of the species of this genus, as the cinnamon-tree, camphor-tree, &c. are of the hermaphrodite kind; but some, as the common bay, have the male flowers on separate trees: In this case the stamina vary in number from eight to fourteen, and the corolla is naked, and divided into four parts. The little bodies adhering to some of the filaments, are the great characteristics of the genus. Vid. *Linnæi* Gen. Plant. p. 174.

LAURUSTINE, the English name of a genus of plants, known among authors by that of *Tinus*. See the article TINUS, *Suppl.*

LAW-*Day*, *Lagedayum*, in our old Law-writers, was any day of open court, and commonly used for the courts of a county or hundred. It is also called *View of frank-pledge*, or *Court-leet*. — *Et quieti sint de Sectis Comitatuum & Hundredorum nostrorum, de visu franci plegii & Lawdayorum*, &c. Chart. 39. H. 3. *Terms of law.*

LAYR. See the article LAIR, *Cycl.*

LAYES, or LEYES, a term used in many parts of England, for such pasture ground, as formerly had been tilled and sown. Ruft. Dict. in voc.

LAZEROLE, in botany, a name used for several species of medlar. See the articles MESPILUS and MEDLAR. *Suppl.*

LEAM, or LIAM, among sportsmen, the line for holding a hawk or dog, more usually called a Leash. See the article LEASH, *Cycl.*

LEDGERS, among builders. See the article PUTLOGS, *Cycl.*

LEE (*Suppl.*) — LEE-*fangs* are ropes reeved into the cringles of a yacht's or hoy's sails. *Blankley's* Naval Expositor, p. 93.

LEECH, the same with LEETCH. See the article LEETCH, *Suppl.*

LEEK *(Suppl.)* — *Houſe*-LEEK, the Engliſh name of a genus of plants, called by botanical writers *Sedum*. See the article SEDUM, *Suppl.*

LEMNA, *Duckweed*, in the Linnæan ſyſtem of botany, the name of a genus of plants, called by others LENTICULA and HYDROPHACE.

The characters of it are theſe: It produces diſtinct hermaphrodite and female flowers on the ſame plant. In the hermaphrodite flowers the cup is monophyllous, of a roundiſh figure, and opens ſidewiſe; it is dilated obliquely outwards, and is large, expanded, obtuſe, and not divided at the edges. There is no corolla; but in this calyx there ſtands two ſubulated, crooked filaments, of the length of the cup, and on theſe double globoſe antheræ. In the female flower there is no corolla; the calyx is the ſame as in the other. The germen of the piſtil is of an oval form; the ſtyle is ſhort and permanent, the ſtigma ſimple. The fruit is a rounded capſule, but terminating in a point, and contains only a ſingle cavity; in which are lodged a ſmall number of ſeeds, of an oblong figure, pointed at each end, and ſtriated on one ſide. Vid. *Linnæi* Gen. Plant. p. 508.

The ſpecies of *Lemna* enumerated by authors are theſe. 1. The roundiſh leaved, ſingle rooted *Duck-weed*. 2. The ſingle rooted *Lemna*, with oblong leaves. 3. The many rooted, broad, oval leaved *Duck-weed*. 4. The ſingle rooted, oval leaved *Lemna*. 5. The oval leaved *Lemna* with no root. 6. The ramoſe, pediculated *Lemna*, with oblong leaves. Vid. *Hill*'s Hiſt. Plant. p. 128.

Beſides theſe ſix diſtinct ſpecies of *Lemna*, there are two varieties that may eaſily be miſtaken for diſtinct ſpecies alſo: theſe are a very ſmall, oblong, and thick leaved kind; and a larger, roundiſh, and thin leaved one.

The common *Lemna* is recommended, as a refrigerant, and reſtringent; and Bates tells us of a wonderful cure performed by an infuſion of it in wine, in an obſtinate jaundice. Id. ibid. p. 130.

LEMON-*tree*, *Limon*, in botany. See the article LIMON, *Suppl.*

The culture of the *Lemon-tree* is much the ſame with that of the Orange-tree. See the article ORANGE, *Suppl.*

However, it is proper to obſerve, that the common *Lemons* are ſomewhat hardier than the orange, and require a greater ſhare of freſh air in winter, for which reaſon they ſhould be placed nearer to the doors or windows of the green-houſe. Another difference likewiſe deſerves to be mentioned; and that is, that the *Lemons* require to be more plentifully watered than the orange. But as to the tender kinds of *Lemons*, they muſt be treated with more care. *Miller*, Gard. Dict.

Water-LEMON, a name ſometimes given to the *Granadilla*, or paſſion flower. See the article GRANADILLA, *Suppl.*

LENTIL, in botany, the Engliſh name of a diſtinct genus of plants, called by botanical writers, *Lens*. See the article LENS, *Suppl.*

Lentils make excellent ſweet fodder; and are therefore to be preferred to all other kinds for calves and other young cattle. They likewiſe are the beſt as well as cheapeſt food for pidgeons. Ruſt. Dict. in voc.

Peruvian-LENTISK, the name ſometimes given to the *Molle* of botanical authors. See the article MOLLE, *Suppl.*

LEOPARD, in zoology, the Engliſh name of the long-tailed *Felis*, with the upper ſpots round, and the lower ones virgated. See the article FELIS, *Suppl.*

LEPRAS, in ichthyography. See the article TURDUS, *Suppl.*

LEPROSY *(Cycl.)* — The leſſer degrees of *Leproſy* are frequently confounded with the ſcurvy, and even itch; from which, however, it may be diſtinguiſhed by the hardneſs of the ſkin in one or more parts of the body, attended with a dry ſcurf, ſometimes oozing puſtules, or dry ſcabs, and always with ſome degree of itching; whereas the true ſcorbutic ſpots are of a livid colour, not commonly ſcurfy or raiſed above the ſkin, and are attended with manifeſt ſigns of a lax ſtate of the fibres, and corruption of the blood. For a real ſcurvy imports a flow, but general reſolution or putrefaction of the whole frame; whereas the ſcabies, impetigo, or leproſy may be found to affect thoſe of a very different conſtitution. *Pringle*, Obſerv. on Diſeaſ. of the Army, p. 306.

This diſorder is ſo far from being curable by externals only, that it is ſometimes dangerous to attempt to remove the ſcurfs of *leprous* people in that manner. On the contrary, it is neceſſary to change the humours, by a ſpare diet, exerciſe, alterative mercurials, or frequent purges of the ſaline kind. Id. ibid.

Dr. Mead recommends the Tincture of Cantharides in this diſtemper. *De morbis biblicis.*

LEPTURA, in the hiſtory of inſects, the name of a genus of four-winged flies, the antennæ of which are oblong, ſlender, and ſetaceous; the exterior wings are truncated at their extremity, and the thorax is of a ſubcylindric figure. *Hill*, Hiſt. Anim. p. 46.

Theſe flies have been, by the generality of authors, reckoned among the beetles. See the article SCARABÆUS, *Suppl.*

LEPTURUS, the name is of Greek origin, and is form'd of the λεπτὸς ſlender, and οὐρα a tail; expreſſing that this fiſh has a very long and ſlender tail.

LEPUS *Marinus*, a name uſed by many authors for the *Lernea*. See the article LERNEA, *Append.*

LERNEA, in zoology, the name of a genus of naked inſects. Its body is of an oblong, cylindric figure, from one to two inches long; and is perforated in the forehead; the tentacula reſemble ears.

It is found on rocks waſhed by the ſea, and even on the ſides of the bream, carp, and roach, in many of our ponds and rivers.

Authors have called it *Lepus marinus*, the ſea-hare; of which they enumerate a great many ſpecies. *Hill*, Hiſt. Anim. p. 88.

LESSES, a term uſed by ſportſmen for the dung of a wild boar, bear, or wolf. Ruſt. Dict. in voc.

LETTUCE — *(Suppl.)* *Lamb's* LETTUCE, in botany, the name of a genus of plants, called by botaniſts *Valerianella*. See the article VALERIANELLA, *Suppl.*

Wild-LETTUCE, a name ſometimes given to the *Prenanthes*, a diſtinct genus of plants. See the article PRENANTHES, *Suppl.*

LEUCO-*Narciſſo-lirion*, a name uſed by *Lobel*, for the plant called by Linnæus *Galanthus*, and comprehended by Tournefort among the *Narciſſo-Leucoiums*. See the article NARCISSO-*Leucoium*, *Suppl.*

LEUCOIUM *bulboſum*, a name ſometimes given to a ſpecies of *Narciſſo-Leucoium*, according to Tournefort, but made a diſtinct genus by Linnæus, under the name *Galanthus*. See the article NARCISSO-*Leucoium*, *Suppl.*

LEUCORHOEA. See the article FLUOR *Albus*, *Suppl.*

LIBELLULA, in zoology, the name of a genus of two winged flies, the mouth of which is furniſhed with jaws, the antennæ ſhort, and the tail terminated by a kind of forceps.

The ſpecies of this genus are very numerous, ſome carrying their wings erect when they ſit, and others horizontally. Vid. *Hill*, Hiſt. Anim. p. 73.

LICE *of trees*. See the article APHIS, *Append.*

LIFE *(Suppl.)* — *Annuity for* LIFE. Dr. Halley's Table of the values of annuities for lives for different ages, inſerted in the Cyclopædia, under ANNUITY, was computed at a high rate of intereſt, and coincides nearly with Mr. De Moivre's Tables at 6 per Cent; but as intereſt is now much fallen, it may be proper here to ſhew the values of ſuch Annuities, when intereſt is eſtimated at 3, 3 ½, 4, and 5 per Cent.

Value of an Annuity for life of 1 £. Intereſt being,

Age	3 *per* Ct.	3½ *per* C.	4 *per* Ct.	5 *per* Ct.

80	2. 34	2. 31	2. 28	2. 23

The columns marked 3 per Ct. &c. ſhew the values of annuities for LIFE in years purchaſe, and decimals of a year; thus an annuity for LIFE at 3 per Ct. for an age of 56, will be 10. 90. that is worth 10 $\frac{9}{10}$ years purchaſe.

Dr. Halley alſo publiſhed a Table [a] for eſtimating the probabilities of life, grounded on the Breſlau Bills of Mortality; and the values of annuities for *life* have been commonly determined from this Table, and from the rate of intereſt. See *De Moivre*, Doct. of Chances, p. 211, ſeq.

We ſhall here inſert Dr. Halley's Table, divided into ſeveral columns, ſhewing alternately the age, and the number of perſons living of that age.—[[a] Philoſ. Tranſ. N° 196. Lowthorp's Abridg. Vol. III. p. 671.]

Age	Perſons	Age	Perſons	Age	Perſons	Age	Perſons
1	1000	22	586	43	417	64	202
2	855	23	579	44	407	65	192
3	798	24	573	45	397	66	182
4	760	25	567	46	387	67	172
5	732	26	560	47	377	68	162
6	710	27	553	48	367	69	152
7	692	28	546	49	357	70	142
8	680	29	539	50	346	71	131
9	670	30	531	51	335	72	120
10	661	31	523	52	324	73	109
11	653	32	515	53	313	74	98
12	646	33	507	54	302	75	88
13	640	34	499	55	292	76	78
14	634	35	490	56	282	77	68
15	628	36	481	57	272	78	58
16	622	37	472	58	262	79	49
17	616	38	463	59	252	80	41
18	610	39	454	60	242	81	34
19	604	40	445	61	232	82	28
20	598	41	436	62	222	83	23
21	592	42	427	63	212	84	20

By the help of this table we may find what the reſpective probabilities are for a man of a certain age, 30, for inſtance, living 1, 2, 3, 4, &c. years. Thus, look for the number 30 in one of the columns of age; then over-againſt that number in the next adjacent column on the right hand, you will find 531, under which are written 523, 515, 507, 499, &c. each correſponding, reſpectively, to the numbers written in the column of age; the meaning of which is, that out of 531 perſons living of the age of 30, there remain but 523, 515, 507, 499, &c. that attain the reſpective ages of 31, 32, 33, 34, &c. and who conſequently do from that term of 30, live 1, 2, 3, 4, &c. years reſpectively.

Hence ſuppoſing the quantities A, B, C, D, E, &c. to repreſent reſpectively the perſons living at a given age, and the ſubſequent years, it is evident, that there being A perſons of the age given, and one year after B perſons remaining, the probability which the perſon of the given age has to continue in life, for one year, is meaſured by the fraction $\frac{B}{A}$ and that the probability which he has to continue in life for two years, is meaſured by the fraction $\frac{C}{A}$ and ſo on. Therefore, if money bore no intereſt, it would be ſufficient to multiply thoſe probabilities by the ſum to be received annually, and the ſum of the products would expreſs the preſent value of the annuity. But as money bears intereſt, all thoſe values muſt be properly diſcounted at compound intereſt according to a given rate, and the new reſulting value will be the true value of an annuity for a given life at a given rate of intereſt.

Mr. De Moivre obſerved, that in Dr. Halley's Table the probabilities of life decreaſed nearly in an arithmetic progreſſion, when conſidered from a term given, and hence he found an eaſy rule for the value of an annuity on a life of a given age. His rule is, $\frac{1-\frac{r}{n}P}{r-1}$ where P repreſents the value of an annuity certain of 1 £ for as many years as are intercepted between the age given, and the extremity of old age, ſuppoſed at 86, and that interval of life is expreſſed by n. r ſtands for the amount of the principal and intereſt of 1 £ in one year.

The rule, therefore, in words at length, will be, Take the value of an annuity certain for ſo many years as are denoted by the complement of life; multiply this value by the rate of intereſt, and divide the product by the complement of life; then let the quotient be ſubtracted from 1, and let the remainder be divided by the intereſt of 1 £; then this laſt quotient will expreſs the value of an annuity for an age given. See *Complement* of LIFE, *infra*.

Thus ſuppoſe it were required to find the preſent value of an annuity of 1 £ for an age of 50, intereſt being at 5 per cent. The complement of life being 36; let the value of an annuity certain, according to the given rate of intereſt, be taken from the tables of ſuch annuities [a], and this value will be found to be 16.5468. Let this value be multiplied by the rate of intereſt 1. 05; the product will be 17. 3741. Let this product be divided by the complement of life, that is, in this caſe, by 36, the quotient will be 0. 04826; ſubtract this quotient from unity, the remainder will be 0.5174. Laſtly, divide this quotient by the intereſt of 1 £; that is, in the preſent caſe, 0. 05, and the new quotient will be 10. 35, which will expreſs the value of an annuity of 1 £ to continue during a life of 50, or, in other words, how many years purchaſe a life of 50 is worth [b].—[[a] See *Dodſon's* Calculator, p. 11.—[b] *De Moivre's* Annuit. Probl. I, and Doctr. of Chances, p. 213, ſeqq.

The following queſtions being of frequent uſe, we have here inſerted them, with the rules for their ſolution.

I. The values of two ſingle lives being given, to find the value of an annuity granted for the time of their joint continuance; or, the value of two ſingle lives being given, to find the value of the joint lives.

Multiply together the values of the two lives, and reſerve the product. Let that product be again multiplied by the intereſt of 1 £; and let that new product be ſubtracted from the ſum of the values of the lives, and reſerve the remainder. Divide the firſt quantity reſerved by the ſecond, and the quotient will expreſs the value of the two joint lives.

Thus ſuppoſing one life of 40 years of age, the other of 50, and intereſt at 5 per Cent; the value of the firſt life will be found in the tables to be 11. 83; the value of the ſecond 10. 35; and the product will be 122. 4405, which product muſt be reſerved. Multiply this again by the intereſt of 1 £; that is, by 0. 05, and this new product will be 6. 12025. which being ſubtracted from the ſum of the lives, or 22. 18, the remainder will be 16. 057975, and this is the ſecond quantity reſerved. Now dividing the firſt quantity reſerved by the ſecond, the quotient will be 7. 62 nearly; and this expreſſes the values of the two *joint lives*.

II. The values of two ſingle lives being given, to find the value of an annuity upon the longeſt of them; that is, of an annuity to continue ſo long as either of them is in being.

From the ſum of the values of the joint lives, ſubtract the value of the joint lives, and the remainder will be the value of the longeſt.

Suppoſe for inſtance, two lives, one worth 13 years purchaſe, the other 14, and intereſt at 4 per Cent. The ſum of the values of the lives is 27; the value of the two joint lives by the rule before given is 9. 23; and ſubtracting 9. 23 from 27, the remainder 17. 77 is the value of the longeſt of the two lives.

III. The values of three ſingle lives being given, to find the value of an annuity upon the longeſt of them:

Take the ſum of the three ſingle lives, from which ſum ſubtract the ſum of all the joint lives combined two and two; then to the remainder add the value of the three joint lives, and the reſult will be the value of the longeſt of he three lives.

Thus ſuppoſing the ſingle lives to be 13, 14, and 15 years purchaſe, the ſum of the values will be 42; the values of the firſt and ſecond joint lives are 9. 24; of the firſt and third 9. 65; of the ſecond and third 10. 18; the ſum of all which is 29. 06; which being ſubtracted from the ſum of the lives, that is, from 42, the remainder will be 12. 94; to which adding the value of the three joint lives 7. 41, the ſum 20. 35, will be the value of the longeſt of the three joint lives.

IV. To find the preſent value of a remainder in fee, after a life of a given age. That is, ſuppoſing A to be in poſſeſſion of an annuity for his life; and that B after the deceaſe of A, is to have the annuity for him and his heirs for ever, to find the preſent value of the remainder; or, as ſome call it, the reverſion.

From

From the value of the fee fimple or perpetuity, fubtract the value of the *life* in poffeffion; what remains will be the value of the reverfion.

Thus fuppofing that A is 60 years of age; an annuity upon his *life*, intereft at 5 per Cent. would be 8. 39; which being fubtracted from the value of the fee, or perpetuity 20, the remainder will be 11. 61; which is the prefent value of the expectation of B.

By this rule the value of an eftate fubject to a jointure may be determined.

In like manner, fuppofing that C were to have an annuity for him and his heirs for ever, after the *lives* of A and B, then from the perpetuity or fee fimple fubtracting the value of the longeft of the two *lives* A and B, the remainder will exprefs the value of C's expectation.

Thus, fuppofing the ages of A to be 40, and of B to be 50, the value of an annuity upon the longeft of thefe two *lives* would be found by the foregoing rule to be 14. 56: and this being fubtracted from the perpetuity 20, the remainder is 5. 44; which is the value of C's expectation.

V. To find the value of an annuity for *life*, after another annuity for *life*.

Suppofe for inftance, that A is in poffeffion of an annuity for his *life*, and that B, after the *life* of A, is to have the annuity for his *life* only, and that his heir or reprefentative is to have nothing, in cafe A furvives B; what is the value of the *life* of B, after the *life* of A.

From the prefent value of the *life* of B, fubtract the prefent value of the joint *lives* of B and A, and the remainder will be the value of B's expectation.

There are many other ufeful queftions, the determinations of which depend on the values of annuities for *lives*, joint *lives*, and fucceffive *lives*; but it would lead us too far to infert them here: We muft therefore refer the reader to M. De Moivre's annuities on *lives*; efpecially the fourth edition, which is more correct than the former. See alfo the Doctrine of Chances, page 211, 212, &c.

We think it proper to add, that Mr. Kerfeboom's Table of the value of annuities for *life*, does not agree entirely with thofe of M. De Moivre, either at 3, or $3\frac{1}{2}$ per Cent. intereft. But as Mr. Kerfeboom feems to have taken great pains in his obfervations on the probabilities of *life*, it may be worth while here to infert his Table.

Mr. Kerfeboom's table of annuities for *life*.

Let the annuity be 100 guilders a year upon a *life* under a year old.

			Guilds.	
Its prefent value is			1667	that is 6 per Ct.
Upon a *life* of 5 years to 1 inclufive, is			1869	5. 35
	10	6	1835	5. 45
	15	11	1770	5. 65
	20	16	1667	6. 00
	25	21	1587	6. 30

	55	51	971	10. 30
	60	56	840	11. 40
	65	61	709	14. 10
	70	66	570	17. 55

See Phil. Tranf. N° 450. Sect. 15.

Monfieur de Parcieux has alfo given us many ufeful obfervations tending to determine the probability of the duration of the *life* of man. See Effai fur les probabilités de la durée de la vie humaine, Paris, 1746. 4to.

According to this gentleman's eftimate, the values of annuities for *life* are higher than thofe of M. De Moivre's Tables. Thus fuppofing intereft at 5 per Cent. Mr. De Parcieux eftimates an annuity for *life* of 100 livres, according to the following table.

Table of the values of an annuity of 100 livres for *life*, according to Monfieur de Parcieux. Intereft at 5 per Cent.

Age	Livres	Age	Livres	Age	Livres

Complement of LIFE, is ufed by Mr. De Moivre, for that time which remains from a given age to the extremity of old age, eftimated by that author at 86 years. Annuit. on Lives, p. 14. Doctrine of Chances, p. 213, feq.

Thus, fuppofing an age of 50, the *Complement of life* will be 36; becaufe this number is the difference between 86 and 50.

Expectation of LIFE, is ufed by Mr. De Moivre, for the time which a perfon of a given age may juftly expect to continue in being, that is when the chance for his living or dying becomes equal.

According to that gentleman's calculation, upon the fuppofition of an equal decrement of *life*, the *Expectation of life* would be expreffed by $\frac{1}{2}n$, if n denotes the complement of *life*. Thus the *expectation of life* for a man of 50 years of age will be, $18 = \frac{36}{2}$: That is, he had an equal chance, or of 1 to 1, of living 18 years. But if that interval be once attained, there arifes a new expectation of $\frac{1}{4}n$; and afterwards of $\frac{1}{8}n$, &c. Annuities p. 65, 66.

Hence he gives the folution of the following problem: To find the *expectation* of two joint *lives*, that is, the time which two *lives* may expect to continue together in being.

For this the rule is, from one half of the fhorteft complement fubtract the fixth part of its fquare, divided by the greateft complement, the remainder will exprefs the number of years fought.

Thus fuppofing a *life* of 40, and another of 50; the fhorteft complement will be 36; the greateft 46; $\frac{1}{2}$ of the fhorteft will be 18; the fquare of 36 is 1296, whereof the fixth part is 216, which being divided by 46, the quotient will be $\frac{216}{46}$ = 4. 69; and this being fubtracted from 18, the remainder 13. 31 will exprefs the number of years due to the two joint *lives*. As to the probability of one *Life*'s furviving others, fee *de Moivre*, Annuit. p. 54. Doct. of Chances, p. 223.

Infurance upon LIVES. The value of infurances upon *Lives* depends upon the probability of the continuance of any propofed *life* or *lives*, during any propofed term. Any queftions of this kind may be determined from Dr. Halley's Table, and from the principles of the Doctrine of Chances. But, as far as we can learn of the practice on fuch occafions, the premiums paid to infurers are generally higher than any computation founded on obfervations concerning the probabilities of human *life*, will warrant. Thus it is not unufual to make a perfon pay 5 per Cent. for the infurance of his *life* for a twelvemonth, that is, in cafe the perfon dies within the year, the infurer is to pay 100 *l.* for every 5 *l.* received. Now it appears from Dr. Halley's Table, which eftimates the probability of *life* low enough, that 5 per Cent. is an adequate value only for a *life* of an advanc'd age, fuch as 64.

LIFE *everlafting*, a name by which the *Elichryfum*, or *Gnaphalium*, of botanical writers, is fometimes called. See the article GNAPHALIUM, *Suppl.*

LIGHT *(Cycl.)* — The motion of *Light* was deduced from the obfervations of an apparent inequality in the times of the eclipfes of the fatellites of Jupiter, by Mr. Romer [a]; but the conclufion was attacked by Monfieur Caffini. Mr. Romer's opinion found an able advocate in Dr. Halley[b]; who removed Caffini's difficulty, and left Mr. Romer's conclufion in its full force. In the year 1707, Monfieur Maraldi endeavour'd to give a new ftrength to Caffini's arguments; but Monfieur Romer's doctrine found a new defender in Mr. Pound[c]. — [[a] See Phil. Tranf. N° 136. Lowthorp's Abridg. Vol. I. p. 409. [b] Phil. Tranf. abr. by Lowth. Vol. I. p. 409, 422. [c] 'sGrav. Phyf. Elem. N° 2636, feqq.]

Mr. Romer's deduction from his theory was, that *Light* fpent about eleven minutes in its paffage from the fun to us; but it hath fince been concluded by others, from the like eclipfes of Jupiter's fatellites, that it is propagated as far in about feven minutes. — [[b] Phil. Tranf. N° 406. *'sGravefande*, Phyf. Elem. N 2638.]

Our excellent aſtronomer, Dr. Bradley, has found nearly the ſame velocity of *Light*, from his accurate obſervations, and moſt ingenious theory, to account for ſome apparent motions in the fixed ſtars. Phil. Tranſ. N° 406. See the article STAR, *Suppl.*

To underſtand this, it muſt be premiſed, that the fixed ſtars are luminous bodies, and at reſt, with reſpect to our planetary ſyſtem, from which they are vaſtly remote. In this ſyſtem alſo the earth is conſidered as one of the planets, and moving about the ſun.

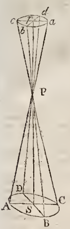

Fig. 1.

Suppoſe the ſun repreſented in S, (Fig. 1.) and that the circle A B C D repreſents the path of the earth, or the ecliptic. At the center S ſuppoſe a perpendicular S P raiſed to the plane of the ecliptic, and that this perpendicular paſſes thro' any fixed ſtar. If a ſpectator were placed in S, he would ſee the ſtar in the ſame perpendicular; but if the ſpectator paſſes over the circle A B C D, the diameter of which is ſuppoſed to bear a ſenſible, tho' ſmall proportion to the diſtance of the ſtar, it will be perceived to change its ſituation in the heavens. For a ſpectator in A would ſee the ſtar in the line A P *a*; in C he would ſee the ſame ſtar in the line C P *c*; and ſo in any other point of his progreſs: Whence it follows, that the ſtar would ſeem to deſcribe a circle in the heavens repreſented by *a b c d*. If the diſtance of the ſtar was ſo very great, that in reſpect of it the diameter of the earth's orbit A C might be eſteemed a point; in this caſe, the foreſaid circle would be entirely inſenſible; all the lines drawn from the points of the orbit to the ſtar might paſs for perpendiculars to the plane of the ecliptic, and in appearance would correſpond to the ſame point in the heavens with the perpendicular in S, in which point the ſtar would always appear, if its light would reach us in an inſtant. But if in this caſe, where the ſtar is ſo remote, the *Light* is ſuppoſed to be propagated from the ſtar with a certain velocity, at the ſame time that the earth proceeds in its orbit, the ſtar will be ſeen in an oblique direction to the plane of the orbit; becauſe of the motion compounded of the motion of *Light*, and that of the ſpectator.

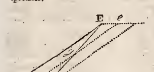

Fig. 2.

Suppoſe the *Light* to move in the line E G (Fig. 2.) making an angle with the line F G, in which the ſpectator is carried along; whom we ſhall conceive placed in F. Let the velocity of the ſpectator be to the velocity of the *Light*, as F G to E G. While the ſpectator moves along F G, the *Light* does the ſame along E G; and the particle of *Light* which is in E, when the ſpectator is in F, enters the eye only when he arrives at G. Now the direction of the *Light*, with reſpect to the eye, makes with the line F G the angle E F G. For if we conceive the line F E drawn, and to be carried with a parallel motion along with the eye, ſo that in reſpect thereof it be at reſt, while this continues moving, the *Light* will reach the eye in the direction of the ſaid line; for when the eye ſhall be in *f*, the middle point between F and G, the transferred line will cut E G in its middle point *g*, to which the particle of *Light* has reached, and which is likewiſe the middle point of the transferred line *f e*. Wherefore the particle of *Light*, which was in E, in the extremity of the line E F, arrives at, and will enter the eye in the direction *e g*.

Fig. 3.

Let the angle E G F (Fig. 3.) be a right one, and E G to F G as the velocity of the *Light* to the velocity of the earth in its orbit; then E F G will be the angle, which the ray of *Light* entering the eye, makes with the plane in which the earth moves round the ſun.

If the earth be in B, (Fig. 4.) it moves in the direction of the tangent to its orbit in this point; that is, if we ſuppoſe the ſpectator in the ſun, the direction of the earth's motion is parallel to S C; and making the angle *a* S C equal to the angle E G F, in the former figure, the line S *a* will repreſent the line in which the ſpectator would ſee the ſtar.

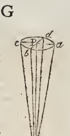

Fig. 4.

In the ſame manner when the earth is in D, the ſpectator in the ſun will ſee the ſtar in S *c*, the angles P S *c* and P S *a* being equal; and this line S *a* or S *c*, by its revolution about P S, would deſcribe a cone, whoſe baſe in the heavens would be a circle repreſenting the apparent path of the ſtar thro' a whole year: Let us ſuppoſe this circle to be *a b c d*, as in the annexed figure.

When the ſtar is not in the perpendicular to the plane of the ecliptic, but the line PS (Fig. 5.) is inclined to that plane, the lines which determine the apparent motion of the ſtar in the heavens, will form cones, as in the caſes already explained; only they would be oblique, and in both caſes the apparent path of the ſtar in the heavens would be determined as above; but in this laſt caſe it would be an ellipſis, the greater diameter of which would be equal to the diameter of the circle *a b c d*, of the former figures; ſo that knowing this ellipſis, the circle might eaſily be found, which the ſtar would deſcribe, if placed in the perpendicular to the plane of the ecliptic.

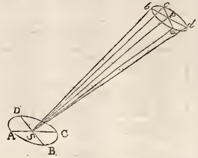

Fig. 5.

The only way to determine, whether the ſtars deſcribe ſuch ellipſes, is by obſervations; in making which there are great difficulties, which however Mr. Bradley has with incomparable induſtry ſurmounted.

Nothing can immediately be determined concerning the foreſaid elliptic motion. The diſtance of the ſtar from the pole of the world muſt be meaſured at different times of the year; and from the different diſtances, the elliptic motion is to be determined by calculation, allowing for the motion of the pole itſelf during the ſpace of time between the obſervations; for the pole moves in a leſſer circle, one degree of which it paſſes over in ſeventy years. Mr. Bradley, making all neceſſary allowances, obſerved ſeveral ſtars at different times of the year, whereby he immediately diſcovered, that their diſtances from the pole of the world varied; and was convinced that this variation could not be attributed to the nutation of the pole; for he examined two ſtars at equal diſtances from the pole, but ſo oppoſite, that the one ought to have receded from the pole as much as the other acceded to it, if the motion was in the pole itſelf. But this did not fall out ſo; for the change of the one ſtar was double of that of the other; a proper allowance being always made for the pole's motion ariſing from above the revolution. However this indefatigable obſerver inferr'd from his obſervations, that the ſtars in certain times receded from, and acceded to, the pole of the world with a motion entirely analogous to that which is performed in an ellipſis; and alſo that they move in ſuch curves, for each of which the motion in the ſame little circle, as *a b c d*, (Fig. 5.) anſwers, when the ſtars are referred to the perpendicular in S to the plane of the ecliptic; and the diameter of this minute circle for them all is 40″ ½.

It is plain from obſervations, to which of the abovementioned cauſes we are to aſcribe the motion of the ſtar. For if the firſt takes place, the ſtar would be carried from *a* to *c*, while the earth paſſed over the part A B C of its orbit; but this being contrary to obſervation, this cannot be the true cauſe. But this change in the ſituation of the ſtar takes place according to the obſervations, while the earth deſcribes the part B C D of its orbit, which is juſt what the ſecond cauſe requires.

If both the cauſes took place at the ſame time, the arc, deſcribed by the earth, would differ from that indicated by either of them; beſides, this concurrence of the cauſes is contrary to the obſervations; unleſs perhaps it may be thought reaſonable to attribute a little influence to the firſt cauſe, but ſo very ſmall a portion, as not to be ſenſibly perceived in the obſervations.

From all which the following concluſions may be deduced: 1. That the ſecond cauſe alone takes place here, viz. That the diſtance of the ſtars is ſo great, that the diameter

ter of the earth's orbit has no fenfible proportion to it. 2. That the angle F E G (Fig. 2.) in the abovementioned triangle, is 20 ″ ¼; and confequently that the ratio of E G to F G, or the velocity of the *Light* to the velocity of the earth in its orbit, as 10210 to 1; whence it follows that the *Light* comes from the fun to us in eight minutes and an half. 3. That the *Light* proceeds with the fame velocity from all the ftars; for all have the fame angle F E G. Whence, (if we fuppofe that all the ftars are not equally diftant from us, as many arguments prove) it will follow, that the motion of *Light*, all the way it paffes through the immenfe fpace, above our atmofphere, is æquable or uniform. 4. Laftly, It muft be confidered, that very fmall differences cannot be perceived; and no body will deny, but that in meafuring a fmall angle, an error of a fecond may be committed, whatever care is ufed to prevent it; and therefore, although we have faid, that the firft caufe is to be rejected, we do not deny that the ftars may poffibly by its influence defcribe a minute circle whofe diameter is 1 ″, or even a little more. *s'Gravefande* Phyf. Elem. Math. L 2. c. 1. p. 709. feq. Hence it appears, that the fucceffive propagation of *Light* will caufe an *aberration* in the appearances of the ftars, planets, and comets. After Mr. Bradley had difcovered this caufe of error in the apparent places of the fixed ftars, Mr. Clairaut [a] and others [b], inveftigated feveral rules for the computation of this aberration. Mr. Euler [c] alfo has lately given us a paper on this fubject. —[[a] Mem. Acad. Scienc. 17. — [b] Mr. Simpfon, in his Effays. — [c] Mem. de L'Academ. de Berlin, Tom. 2. Pp. 141, feq.]

LIGNUM *Vitæ*, the wood of a genus of trees, called by botanifts *Thuya*. See the article THUYA, *Suppl.*

Lignum Vitæ is much valued by turners; making extremely beautiful cups, bowls, boxes, and other curiofities. Ruft. Dict. in voc.

LILLY *(Suppl)*—*Afphodel*-LILLY, *Belladonna* LILLY, *Daffodel*-LILLY, *Guernfey*-LILLY, *Mexican*-LILLY, *Japan*-LILLY, names ufed by different authors for the *Amaryllis*, or *Lillio-Narciffus* of Linnæus and Tournefort. See the article LILIO-NARCISSUS, *Suppl.*

LILLY-*Daffodel*, a name fometimes given to a genus of plants, known among authors by that of *Pancratium*. See the article PANCRATIUM, *Append.*

Day-LILLY, a name fometimes ufed for the *Hemerocallis* of botanifts. See the article HEMEROCALLIS, *Suppl.*

Hyacinth-LILLY, in botany, a name given by fome writers to the *Scilla*, or *Lillio-Hyacinthus*, of botanifts. See the article LILLIO-HYACINTHUS, *Suppl.* and SCILLA, *Append.*

May-LILLY, the name by which fome call the *Convallaria* of Linnæus, a large genus of plants, comprehending the *Lillium-Convallium*, *Polygonatum*, &c. of other writers. See the article CONVALLARIA, *Append.*

Perfian-LILLY, a name fometimes given to the *Fritillaria*, a diftinct genus of plants. See the article FRITILLARIA, *Suppl.*

Superb-LILLY, the Englifh name of a diftinct genus of plants, called by Linnæus *Gloriofa*. See the article GLORIOSA, *Append.*

Water-LILLY, *Nymphæa*, in botany, the name of a genus of plants. See the article NYMPHÆA, *Suppl.*

LIMAX, in the hiftory of infects, the name of a genus of thefe animals, comprehending all the naked fnails, See the article SNAIL, *Suppl.*

The body of the *Limax* is of a figure approaching to cylindric, and is perforated at the fide; the tentacula are four in number, and two of them have the appearance of eyes.

Of this genus authors enumerate the following fpecies: 1. The black naked *Snail*. 2. The red naked *Snail*. 3. The yellow one, called the *Amber Snail*, variegated with fpots of a greyifh colour. 4. The very large grey *Limax*, fpotted with a dufky-brown. 5. The little fhort and thick grey *Limax*, without fpots. 6. The fmooth-bodied, reddifh-brown *Limax*. 7. The fmall dufky-brown, furrow'd *Limax*. 8. The deep chocolate-coloured *Limax*. *Hill*, Hift. Anim. p. 87.

LIME *(Cycl.)* — LIME-*water*. It appears now from the ingenious Dr. Alfton's experiments, that one part of quick *Lime* is fufficient for five or fix hundred parts of water. Water will diffolve but a certain portion of quick *Lime*; and how much that is cannot be eafily afcertained. So far feems certain from Dr. Alfton's experiments, that one pound of quick *Lime* is fufficient for making fix hundred pounds of good *Lime* water; and that thofe who with Charas have fuppofed, that the fecond and third *Lime-water* is weaker than the firft, have been led into error by the fmall quantity of water they ufed. And it has been generally believed, that in order to obtain good *Lime-water*, the quick *Lime* muft not only be recent, and fully calcined, but alfo for one part of quick *Lime* only eight, ten, or at moft twelve parts of water taken; as if it could impregnate no more. But the Doctor fays he has found by many experiments, that it is altogether indifferent whether the water be hot or cold, poured on gradually, or at once, the water poured on the *Lime*, or the *Lime* thrown into the water; whether the quick *Lime* be in fhells, or flaked; or even expofed to the air for feveral months, for fuch quantities of the water as are commonly ufed; and if the quick *Lime* be frefh, whether for one pound of it, eight, ten, twenty, fifty, or five hundred pounds of water be taken. Only it is neceffary, even for the firft water after the ebullition is over, to ftir and mix the *Lime* with the water, and allow it time to impregnate itfelf; which is beft known by the cruft formed on its furface. Filtration indeed is not neceffary, if it be not to prevent any undiffolved *Lime* being mixed with it; or crufts diminifhing its tranfparency.

The Doctor, for his own ufe, poured about eight pounds of boiling water upon a pound of ftone quick *Lime* in a glazed earthen veffel. He drank about a pint and an half of this *Lime-water*, daily for about fixteen months; filling up the veffel, when neceffary, with frefh water, fometimes hot, and fometimes cold, without obferving any difference in the *Lime-water*, which he conftantly filter'd through grey paper, before he drank it. He obferved, that the *Lime* was not exhaufted after two years and two months, nor was the water fenfibly weaker, when it ftood a fufficient time on the *Lime*, which he knew by the crufts that were formed. But the *Lime* becoming confiderably lighter, after it is long thus ufed, it at length requires feveral days to fubfide, and form the crufts, and after the crufts are formed, it does not leave half the water clear, as it did at firft. On the whole, this fingle pound of *Lime* afforded the Doctor about fix hundred pounds of *Lime-water*. He adds, that having taken *Lime-water* made indifferently of Lime-ftone, or of Chalk, or of Shells, and fometimes made of all the three together, he was never able to difcover any difference in their effects. But fo much *Lime-water* is not to be obtained from quick-lime, unlefs it be frefh, completely calcined, and free from heterogeneous fubftances; for if defective in any of thefe, it will yield proportionably lefs *Lime-water*.

Lime-water, which was long looked on as a cauftic, was, in the laft century, found to be a very fafe and valuable remedy. It is uncertain who firft ventured to give it inwardly; but Willis, Bates, and Moreton feem to have ufed it much.

Lime-water kills worms, and many other, if not all, infects; hence Dr. Alfton concludes it might prove a good anthelmintic for children, and experience has confirmed this notion.

It is probable, that *Lime-water* may be of great ufe in long fea voyages, in preventing the corruption of water, or infects breeding in it, as well as curing the difeafes to which feafaring people are moft fubject. The experiment is certainly fafe, eafy, and attended with no expence; one pound of frefh well-burnt quick-lime of any kind, being enough for a hogfhead of water, which may not only be ufed for common drink by the difeafed, or for prevention by the healthy; but alfo by boiling and expofing it to the air for a fhort time, it may be reduced to fweet water, and ufed in dreffing the victuals of the moft delicate.

The virtues of *Lime-water* do not depend on its abforbency; and it may as juftly be called antalcaline, as antacid.

Lime-water prevents or long protracts the putrefaction of animal fubftances. Dr. Alfton alfo thinks that quick-lime in a fhip's well, would effectually prevent the corruption of the water, and confequently the putrid fteams, or foul air thence arifing, which fometimes prove fatal to the crew.

The virtues of *Lime-water* outwardly applied in many difeafes of the fkin, in excoriations, ulcers, gangrenes, &c. are well known. Perhaps there is not a better gargarifm for feveral forts of fores in the mouth and throat, than *Lime-water*. It has alfo been known to be of great ufe in the tooth-ach. Inwardly taken, *Lime-water* has all the virtues of the pure element, which are not a few; and on which probably depend the good effects of mineral waters, more than on the minerals they contain. Dr. Alfton never found it caufed thirft; on the contrary, he found it quenched thirft, as well as fimple-water, and cuftom rendered it agreeable. *Lime-water* is notably detergent and attenuating, even more fo than foap itfelf, of mucous, vifcid, and other animal fordes, which makes it preferable, in many cafes, to the pureft, as well as to mineral waters. In a word, *Lime-water* may be faid, in general, to purify the blood, with as good reafon, as any one medicine whatever, efpecially from any putrid, purulent, or fcorbutic foulnefs.

That *Lime-water* is lithontriptic has been fhewn fufficiently by Dr. Hales, and more fully by Dr. Whytt; and this has been further confirmed by Dr. Alfton, who has fhewn the efficacy of *Lime-water* in this refpect, not only when made by the firft infufion, and affifted by artificial heat; but even after fifty or more infufions, and in the common air. The Doctor thinks that the energy of *Lime-water* in this cafe probably confifts in its penetrating detergency, whereby infinuating itfelf among the folid parts of the calculi, or into their pores, it feparates them, or diminifhes their cohefion, but does not diffolve them.

Since there is but a fmall proportion of *Lime* in the water, it may be thought that taking a few grains of the quick-lime in fubftance would prove much more effectual in the Stone, than large quantities of *Lime-water*. But this is a miftake; and hence Mrs. Stephens's egg-fhells and fnail-fhells, if burnt to quick-lime, can never be equally fuccefsful with *Lime-water* for the Stone.

As for the *aquæ benedictæ compofitæ*, or *compound Lime-waters*, they are not to be compared with fimple *Lime-water* in the gravel; nor, in Dr. Alfton's opinion, in any difeafe requiring this water.

The Doctor adds, in his Appendix, that though he cannot yet determine how far *Lime-water* may be proper, even in acut

acute diftempers, yet he has found it fafe in feverifh colds; and by the cafes he there mentions, it feems probable that *Lime-water*, by its diluent, and diuretic qualities, may prove more ufeful in fevers, than is at prefent believed.

However, this may prove on farther trials, it may be faid, in general, that *Lime-water* is diluent, detergent, antifceptic, anthelmintic, diuretic, and vulnerary; ufeful in all difeafes proceeding from, or accompanied with obftructions in the bowels or glands, vifcid phlegm, calculous concretions, or putrefaction; and commended for the fcurvy, fcrophulæ, gravel, confumption, empyema, afthma, arthritis vaga, œdematous fwellings, diabetes, fluor albus, fluxes, &c. and outwardly for difeafes of the fkin, ulcers, gangrenes, &c. It may be taken to the quantity of a pound, once, twice, or thrice a day; or ufed for common drink. See Dr. Alfton's Differtation on quick-lime, and *Lime water*, Edinb. 1752.

The ingenious and learned Dr. Whytt of Edinburgh, has greatly recommended *Lime-water*, in the ftone and gravel. See his effay on the virtues of *Lime-water*, in the cure of the ftone. This gentleman prefers oyfter-fhell *Lime-water* to any other for thofe diftempers. Dr. Alfton feems to think this a matter of indifference, and was himfelf cured chiefly by the ftone quick-lime water before-mentioned.

LIMER, or LIME-*Hound*, names fometimes ufed for the blood-hound. See the article HOUND, *Suppl.*

LIMITED, adjunct. See the article ADJUNCT, *Cycl.*

LIMITS (*Suppl.*) — We may add to what is faid under this head in the *Supplement*, that there being two cafes of variable quantities and ratio's tending to a *Limit*, it might have conduced to perfpicuity, and prevented difputes, to have diftinguifhed thefe different *Limits* by fome addition. As in the firft cafe, to have called it a *Limit* or ultimate ratio *inclufive*; becaufe the *Limit* is the laft of the quantities or ratio's limited: And in the fecond, to have called it a *Limit* or ultimate ratio *exclufive*; becaufe the quantities limited never attain to the *Limit*, tho' they approach to it indefinitely.

This diftinction may perhaps receive fome farther illuftration from the following example. It is known that the ofculatory circle is a circle that touches a curve fo clofely that no other circle can be drawn through the point of contact between them, all other circles paffing within or without them both; and hence the ofculatory circle is fuppofed to have an equal curvature with the curve at that point. See Mr. *Mac Laurin*'s flux. art. 364.

Now if we conceive the ofculatory circle at the end of the great axis of an ellipfis, it will fall entirely within the ellipfis; and the curvatures of the ellipfis and ofculatory circle may both be faid to be *limits* of the curvatures of all the circles falling wholly within, and touching the ellipfis at the end of its great axis. But the term *Limit* will not in both cafes have precifely the fame meaning; for the ofculatory circle is a *Limit inclufive*, being the laft of the circles limited; and the ellipfis is a *Limit exclufive*, none of the circles limited ever coinciding with it. As to the circles which fall wholly without the ellipfis, and touch it at the end of its great axis, they have no *Limit inclufive*, no circle touching the ellipfis fo clofely, that no other can pafs between; the only *Limit* here is *exclufive*, the ellipfis itfelf.

The contrary of this happens at the endo f the leer axis. At any other point of the ellipfis one half of every ofculatory circle is a *Limit inclufive* of the femicircles that fall within, and the other half is a *Limit inclufive* of thofe that fall without.

May we not afk, if a curve is the *Limit* of its infcribed or circumfcribed polygons in any other fenfe, than the curvature of the illipfis is the *Limit* of the curvatures of the circles before defcribed, which approach nearer and nearer to the curve, but never coincide with it? It is true we hear it often faid, that the ofculatory circle is æquicurval, and fo coincides with the ellipfis; but this feems a confequence of the language of infinitefimals. It would be more accurate to fay, that the curvature of the ellipfis is the *Limit exclufive* of all the before mentioned circles, and that the ofculatory circle is their *Limit inclufive*. That excellent geometer, Mr. Simfon, in his Conic Sections, Lib. v. Prop. 36. Cor. fays only, after demonftrating the chief property of the ofculatory circle, that *eandem habere cum fectione conica curvaturam dicitur*, giving this only as an appellation, but not as a propofition.

LIMNOPEUCE, in botany, the name by which Vaillant calls the *Hippuris* of Linnæus. See the article HIPPURIS, *Suppl.*

LINE (*Cycl*) — *Algebraic* LINES are divided into different orders, according to the degree of their equations. Thefe degrees are eftimated, as in determined equations, by the degree of the higheft term of the equation.

Thus $a + by + cx = 0$ is a general equation, expreffing the nature of *Lines* of the firft order, or of ftrait *Lines*.

The equation $a + by + cx + dyy + exy + fxx = 0$ reprefents the *lines* of the fecond order; that is, the conic fections, and the circle, which is one of them.

And the equation $a + by + cx + dyy + exy + fxx + gy^3 + bxyy + ix^2y + lx^3 = 0$, expreffes in general the *lines* of the third order. And the *Lines* of the fourth and higher orders may be expreffed in the like manner. See *Cramer*, Introd. a l'analyfe des lignes courbes. p. 52, feq.

Mr. Cramer ufes the terms, *Line* of the fecond, third, fourth, &c. order, and *Curve* of the fecond, third, fourth, &c. order, indifferently. Sir Ifaac Newton has made a diftinction: according to him,

LINE *of the third order* is the fame as CURVE *of the fecond kind*; becaufe a *Line* of the firft order, cannot, ftrictly fpeaking, be called a Curve.

Lines of the third order may be cut by a right line in three points, and by a circle in fix points.

We have a fhort treatife by Sir Ifaac Newton upon the *Lines* of the third order, entitled, *Enumeratio linearum tertii ordinis*, which was firft printed at the end of Dr. Clarke's latin tranflation of Sir Ifaac's Optics; and fince publifhed more correctly by the late Mr. Jones in 1711, with the treatife of quadratures, and other tracts of its illuftrious author.

This enumeration is fo concife, as to need a comment. Mr. Stirling gave one in 1717; but this comment is too difficult for beginners. Mr. Cramer has lately explained this fubject very fully, in his *Introduction a l'analyfe des lignes courbes algebriques*, printed at Geneva 1750, 4to, to which the curious may have recourfe; as alfo to the Appendix to Mr. Mac Laurin's Algebra, entitled, De linearum geometricarum proprietatibus generalibus; and to Mr. *Euler*'s Analyfis infinitorum, Vol. II.

An algebraic *Line* of the order m can cut another algebraic *Line* of the order n, in the number of points expreffed by mn, but not in more. Thus if $m = 1$ and $n = 2$, the *lines* of thofe orders can interfect each other in two points only; and if $m = 2$ and $n = 2$, then may they interfect each other in four points, as is well known; fince a ftrait *Line* cannot interfect a conic fection in more than two points; nor can one conic fection interfect another in more than four points. In like manner if $m = 5$ and $n = 4$, then may the *lines* of thefe orders interfect each other in 20 points; but not in more. See *Cramer*, Anal des lignes courbes, p. 75, 76.

The number of the fpecies of the *Lines* of the third order amount to 78. See Mr. *Murdoch*'s Genefis Curvarum per Umbras. Sir Ifaac reckoned only 72 fpecies of the third order; but Mr. Stirling and Mr. Stone have fhewn his enumeration to be imperfect; and Mr. Murdoch has fince found fome new fpecies.

LION. The *Lion* is comprehended among the *felis*, or catkind of animals. See the article FELIS, *Append.*

LION's *leaf*, the Englifh name of a genus of plants, defcribed by Tournefort under that of *Leontopetalon*. See the article LEONTOPETALON, *Suppl.*

LION's *foot*, the Englifh name of a diftinct genus of plants, called by botanifts *Catanance*. See the article CATANANCE, *Suppl.*

LIQUID *Amber*, in botany, the name of a diftinct genus of plants, called by botanifts *Anthofpermum*, and *Tournefortia*. See the articles ANTHOSPERMUM, *Append.* and TOURNEFORTIA, *Suppl.*

LIQUORICE (*Suppl.*)—*Vetch*-LIQUORICE, the Englifh name of a genus of plants, called by botanifts *Orobus*. See the article OROBUS, *Suppl.*

Wild LIQUORICE, the name of a diftinct genus of plants, called by authors *Aftragalus*. See the article ASTRAGALUS, *Suppl.*

LIQUORS, fermented. See the article FERMENTED *liquors*, *Suppl.* and *Append.*

LIST, in the fea-language, the fame with *luft*. See the article LUST, *Suppl.*

LITHONTRIPTIC (*Suppl.*) — The reward which the parliament of England gave to Mrs. Stephens, the inventrefs of fome medicines, which were faid to be a perfect and certain cure for the *Stone*, made the generality of the world believe, that they were really as efficacious as they were pretended to be; but it appeared, on examination, that the opinion of a cure in the very inftances on the fuccefs of which the reward was given, was erroneous; and that the *Stones* had all the time remained in the bladders of the patients, tho' fuppofed to have been voided, after being diffolved and wafhed away by the medicines.

The principal inftance of a fuppofed cure was Mr. Gardiner. This man was in December 1748, examined by able furgeons, and found to have a ftone in his bladder; after this he took Mrs. Stephens's medicines for eight months without intermiffion; and at the end of that time he declared himfelf free from all his ufual complaints; and on fearching him, there could no ftone be found in the bladder. Mr. Gardiner died about three years afterwards, and his body was opened. When the bladder was examined, there were found in it fix preternatural apertures of different fizes; but the biggeft capable of admitting the end of a finger. Each of thefe apertures led to a feparate bag form'd by an enlargement of the internal membrane of the bladder, protruded between the fibres of its mufcular coat. Thefe bags were eafily feen on the back part of the bladder a little above the veficulæ feminales, and when viewed on the outfide, they feemed to be but two, tho' in reality equal in number to the openings within, and divided from one another by the duplicature of the internal membrane, which form'd a feptum between each of them. Philof. Tranf. N° 462. p. 12.

As to Mrs. Stephens's medicine, it is a compofition of foap, and lime made of different fhells, which every body knows

knows to be highly cauſtic; and is therefore condemned by Dr. Mead; ſince its corroſive quality muſt be injurious to the bladder. However, under proper management, he thinks it may be of ſome ſervice in expelling gravel by the urinary paſſages; tho' it will never be able to break calculi of the hardneſs of ſtone: And beſides, its long continued uſe muſt be attended with great danger, for the reaſons above given. And as for its ſubſtitute, the ſoap-lees, though it be a medicine of a more commodious form for taking, yet it will not prove much ſafer in its conſequences, for the ſame reaſons. *Mead*, Monit. and Pract. Medic. pag. 199, ſeq.

Dr. Whytt of Edinburgh, after conſidering the inconveniencies, and ſometimes the miſchiefs alſo, of this celebrated ſpecific, reſolved to omit the ſoap, and try what virtues lime-water might have in diſſolving the calculus. See the article LIME-*water*, *Append.*

His firſt experiments were made on ſeveral fragments of calculi, with lime-water, from common quick-lime; and afterwards reſolving to try the power of animal lime, he repeated them with lime-water made with oyſter-ſhells and cockle-ſhells, well calcined, by pouring ſeven or eight pints of water on one pound of the freſh-calcined ſhells. The experiments ſucceeded with both ſorts; but he ſoon found, that the oyſter and cockle-ſhell lime-water poſſeſſed a much greater power of diſſolving the calculus, than that of the ſtone-lime.

He therefore propoſes the drinking of ſhell-lime-water to the quantity of four pints, every day, for adults; and for children leſs in proportion: And he concludes with inſtances of the happy effects of this method. However, as ſtones of great hardneſs can never be diſſolved by any medicine whatſoever, Dr. Mead recommends, in theſe caſes, a new method of cutting for the Stone. Id. ibid. See the article LITHOTOMY, *Append.*

Dr. Hartley has publiſhed, in the London Gazette, the following receipt for making a *lithontriptic* electuary. Take five pounds of Alicant ſoap, ſhaved, and one pound of oyſter-ſhell lime; put them into a tin veſſel, and pour upon them five quarts of water; make the water boil, till the ſoap be perfectly diſſolved in it, and then ſtrain all into a glazed earthen veſſel. Expoſe this maſs to the air, ſtirring it every day, till it becomes both mild to the taſte, and of a proper conſiſtence to be formed into pills, or long pellets, without ſticking to the fingers. This may be expected to happen in two or three months. If it becomes ſufficiently mild before it has acquired a due conſiſtence, it may be brought to this, by being heated over the fire, in a tin veſſel: If it acquires a too hard conſiſtence, before it is ſufficiently mild, it muſt be ſoftened with water. This is what the Doctor calls the *lithontriptic* maſs or electuary; which he orders to be made in a tin veſſel, becauſe a braſs or copper one would make it emetic.

He gives another more expeditious way of making it, which is this: Pour two gallons of water upon a pound of oyſter-ſhell lime; ſtir it two or three times, and when it has fallen to the bottom, pour off the clear part of the water. Repeat this fifteen or twenty times, or till the clear water, which is poured off, be almoſt taſteleſs; leaving about five pints of water upon the lime, after the laſt ablution. Then pour this mixture of water and dulcified lime upon five pounds of Alicant-ſoap, ſhaved; and proceed as directed in the firſt receipt. The maſs, prepared in this manner, will be fit for uſe in a few days, or even immediately; but then the Doctor prefers the foregoing receipt, where time can be allowed for it.

If the maſs of ſoap and oyſter-ſhell lime, dulcified in either of the above-mentioned ways, be made of the conſiſtence of an electuary, it is then called the *lithontriptic* electuary; which for cure is more convenient than the maſs, for thoſe who deſire to take the medicine diſſolved in a liquid vehicle, as milk, water ſweetened with honey or ſugar, water flavoured with brandy or rum, and ſmall beer.

Where a perſon is ſuppoſed to have a large Stone in the kidneys or bladder, he ought to take every day as much of the maſs, or electuary, as contains two ounces of the ſoap, unleſs his pain and provocation to make water be violent; in which caſe it will be proper to begin with about half this quantity, and to increaſe it as he can bear. The medicine ought alſo, in this caſe, to be dulcified, in an extraordinary degree.

By this medicine, the Doctor thinks the generation of gravel, and gravel-ſtones, may be entirely prevented. See the article STONE, *Append.*

It is likewiſe recommended in diſorders of the ſtomach and bowels, ariſing from, or attended with acidities there; and in gouty habits. The patient may, in many of theſe caſes, begin with ſuch a quantity every day, as contains an ounce of ſoap, and afterwards increaſe or leſſen this quantity, as he finds occaſion.

LITHOTOMY (*Cycl.*) — We have an hiſtory of the lateral operation for the ſtone by Monſ. Morand, who argues, that the methods of Celſus, Frere Jacques, Rau, and Cheſelden, are in the main the ſame. See Mem. de L'Acad. des Sciences, 1731.

APPEND.

Mr. Cheſelden's method is deſcribed in his anatomy, Chap. VI. of the fifth edition This method of cutting for the ſtone is much recommended by Dr. Mead; who aſſures us, that now not only children and youths, but alſo perſons advanced in years, may ſubmit to this operation, without great danger; and in caſe the ſtone prove too big to be extracted without tearing the neck of the bladder, it is now no longer neceſſary to ſplit the ſtone, before the extraction; the invention of which is aſcribed to Ammonius, a Greek phyſician, who from thence was furnamed λιθοτόμος, the lithotomiſt. *Mead*, Monit. and Pract. Med. p. 203.

Mr. Houſtet has collected a great many inſtances of ſtones lodged in facs formed in the bladder, from which it was impoſſible to extract them, without tearing the bladder, or cutting on one ſide of the fac, which Mr. Garengeot did once with ſucceſs. In ſome of the caſes which he mentions, the veſſels of the bladder were in appearance grown into the ſtone, and the extraction of the ſtone was attended with a mortal hæmorrhage. See Mem. de L'Acad. de Chirurg. Tom. I.

The diſtenſion of the bladder with a liquor in performing the high operation for the Stone, is attended with difficulties, eſpecially in women. Dr. Kulm has therefore contrived an elevatory catheter for that ſex. The bending of the inſtrument is fitted to the turn of the os pubis, and its great curve, inſtead of being only furrowed, is pierced quite through. He introduces this, with its convexity to one ſide, then gently raiſes it to the hypogaſtrium, and cuts ſecurely upon it. See Nov. Act. Erudit. Lipſ. Mart. 1732.

LITHOZUGIA, in natural hiſtory, the name of a genus of foſſils, of the claſs of the *Scrupi*, compoſed of a cryſtalline matter a little debaſed, and containing within them various extraneous bodies, as pebbles. &c. See the article SCRUPI, *Append.*

Dr. Woodward has ranked this genus among the pebbles, becauſe of the pebbles they contain; which is by no means a ſufficient reaſon for confounding two ſuch different foſſils; the *Lithozugia* approaching to the nature of flint.

Mercatus and other naturaliſts have called the *Lithozugia oculati lapides*; and among Engliſh lapidaries they are known by the name of *Pudding-ſtones*. See the article OCULATUS *Lapis*, *Suppl.*

Of this genus we have the following ſpecies, 1. The yellowiſh-white *Lithozugium*, filled with pebbles. 2. The greeniſh-white *Lithozugium*, filled with pebbles. 3. The red *Lithozugium*, filled with pebbles. Vid. *Hill*, Hiſt. Foſſ. p. 557—559.

Beſides theſe, there are other *Lithozugia* of a coarſer texture, approaching to the nature of quarry-ſtone; of theſe we have the following ſpecies: 1. The fleſh-coloured *Lithozugium*, filled with reddiſh, impure, cryſtalline nodules. 2. The bluiſh and glittering *Lithozugium*, filled with white, impure, cryſtalline nodules. 3. The whitiſh-green elegant *Lithozugium*, filled with cryſtalline nodules: And, 4. The friable, pale-red *Lithozugium*, variegated with white veins, and red nodules. *Hill*, Hiſt. Foſſ. p. 560—562.

LIVE *ever*, a name ſometimes given to the *anacampſeros*, or orpin, a diſtinct genus of plants. See the article ANACAMPSEROS, *Suppl.*

LIVE *in idleneſs*, a name ſometimes uſed for the violet. See the article VIOLA, *Suppl.*

LIVER (*Suppl.*) — *Infarction of the* LIVER. See the article HEPATIS *Infarctus*, *Suppl.*

LIZARD's *tail*, the Engliſh name of a genus of plants, deſcribed by Linnæus under that of *Saururus*. See the article SAURURUS, *Suppl.*

LOCKER-*gowlans*, a name by which ſome call a ſpecies of Hellebore. See the article HELLEBORUS, *Suppl.*

LOCUST, or *St.* JOHN's *bread*, in botany, names uſed by ſome for the *Ceratonia*, or *Siliqua*, of botaniſts, See the article SILIQUA, *Suppl.*

Baſtard LOCUST, a name ſometimes uſed for a diſtinct genus of plants, called by botaniſts *Courbaril*, or *Hymenæa*. See the article HYMENÆA, *Suppl.*

LOCUST *of Virginia*, a name by which a ſpecies of *acacia* is ſometimes called. See the article ACACIA, *Suppl.*

LOCUST-*tree*, in botany, a name given by the people of the Weſt-Indies to a ſpecies of *Acacia*. See the article ACACIA, *Suppl.*

LOGARITHM (*Suppl.*) — In the common tables of *Logarithms* we find the *Logarithm* correſponding to any given number within the limits of the table, by inſpection; but it is of uſe alſo to have a table wherein the *Logarithms* are placed in their natural order, from 0 to 100,000 for inſtance, and with the correſponding natural numbers; ſo that a *Logarithm* being given, we may find the correſponding number by inſpection only, which can ſeldom be done by the common tables; nor can the correſponding number to a *Logarithm* not in the table be found without ſome trouble.

A table of this ſort is called by Dr. Wallis an *anti-logarithmic canon*; and by this canon a *Logarithm* being given, its number may be found with the ſame facility that a *Logarithm* of a given number may be found by the common canon.

Dr.

Dr. Wallis tells us, that a canon of this kind was formed many years ago. It was begun, perhaps, by Harriot, and it was finifhed at leaft, and prepared for the prefs, if not begun, by Warner. This canon feems to have been loft; but the lofs has been fupplied by Mr. Dodfon. See the *Anti-logarithmic canon* by James Dodfon, Lond. 1742. fol. where the author alfo fhews the conftruction and ufe of his table at large.

Imaginary LOGARITHM is ufed for the *logarithm* of negative and imaginary quantities [a], fuch as $a-\sqrt{-a}$, &c. Thus alfo the fluents of certain imaginary fluxionary expreffions, fuch as $\frac{\dot{x}}{x\sqrt{-1}}$, $\frac{a\dot{x}}{2bx\sqrt{-1}}$, &c. are *imaginary logarithms*.

[a] *Euler*, Analyf. infin. Vol. 1. pag. 72, 74.]

The expreffion $\frac{\dot{x}}{x}$ reprefents the fluxion of the *Logarithm* of x, and the fluent therefore of $\frac{\dot{x}}{x}$ is the *Logarithm* of x; but no *Logarithm* can reprefent the fluent of $\frac{\dot{x}}{x\sqrt{-1}}$, which is therefore called an *imaginary Logarithm*.

However, when thefe *imaginary Logarithms* occur in the folutions of problems, they may be transformed into circular arcs or fectors; that is, the imaginary *Logarithm*, or imaginary hyperbolic fector becomes a real circular fector. See *Bernoulli*, Oper. Tom. I. p. 400. and p. 512. *Mac Laurin's* Fluxions, Art. 762, feq. *Walmefley*, Anal. des mef. p. 63.

LOGARITHMIC. This head is referred to in the *Append.* from the article CURVE, in the *Suppl.* by miftake. But fee the article LOGARITHMIC, *Suppl.*

LOGGERHEAT, in the fea-language, denotes a large round ball of iron, with a long handle, for heating pitch. *Blanckley's* Nav. Expof. p. 100.

LOGWOOD, the wood of a genus of plants, called by Linnæus *Hæmatoxylum*. See the article HÆMATOXYLUM, *Suppl.*

LONDON *pride*, a name ufed among Gardeners for the *geum*, a diftinct genus of plants. See the article GEUM, *Suppl.*

LONICERA, *(Suppl.)* in the Linnæan fyftem of botany, the name of a large genus of plants, comprehending, according to that author, the *Caprifolium*, *Periclimenum*, *Chamæcerafus* and *Xylofteum* of Tournefort, and other botanifts; together with the *Triofteofpermum* and *Symphoricarpos* of Dillenius. See the articles CAPRIFOLIUM, &c. *Suppl.*

The characters are thefe. The cup is a fmall perianthium, placed on the germen, and divided into five fegments. The flower confifts of a fingle petal, the tube is oblong, and gibbofe downwards, the limb is divided into five fegments, one of which is more deeply ferrated than the reft, and all turn backward. The ftamina are five fubulated filaments, nearly of the length of the flower; the antheræ are oblong, the germen is roundifh, and placed under the receptacle, the ftyle is filiform, and of the length of the flower, the ftigma is obtufely capitated. The fruit is a roundifh, umbilicated berry, containing two cells; the feeds are roundifh and compreffed.

As they all agree in thefe general characters, they are to be accounted only one genus. *Linnæi* Gen. Plant. p. 75.

LOOKING *Glafs(Suppl.)*—*Venus's* LOOKING *glafs*, in botany, a name by which fome call the *Campanula*. See the article CAMPANULA, *Suppl.*

LOOSE *ftrife*, a name fometimes given to the *Lyfimachia*, or willow-herb of botanifts. See the article LYSIMACHIA, *Suppl.*

Podded LOOSE *ftrife*, the name of a genus of plants, called by botanifts *Epilobium*, or *Chamænerium*. See the article CHAMÆNERIUM, *Suppl.*

Spiked LOOSE *ftrife*, the name of a genus of plants, called by botanifts *Salicaria*. See the article SALICARIA, *Suppl.*

LORANTHUS, in the Linnæan fyftem of botany, the name of a genus of plants, called by others *Lonicera*. See the article LONICERA, *Suppl.*

LORD *in grofs*, he who is *Lord*, not by reafon of any manor, as the king in refpect of his crown, &c. *Terms of law*, *Blount*, *Cowel*.

LOTE-*tree*, in botany, the name of a genus of plants, called by authors *Celtis*. See the article CELTIS, *Suppl.*

LOTUS *Africanus*, in botany, a name by which fome call the *Guaiacana* of Tournefort. See the article GUAIACANA, *Suppl.*

Bladder LOTUS, a name fometimes given to a fpecies of *Vulneraria*. See the article VULNERARIA, *Suppl.*

LOVE-*grafs*, in botany. See the article GRASS, *Append.*

LOVE *in a mift*, a name ufed among gardeners for the *Granadilla*, or paffion-flower. See the article GRANADILLA, *Suppl.*

LOVE *lies a-bleeding*, a popular name for the *Amaranth*. See the article AMARANTH, *Suppl.*

LOUSE*(Suppl.)* — *Tree*-LOUSE, a genus of infects, called by zoologifts *Aphis*. See the article APHIS, *Append.*

LOUSE-*wort*, a name ufed by fome for the *Delphinium* of botannical writers. See the article DELPHINIUM, *Suppl.*

LOUSE-*wort* is alfo the Englifh name of a genus of plants, called by botanifts *Pedicularis*. See the article PEDICULARIS, *Suppl.*

LOWINGS, in falconry. See the article LUNES, *Append.*

LUMBRICUS, in zoology, the name of a genus of infects, called in Englifh earth-worms. See the articles WORM and EARTH-*worms*, *Suppl.*

The *Lumbricus* is an infect of the larger kind, of an oblong form, confiderably thick rounded in fhape, and covered with a foft and flender fkin, marked with annular ridges, and furrows. When full grown, it is often ten inches, or more, in length, and more than a third of an inch in diameter. Its colour is a dufky red.

It is common every where, at little depths, under the furface of the earth; it is not unfrequently alfo met with in the human inteftines, as well as in thofe of other animals, in which ftate it has been fuppofed a different creature, and called by a new name.

Befides the common earth-worm, there is found another fpecies of *Lumbricus* in the mud about the Sea-fhores, very large, growing very often to a foot or more in length; it entirely refembles the other, only that it is of a paler red, and has its fkin covered with little prominences, which makes it rough or fcabrous to the touch. Vid. *Hill*, Hift. Anim. p. 15.

LUNES, or LOWINGS, in falconry, leafhes, or long lines to call in hawks. Ruft. Dict. in voc.

LUNGS *(Suppl.)* — *Sea*-LUNGS, the Englifh name of the *Medufa*, a genus of infects. See the article MEDUSA, *Append.*

Ships-LUNGS, a name given to the ventilators of fhips. See the article VENTILATOR, *Append.*

LUNG-*wort (Suppl.)*— *Cow's* LUNG-*wort*, a name fometimes given to the *Verbafcum*, or Mullein. See the article VERBASCUM, *Suppl.*

LURCHER, among fportfmen, a kind of hunting dog, like a mongrel greyhound, with pricked ears, a fhaggy coat, and generally of a yellowifh-white colour. Ruft. Dict. in voc.

LUST-*wort*, a name by which fome call *Ros folis*, a diftinct genus of plants. See the article ROS *folis*, *Suppl.*

LYCIUM, *Avignon-berry*, *Avignon-thorn*, or *box-thorn*, in botany, the name of a genus of plants, the characters of which are thefe: The cup is a fmall, erect, obtufe, permanent perianthium, divided into five fegments; the flower confifts of a fingle infundibuliform petal; the tube is cylindric, patent and crooked; the limb is fmall, divided into five fegments, obtufe and patulous; the ftamina are five fubulated filaments, growing out of the tube of the flower; they are fhorter than it, and inclinated; the antheræ are erect; the germen of the piftil is roundifh; the ftyle is fimple, and longer than the ftamina; the ftigma is bifid and thick; the fruit is a roundifh berry, containing two cells; the feeds are numerous, and kidney-fhaped; and the receptacles are convex. Vid. *Linnæi* Gen. Plant. p. 81.

This genus comprehends likewife the *Jafminoides* of other authors.

LYCOCTONUM. See the article ACONITE, *Cycl.*

LYING *under the fea*, is when, in a ftorm, the fhip is a-hull, and the helm fo faftened a-lee, that the fea breaks upon her bow, or broadfide. *Blanckley*, Nav. Expof. p. 102.

LYNCHET, among farmers, a line of green fward, ferving as a boundary to feparate plowed land, in common fields. Ruft. Dict. in voc.

LYSIMACHIA *filiquofa*, the name by which fome call the *Chamænerium* of Tournefort. See the article CHAMÆNERIUM, *Suppl.*

M.

MACAO, in zoology, the name of a fpecies of parrot. See the article MACAW, *Suppl.*

MACAW, (*Suppl.*) or MACAW-*tree*, in botany, the name of a fpecies of palma, or *Phœnix*. See the article PHOENIX, *Suppl.*

MACHINE (*Cycl.*) — The fimple *Machines*, or mechanical powers, according to their different ftructure, ferve for different purpofes; and it is the bufinefs of the fkilful mechanift to choofe them, or combine them, in the manner that may be beft adapted to produce the effect required, by the power which he is poffeffed of, and at the leaft expence. The lever can be employed to raife weights a little way only, unlefs the engine itfelf be moved; as, for inftance, to raife ftones out of their beds in quarries. But the axis and wheel may ferve for raifing weights from the greateft depths. Pullies being eafily carried, are therefore much employed in fhips. The wedge is excellent for feparating the parts of bodies; and the fcrew for compreffing or fqueezing them together; and its great friction is even fometimes of ufe, to preferve the effect already produced by it. The ftrength of the *Machine*, and of its parts, muft be proportioned to the effects which are to be produced by it. Thus, when the center of motion is placed between the power and the weight, it muft fuftain the fum of their efforts: a fmall ballance, therefore, ought not to be employed for weighing great weights; for thefe diforder its ftructure, and render it unfit for ferving that purpofe with accuracy. Neither are great *Machines* proper for producing fmall effects. It were to be wifhed, that we had a detail of all thefe things drawn up by fome fkilful and experienced mechanift.

From thefe fimple *Machines*, compounded ones are formed by various combinations, and ferve for different purpofes; in all which the fame general laws take place; and particularly this, that the power and weight fuftain each other, when they are in the inverfe proportion of the velocities which they would have in the directions wherein they act, if they were put in motion.

But in practice the friction of *Machines* is to be confidered, without allowing for which we fhall often find ourfelves at a lofs See the article FRICTION, *Append.*

Accurate defcriptions and draughts of *Machines* would be a very curious and ufeful work. But to make a collection of this kind as advantageous as poffible, it fhould, befides the defcriptions of *Machines*, contain an analyfis of them; pointing out their advantages and difadvantages; the reafons of the conftructions; and the general problems, implied in thefe conftructions, with their folutions, fhould be extracted. None of thefe things have as yet been done, in a complete and fatisfactory manner, in any treatife of this kind. However, many curious particulars may be gathered from Strada, Beffon, Beroaldus, Auguftinus de Ramellis, Bockler, Leupold, Beyer, Limpergh, Van Zyl, Perault, and others; a fhort account of whofe works we find in *Wolfii* commentatio de præcipuis fcriptis mathematicis. Elem. Mathef. Univ. Tom. 5. pag. 84. feq. To thefe muft be added, Monfieur Belidor's Architecture Hydraulique, and Dr. Defaguliers's Courfe of Experimental Philofophy. The Royal Academy of Sciences at Paris have alfo given us a collection of *Machines* and inventions approved of by them. This work, publifhed by Monfieur Gallon, confifts of fix volumes in 4to, containing engraved draughts of the *Machines*, with their defcriptions annexed. But a complete inftitution of practical *Mechanics* is ftill wanting. See the article MECHANICS, *Append.*

MACHINE *of Marly* (*Cycl.*) — This *Machine* was made by a common mechanic of Liege, and has a great many excellent contrivances; but yet does not raife all the water that it might have done, becaufe the maker did not know how to give the River Seine all the advantages of which it was capable. Hence appears the neceffity of a mechanic's being well acquainted with mathematics; or that able mathematicians would apply themfelves to mechanics more than they do, and not think it below them to direct workmen. See *Defagul.* Exper. Philof. Vol. II. p. 442, to 449.

According to Dan. Bernoulli's computation, the effect of the *Machine of Marly* is not more than $\frac{1}{56}$ of its abfolute force; that is, there is a lofs of $\frac{55}{56}$ of that force. *Dan. Bernoul.* Hydrodyn. p. 182.

MACHINES *for raifing water.* See the article *Raifing* WATER, *Append.* See alfo the article FIRE-*engine*.

MACROCERCI, the name eftablifhed by Dr. Hill for a large genus of animalcules, diftinguifhed from all others by having tails longer than their bodies. See the article ANIMALCULE, *Cycl. Suppl.* and *Append.*

MAD-*wort*, the Englifh name of a genus of plants, called by botanifts *Alyffon*. See the article ALYSSON, *Suppl.*

MADDER (*Suppl.*) — *Petty*-MADDER, the Englifh name of a genus of plants, known among authors by that of *Rubeola*. See the article RUBEOLA, *Suppl.*

MADNESS — Dr. Michelotti relates the cure of a young man, who, after being expofed to very hot weather at fea, and having committed violent debauches in drinking, became mad, without any fever. He was cured by violent bleeding, ftarving, weak very cold drink, the cold bath, and pouring cold water on his head. Hift. de l'Acad. des Scienc. 1734. See the article MANIA, *Suppl.*

MAGNESIA, the fame with *Manganefe*. See the article MANGANESE, *Suppl.*

MAGNET (*Cycl.*) — *Armed* MAGNET. See the article LOAD-STONE, *Suppl.*

The power of natural *Magnets* may be greatly increafed by art; and this feems to have received farther and very great improvements from Dr. Knight. See Philof. Tranf. N° 474. p. 163. feq.

The poles of natural *Magnets* may be inverted, or their directions may be changed. Remarkable inftances of this may be feen in the Phil. Tranf. N° 101. p. 164. feq. and N° 476. p. 36. feq. Thus the magnetical virtue may be placed in fuch a manner, that the two oppofite ends of a ftone fhall become, both, fouth poles; and the middle quite round, a north pole. Or, the two oppofite ends may be north poles; and the two oppofite fides fouth poles. Half of the furface of the ftone may be made a north pole, and the other half a fouth pole. A north pole may be placed fo as to be furrounded by a fouth pole; and at the other end of the ftone, a fouth furrounded by a north pole; fo that the edges of each furface have a pole of a different denomination from that which occupies the middle. See Phil. Tranf. N° 476. p. 361. feq.

Artificial MAGNET. *Artificial Magnets* have been made in great perfection by the before mentioned gentleman. See the Phil. Tranf. N° 474, p. 161. feq. where various experiments of the force of thefe *Artificial Magnets* are recorded; one in particular weighing, without its armour, juft an ounce, and with the armour, cramps, and rings, one ounce 17 pen. wt. lifted fix pounds ten ounces troy weight. See pag. 166, N° cit.

It is hoped, that Doctor Knight will foon oblige the world with his difcoveries in magnetifm. In the mean time, the ingenious Mr. Canton has found out a method of making artificial *Magnets*, without the ufe of, and yet far fuperior to, natural ones. This gentleman has fucceeded fo well in his attempts to convey a confiderable magnetic virtue to bars of hardened fteel, as to be able to impregnate fuch bars with this virtue, to as high a degree as any of the fame weight and dimenfions which he had yet feen or heard of; and to as high a degree, as, he apprehends, the fame bars in their prefent ftate are capable of being impregnated. Mr. Canton has publifhed the defcription of his procefs, with fuch directions, that any perfon may readily perform the fame.

The apparatus, befides the bars of hard and foft fteel, confifts only in an iron poker and tongs, the larger they are, and the longer they have been ufed, the better. But for the application of this apparatus, we muft refer to the ingenious author himfelf, who has expreffed himfelf clearly and concifely, and added figures for the more eafy intelligence of his procefs. See a method of making artificial *Magnets*, without the ufe of natural ones, by *John Canton*, M. A. London, 1751. See alfo Phil. Tranf. Vol. 47. p. 31.

MAGPYE, in ornithology, the Englifh name of a large order of birds. See the article PICA, *Suppl.*

MAHOGANY, a well known, and, juftly, much valued wood, brought from Jamaica, and other parts of the Weft-Indies.

It is the wood of a very beautiful tree, with pinnated leaves, but hitherto not reduced to any certain clafs or genus of plants. Catefby, indeed, who faw only the withered remains of its flower, tells us, that he could plainly perceive it to be pentapetalous, or confifting of five leaves. Its fruit has fome, tho' but a remote, refemblance to that of the pine.

MAIDEN-*hair* (*Suppl.*) — *Black* MAIDEN-*hair*, a name fometimes given to the *Filicula*, or dwarf Fern. See the article FILICULA, *Suppl.*

Englifh MAIDEN-*hair*, the name of a genus of plants, called by botanifts *Trichomanes*. See the article TRICHOMANES, *Suppl.*

White MAIDEN-*hair*, the name by which fome call the *Ruta-muraria*, or wall-rue. See the article RUTA-*muraria*, *Suppl.*

MAILLS, on fhip-board, are fquare machines, compofed of a number of rings interwoven net-wife, and ufed for rubbing off

off the loose hemp which remains on lines or white cordage, after it is made. *Blanckley*'s Nav. Expos. p. 102.

MAKE-*Hawk*, in falconry. See the article Hawk, *Append.*

MALIGNANT (*Cycl.*) — *Malignant* fevers and fluxes are frequent, not only in marshy countries, after hot seasons, but in populous cities. See the article City, *Append.*

History abounds with examples of *malignant* or pestilential fevers, added to the other calamities of a siege: Nay, there is scarce any instance of a town being long invested, without some fatal malady of this kind; which may, in great part, be attributed to the filth of the place, crowded with people and cattle. Corrupted grain, and meats long salted becoming putrid, have likewise given rise to *malignant* diseases.

It is remarkable how much the plague, and other pestilential fevers, hot scurvies, and dysenteries have abated in Europe within this last century; a blessing we can ascribe to no other second cause, than to the improvement of every thing relating to cleanliness, and to the more general use of Antiseptics. See the article Antisceptics, *Append.*

In regard to diet too, it may be observed, that hopped beer, wine, and spirituous liquors coming more into general use, have been a great means of suppressing putrid and *malignant* diseases. Greens and fruit are likewise more universally eat, and salted meats make a much less part of diet than formerly. To this add the more general consumption of tea and sugar. All which are no inconsiderable antisceptics. *Pringle*, Observ. on Dis. of the army, p. 284, 288, 293.

As to the contageous nature of all putrid disorders, Dr. Pringle thinks that the putrid effluvia, received into the blood, have a power of corrupting the whole mass, of which he conceives the resolution of the blood, and sometimes even its smell, in the advanced state of a *malignant* fever, the offensiveness of the sweats, and other excretions, the livid spots, blotches, and mortifications incident to this distemper, to be sufficient proofs. By the acrimony of these effluvia, the nerves are affected with various spasms, the pulse is always quickened, at first raised, but soon depressed. Id. ibid. p. 298.

Were putrefaction the only change made in the body by contagion, it would be easy to cure such fevers, at any period, by the use of acids, or other antisceptics. But, as this cannot be effected, till the stated time of their decline, it seems probable, that whilst the sceptic progress goes on, the fever is chiefly supported by an inflammation in the brain; so that a cure cannot be expected, till the obstructing matter is resolved or suppurated. Id. ibid.

That this is the case, appears from the method of cure. Thus, before the inflammation is fixed, the sceptic particles may be expelled by sweating; after that period, the most effectual method is to support the strength; but so as not to increase the inflammation; and near the end of the last stage of the disease, the humours being resolved by putrefaction, the obstruction is thereby removed; at which time the stronger antisceptic and cordial medicines have place, in order to correct and expel what is so much vitiated. In this low state the volatiles are often necessary for raising the pulse: Wine is a constant cordial; and not only wine, but camphor, snake-root, and the bark, are endowed with strong antisceptic qualities. Id. ibid. p. 299. seq. See the articles Bilious *fever*, Hospital-*fever*, Dysentery, &c. *Append.*

MALABAR-*nut*, in botany, the English name of a genus of plants, called by botanists *Adhatoda*. See the article Adhatoda, *Suppl.*

MALL, or *Sea*-Mall, the name by which we call several species of the *Larus*, or gull. See the article Larus, *Suppl.*

MALLOW, in botany, the English name of a genus of plants, called by botanists *Malva*. See the article Malva, *Suppl.*

Jews Mallow, the name by which some call the *Corchorus*, of botanists. See the article Corchorus, *Append.*

Indian Mallow, a name given to two different genuses of plants, called *Sida* and *Urena*, by botanists. See the articles Sida and Urena, *Suppl.*

Marsh-Mallow, the English name of a genus of plants, called *Althæa* by botanical writers. See the article Althæa, *Suppl.*

Syrian Mallow, or *Venetian* Mallow, names by which some call the *Ketmia*, of botanical authors. See the article Ketmia, *Suppl.*

Vervain Mallow, the English name of a distinct genus of plants, known among botanists by that of *Alcea*. See the article Alcea, *Suppl.*

Yellow Mallow, a name sometimes given to the *Sida* of Linnæus. See the article Sida, *Suppl.*

MALOBATHRUM, among the Romans, a precious kind of ointment, brought from the Indies through Syria to Rome. *Pitisc.* in voc.

MALTSTER, a person whose employment it is to make malt, or one who trades with it. Ruff. Dict. in voc.

MALVINDA, in botany, the name given by Dillenius, to a genus of plants, called by Linnæus *Sida*. See the article Sida, *Suppl.*

MALUS, the *Apple-tree*, in botany, the name of a genus of plants, the characters of which are these; the flower is rosaceous, and consists of several leaves; the fruit is fleshy, almost round, and for the most part umbilicated at both ends; it is divided into several cells or partitions, in each of which is contained an oblong callous seed.

The species of *Apple-tree*, enumerated by Mr. Tournefort, are these: 1. The *Apple* with a full or double flower. 2. The *Dwarf-Apple*, with white fruit; this is rather a shrub than a tree. 3. The *Dwarf-Apple*, with reddish fruit. 4. The *Crab-tree*, or wild *Apple*, with very sour fruit. 5. The wild *Apple*, with acid fruit. 6. The wild *Apple*, with white and acid fruit. 7. The large *Apple*, with very tender and early ripening fruit. 8. The cultivated *Apple*, with green spots both without and within the fruit. 9. The garden *Apple*, with fruit almost without a pedicle. 10. The garden *Apple*, with roundish pale green fruit, of a sweetish acid taste, 11. The garden *Apple*, with greenish iron coloured fruit. 12. The garden *Apple*, with fruit full of protuberances. 13. The garden *Apple*, with orbicular, sweet-scented fruit. 14. The garden *Apple*, with bright purple fruit. 15. The garden *Apple*, with blood coloured fruit, of a sweetish sour taste. 16. The garden *Apple*, with large reddish and very acid fruit, and a long pedicle. 17. The garden *Apple*, with deep red and violet scented fruit. 18. the garden *Apple*, with pale red, scentless, and large fruit. 19. The garden *Apple*, with deep blood-red coloured fruit, variegated with rust-coloured spots. 20. The garden *Apple*, with turbinated, tender fruit. 21. The garden *Apple*, with oblong, hard, chesnut-tasted fruit. 22. The garden *Apple*, with globose fruit, partly red and partly yellow, and of a sweetish-sour taste. 23. The garden *Apple*, with orbicular sessile fruit, of a vinous taste. 24. The garden *Apple*, with pentagonal stelliform fruit, and somewhat acid taste. 25. The garden *Apple*, with polygonal fruit, of a vinous and somewhat acid taste. 26. The large, angular, vinous-tasted garden *Apple*. 27. The garden *Apple*, with large pileiform greenish-yellow fruit. 28. The garden *Apple*, with striated fruit, variegated with yellowish-red spots. 29. The garden *Apple*, with fruit partly white, and partly reddish, variegated with red spots. 30. The angular, sweet, garden *Apple*, dissolving in the mouth. 31. The angular, whitish, citron-coloured garden *Apple*. 32. The fructiferous *Apple*, with fading flowers. 33. The garden *Apple*, with oblong, sugar tasted, Anis-scented, greyish iron-coloured fruit. 34. The garden *Apple*, with whitish fruit partly punctated, and partly variegated with deep-red striæ. 35. The hard, sugar tasted garden *Apple*, with purple fruit. 36. The garden *Apple*, with very sweet, red, sessile fruit. 37. The oblong, somewhat arched, very white garden *Apple*, of a sweetish acid Taste. *Tournef.* Inst. Bot. 634, seq.

MAN, *Homo*, in zoology, is ranked by Linnæus at the head of a class of animals, which he calls *Anthropomorpha*. See the article Anthropomorpha, *Suppl.*

He distinguishes *Men*, according to their colours; into the European, or white *Men*; the American, or reddish-coloured *Men*; the Asiatic, or tawney-brown-coloured men; and lastly, those of Africa, or the blacks. *Linnæi*, system. Natur. p. 63. Mons. Buson, among many other curious particulars, has given us several relating to the natural history of *Man*. See Histoire Naturelle Vol. III. pag. 305. Edit. Paris. That ingenious author has entered into a considerable detail with respect to the varieties of the human species. See Vol. III. pag. 371, seq. of the same work.

MANCHINEEL-*tree*, the English name of a genus of plants, called by botanists *Mancanilla*. See the article Mancanilla, *Suppl.*

MANGLES, in botany, the name by which Plumier calls the *Rhizophora* of Linnæus. See the article Rhizophora, *Suppl.*

MANGROVE-*tree*, a name by which some call the *Ketmia*. See the article Ketmia, *Suppl.*

Mangrove-*grape*, the name of a genus of plants, known among authors by that of *Guajabara*. See the article Guajabara, *Append.*

MANIS, in zoology, the name of the scaly lizard, otherwise called *Lacertus squamosus*. See the article Lacertus *squamosus*, *Suppl.*

MANNING (*Suppl.*) — Manning *of a hawk*, in falconry, is the making her tractable, gentle, and tame. Dict. Rust. in voc.

MANTLE (*Suppl.*) — *Ladies*-Mantle, in botany, the English name of a genus of plants, known among authors by that of *Alchimilla*. See the article Alchimilla, *Suppl.*

MARACOCK, a name sometimes used for the *Granadilla* of botanical writers. See the article Granadilla, *Suppl.*

MARANTA, *Indian arrow-root*, in botany, the name of a genus of plants, the characters of which are these; the cup is a small perianthium affixed upon the germen, of a lanceolated figure, and consisting of three leaves; the flower is monopetalous, and of the ringent kind; the tube is oblong, compressed, crooked, and oblique; the limb is divided into six parts, the alternate exterior segments being of an ovated figure, equal in size, and small, one standing below,

below, and two above; whereas the two lateral segments are very large, of a roundish figure, and represent a lower lip; the the upper one being small, and bipartite. The stamen is a single membranaceous filament, much resembling a segment of the corolla; the anthera is of a linear figure, and affixed to the side of the filament; the germen of the pistil is roundish, and is placed beneath the receptacle of the flower; the style is simple, and of the length of the flower; and the stigma is somewhat trigonal and bent. The fruit is a roundish capsule, somewhat obscurely trigonal, and composed of three valves, in each of which there is a single, hard, rugose seed, of an ovated figure.

It is a native of America, described by Plumier, and is nearly allied to the Canna, but cannot be joined with it. Vid. Linnæi Gener. Plantar. p. 2.

MARJORAM *(Suppl.)* — *Spanish* MARJORAM, a name used by some for the *Urtica*, with pellitory leaves and round balls. See the article URTICA, *Suppl.*

Sweet MARJORAM, a name given by some to a genus of plants, called by others *Parthenium*. See the article PARTHENIUM, *Suppl.*

MARKING-*Yarn*, in ships of war, is white yarn spun the wrong way, and put into all cordage of three inches and upwards, as the king's mark. *Blanckley's* Naval Expositor, p. 103.

MARSH-*Elder*, or *Water-Elder*, the name by which some call the *Opulus*. See the article OPULUS, *Suppl.*

MARSH-*fever*, is a species of bilious *fever*. See the article BILIOUS, *Append.*

Those, seized with the *Marsh-fever*, are tormented with a burning heat, and violent head-ach. They complain likewise of intense thirst, aking of the bones, a pain of the back, great lassitude and inquietude; and frequently of a nausea, sickness, or a pain about the pit of the stomach; which is sometimes attended with a vomiting of green or yellow bile, of an offensive smell. The head is sometimes so suddenly and violently affected, that without any previous complaint, the patients run about in a wild manner, as if they were mad; and would throw themselves out of windows, or into the water, if not prevented. *Pringle*, Observ. on the Dis. of the Army, p. 171.

MARSH *trefoil*, the name of a genus of plants, called by authors *Menyanthes*. See the article MENYANTHES, *Suppl.*

MARSHY *Countries*. It is to be observed, that neither canals, nor even large inundations, where the water is deep, are nearly so dangerous in regard to peoples health, or exhale so much noxious vapours, as *marshy* grounds, or meadows that have been once floated, and but lately drained; and that fields, tho' dry in appearance, may nevertheless be moist, by the transpiration of subterraneous water. *Pringle*, Observ. on the Dis. of the Army, p. 82.

By this exhalation, as well as by that of ditches and canals, in all which innumerable plants and insects die and rot, the atmosphere is filled, especially during the latter part of summer and autumn, with moist, putrid, and insalutary vapours. Add to this, that *marshy* countries being low, and without hills to receive the winds, or direct them in streams upon the lower grounds, the air is apt to stagnate and corrupt. The common water too, being either collected from rains, and preserved in cisterns, or drawn from shallow wells, is, in hot and dry seasons, soon corrupted; so that every thing conspires, in summer, not only to relax the solids, but to dispose the humours to putrefaction. Id. ibid. p. 2.

In *marshy* countries rainy and moist seasons differ greatly; since intense and continued heats occasion the greatest moisture in the atmosphere, by the immense exhalations they raise; whereas frequent showers, during the hot season, cool the air, check the excess of vapours, dilute and refresh the corrupted stagnating water, and precipitate all putrid and noxious effluvia. But, if heavy rains in the beginning of summer, are succeeded by great and uninterrupted heats, those rains, by overflowing the meadows, serve only for matter of more exhalation, and to make the season more fickly, and the distempers more fatal. Id. ibid. p. 5.

The epidemic of the hot season, and the great endemic of *marshy* countries, is a fever of an intermitting nature, commonly of a tertian shape, but of a bad kind; which in the damper places and worst seasons, appears in the form of a double tertian, remittent, continued, putrid, or even an ardent fever. *Marshy* countries are likewise subject, more than any others, to the cholera morbus, dysentery, and a kind of scurvy, peculiar to a moist and corrupted air; the symptoms of which last agree so much with the sea-scurvy, that they may be accounted the same disease; the exhalations of the canals and *marshes*, in hot weather, acting like the vapour which rises from the bildge-water of a ship. Id. ibid. p. 6, seq.

As to the diet necessary in moist places, it may be observed in general, that those who can afford to live above the common rate, keep freest from the diseases of the *marshes*. For such climates require dry houses, the apartments raised from the ground, proper exercise, without labour in the sun, or in the evening damps, a just quantity of vinous liquors, and victuals of good nourishment. Without such helps, not only strangers, but the natives themselves, are extremely sickly after hot and close summers. Id. ibid. p. 9.

MARTAGON, the name given by some to several species of *Lilly*. See the article LILIUM, *Suppl.*

MARTIN, in ornithology, the English name of the black *Hirundo*, with only the throat white. See the article HIRUNDO, *Suppl.*

MARYGOLD *(Suppl.)* — *Fig*-MARYGOLD, the name by which some call the *Ficoides* of botanists. See the article *Suppl.* and *Append.*

MASH, the name of a drink given to horses or cattle. It is made of half a peck of ground malt, put into a pail; on which is poured as much hot scalding water, as will wet it well; then stirring it about half an hour, till it becomes lukewarm, and sweet like honey, it is to be given to the horse. A *mash* is only given after a purge, to make it work better; after hard labour, or for drink in time of sickness. Ruft. Dict. in voc.

MASTER-*wort*, a name sometimes given to the *Astrantia* of botanical writers. See the article ASTRANTIA, *Suppl.*

MASTIC-*tree*, the name by which some call the *Lentiscus* of authors. See the article LENTISCUS, *Suppl.*

MASTIC-*tree of Jamaica*, a name sometimes given to the *Calaba*, or *Caryophillum*. See the article CARYOPHILLUM, *Append.*

Indian MASTIC, the name by which the *Molle*, or Peruvian Lentisk is sometimes called. See the article MOLLE, *Suppl.*

MATFELON, a name sometimes gived to the *Jacea* of botanists, more usually called *Knapweed*. See the article JACEA, *Suppl.*

MATURATION *of fruit*. For the several ways of hastening the *maturation of fruit*, see the articles HOT-*beds*, FORCING, and CAPRIFICATION, *Suppl.*

MAUDLIN, the English name of a genus of plants, called by botanists *Ageratum*. See the article AGERATUM, *Suppl.*

MAUROCENIA, in botany, the name of a genus of plants, the characters of which are these; the cup is a very small one-leaved perianthium, divided into five segments, and permanent; the flower consists only of one leaf, divided into five oval, patent segments; the stamina are five erect subulated filaments, longer than the flower; the antheræ are simple; the germen of the pistil is conic; there is no style; the stigmata are three, and gibbous; the fruit is an oval berry, umbilicated with the stigmata; the seeds are three, oblong, and scarce separable from the pulp.

Dillenius makes this genus a species of Frangula. Vid. *Linnæi* Gen. Plant. p. 125.

MAW, or SEA-MAW, the same with the *Sea-Mall*. See the article MALL, *supra*.

MAY-*bush*, in botany, a name sometimes given to the *Mespilus*, or Medlar. See the article MESPILUS, *Suppl.*

MAY-*duke*, a name used among Gardeners for a species of cherry-tree. See the article CERASUS, *Suppl.*

MAY-*lilly*, a name sometimes used for the *Convallaria*, or *Lilium Convallium*. See the article LILIUM CONVALLIUM, *Suppl.*

MAY-*weed*, a name by which some call the *Chamæmile*. See the article CHAMÆMELUM, *Suppl.*

MAZE, in gardening, the same with *Labyrinth*. See the article LABYRINTH, *Cycl.* and *Suppl.*

MEADOW-*grass*, in botany. See the article GRASS, *Append.*

MEADOW-*rue*, the English name of a genus of plants, called by botanists *Thalictrum*. See the article THALICTRUM, *Suppl.*

MEADOW-*sweet*, in botany, the English name of a genus of plants, called by authors *Ulmaria*. See the article ULMARIA, *Suppl.*

MEALY-*tree*, in botany, a name sometimes given to the *Viburnum*. See the article VIBURNUM, *Suppl.*

MECHANICS *(Cycl.)* — The term *Mechanics* has of old been, and still is, used in a double sense in very different sciences, both with respect to their objects and principles. For the name *Mechanics* is applied equally to that science which treats of the equilibrium and comparison of powers; and to that science in which the nature, generation, and alteration of motion is explained. To avoid ambiguity, therefore, it would be proper to give the name *Statics* to the science of the equilibrium and comparison of powers, and to restrain the term *Mechanics* to the science of motion.

These two sciences not only differ as to their objects and principles, but also with respect to the times in which they have been cultivated. Some of the principles of *Statics* were established by Archimedes; but Galileo laid the first foundation of Mechanics, when he investigated the descent of heavy bodies; and since his time, by the assistance of the new methods of computation, a great progress has been made, particularly by Sir Isaac Newton, in his Principia. This admirable work is now rendered more accessible to beginners by the learned comment of the fathers le Seur and Jacquier, printed, with the text, at Geneva, 1739,

1739, 4to, 1742, 4 vols. 4to. We have also the sciences of Statics and *Mechanics* treated of under the name of Phoronomia, by the late learned professor Herman. Amst. 1716. 4to. Mr. Euler's *Mechanica, sive de motus scientia*; is sufficiently recommended by the name of the author, well known as one of the most eminent mathematicians in Europe. This work, however, did not escape the censure of a late ingenious writer; but granting the justness of his remarks, it may be said, that a few inaccurate expressions, owing to analogies carried too far, and to the style of infinitesimals, are but small flaws in such a work. As to statics, the subject has been almost exhausted by Varignon, in his Mecanique, Paris, 1725, 2 vol. 4to.

The doctrine of machines or engines is a principal branch of *Mechanics*; but has not as yet been treated as it deserves. We shall here insert a few observations on this useful subject, from a late eminent author.

In treating of machines, we should consider the weight that is to be raised, the power by which it is to be raised, and the instrument or engine by which this effect is to be produced. There are two principal problems that ought to be resolved in treating of each of them.

The first is, to determine the proportion which the power and weight ought to have to each other, that they may just sustain one another, or be in æquilibrio.

The second is, to determine what ought to be the proportion of the power and weight to each other, in a given machine, that it may produce the greatest effect possible, in a given time.

All the writers on *Mechanics* treat of the first of these problems, but few have considered the second, tho' equally useful with the other.

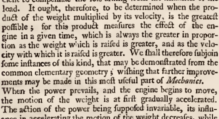
As to the first problem, this general rule holds in all powers: Suppose the engine to move, and reduce the velocities of the power and weight to the respective directions in which they act; find the proportions of those velocities; then if the power be to the weight, as the velocity of the weight is to the velocity of the power, or, which amounts to the same thing, if the power multiplied by its velocity, gives the same product as the weight multiplied by its velocity, this is the case wherein the power and weight sustain each other, and are in equilibrio; so that in this case, the one would not prevail over the other, if the engine was at rest; and if it is in motion, it would continue to proceed uniformly, if it were not for the friction of its parts, and other resistances.

The second general problem in *Mechanics*, is, to determine the proportion which the power and weight ought to bear to each other, that when the power prevails, and the machine is in motion, the greatest effect possible may be produced by it in a given time. It is manifest, that this is an inquiry of the greatest importance, tho' few have treated of it. When the power is only a little greater than that which is sufficient to sustain the weight, the motion is too slow; and tho' a greater weight is raised in this case, it is not sufficient to compensate the loss of time. When the weight is much less than that which the power is able to sustain, it is raised in less time; and this may happen not to be sufficient to compensate the loss arising from the smallness of the load. It ought, therefore, to be determined when the product of the weight multiplied by its velocity, is the greatest possible; for this product measures the effect of the engine in a given time, which is always the greater in proportion as the weight which is raised is greater, and as the velocity with which it is raised is greater. We shall therefore subjoin some instances of this kind, that may be demonstrated from the common elementary geometry; wishing that farther improvements may be made in this most useful part of *Mechanics*.

When the power prevails, and the engine begins to move, the motion of the weight is at first gradually accelerated. The action of the power being supposed invariable, its influence in accelerating the motion of the weight decreases, while the velocity of the weight increases. Thus the action of a stream of water, or air, upon a wheel, is to be estimated only from the excess of the velocity of the fluid above the velocity already acquired by the part of the engine which it strikes, or from their relative velocity. On the other hand, the weight of the load that is to be raised, and the friction, tend to retard the motion of the engine; and when these forces, viz. those that tend to accelerate it, and those that tend to retard it, become equal, the engine then proceeds with the uniform motion it has acquired.

Let A B (Fig. 1.) represent the velocity of the stream, A C, the velocity of the part of the engine which it strikes,

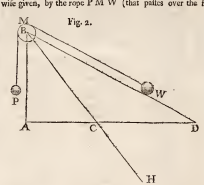
Fig. 1.



when the motion of the machine becomes uniform; and C B will represent their relative velocity, upon which the effect of the engine depends. It is known that the action of a fluid, upon a given plane, is as the square of this relative velocity; consequently the weight raised by the engine, when its motion becomes uniform, being equal to this action, it is likewise as the square of C B. Let this be multiplied by A C, the velocity of the part of the engine impelled by the fluid; and the effect of the engine in a given time will be proportional to $A\,C \times C\,B^2 =$ (supposing C B to be bisected in D) $A\,C \times 2\,C\,D \times 2\,D\,B = 4\,A\,C \times C\,D \times D\,B$; consequently, the effect of the engine is greatest, when the product of A C, C D, and D B is greatest. But it is easy to see, that this product is greatest, when the parts A C, C D, and D B, are equal; for if you describe a semicircle upon A D, and the perpendicular C E meet the circle in E, then $A\,C \times C\,D = C\,E^2$, and is greatest, when C is the center of the circle; so that in order that $A\,C \times C\,D \times D\,B$ may be the greatest possible, A D must be bisected in C; and C B having been bisected in D, it follows, that A C, C D, D B, must be equal; or that A C, the velocity of the part of the engine impelled by the stream, ought to be but one third of A B, the velocity of the stream. In this case, when (abstracting from friction) the engine acts with the utmost advantage; the weight raised by it is to the weight that would just sustain the force of the stream, as the square of C B, the relative velocity of the engine and stream, to the square of A B, which would be the relative velocity, if the engine was quiescent; that is, as 2×2 to 3×3, or 4 to 9. Therefore, that the engine may have the greatest effect possible, it ought to be loaded with no more than $\frac{4}{9}$ of the weight, which is just able to sustain the efforts of the stream. See *Mac Laurin's* Account of Sir Isaac Newton's Discov. p. 171. seq. and Fluxions, Art. 908.

Again suppose that a given weight P, (Fig. 2.) descending by its gravity in the vertical line, raises a greater weight W likewise given, by the rope P M W (that passes over the fixed

Fig. 2.



pully M) along the inclined plane B D, the height of which B A is given; and let it be required to find the position of this plane, along which W will be raised in the least time, from the horizontal line A D to B. Let B C be the plane upon which if W was placed, it would be exactly sustained by P; in which case, P is to W as A B to B C. But W is to the force with which it tends to descend along the plane B D, as B D to A B; consequently the weight P is to that force, as B D to B C. Therefore the excess of P above that force (which excess is the power that accelerates the motions of P and W) is to P, as B D — B C to B D; or taking B H upon B C equal to B D, as C H to B D. But it is known that the spaces described by motions uniformly accelerated, are in the compound ratio of the forces which produce them and the squares of the times; or that the square of the time is directly as the space described in that time, and inversly as the force; consequently, the square of the time, in which B D is described by W, will be directly as B D, and inversly as $\frac{C\,H}{B\,D}$, and will be least when $\frac{B\,D^2}{C\,H}$ is a minimum; that is, when $\frac{B\,C^2}{C\,H} + C\,H + 2\,B\,C$, or (because $2\,B\,C$ is invariable) when $\frac{B\,C^2}{C\,H} + C\,H$ is a minimum. Now as when the sum of two quantities is given, their product is a maximum, when they are equal to each other; so it is manifest, that, when their product is given, their sum must be a minimum, when they are equal. Thus it is evident, that as in Fig. 1. the rectangle or product of the equal parts A C and C D was equal to $C\,E^2$; so the rectangle of any two unequal parts, into which A D may be divided, is less than $C\,E^2$, and A D is the least sum of any two quantities, the product of which is equal to $C\,E^2$. But the product of $\frac{B\,C^2}{C\,H}$ and C H is $B\,C^2$, and consequently given; therefore the sum of $\frac{B\,C^2}{C\,H}$ and C H is least, when

these

thefe parts are equal, that is, when C H is equal to B C, or B D equal to 2 B C. It appears, therefore, that when the power P and weight W are given, and W is to be raifed by an inclined plane, from the level of a given point A to the given point B in the leaft time poffible; we are firft to find the plane B C, upon which W would be fuftained by P, and to take the plane B D double in length of the plane B C; or we are to make ufe of the plane B D, upon which a weight that is double of W could be fuftained by the power P.

For another example, fuppofe a fluid, moving with the velocity and direction A C, (Fig. 3.) ftrike the plane C E; and fuppofe that this plane moves parallel to itfelf in the direction C B, perpendicular to C A, or that it cannot move in any other direction. Then let it be required to find the moft advantageous pofition of the plane C E, that it may receive the greateft impulfe from the action of the fluid. Let A P be perpendicular to C E in P, draw A K parallel to C B, and let P K be perpendicular upon it in K, and A K will meafure the force with which any particle of the fluid impells the plane E C, in the direction C B. For the force of any fuch particle being reprefented by A C, let this force be refolved into A Q parallel to E C, and A P perpendicular to it; and it is manifeft, that the latter A P only has any effect upon the plane C E. Let this force A P be refolved into the force A L perpendicular to C B, and the force A K parallel to it; then it is manifeft, that the former, A L, has no effect in promoting the motion of the plane in the direction C B: fo that the latter A K, only, meafures the effort by which the particle promotes the motion of the plane C E in the direction C B. Let E M and E N be perpendicular to C A and C B, in M and N; and the number of particles, moving with directions parallel to A C, incident upon the plane C E, will be as E M. Therefore the effort of the fluid upon C E being as the force of each particle, and the number of particles together, it will be as $AK \times EM$; or, becaufe A K is to A P ($= EM$,) as E N to C E, as $\frac{EM^2 \times EN}{CE}$; fo that C E being given, the problem is reduced to this, to find when $EM^2 \times EN$ is the greateft poffible, or a maximum. But becaufe the fum of EM^2 and of EN^2 ($= CM^2$) is given, being always equal to CE^2, it follows, that $EN^2 \times EM^4$, is greateft, when $EN^2 = \frac{1}{3} CE^2$; in the fame manner as it was demonftrated above, that when the fum of A C and C B (Fig. 1.) was given, $AC \times CB^2$ was greateft, when $AC = \frac{1}{3} AB$. But when $EN \times EM^4$ is greateft, its fquare root $EN \times EM^2$ is of neceffity at the fame time greateft. Therefore the action of the fluid upon the plane C E in the direction C B is greateft when $EN^2 = \frac{1}{3} CE^2$, and confequently $EM^2 = \frac{2}{3} CE^2$; that is, when E M, the fine of the angle A C E, in which the ftream ftrikes the plane, is to the radius, as the $\sqrt{2}$ to $\sqrt{3}$; in which cafe it eafily appears, from the trigonometrical tables, that this angle is of 54°. 44′.

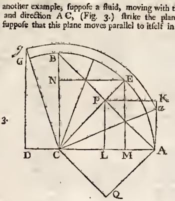


Fig. 3.

Several ufeful problems in *Mechanics* may be refolved by what was fhewn in the preceding paragraph. If we reprefent the velocity of the wind by A C, a fection of the fail of a wind-mill perpendicular to its length by C E, as it follows from the nature of the engine, that its axis ought to be turned directly towards the wind, and the fail can only move in a direction perpendicular to the axis, it appears, that, when the motion begins, the wind will have the greateft effect to produce this motion, when the angle A C E, in which the wind ftrikes the fail, is of 54°. 44′. In the fame manner, if C B reprefent the direction of the motion of a fhip, or the pofition of her keel, abftracting from her lee-way, and A C be the direction of the wind, perpendicular to her way, then the moft advantageous pofition of the fail C E, to promote her motion in the direction C B, is when the angle A C E, in which the wind ftrikes the fail, is of 54°. 44′. The beft pofition of the rudder, where it may have the greateft effect in turning round the fhip, is determined in like manner. And the fame angle enters likewife into the determination of the figure of the rhombufes that form the bafes of the cells in which the bees depofite their honey, in the moft frugal manner. See the article Bee, *Suppl.*

But it is to be carefully obferved, that when the fine of the angle A C E is to the radius as $\sqrt{2}$ to $\sqrt{3}$; or, which is the fame thing, when its tangent is to the radius, as the diagonal of a fquare to its fide; this is the moft advantageous angle only at the beginning of the motion of the engine; fo that the fails of a common wind-mill ought to be fo fituated, that the wind may indeed ftrike them in a greater angle than that of 54°. 44′. For it is demonftrable, that when any part of the engine has acquired the velocity c, the effort of the wind upon that part will be greateft, when the tangent of the angle in which the wind ftrikes it is to the radius, not as the $\sqrt{2}$ to 1, but $\sqrt{2 \times \frac{9cc}{4aa}} \times \frac{3c}{2a}$ to 1; the velocity of the wind being reprefented by a. If, for example, $c = \frac{1}{3} a$; then the tangent of the angle A C E ought to be double of the radius; that is, the angle A C E ought to be of 63° 26′. If $c = a$; then A C E ought to be of 74° 19′. This obfervation is of the more importance, becaufe, in this engine, the velocity of the parts of the fail remote from the axis, bears a confiderable proportion to the velocity of the wind, and perhaps fometimes is equal to it; and becaufe a learned author, Mr. Daniel Bernoulli, has drawn an oppofite conclufion from his computations in his *Hydrodynamics*, by miftaking a minimum for a maximum; where he infers, that the angle in which the wind ftrikes the fail, ought to decreafe as the diftance from the axis of motion increafes; that if $c = a$, the wind ought to ftrike in an angle of 45°; and that if the fail be in one plane, it ought to be inclined to the wind, at a medium, in an angle of 50°. How he fell into thefe miftakes, is fhewn by Mr. *Mac Laurin*, in his Fluxions, §. 914.

In like manner, though the angle A C E of 54°. 44′. be the moft advantageous at the beginning of the motion, when a fhip fails with a fide wind; yet it ought to be enlarged afterwards as the motion increafes. In general, let A a, parallel to C B, be to A C, as the velocity which the engine has already acquired in the direction C B, to that of the ftream; upon A C produced take A D to A C as 4 to 3, draw D G parallel to C B, and let a circle defcribed from the center C with the radius C a, meet D G in g; and the plane C E fhall be in the moft advantageous fituation for promoting the motion of the engine, when it bifects the angle a C g.

It is generally fuppofed, that a direct wind always promotes the motion of a fhip, the fail being perpendicular to the wind, more than any fide-wind; and this has been affirmed in feveral late ingenious treatifes; but, to prevent miftakes, we are obliged to obferve, that Mr. *Mac Laurin* has demonftrated the contrary, in his Treatife of Fluxions, §. 919; where other inftances of this fecond general problem in *Mechanics* are given, to which we refer. See *Mac Laurin's* Account of Sir Ifaac Newton's Philofophical Difcoveries, B. II. c. 3. p. 173. feq.

MECHOACAN, *(Cycl.)* the name by which the great American *Convolvulus*, or bindweed, is known in the fhops. See the article Convolvulus, *Suppl.*

MEDIC-*vetching*, a name by which fome call the *Onobrychis*, a diftinct genus of plants. See the article Onobrychis, *Suppl.*

MEDICA *(Suppl.)*—*Baftard*-Medica, the Englifh name of a genus of plants, called by botanical writers *Medicago*. See the article Medicago, *Suppl.*

MEDLAR *(Suppl.)*—*Parfley-leaved* Medlar, the name by which fome call a fpecies of *Cratægus*. See the article Cratægus, *Suppl.*

MEDUSA, in zoology, the name of a genus of infects, of the order of the *Gymnarthria*. See the article Gymnarthria, *Append.*

The body of the *Medufa* is of an orbiculated convex figure of a gelatinous fubftance, and not hairy. The tentacula, or the plicæ, which ferve inftead of them, are fituated in the center of the under part of the animal. Authors have defcribed them under the names *Urticæ marinæ*, and *Pulmones marini*. See the article Urtica *Marina*, *Suppl.*

MELANCHOLY *thiftle*, *Cirfium*, in botany, the name of a fpecies of *Thiftle*. See the article Thistle, *Suppl.*

MELANTHIUM, in botany, a name ufed by fome authors for a fpecies of *Nigella*. See the article Nigella, *Suppl.*

MELOE, in zoology, the name of a genus of four-winged flies, whofe antennæ are flender and filiform; and the exterior wings dimidiated. It is called in Englifh the *oil-beetle*, as being foft and mucuous to the touch. It is black, but not at all gloffy, and has been defcribed by authors under the names *Scarabæus mollis*, *Cantharus unctuofus*, and *Profcarabæus*. See the article Scarabæus, *Suppl.*

MELON *(Suppl.)*—*Water*-Melon, the name of a genus of plants, called by botanifts *Anguria*. See the article Anguria, *Suppl.*

Thiftle-Melon, *Cactus*, in botany, the name of a genus of plants. See the article Cactus, *Suppl.* and *Append.*

MENIANTHES, in botany, the same with *Menyanthes*, a distinct genus of plants. See the article MENYANTHES, *Suppl.*

MENISPERMUM, in botany, the name of a distinct genus of plants, the characters of which are these: The cup is a deciduous perianthium, composed of six ovato-oblong leaves, erecto-patent, and of the length of the corolla; which consists of six ovato-oblong, obtuse, hollow petals, erecto-patent, like the leaves of the cup; the stamina are six very short filaments; the antheræ are simple, and shorter than the corolla; the germina are three, suboval, and terminate in as many patenti-reflex styles, of the length of the corolla; the stigmata are obtuse and emarginated. The fruit is composed of three oval berries, each containing a single cell, and in it a large, single, lunulated, compressed seed. *Linnæi* Gen. Plant. p. 155.

Plukenet calls this genus the one-leaved Virginian *hedera*, with the leaves of convolvulus.

MERCURY (*Suppl.*) — *Virgin*-MERCURY, called *Jungfraw* by the German miners, is used for that which discovers itself without the assistance of fire. This is sometimes seen in drops, globules, or larger masses in the ore, or falls in drops from the crevices in the roof or walls of the mine, or finally is found in large quantities in the hollows of the rocks. These large collections of pure virgin quicksilver often discover themselves by bursting out in small streams in the mines of Friuli. They sometimes are surprised with a stream of it like a thread, which gradually increasing to the thickness of a packthread, continues to run three or four days, and discharges in that time a vast quantity of the quicksilver; if the miners can follow this spring to the head, they generally obtain a large quantity more; and often this sort of springing up of it leads them to very rich veins of the mine which they did not before know of. They give the same name of *Jungfraw* or virgin-quicksilver also to that *Mercury* which has no need of fire for the separation, but is wash'd out of its ores by a sieve and large quantities of water, continually and forcibly running on it.

The ores of quick-silver often contain a large quantity of that mineral embedded in them in this form, and often so mix'd in other parts with sulphurs, as to be disguised into cinnabar; in this case a great deal is separated by this washing, which at the same time frees the ore from dirt, and renders it fitter for the operation of the fire, by which a great deal more is then extracted.

The union of *Mercury* with antimony is very difficult, but has been effected by Monf. Malouin. See Hist. Ac. Scienc. 1740.

The same gentleman succeeded also in uniting *Mercury* with tin and lead, so as to improve these metals in some respects, rendering them harder, whiter, and more sonorous. Hist. Ac. ibid.

English MERCURY, the name of a distinct genus of plants, called by botanists *Chenopodium*. See the article CHENOPODIUM, *Suppl.*

MERLIN, in ornithology, the English name of the yellow-legged *Falco*, with a variegated back, and a brown and white belly. See the article FALCO, *Suppl.*

This bird is also called *Oesalon*. See the article ŒSALON, *Suppl.*

MESHES *of nets*, the openings and vacancies in net-works. Rust. Dict. in voc.

MESSES *of soldiers*, in what respect useful. See the article DIET, *Append.*

METALS are expanded by *Heat*, but in different degrees. See the articles HEAT and PENDULUM, *Append.*

By what may be learned from the analyses of metals, so far as that subject has yet been prosecuted, it seems that they all contain a running *Mercury* fixed in them, as water is fixed in dry, animal, and vegetable substances; and joined with a sulphur or an inflammable part, and an earth, with a little salt in some of them. *Shaw's* Lectures, p. 162.

METHONICA, in botany, the name given by Tournefort to a distinct genus of plants, called by Linnæus *Gloriosa*. See the article GLORIOSA, *Append.*

METOPE (*Cycl.*) — Le Clerc observes, that the beauty of *Metopes* consists in their regularity, on appearing to be perfect squares; and yet when they are equally square, they appear to be less in height than in breadth, on account of the projecture of the little bandelet; for which reason they should be made a minute or two more in height than in breadth, in order to make their appearance uniform.

He also observes, that when the triglyphs and *Metopes* follow each other regularly, the columns must only stand one by one; excepting those of the inner angles, which ought always to be accompanied by two others, one on each side; and here it is worth remarking, that these two columns which accompany that of the angle, are not less necessary on account of the solidity of the building, than of the regularity of of the intercolumniations.

MEU, MEW, or SPIGNEL, a name sometimes given to the *Meum* of botanists. See the article MEUM, *Suppl.*

MEWING, a disorder incident to all kind of birds, being the casting of their feathers. Rust. Dict. in voc.

MIDAS's *Ear-shell*, a name used by some for a species of *buccinum*, or trumpet-shell. See the article TRUMPET-*shell*, *Suppl.*

MILFOIL, a name sometimes given to the *Millefolium*, or yarrow, of other writers. See the article MILLEFOLIUM, *Suppl.*

MILK-*vetch*, the name of a genus of plants, called by botanists *Astragalus*. See the article ASTRAGALUS, *Suppl.*

Bastard MILK-*vetch*, a name sometimes given to the *Phaca*, or *Astragaloides*, of botanists. See the article ASTRAGALOIDES, *Suppl.*

MILK-*wort*, the name of a distinct genus of plants, called by authors *Polygala*. See the article POLYGALA, *Suppl.*

MILK-*wort*, or WART-*wort*, is also a name sometimes given to the *Euphorbia*. See the article EUPHORBIA, *Suppl.*

MILLET, the English name of a distinct genus of plants, called by authors *Milium*. See the article MILIUM, *Suppl.*

MILLET-*grass*, in botany. See the article GRASS, *Append.*

MILT-*waste*, the English name of a distinct genus of plants, known among authors by that of *Asplenium*. See the article ASPLENIUM, *Suppl.*

MINERAL *Juices*. See the article JUICES *mineral*, *Suppl.*

MINERAL *Kermes*. See the article KERMES *mineral*, *Suppl.*

MINERALOGY, the study which teaches the previous part of metallurgy, the way of finding, judging of, and digging mines; with the uses of salts and earths for the making of fluxes in order to the assaying, and making of ores to separate their metals. This art requires a considerable compass of knowledge, before it can be practis'd to advantage; for as it includes the discovery, sinking, and working of mines, it requires a competent knowledge of the nature of effluvia, and the effects of all mineral matters, salts, sulphurs, &c. as well as the knowledge of all valuable mineral substances, as earths, bitumens, stones, ores, gems, and metals. It likewise requires a knowledge in the internal structure of the earth, and its various strata, with a competent skill in mensuration, hydraulics, measuring, and mechanics; for without these we can never judge what mountain, plain, or valley is proper to be dug, or in what manner to dig it, how to discharge the water that may flow into the works, how the beds of ore and stone will dip and run, how the various kinds of earth, marble, and other mineral or metalic matter, are to be cut through or broken, or how the general process of mining should be conducted, in order to procure, with the least expence, the matter of the ore. *Shaw's* Lectures, p. 240.

MINT (*Suppl.*) —*Corymbiferous* MINT, in botany, a name given by some to a species of Tanzy. See the article TANACETUM, *Suppl.*

Spear-MINT, the name commonly given to the narrow leaved spiked *Mint*. See the articles MENTHA and MINT, *Suppl.*

Cat's-MINT, the English name of a genus of plants, called by botanical writers *Cataria*. See the article CATARIA, *Suppl.*

MIRE-*Drum*, and MIRE-*Snipe*, names used in different parts of the kingdom for the *ardea stellaris*, or bittern. See the articles BITTERN and HERON, *Suppl.*

MISCARRIAGE, the popular term for *Abortion*. See the articles ABORTION, *Cycl.* and PREGNANCY, *Suppl.*

MISLETOE, the English name of a distinct genus of plants, called by botanists *Viscum*. See the article VISCUM, *Suppl.*

MITCHELS, among builders, are purbeck stones, from fifteen inches square to two feet, squared and hewed ready for paving. Rust. Dict. in voc.

MITHRIDATE-*mustard*, in botany, the name by which some call the *Thlaspi*, or treacle mustard. See the article THLASPI, *Suppl.*

Bastard-MITHRIDATE-*mustard*, a name sometimes given to the *Thlaspidium* of botanists. See the article THLASPIDIUM, *Suppl.*

MITRE-*shell*, the English name of the smooth and slender buccinum, with a split rostrum. See the article TRUMPET-*shell*, *Suppl.*

MOCK-*orange*, a name by which the *syringa*, or pipe-tree, is sometimes called. See the article SYRINGA, *Suppl.*

MOCK-*privet*, a name sometimes given to the *Phyllerea* of botanists. See the article PHYLLEREA, *Suppl.*

MODILLION (*Cycl.*) — In the Corinthian order it is usual to have a leaf which takes up the whole breadth, and almost the whole length, of the modillions; but Le Clerc is of opinion, that they would be more graceful if this leaf were less, both in length and breadth. The leaf ought likewise to be of the same kind with those which make the ornament of the capital. Build. Dict. in voc.

MOISTURE. The bad effects of too much *moisture*, in regard to health, has been considered under the article MARSHY *Countries*, *Append.*

MOMORDICA (*Suppl.*) — *Stinking* MOMORDICA, a name used by some for the large fruited white *bryony* of Ceylon. See the article *Bryonia alba*, *Suppl.*

MONBIN, in botany, the name given by Plumier to a genus of plants, called by other botanists *Spondias*. See the article SPONDIAS, *Suppl.*

MONEDULA, in ornithology, a name used by some writers for the *Jackdaw*, a species of *Corvus*. See the articles CORVUS, and JACKDAW, *Suppl.*

MONEY-*wort*, the English name of a distinct genus of plants, known among botanists by that of *Nummularia*. See the article NUMMULARIA, *Suppl.*

MONK's-*rhubarb*, the English name of the broad-leaved garden *Lapathum*, or dock. See the article LAPATHUM, *Suppl.*

MONKEY, in zoology, a name given by way of distinction to those apes which have tails; the others, or those without tails, being more properly called *apes*.

The same distinction holds in latin, the tailed ones being called *Cercopitheci*, and those without tails *Simiæ*. See the articles CERCOPITHECUS and SIMIA, *Suppl.*

MONKEY, in the sea-language, a block made of iron, with a catch, used in gins for driving piles. *Blanckley's* Naval Expositor, p. 107.

MONOCEROS *piscis*. Besides the two kinds of unicorn-fish described in the Supplement under the article MONOCEROS, there is another very large one of the same genus. See the article UNICORN, *Suppl.*

MONOCULUS, in zoology, the name of a genus of insects, of the Podaria kind. See the article PODARIA, *Append.*

Its body is short, of a roundish figure, and covered with a firm crustaceous skin; the fore legs are ramose, and serve for leaping and swimming. It has but one eye, which is large, and composed of three smaller ones.

Of this genus, many of which have been reckoned among the microscopic animals, authors enumerate a great number of species; for which see *Hill*, Hist. Anim. p. 22.

MONORCHIS. Beside the common signification of this word as the name of a plant, physicians have also us'd it to express a man who has but one testicle.

MONOTRIGLYPH, in architecture, denotes the space of one *Triglyph*, between two pillasters or two columns. Build. Dict. in voc. See the article TRIGLYPH, *Cycl.*

MOON (*Cycl.*) — The path of the *moon* is concave towards the sun throughout.

In other secondary planets, as the satellites of the superior planets, that part of the path of these satellites which is nearest the sun, is convex towards the sun, and the rest is concave. And we often find in elementary treatises of astronomy, the *Moon*'s path represented in the same manner; that is, as partly convex and partly concave towards the sun; but this is a mistake. For it is to be observed, in general, that the force which bends the course of the satellite into a curve, when the motion is referred to an immoveable plane, is, at the conjunction, the difference of its gravity towards the sun, and of its gravity towards the primary. When the former prevails over the latter, the force that bends the course of the satellite tends towards the sun; and consequently the concavity of the path is towards the sun; and this is the case of the *Moon*. When the gravity towards the primary exceeds the gravity towards the sun, at the conjunction, then the force that bends the course of the satellite tends towards the primary, and therefore towards the opposition of the sun; consequently the path is there convex towards the sun; and this is the case of the satellites of Jupiter. When these two forces are equal, the path has, at the conjunction, what mathematicians call a point of rectitude; in which case, however, the path is concave towards the sun throughout.

The gravity of the *Moon* towards the sun having been found to be greater, at her conjunction, than her gravity towards the earth, so that the point of equal attraction, where those two powers would sustain each other, falls then between the *Moon* and earth, some [a] have apprehended that either the parallax of the sun is very different from that which is assign'd by astronomers, or that the *Moon* ought necessarily to abandon the earth. This apprehension may be removed easily, by attending to what has been shewn by Sir Isaac Newton, and is illustrated by vulgar experiments concerning the motions of bodies about one another, that are all acted upon by a third force in the same direction. Their relative motions not being in the least disturbed by this third force, if it act equally upon them in parallel lines; as the relative motion of the ships in a fleet, carried away by a current, are no way affected by it, if it act equally upon them; or as the rotation of a bullet or bomb, about its axis, while it is projected in the air; or the figure of a drop of falling rain, are not at all affected by the gravity of the particles of which they are made up, towards the earth. It is to the inequality of the action of the sun upon the earth and *Moon*; and the want of parallelism in the directions of these actions, only, that we are to ascribe the irregularities in the motion of the *Moon*.

[[a] The ingenious Mr. *Baxter*, author of *Matho*, or cosmotheoria puerilis.]

But it may contribute towards removing this difficulty to observe, that if the absolute velocity of the *Moon*, at the conjunction, was less than that which is requisite to carry a body in a circle there around the sun, supposing this body to be acted on by the same force which acts there on the *Moon* (i. e. by the excess of her gravity towards the sun, above her gravity towards the earth) then the *Moon* would, indeed, abandon the earth. For, in that case, the *Moon* having less velocity than would be necessary to prevent her from descending within that circle, she would approach to the sun, and recede from the earth. But tho' the absolute velocity of the *Moon*, at the conjunction, be less than the velocity of the earth in the annual orbit, yet her gravity towards the sun is so much diminished by her gravity towards the earth, that her absolute velocity is still much superior to that which is requisite to carry a body in a circle, there, about the sun, that is acted on by the remaining force only. Therefore, from the moment of the conjunction, the *Moon* is carried without such a circle, receding continually from the sun to greater and greater distances, till she arrives at the opposition; where being acted on by the sum of those two gravities, and her velocity being now less than what is requisite to carry a body in a circle, there, about the sun, that is acted on by a force equal to that sum, the *Moon* thence begins to approach to the sun again. Thus, she recedes from the sun, and approaches to it by turns, and in every month her path hath two apsides, a perihelium at the conjunction, and an aphelium at the opposition; between which she is always carried in a manner similar to that in which the primary planets revolve between their apsides. The planet recedes from the sun at the perihelium, because its velocity, there, is greater than that with which a circle could be described about the sun at the same distance by the same centripetal force; and approaches towards the sun from the aphelium, because its velocity, there, is less than is requisite to carry it in a circle, at that distance about the sun. See *Mac Laurin*'s Account of Sir Isaac Newton's Phil. Disc. Book 4. c. 5.

MOON-*wort*, the English name of a distinct genus of plants, called by botanists *Lunaria*. See the article LUNARIA, *Suppl.*

MOON-*trefoil*, a name by which the *Medicago* of botanists is sometimes called. See the article MEDICAGO, *Suppl.*

MOON-*seed*, in botany, the English name of a genus of plants, called by botanists *Menispermum*. See the article MENISPERMUM, *Append.*

MOOR-*buzzard*. See the article BUZZARD, *Suppl.*

MOOTER, in the dock-yards, the person who forms and smooths the tree-nails for use. *Blanckley's* Nav. Expositor, p. 108.

MORBUS *Hungaricus*. See the article HUNGARICUS *morbus*, *Append.*

MORDELLA, a name given by some writers to the *Ear-wig*. See the article EAR-*wig*, *Append.*

MORDELLA, in zoology, the name of a genus of four-winged flies, distinguished by having the last joint of the antennæ globose; most of the species have also legs for leaping. See the article FLY, *Suppl.*

Of this genus there are a great many species, for which see *Hill*, Hist. Anim. p. 49.

MORILLES, a kind of mushroom, about the bigness of a wallnut, pierced with holes like a honey-comb, and said to be good for creating an appetite. They are also accounted restorative, and frequently used in sauces and ragouts.

MORMYLUS, in ichthyology, the name of a species of *Sparus*, with the upper jaw longest, and with twelve parallel, transverse black lines on each side. See the article SPARUS, *Suppl.*

MORTAR (*Cycl.*) — It is said, that the spherical figure is best for the chamber of a *mortar*. Hist. Acad. Scienc. 1740.

But this proposition seems doubtful. By some experiments made before the Royal Society in 1742, it appeared, that the longest cylindrical chambers of the same capacity threw the ball farthest; which may give ground to suspect that a long cylinder might be a better figure for the chamber of a *Mortar* than a sphere of equal capacity. See the article GUNNERY, *Append.*

Coehorn MORTAR, a small kind of *Mortar*, invented by the famous engineer baron Coehorn, to throw small shells or granades. These *Mortars* are commonly fixed, to the number of a dozen, to a block of oak, at an elevation of 45°.

MORTIFICATION, in medicine. See the article SPHACELUS, *Cycl.* and *Suppl.*

MOSCHUS, the *musk animal*. See the articles MOSCHIFERUM *animal*, and MUSK, *Suppl.*

MOTH, in zoology, the English name of a large class of butterflies, comprehending all the nocturnal ones, or those which fly by night, and called *Phalenæ* by authors. See the article PHALENÆ, *Suppl.*

MOTH-*mullein*, in botany, the English name of a distinct genus of plants, known among botanical writers by that of *Blattaria*. See the article BLATTARIA, *Suppl.*

MOTHER-*wort*, the name for two diftinct genufes of plants, the *cardiaca* and *matricaria*, of botanical writers. See the articles CARDIACA and MATRICARIA, *Suppl.*

MOTHER *of thyme*, the Englifh name of a diftinct genus of plants, called by botanifts *ferpyllum*. See the article SERPYLLUM, *Suppl.*

MOUNTAIN, or HILL. It has been found by experiment, that *hills*, though they meafure twice as much as the plain ground they ftand on, yet the produce of one can be no more than that of the other; and therefore in purchafing lands, the hills ought to be eftimated, not according to their fuperficies, but according to the bafe on which they ftand. So that in fome cafes; that is, if the foil be equally rich, two acres on the fide of a hill ought to pafs for no more than one upon the plain of equally rich land.

The reafon of this is evident; for as long as all plants preferve their upright method of growing, *hilly* ground can bear no more plants in number than the plain at the bafe. Again, as to building on a *hill*, the two fides can bear only the fame number of houfes as the bafe on which it ftands. The fame holds in regard to park-pailing over an *hill*; for tho' the meafure over it be fometimes near double the line at the bottom, yet both may be inclofed by the fame number of pales of the fame breadth. *Miller*'s Gard. Dict. in voc. *Hills*.

The method often ufed for meafuring the heights of *Mountains*, by the finking of the mercury in the barometer, is very far from being accurate in practice. That the mercury generally falls, when the barometer is carried up to a higher ground, is true, and has been known ever fince the time of Pafcal. The only queftion is, in what proportion? and this queftion is not yet determined with fufficient accuracy. The rule followed by the generality of authors, is, that the heights of *Mountains*, or other rifing grounds, are as the logarithms correfponding to the heights of the mercury in the barometer. And the foundation of this rule is, that the denfity of the air is every where proportional to the weight of the fuperincumbent air. But the application of this principle is improper in the prefent cafe, becaufe it can hold true only when the air is of the fame degree of heat, which it feldom is, on the different parts of high *Mountains*, in the valleys, and at the furface of the fea. In afcending the Cordelleras of Peru, for inftance, the air is found to be of all temperatures, from the hotteft fummer, to the coldeft winter. And experiments are directly contrary to the rule. For by Father Feuillée's obfervations on the Pic of Tenerif, the mercury in the barometer ftood at 17 inches five lines Paris meafure, at the height of 13158 Paris feet above the furface of the fea, when the barometer at that furface ftood at 27 inches 10 lines. But, according to the rule abovementioned, the barometer on the Pic ought to have been above two inches and two lines lower than what it was found to be by the experiment.

A difference may alfo be perceived between the computed and obferved heights of the barometer, at much fmaller elevations; fuch as 1542 feet; where the obferved height of the mercury exceeded that found by computation above a line and an half; which would make a very confiderable error in the height of the place.

From whence it follows, that the elafticity or fpring of the air at different heights, is not proportional to its denfity, or which amounts to the fame thing, that the mean degree of heat is different at different heights from the furface of the earth; for it is well known, that a difference of heat will make a difference of elafticity in the air, its denfity remaining the fame. See *Daniel Bernoulli* Hydrodynamic. p. 213. feq.

This learned author obferves, that father Feuillée's experiment on the Pic of Tenerif, overturns all the rules and hypothefes hitherto contrived for difcovering the heights of places, from the fall of mercury in the barometer. Mr. Bernoulli has given a new hypothefis of his own, and has founded fome computations on it, which agree pretty well with the experiments he mentions; but it were to be wifhed that this fubject were re-examined with more care by a greater variety of experiments than has been done hitherto.

Monf. Caffini de Thuri has given us [c] a detail of feveral obfervations made with care on two high *Mountains* of Auvergne, and upon the *Mountain* Canigou, one of the higheft of the Pyrenees. From thefe obfervations it appears, that the variations of the heights of the mercury in the barometer, correfponding to the elevation of places above the level of the fea, follow no regular progreffion; there having been found fometimes an inch of difference between the height of the mercury found by obfervation on the *Mountain* Canigou, from the height that refulted from the progreffion eftablifhed in the Memoirs of the Royal Academy in 1703. This progreffion being deduced from obfervations made at fmall elevations, proved erroneous; nor have any of the hypothefes made fince been fufficient to reconcile the irregularities in obfervations, the exactitude of which admits of no doubt. [[c] Mem. Acad. Scienc. 1740. p. 94.]

MOUNTAIN-*heath*, the name by which fome call the *Saxifrage* of botanical writers. See the article SAXIFRAGE, *Suppl.*

MOURAILLE, or BARNACLES, among farriers, is an inftrument compofed of two branches joined at one end with a hinge. It is commonly made of iron, and ferves to take hold of a horfe's nofe, and keep it tight by bringing to, or almoft clofing the other end of the branches, and fo tying them with a ftrap.

MOUSE (*Suppl.*) — MOUSE, in the fea language, is a large knot artificially made by the riggers on the fhip's ftays. *Blanckley*'s Nav. Expof. p. 108.

MOUSE-*ear*, a name fometimes given to the *Hierachium*, or hawkweed of botanifts. See the article HIERACHIUM, *Suppl.*

MOUSE-*tail*, the Englifh name of a diftinct genus of plants, known among botanifts by that of *Myofurus*. See the article MYOSURUS, *Append.*

Dor-MOUSE, the Englifh name of a genus of animals, called by authors *Sorex*. See the article SOREX, *Suppl.*

Sea-MOUSE, the Englifh name of a genus of infects, called by Dr. Hill *Aphrodita*. See the article APHRODITA, *Append.*

MULBERRY-*blite*, a name ufed by fome for a fpecies of blite. See the article BLITUM, *Suppl.*

MULCH, a term ufed by gardeners for rotten dung, or the like, thrown upon beds of young plants, to preferve them from the bad effects of cold or drought.

MULES, among farriers, a diforder incident to horfes, otherwife called *Scratches*. See the article SCRATCHES, *Cycl.*

MULLEIN, the Englifh name of a diftinct genus of plants, called by botanifts *Verbafcum*. See the article VERBASCUM, *Suppl.*

MULLET (*Suppl.*) is alfo ufed as the name of feveral fpecies of *Trigla*. See the article TRIGLA, *Suppl.*

MUNDICK (*Cycl.*) — This mineral fubftance is of an arfenical nature. See *Geoffroi*, in Mem. Acad. Scienc. 1738. p. 107. edit. Paris.

MUS-*marinus*, a name ufed by fome for the *Aphrodita*, a genus of fea infects. See the article APHRODITA, *Append.*

MUSCA, *Crabroniformis* and *Rapax*, names fometimes ufed for the Fly. See the article ASILUS, *fupra.*

MUSCA *Vefpiformis*, the Wafp-fly. See the article ASILUS, *fupra.*

MUSCLE (*Suppl.*) — *Acceleratory* MUSCLES. See the article ACCELERATOR, *Cycl.*

MUSCUS, *Mofs*, in botany, a very comprehenfive clafs of plants, containing a great many diftinct genera. See the article MOSS, *Suppl.*

MUSICAL *Accent*, among Hebrew grammarians. See the article ACCENT, *Cycl.*

MUSICAL *Numbers* (*Suppl.*) — A table of *mufical* numbers within any propofed limit may be thus expeditioufly formed. Place the terms of the progreffion 1, 5, 25, 125, &c. in a column under each other; and multiply every term of this progreffion by 3, continually, till you forefee that the products will exceed the propofed limit. Then if all the numbers thus found be doubled continually, till it be forefeen that the doubled numbers would exceed the propofed limit; all thefe products together, with the powers of 2, will give the *mufical* numbers required.

Thus if it were required to find all the *mufical* numbers within the compafs of eleven octaves; that is, between 1 and 2048; form the column 1, 5, 25, &c. and multiply every term by 3, continually, as in the annexed example;

1. 3. 9. 27. 81. 343. 729, &c.
5. 15. 45. 135. 405. 1215, &c.
25. 75. 225. 675. 2025, &c.
125. 375. 1125, &c.
625, 1875, &c.
&c.

The numbers of which being doubled as often as poffible within the limit 2048, and collected and ranged in order with the powers of 2, will give the following numbers, 1. 2. 3. 4. 5. 6. 8. 9. 10. 12. 15. 16. 18. 20. 24. 25. 27. 30. &c. as in the following table;

Table of *musical* numbers; contained in eleven octaves.

Num.	Chord Asc.	Chord Desc.	Num.	Chord Asc.	Chord Desc.	Num.	Chord Asc.	Chord Desc.
1	F	B	144	G	A	750	B♯	F♭
2	F^{1}	B^{1}	150	G♯	A♭	768	C	E
3	C	E	160	A	G	800	C♯	E♭
4	F^{2}	B^{2}	162	Ȧ	G̣	810	Ċ♯	Ẹ♭
5	A	G	180	B	F	864	D	*D*
6	C	E	192	C	E	900	D♯	*D*♭
8	F^{3}	B^{3}	200	C♯	E♭	960	E	C
9	G	A	216	D	*D*	972	Ė	C̣
10	A	G	225	D♯	*D*♭	1000	E♯	C♭
12	C	E	240	E	C	1024	F^{10}	B^{10}
15	E	C	243	Ė	C̣	1080	Ḟ♯	Ḅ♭
16	F^{4}	B^{4}	250	E♯	C♭	1125	Ḟ♯♯	Ḅ♭♭
18	G	A	256	F^{8}	B^{8}	1152	G	A
20	A	G	270	Ḟ♯	Ḅ♭	1200	G♯	A♭
24	C	E	288	G	A	1215	Ġ♯	Ạ♭
25	C♯	E♭	300	G♯	A♭	1250	G♯♯	A♭♭
27	D	*D*	320	A	G	1280	A	G
30	E	C	324	Ȧ	G̣	1296	Ȧ	G̣
32	F^{5}	B^{5}	360	B	F	1350	Ȧ♯	G̣♭
36	G	A	375	B♯	F♭	1440	B	F
40	A	G	384	C	E	1458	Ḃ	F
45	B	F	400	C♯	E♭	1500	B♯	F♭
48	C	E	405	Ċ♯	Ẹ♭	1536	C	E
50	C♯	E♭	432	D	*D*	1600	C♯	E♭
54	D	*D*	450	D♯	*D*♭	1620	Ċ♯	Ẹ♭
60	E	C	480	E	C	1728	D	*D*
64	F^{6}	B^{6}	486	Ė	C̣	1800	Ḋ♯	*D*♭
72	G	A	500	E♯	C♭	1875	D♯♯	*D*♭♭
75	G♯	A♭	512	F^{9}	B^{9}	1920	E	C
80	A	G	540	Ḟ♯	Ḅ♭	1944	Ė	C̣
81	Ȧ	G̣	576	G	A	2000	E♯	C♭
90	B	F	600	G♯	A♭	2025	Ė♯	C̣♭
96	C	E	625	G♯♯	A♭♭	2048	F^{11}	B^{11}
100	C♯	E♭	640	A	G			
108	D	*D*	648	Ȧ	G̣			
120	E	C	675	Ȧ♯	G̣♭			
125	E♯	C♭	720	B	F			
128	F^{7}	B^{7}	729	Ḃ	F̣			
135	Ḟ♯	Ḅ♭						

To understand this table it is to be observed, that by dividing a given stretched string or chord, by means of a moveable bridge, the sounds produced by its parts will be higher in pitch than those produced by the given chord. And, on the contrary, if we multiply a chord, that is, by a moveable bridge lengthen the sounding part of a chord, we shall have sounds lower in pitch than the given chord. Hence we have the foundation of an ascending, and of a descending scale of musical sounds. The first column of each division of the table, marked *Num.* expresses the musical numbers; the second column marked *Asc.* the names of the notes in the ascending scale; and the third column marked *Desc.* the names of the notes of the descending scale. Thus if the given chord be unity, and called F, then will 15 be E in the the fourth octave ascending of F; 45 will be B in the sixth octave of F, &c. In the descending scale unity will be B; 15 will be C in the fourth octave descending from B; and 45 will be F of the sixth octave, &c.

The reason why unity is marked F in the ascending scale, and B in the descending scale, is, because according to the received notation of what is called the natural scale among musicians; F has no fourth in ascending, nor B a fourth in descending. Now it is plain that no aliquot division of a string can give a fourth, or any of its octaves ascending; nor can any multiple of a string, give the fourth, or any of its octaves, in descending. For the fourth being expressed by $\frac{4}{3}$ in ascending; and by $\frac{3}{4}$ in descending, its octaves will be $\frac{8}{3}$, $\frac{16}{3}$, $\frac{32}{3}$, &c. in the first case, and $\frac{3}{8}$, $\frac{3}{16}$, $\frac{3}{32}$, &c. in the second case, none of which numbers can be multiples, or submultiples of a given string.

F and B being the given sounds, their octaves will be expressed by F^{1}, F^{2}, F^{3}, &c. and B^{1}, B^{2}, B^{3}, &c. which are, respectively, the first, second, and third octaves above the F and below B.

A dot marked over a letter shews that it signifies a sound higher by a comma than the sound expressed by the letter itself. And a dot placed below, denotes the sound to be lowered by a comma. Thus, in the table I find 81 to be Ȧ | G̣, which denotes that A, or the sharp in the seventh octave of F, ascending, is raised a comma; and that G or the sharp third from B, descending, is lowered by the same interval.

If B in the descending scale be supposed to be a tritonus, that is, two tones major, and one tone minor above F of the ascending scale, then will A in one of these scales correspond or be denoted by the same numbers with G in the other scale; and C will correspond to E, but D in the ascending scale will not be expressed by the same numbers as in the descending scale: For in the former D will be a tone major above C, whereas in the latter D must by analogy be a tone major below E, and therefore only a tone minor above C, which is the reason why *D* is in Italicks in the descending scale.

Mr. Hensling has mentioned the distinction between an ascending and a descending scale in the Miscel. Berolinens. He places unity in the ascending scale in F, as it ought; but in the descending scale he places unity in E, which disturbs the analogy of the two scales.

The trumpet and french horn, not having (commonly) a compass beyond four octaves; and their sounds being formed in a manner analogous to those produced by the division of a string, it follows that all the true notes of these instruments will be represented by the musical numbers, 1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, 16, &c. This is a fact well known [a], and a confirmation of the truth of that theory which derives all musical proportions from the elements 2, 3, and 5[b]. — [[a] See the article TRUMPET, *Append.* and Philos. Trans. N° 195. [b] See Phil. Trans. loc. cit.]

MUSK *Hyacinth*, a name sometimes given to a distinct genus of plants, called by botanists *Muscari*. See the article MUSCARI, *Suppl.*

MUSK-*seed*, a name used by some writers for the *Ketmia*. See the article KETMIA, *Suppl.*

MUST (*Suppl.*) — A *must* for artificial wine may be thus made: Take twenty pounds of fine sugar; five gallons of water; four ounces of white tartar finely pulverized, or cream of tartar, and boil them in a large vessel over a gentle fire.

MUSTARD (*Suppl.*)—*Mithridate*-MUSTARD, the name of a genus of plants, called by botanists *Thlaspi*. See the article THLASPI, *Suppl.*

Bastard-Mithridate-MUSTARD, the same with the *Thlaspidium* of botanical writers. See the article THLASPIDIUM, *Suppl.*

Rough-Podded MUSTARD, the name by which a species of *Sysimbrium* is sometimes called. See the article SYSIMBRIUM, *Suppl.*

Tower-MUSTARD, the English name of a distinct genus of plants, called by botanists *Turritis*. See the article TURRITIS, *Suppl.*

Treacle-MUSTARD, a name promiscuously used for two distinct genuses of plants, the *Thlaspi* and *Jonthlaspi*. See the articles THLASPI and JONTHLASPI, *Suppl.*

MUTULE (*Cycl.*) — Le Clerc makes *Mutules* in the entablement of the Doric order, not only to distinguish it the more from other entablements, but also because they agree very well with the nobleness of this order, and add something of a masculine beauty to it.

Mutules are commonly made of the same breadth with the triglyphs; but the same author thinks it would be much better if they were made of the same breadth with the capitals of the triglyphs. Nor does he run his *Mutules* so near the extremity of the larmier or drip, as is usually done; leaving a space of three or four minutes between the two, that the profile may appear the more distinctly.

MYOCTONUM. See the article ACONITE, *Cycl.*

MYOSURUS, *Mouse-tail*, in botany, the name of a distinct genus of plants, the characters of which are these: the cup is a deciduous perianthium, composed of five semi-lanceolate, obtuse, reflex, coloured leaves, joined on above the base. The corolla, which is considerably smaller than the cup, consists of five extremely minute petals, and is tubulated at the base, and opens obliquely inwards. The stamina are five filaments, of the length of the cup; the antheræ are erect, and oblong: the germina are very numerous, and are placed on the receptacle in form of a conic, oblong cluster; there are no styles; the stigmata are simple; there is no pericarpium; the receptacle is extremely long, styliform, and covered with numerous, oblong, and acuminated seeds, laid in an imbricated manner. *Linnæi* Gen. Plant. p. 134.

This genus has a great affinity with the ranunculus, and is common in our corn fields. Dodonæus calls it *Cauda Murina*.

MYRICA, *Sweet William*, in the Linnæan system of botany, the name of a genus of plants, the characters of which are these: The male flowers are arranged in an oblong amentum; the cup is a squama of a lunulated figure; there is no corolla, nor proper perianthium; the stamina are four, rarely six, thread-like filaments, longer than the cup; the antheræ are two in number, and didymous. The female flowers are the same as the male ones; the germen of the pistil is of an oval shape; the styles are two; and the stigmata simple; the fruit is an unilocular berry, containing only one seed. *Linnæi* Gen. Plant. p. 474.

This genus comprehends the *Gale* of Tournefort and others; and is nearly allied to the *Pistachia-nut* tree, a species of *Terebinthus*. See the article TEREBINTHUS, *Suppl.*

MYRTLE, the English name of a genus of trees, called by botanists *Myrtus*. See the article MYRTUS, *Suppl.*

Dutch-MYRTLE, or *Candleberry*-MYRTLE, names sometimes given to the *Myrica*, or *Gale* of botanists. See the article MYRICA, *Append.*

MYRTLE-*Sumach*. See the article SUMACH, *infra*.

N.

N.

NAIA, in zoology, the name of a ſpecies of *Coluber*, the ſcuta of whoſe abdomen are one hundred and ninety in number, and the ſquamæ of the tail ſixty. See the article COLUBER, *Append.*

NAMES. *Specific* NAMES. See the article SPECIFIC, *Suppl.*

NAPELLUS. See the article ACONITE, *Cycl.*

NAPHA, a name given by many of the writers in pharmacy to orange-flower water.

NASEBERRY *tree*, the Engliſh name of a diſtinct genus of plants, called by botaniſts Cainito, or *Chryſophyllum*. See the article CHRYSOPHYLLUM, *Append.*

NASTURTIUM *aquaticum*, the name by which C. Bauhine calls the *Syſimbrium*. See the article SYSIMBRIUM, *Suppl.*

NASTURTIUM-*Indicum*, in botany, a name uſed by ſome for a genus of plants, called by others *Cardamindum*, and *Tropæolum*. See the articles CARDAMINDUM, *Suppl.* and TRAPÆOLUM, *Append.*

NAVEL (*Suppl.*) — NAVEL-*hoods*, in ſhip-building, large pieces of ſtuff fitted into the hawſe-holes, to keep the cables from wearing them. *Blanckley's* Nav. Expoſ. p. 110.

NAVEL-*line*, on ſhip-board, a rope reeved through a block made faſt to the middle rib, and another block made faſt to the maſt-head.

NAVEL-*wort* (*Suppl.*)— *Baſtard* NAVEL-*wort*, a name ſometimes given to the *Craſſula* of botanical writers. See the article CRASSULA, *Append.*

Venus's NAVEL-*wort*, the name of a genus of plants, called by authors *Omphalodes*. See the article OMPHALODES, *Suppl.*

Water NAVEL-*wort*, a name ſometimes given to the *Hydrocotyle* of botaniſts. See the article HYDROCOTYLE, *Suppl.*

NECKIB-*el-eſheraf*, in Egypt, the head of the ſherif, or relations of Mahomet, who has the great cognizance of their actions, and the power of inflicting puniſhments upon them. *Pocock's* Egypt, p. 171.

NECKLACE-*ſnake*. See the article SNAKE, infra.

NECTYDALIS, in zoology, the name of a genus of four-winged inſects, diſtinguiſhed by having the antennæ ſetaceous, the exterior pair of wings dimidiated, and the interior pair membranaceous. *Hill*, Hiſt. Anim, p. 55.

Some have called it a *cimex*, and others a *forficula*, or ear-wig, but both erroneouſly. Id. p. 56.

NEEDLE-*fiſh*, the Engliſh name of the *Syngnathus*, with the middle of the body hexangular, and the tail pinnated. See the article SYNGNATHUS, *Suppl.*

It is the ſame fiſh with the *Acus Ariſtotelis ſpecies altera major*. See the article ACUS, *Suppl.*

NEEDLE-*ſhell*, the Engliſh name of a ſpecies of *Centronia*, or *Echinoderma*. See the articles ECHINODERMA, *Suppl.* and CENTRONIA, *Append.*

NEEDLE-*ſhell* is alſo the Engliſh name of a ſpecies of *Turbo*, which is ſlender, and has ventricoſe ſpires, and a ſmall mouth. See the article TURBO, *Suppl.*

Touch-NEEDLES. See the article TOUCH-*needles*, *Suppl.*

Shepherd's-NEEDLE, the name by which ſome writers call the *Scandix*, or *Venus's-comb*. See the article SCANDIX, *Suppl.*

NEGRO-*oil*, a name by which the *palma* of botaniſts is ſometimes called. See the article PALMA, *Append.*

NEP, *Nepeta*, a name ſometimes uſed for the Cat-mint, or *Cataria* of botaniſts. See the article CATARIA, *Suppl.*

NEPA, the name by which ſome call a genus of inſects, otherwiſe known by that of *Scorpio paluſtris*, the water-ſcorpion. See the article SCORPIO, *Suppl.*

NEREIS, in zoology, a genus of inſects of the gymnarthria kind, the body of which is of a cylindric figure; the tentacula are four in number, but two of them are uſually very ſhort. *Hill*. Hiſt. Anim. p. 92.

Authors have deſcribed this genus under the name of *Scolopendra marina*. See the article SCOLOPENDRA *marina*, *Suppl.*

NERIUM, or NERION, in botany, the name of a genus of plants, called in Engliſh *Oleander*. See the article NERION, *Suppl.*

NETTLE (*Suppl.*) — *Sea*-NETTLE, the Engliſh name of a genus of inſects, called by Dr. Hill *Meduſa*. See the article MEDUSA, *Append.*

Hedge-NETTLE, a name by which ſome call the *Galeopſis* of botanical writers. See the article GALEOPSIS, *Suppl.*

Shrubby Hedge NETTLE, the name given by ſome writers to the *Praſſium*, a diſtinct genus of plants. See the article PRASIUM, *Suppl.*

NEUROPTERA, in zoology, the name by which Dr. Hill calls a claſs of four-winged flies, from their wings being membranaceous with nerves, and being diſpoſed in a reticulated form. Vid. *Hill*, Hiſt. Anim. p. 69.

NIGHT (*Cycl.*) — For the diviſions of the *Night* among the antients, ſee the articles DAY, HOUR, &c. *Cycl.*

NIGHTSHADE, *Climbing* NIGHTSHADE, a name ſometimes uſed for the *Baſella* or *Cuſcuta* of botaniſts. See the article CUSCUTA, *Suppl.*

Deadly NIGHTSHADE, a name by which ſome call the *Belladonna*, a diſtinct genus of plants. See the article BELLADONNA, *Suppl.*

Inchanter's NIGHTSHADE, the Engliſh name of a genus of plants, called by botaniſts *Circæa*. See the article CIRCÆA, *Suppl.*

American NIGHTSHADE, a name given to the *Solanoides*, or *Rivinia*, of botaniſts. See the article RIVINIA, *Suppl.*

Virginian NIGHTSHADE, the name by which ſome call a ſpecies of *Phytolacca*. See the article PHYTOLACCA, *Suppl.*

NINDSI, or NINZI, the name of a diſtinct genus of plants, called by botaniſts *Sium*. See the article SIUM, *Suppl.*

NINSI, in botany, a name uſed by ſome for the *Panax*, or All-heal of Linnæus. See the article PANAX, *Append.*

NINTH, in muſic, one of the diſſonant intervals in muſic. It is properly the ſecond doubled; but is differently uſed. When an upper part ſyncopates, the ſecond is accented and treated as a *Ninth*; i. e. it is reſolved by an eighth, and accompanied by a third or fifth, and often a ſyncopated ſeventh. But when the lower part ſyncopates, the ſecond is not thus uſed, but is accompanied by the fourth and ſixth. In thorough baſs, as the *Ninth* has always, or at leaſt commonly, an eight placed after it thus, 9 8; to ſhew that that is reſolved by deſcending to the Octave. Vid. *Broſſ*. Dict. Muſ. in voc.

NOLI *me tangere*, the name uſed by ſome for a ſpecies of *Balſamine*. See the article BALSAMINA, *Suppl.*

NONE-*ſo-pretty*, a popular name for the *Geum* of botanical authors. See the article GEUM, *Suppl.*

NONE-*ſuch*, a name ſometimes given to the *Lychnis* of botaniſts. See the article LYCHNIS, *Suppl.*

NOSE-*bleed*, in botany, a popular name for the *Millefolium* of botanical writers. See the article MILLEFOLIUM, *Suppl.*

NOTOPEDA, in zoology, a name ſometimes given to the *Elater*, a genus of four-winged flies. See the article ELATER, *Append.*

NUMB-*fiſh*, or *Cramp-fiſh*, names given to the *Torpedo*, which is a ſpecies of *raja*, See the articles RAJA, *Suppl.* and TORPEDO, *Cycl.*

NUMBER (*Cycl.*) — *Figurate* NUMBERS. Thoſe of the firſt order are 1, 1, 1, 1, &c. Thoſe of the ſecond order the ſucceſſive ſums of thoſe of the firſt order, viz. 1, 2, 3, 4, 5, &c. and form an arithmetical progreſſion. Thoſe of the third order are the ſucceſſive ſums of thoſe of the ſecond, viz. 1, 3, 6, 10, 15, and are the triangular numbers. Thoſe of the fourth order are the ſucceſſive ſums of the third, viz. 1, 4, 10, 20, 35, and are the pyramidal numbers, and ſo on.

The figurate *Numbers* of any order may be found without computing thoſe of the preceding orders, by taking the ſucceſſive products of as many of the *Numbers* 1, 2, 3, 4, 5, &c. in their natural order, as there are units in the *Number*, which denominates the order of figurates required, and dividing thoſe products always by the firſt product. Thus the triangular *Numbers* are found by dividing the products 1×2, 2×3, 3×4, 4×5, 5×6, &c. each by the firſt product 1×2. The pyramids alſo are found by dividing the products $1 \times 2 \times 3$, $2 \times 3 \times 4$, $3 \times 4 \times 5$, $4 \times 5 \times 6$, &c. each by $1 \times 2 \times 3$. In general, the figurate *Numbers* of any order denoted by M, are found by ſubſtituting ſucceſſively 1, 2, 3, 4, 5, &c. in the place of x in the general expreſſion $\frac{x.\ x+1.\ x+2.\ x+3.\ \&c.}{1.\ 2.\ 3.\ 4.\ \&c.}$ where the factors in the numerator and denominator are ſuppoſed to be multiplied by each other, and to be continued, till the number in each be equal to that which expreſſes the order of the figurates required, diminiſhed by unity. And when a figurate *Number* of any order is divided by the correſponding figurate of any higher order, the numerator of the quotient is invariable, and x. is in its denominator of as many dimenſions as there are units in the difference of the *Numbers* that denote thoſe orders. See *Mac Laurin's* fluxions Art. 351 in the notes.

Figural NUMBERS. See the article FIGURAL, *Append.*

Muſical NUMBERS. See the article MUSICAL, *Append.*

NUMBERING *Rods*. See the article NEPER's *Bones*, *Cycl.*

NUMMULARIA, *Money-wort*, the name by which ſome call the *Lyſimachia* of botaniſts. See the article LYSIMACHIA, *Suppl.*

NUT *(Suppl.)*—*Bladder*-NUT, the Engliſh name of a diſtinct genus of plants, called by botaniſts *Staphylæa*, and *Staphylodendron*. See the article STAPHYLODENDRON, *Suppl.*

Cocoa-NUT, the name of a genus of plants, called by botaniſts *Cacao*. See the article CACAO, *Suppl.*

Earth-NUT, in botany, a name given to two diſtinct genuſes of plants, called by botaniſts *Bulbocaſtanum* and *Arachis*. See the articles BULBOCASTANUM, *Suppl.* and ARACHIS, *Append.*

Hazle-NUT, in botany. See the article HAZLE, *Suppl.*

Malabar-NUT, the name of a genus of plants, known among botaniſts by that of *Adhatoda*. See the article ADHATODA, *Suppl.*

Peas-NUT, the name by which ſome call the *Lathyrus* of botanical writers. See the article LATHYRUS, *Suppl.*

Phyſic NUT, a name ſometimes given to the *Ricinoides* of Tournefort. See the article RICINOIDES, *Suppl.*

Pig-NUT, a name by which the *Bulbocaſtanum*, or earth-*nut*, is ſometimes called. See the article BULBOCASTANUM, *Suppl.*

Spaniſh-NUT, a name by which ſome call the *Siſyrinchium* of botanical writers. See the article SISYRINCHIUM, *Suppl.*

Wall-NUT, the name of a well known genus of trees, called by Linnæus *Juglans*, and by Tournefort ſimply *Nux*. See the article NUX. *Suppl.*

NYCTANTHES, in the Linnean ſyſtem of botany, the name of a genus of plants, the characters of which are theſe; the cup is a one-leaved perianthium, very ſmall, of a cylindric figure, lightly divided into eight ſegments, or denticulæ, of a ſubulated figure, and permanent. The flower conſiſts of a ſingle petal, and is of a hypocrateriform kind; the tube is cylindric, and longer than the cup; the limb is plain, divided into eight ſegments of an oblong figure, and patent; the ſtamina are two extremely ſmall filaments, affixed to the receptacle, and of a ſubulated figure; the antheræ are erect, and ſomewhat acute; the germen of the piſtil is roundiſh and depreſſed; the ſtyle is ſimple, and of the length of the tube; the ſtigmata are two, and are erect; the fruit is a didymous berry, of a roundiſh figure, and contains two cells; the ſeeds are roundiſh and large, and one only is contained in each cell. *Linnæi* Gen. Plant. p. 6.

O.

OAK (*Cycl.*) — OAK-*of-Jerusalem*, the English name of a genus of plants, called by botanists *Chenopodium*, See the article CHENOPODIUM, *Suppl.*

Poison-OAK, a name sometimes given to the *Toxicodendron* of botanists. See the article TOXICODENDRON, *Suppl.*

OAT-*grass*, in botany. See the article GRASS, *Append.*

OBELIAS, among the antients, a kind of small cakes, which were toasted on little spits, and served to table as a desert to be eaten dipped in sweet wine, called *Passum*. *Pitisc.* in voc.

OBELLISCOTHECA, the name given by Vaillant to a genus of plants, called by Linnæus *Rudbeckia*. See the article RUDBECKIA, *Append.*

OBTUSE (*Cycl.*) — OBTUSE-*angular Section of a Cone*, a name given to the hyperbola by antient geometricians, because they considered it only in such a cone, whose section by the axis is a triangle, *obtuse*-angled at the vertex.

OCKHAM, or OCHAM, See the article OAKHAM, *Cycl.*

OCTAETIS, in natural history, a name given by Linnæus, and many other authors, to a kind of star-fish of the astrophyte class, the rays of which are eight in number, where they first part from the body, but soon divide into many more.

OIL-*beetle*, the English name of a genus of insects, called by Dr. Hill *Meloe*. See the article MELOE, *Append.*

OILY-*grain*, the name by which some call the *Sessamum*, of botanical authors. See the article SESSAMUM, *Append.*

OLD-*wife-fish*, the name by which a species of *Ballistes* is called in several of our plantations. See the article BALLISTES, *Suppl.*

OLD-*wife* is also a name given to the *wrasse*, a species of *Labrus*. See the article LABRUS, *Suppl.*

OLIVE (*Suppl.*) — *Spurge*-OLIVE, a name sometimes given to the *Thymelæa* of botanists. See the article THYMELÆA, *Suppl.*

Wild-OLIVE, the English name of a distinct genus of plants, called by Linnæus *Elæagnus*. See the article ELÆAGNUS, *Suppl.*

Wild-OLIVE *of Barbadoes*, a name by which some call the *Bontia*, a distinct genus of plants. See the article BONTIA, *Suppl.*

ONE-*berry*, a name by which the *herba Paris* is sometimes called. See the article HERBA *Paris*, *Suppl.*

ONE-*blade*, or ONE-*leaf*, names sometimes given to the *Smilax* of botanical writers. See the article SMILAX, *Suppl.*

ONION(*Suppl.*)— *Sea*-ONION, a name by which the *Scilla* of botanists is sometimes called. See the article SCILLA, *Append.*

OPERCULUM, in the history of shell-fish, denotes the cartilaginous cover, with which nature has furnished the mouths of the univalve water-shells; for as to the land ones, they have only a viscid liquor to supply the place of an *Operculum*.

ORACH, a name by which the *Chenopodium* of botanical authors is sometimes called. See the article CHENOPODIUM, *Suppl.*

ORANGE-*Mint*, the name of a species of *Mint*. See the articles MENTHA and MINT, *Suppl.*

Mock-ORANGE, a name sometimes given to the *Syringa*, or pipe-tree. See the article SYRINGA, *Suppl.*

ORELLANA, in botany, a name given to a species of *Mitella*. See the article MITELLA, *Suppl.*

ORPHEUS. This fish has been called *Orphos*, *Orphus*, and *Cernua*, by different writers. It is a species of *Sparus*, with the tail not forked, and with a black spot near it. See the articles SPARUS and ORPHEUS, *Suppl.*

ORPINE, in botany, the English name of a genus of plants, known among botanical writers by that of *Telephium*. See the article TELEPHIUM, *Suppl.*

Bastard-ORPINE, a name given to two distinct genuses of plants, called by botanists *Anacampseros* and *Andrachne*. See the articles ANACAMPSEROS, and ANDRACHNE, *Suppl.*

ORRERY, an astronomical instrument, or rather machine, for representing the motions and various appearances of the planets; and hence, with greater propriety, called *Planetarium*. See the article PLANETARIUM, *Append.*

The reason of its being called an *Orrery*, was this: Mr. Rowley, a mathematical instrument-maker, having got one from Mr. George Graham, the original inventor, to be sent abroad with some of his own instruments, he copied it, and made the first for the Earl of *Orrery*. Sir Richard Steel, who knew nothing of Mr. Graham's machine, thinking to do justice to the first encourager, as well as to the inventor, of such a curious instrument, called it an *Orrery*, and gave Mr. Rowley the praise due to Mr. Graham. *Desaguliers*, Experiment. Phil. vol. 1. p. 430.

Since that time *Orreries* have been much in vogue, and executed in the most ornamental manner.

ORTHOCEROS, the same as *Orthocerites*. See the article ORTHOCERITES, *Suppl.*

ORYZA, *Rice*, in botany, the name of a genus of plants, of which we know only one species: The characters are these: The cup is a glume, composed of two valves, with a single flower; it is very small, and the valves are acuminated, and nearly equal in size; the flower is also composed of two obtuse and permanent valves; the nectarium consists of two very small deciduous leaves; the stamina are six capillary filaments of the length of the flower; the antheræ are bifid at the base; the germen of the pistil is of a turbinated figure; the styles are two, capillary, and reflex; the stigmata are plumose; there is no pericarpium; the seed is single, large, oblong, obtuse, and compressed. *Linnæi* Gen. Plant. p. 152.

OSCULATION in geometry, is used for the contact between any given curve and its osculatory circle; that is, the circle of the same curvature with the given curve. See the article CURVATURE, *Append.*

OSCULATORY-*circle*, in geometry, is used chiefly by foreign mathematicians, for the circle of curvature; that is, the circle having the same curvature with any curve at any given point. See the article CURVATURE, *Append.*

OSCULATORY-*Parabola*. See the article PARABOLA, *Append.*

OSCULATORY-*point*, the point of contact between a curve and its *osculatory* circle. See the article CURVATURE, *Append.*

OSIER, the English name for the willow with very long and narrow leaves. See the article SALIX, *Suppl.*

OTARDES, in ornithology. See the article OTIS, *Suppl.*

OUZEL, or *Ring*-OUZEL, the English name of the black *Turdus*, with a white ring round its neck. See the article TURDUS, *Suppl.*

OWL, in ornithology, a large genus of birds, for the characters of which see the article STRIX, *Suppl.*

Grey-OWL. See the article ULULA, *Suppl.*

Great-white OWL, a very large species, nearly equal to a goose in bigness; of a beautiful bright white all over, only sprinkled, as it were, with little spots of a blackish colour.

The other species are: 1. The black and white horned *Owl*. 2. The lesser horned *Owl*. 3. The yellow *Owl*. 4. The hazel-eyed *Owl*. 5. The yellow-eyed *Owl*. 6. The *Owl*, with a variegated tail. 7. The little *Owl*. 8. The common brown *Owl*, or Jay-*Owl*. 9. The *Scops*. 10. The German horned *Owl*. 11. The church *Owl*, or lesser barn *Owl*. 12. The white-beaked *Owl*. 13. The yellow-beaked American *Owl*. 14. The *Jacurutu*. *Hill*, Hist. Anim. p. 119. seq.

OX-*eye*, in botany, the English name of a genus of plants, called by botanists *Buphthalmum*. See the article BUPHTHALMUM, *Suppl.*

OX-*eye-daisy*, a name sometimes given to the *Leucanthemum* of botannical writers. See the article LEUCANTHEMUM, *Suppl.*

OX-*lip*, a name by which the *Primula veris*, primrose, or prime rose, is sometimes called. See the article PRIMULA, *Suppl.*

P.

P.

PADDLE, or PADDLE-*ftaff*, a fmall ftaff, fhod with iron, for cleanfing the plough from ftubble, clods, earth, &c. Dict. Ruft. in voc.

It is alfo much ufed by mole-catchers.

PADUS, in the Linnæan fyftem of botany, the name of a genus of plants, the characters of which are thefe : The cup is a permanent perianthium, formed of a fingle leaf, of a campanulated figure, villofe at the bafe, divided into five fegments, patent, and fcarce at all reflex ; the flower confifts of five large, roundifh, patent petals, inferted by their ungues into the edge of the calyx ; the ftamina are twenty or thirty filaments, of a fubulated figure, nearly of the length of the flower, and inferted into the calyx ; the antheræ are roundifh ; the germen is roundifh ; the ftyle is filiform, and of the length of the ftamina ; the ftigma is obtufe and entire ; the fruit is a roundifh drupe ; the feed is an oval, acuminated nut, with a furrow ; the receptacle of the flower, which invefts the inner furface of the cup, is hairy in this genus ; which comprehends the *Laurocerafus*, and *Cerafus avium* of authors. Vid. *Linnæi* Gen. Plant. p. 215.

PAIGLES, a name fometimes ufed for the *Primula*, or *Cowflip*. See the article PRIMULA, *Suppl.*

PAINS, or *After*-PAINS in Midwifry. See the articles DELIVERY and LYING-*in-women*.

PALM-*tree*, *Palma*, in botany, the name of a diftinct genus of plants, called by Linnæus *Phœnix*. See the article PHOENIX, *Suppl.*

PALMA *Chrifti*, a name frequently given to the common *Ricinus*. See the article RICINUS, *Suppl.*

PALMETTO, the name by which fome call a fpecies of the palm or date-tree, defcribed by Linnæus under that of *Phœnix*. See the article PHOENIX, *Suppl.*

PANAX, in the Linnæan fyftem of botany, the name of a diftinct genus of plants, the characters of which are thefe : The umbel of the calyx is fimple, equal and thick ; the involucrum is very fmall, and formed of a number of leaves, fubulated and permanent ; the perianthium of each flower is very fmall, divided into five fegments, and permanent ; the general corolla is uniform, and the peculiar ones confift of five oblong, crooked, equal petals. The ftamina are five very fhort filaments ; the antheræ are fimple ; the germen of the piftil is roundifh, and placed below the perianthium ; the ftyles are two, and fmall ; and the ftigmata are fimple ; the fruit is a roundifh berry, having one cell, and is coronated with the cup ; the feeds are two, and of a kidney-like fhape.

This genus comprehends the famous *Ginfeng*, *Araliaftrum*, *Ninfi*, and *Aureliana* of other writers.

PANCRATIUM, the *fea-daffodil*, in botany, the name of a genus of plants, the characters of which are thefe : The cup is an oblong, obtufe, compreffed fpatha, opening in the plane fide, and deciduous ; the nectarium of the flower is formed of a fingle leaf, of a cylindraceo-infundibuliform fhape, coloured at top, and with an open mouth, divided into ten fegments ; the petals are fix, lanceolated and plane, and are inferted externally into the tube of the nectarium, above the bafe ; the ftamina are fix fubulated filaments, affixed to the apex of the nectarium ; the antheræ are oblong, and incumbent ; the germen of the piftil is trigonal, and placed under the receptacle ; the ftyle is filiform, and fomewhat longer than the ftamina ; the ftigma is obtufe ; the fruit is a roundifh, triquetrous capfule, formed of three valves, and containing three cells ; the feeds are numerous and globofe ; and the receptacle is columnar. Vid. *Linnæi* Gen. Plant. p. 138.

PANIC, *Panicum*, in botany, the name of a diftinct genus of plants. See the article PANICUM, *Suppl.*

PANICLE, *Panicula*, among botanifts. See the article PANICULA, *Cycl.* and *Append.*

PANICULA (*Cycl.*) — According to Mr. Miller, the *Panicula*, or panicle, is a ftalk diffufed into feveral pedicles, or footftalks, fuftaining the flowers or fruits, as in oats, &c. *Miller*, Gard. Dict.

PANORPA, the *fcorpion-fly*, in zoology, a genus of four-winged infects of the *Neuropetra* kind, the diftinguifhing characters of which are thefe : Its roftrum or trunk is of a cylindric figure, and horny ftructure ; and its tail is furnifhed with a weapon of the cheliform kind. See the article SCORPION-*fly*, *Suppl.*

PANSEY, or PANSY, a fpecies of violet, otherwife called the *Heart's-eafe*. See the articles VIOLA, *Suppl.* and HEART'S EASE, *Append.*

PAPAW, the name by which fome call the *Papaya*, a diftinct genus of plants. See the article PAPAYA, *Suppl.*

PAPPOSE-*plants*, among botanifts, fuch whofe feeds are covered with a *Pappus*, or down. See the article PAPPUS, *Cycl.*

PARABOLA (*Cycl.*)— *Ofculatory*-PARABOLA, in geometry, is ufed particularly for that *Parabola* which not only ofculates or meafures the curvature of any curve at a given point, but alfo meafures the variation of the curvature at that point. See *Mac Laurin's* Appendix to his Algebra, p. 17. *Cramer*, Analyf. des Lignes Courbes, p. 559. See the article CURVATURE, *Append.*

A curve, ftrictly fpeaking, may have an indefinite number of *Ofculatory Parabolas* at any of its points ; but the appellation may be reftrained to that particular *Parabola* which meets the curve fo clofely, that no other parabolic arc can be drawn between them ; and this *Parabola* will meafure the variation of the curvature of the curve at that point. See the article VARIATION of *curvature*, *Suppl.*

PARABOLIFORM *Curves*, a name fometimes given to the parabolas of the higher kind.

PARADISE (*Cycl.*) *Bird of* PARADISE. See the articles PARADISÆA and MANUCODIATA, *Suppl.*

PARALLELOGRAM (*Cycl.* and *Suppl.*) — *Newtonian*, or *Analytic*. PARALLELOGRAM, in algebra, an appellation ufed for an invention of Sir Ifaac Newton's, to find the firft term of an infinite converging feries.

This is fometimes called the method of the *Parallelogram* and *Ruler* ; becaufe a ruler or right line is alfo ufed in it.

This *analytic Prallelogram* is formed by dividing any *Parallelogram* into equal fquares or *Parallelograms*, by lines drawn horizontally and perpendicularly through the equal divifions of the fides of the *Parallelogram*. The cells thus formed are filled with the dimenfions of the fpecies x and y, and their products. The powers, $y^0 = 1$, y, y^2, y^3, y^4; &c. of y, for inftance, being placed in the loweft horizontal range of cells, and the powers of x, or $x^0 = 1$, x, x^2, x^3, &c. in the vertical column to the left, or vice verfa ; fo that thefe powers and their products will ftand thus :

A						
	x^4	$x^4 y$	$x^4 y^2$	$x^4 y^3$	$x^4 y^4$	
	x^3	$x^3 y$	$x^3 y^2$	$x^3 y^3$	$x^3 y^4$	
	x^2	$x^2 y$	$x^2 y^2$	$x^2 y^3$	$x^2 y^4$	
	x	$x y$	$x y^2$	$x y^3$	$x y^4$	
B	1	y	y^2	y^3	y^4	C

Then, when any literal equation is propofed, mark fuch of the the *Parallelograms* or cells, as correfpond to all its terms ; and let a ruler be applied to two, or perhaps more, of the *Parallelograms* fo marked, of which let one be the loweft in the left-hand column at A B, the other touching the ruler towards the right-hand ; and let all the reft not touching the ruler lie above it. Then felect thefe terms of the equation which are reprefented by the *Parallelograms* that touch the ruler, and from them find the quantity to be put in the quote.

This is Sir Ifaac Newton's famous rule, of the application of which he has left us fome examples in his method of fluxions and infinite feries, p. 9 and 10. but without demonftration ; which has been fince fupplied by others. See Mr. *Colfon's* Comment on that treatife, p. 192, feq. *Mac Laurin's* Algebra, p. 251, feq. and particularly Monf. *Cramer's* Analyf. des Lignes Courbes, chap. 7. p. 148, feq.

This learned author obferves [a], that this invention, which is the true foundation of the method of feries, was but imperfectly underftood, and not valued as it deferved for a long time. He thinks it more convenient in practice to ufe the *Analytic Triangle* [b] of the Abbé de Gua, which takes in no more than the diagonal cells lying between A and C, and thofe which lie between them and B. [[a] In his preface, p. 11. [b] Lib. cit. p. 156.]

PARALLELOPLEURON, a term ufed by fome writers for an imperfect parallelogram, or a kind of trapezium, having unequal angles and fides, but which obferve a certain regularity and proportion.

PARAMECIUM, in zoology, the name given by Dr. Hill to a genus of animalcules of the *Gymnia* kind, and of an irregular oblong figure. See the articles ANIMALCULE *Cycl.* *Suppl.* and *Append.* and GYMNIA, *Append.*

Of this genus authors defcribe feveral fpecies ; for which fee *Hill*, Hift. Anim. p. 4. feq.

PARASITICAL *Plants*. See the article PARASITE, *Cycl.*

PARK *Leaves*, a name by which the *Androfæmum*, or *Tutfan*, is fometimes called. See the article ANDROSÆMUM, *Suppl.*

PARENCHYMA (*Cycl.*)—Befides the veffels and canals of the human body, the antients fuppofed a fimple homogeneous and firm matter, peculiar to each part, and thereby diftinguifhing the

the habit of one part from that of another. But fome moderns have denied the exiftence of a *Parenchyma*, or pulpy matter, and have afferted, that the whole body is compofed of veffels and canals. The chief promoter of this opinion was Ruyfch, who having laid the injected parts of the body in rectified fpirit of wine, and then dried them in the air; whatever was not injected, was thereby diffipated, and the remainder confifted merely of veffels; from whence he concluded, that the whole was compofed of veffels. But it feems certain, that a frefh mufcle can never be fo injected, as to appear wholly compofed of canals. If indeed, after injection, it be fuffered to dry, the parts not injected will exhale, and the more the mufcle is dried, the more it will appear compofed of veffels. What is here faid of a mufcle, holds true of all other parts of the body. Thus many veffels run through the fubftance of a bone; but no one has yet been able to demonftrate, that the whole bone is compofed of veffels. There always remains a fubftance peculiar to bones, which has never yet been fhewn to be vafcular. In the brain alfo there always remains fomething which cannot be demonftrated vafcular.

The *Parenchyma* is fenfibly full of juices, fo that very little of truly folid matter remains, when thefe juices are exhaled.

PARIS-*herb*, in botany, the name of a diftinct genus of plants. See the article HERBA *Paris*, *Suppl.*

PAROTID-*glands*. In a fuppuration of thefe, one caution only is needful; namely, to open the abfcefs, as foon as it can be fuppofed to have formed matter; without waiting for a fluctuation, or even foftnefs of the tumour, that may never happen; the pores being here fo very vifcid, that after it is ripe, the part will feel as hard as if the fuppuration had not begun. *Pringle*, Obferv. on the Difeafes of the Army, p. 277.

PARROQUET, in ornithology, the name by which we call the fmaller fpecies of Parrots. See the article PSITTACUS, *Suppl.*

There are a great number of diftinct fpecies of *Parroquets*, as well as of Parrots, which having got peculiar names, are defcribed under their refpective articles.

PARSLEY (*Suppl.*) — *Baftard*-PARSLEY, the name of a genus of plants, known among botanifts by that of *Caucalis*. See the article CAUCALIS, *Suppl.*

Corn-PARSLEY, *Field*-PARSLEY, and *Macedonian*-PARSLEY, names ufed by fome for a fpecies of *Sium*. See the article SIUM, *Suppl.*

Fool's-PARSLEY, the name given by fome writers to a fpecies of *Cicuta*, or hemlock. See the article CICUTA, *Suppl.*

Macedonian-PARSLEY, the name by which the *Myrrhis* of botanifts is fometimes called. See the article MYRRHIS, *Suppl.*

Mountain-PARSLEY, the Englifh name of a genus of plants, called by botanifts *Oreofelinum*. See the article OREOSELINUM, *Suppl.*

PARSLING, on fhip-board, fmall pieces of old canvas, cut four inches broad, and wrapped about fhrouds, ftays, ftraps for blocks, &c. before ferved with fpun yarn. *Blanckley's* Nav. Expof. p. 115.

PARSNEP (*Suppl.*) — *Cows*-PARSNEP, the Englifh name of a diftinct genus of plants, called by botanifts *Sphondylium*. See the article SPHONDYLIUM, *Suppl.*

Sea or *Prickly-headed* PARSNEP, names given to the *Echinophora* of botanifts. See the article ECHINOPHORA, *Suppl.*

Water-PARSNEP, the name ufed by fome for a fpecies of *Sium*, See the article SIUM, *Suppl.*

PASSION-*flower*, the Englifh name of a genus of plants, called by botanifts *Granadilla*. See the article GRANADILLA, *Suppl.*

PASTE (*Suppl.*) — *Chryfolite* PASTE. See the article CHRYSOLITE, *Append.*

PASTINACHA (*Suppl.*) — is alfo ufed for the carrot, or *Daucus* of botanifts. See the article DAUCUS, *Suppl.*

PEA (*Suppl.*) — *Everlafting*-PEA, or *Earth-nut* PEA, names fometimes given to the *Lathyrus*. See the article LATHYRUS, *Suppl.*

Heart-PEA, or *Bladder*-PEA, names by which the *Corindum* of botanifts is fometimes called. See the article CORINDUM, *Suppl.*

Indian-PEA, the name by which a fpecies of *Orobus* is fometimes called. See the article OROBUS, *Suppl.*

Pigeon-PEA, a name fometimes given to the *Cytifus*, or fhrubtrefoil. See the article CYTISUS, *Suppl.*

Scarlet-PEA, in botany, the Englifh name of a genus of plants, called by Linnæus *Glycine*. See the article GLYCINE, *Suppl.*

Winged-PEA, a name by which fome call the *Lotus*. See the article LOTUS, *Suppl.*

PEACOCK, in ornithology, the Englifh name of a genus of birds, called by zoologifts *Pavo*. See the article PAVO, *Suppl.*

PEACOCK-*fifh*, the Englifh name of a fifh of the *Turdus*, or wraffe-kind. See the article PAVO, *Suppl.*

PEAR (*Suppl.*) — *Prickly*-PEAR, a name fometimes ufed for the *Opuntia Cereus*, *Melocactus*, &c. all comprehended by Linnæus under that of *Cactus*. See the article CACTUS, *Suppl.* and *Append.*

PEDALES. See the article ABBOT, *Cycl.*

PEEVIT, the Englifh name of a bird of the *Larus*, or gullkind, with a black head, and grey coloured body. See the article LARUS, *Suppl.*

PELLITORY *of Spain*, the Englifh name of a genus of plants called by different authors *Chamæmelum* and *Buphthalmum*. Linnæus defcribes it under this laft. See the article BUPHTHALMUM, *Suppl.*

The root of this plant is known in the fhops by the name of *Pyrethrum*. See the article PYRETHRUM, *Suppl.*

Double PELLITORY, a name fometimes given to the *Ptarmica*, or fneezewort, of botanical writers. See the article PTARMICA, *Suppl.*

PENDULUM (*Cycl.* and *Suppl.*) — Huygens having difcovered that the vibrations of a *Pendulum* movingin a cycloid, would be performed in equal times, even tho' the vibrations were unequal, this principle was applied to the conftruction of *Pendulum*-clocks; but great inequalities were ftill obferved in their motions; and many years paffed before any fuccefsful attempts were made to remedy thefe irregularities. The late excellent artift Mr. George Graham apprehending, that the irregularities in the motions of clocks arofe from a change of length in the *Pendulum*, by the influences of heat and cold, made feveral trials in order to difcover whether there was any confiderable difference of expanfion between brafs, fteel, iron, filver, &c. when expofed to the fame degrees of heat; conceiving that it would not be very difficult, by making ufe of two forts of metals differing confiderably in their degrees of expanfion and contraction, to remedy, in a great meafure, the irregularities to which common *Pendulums* are fubject. But no hopes of fuccefs arifing from the experiments he then made, he turned his thoughts to the application of the obfervations he had made about the extraordinary expanfion of quickfilver by heat, and he found out a proper method of applying a column of that fluid to the *Pendulum* of a clock, in order to prevent the irregularities arifing from its different lengths by the effects of heat and cold, which fucceeded extremely well, and is what is now called Mr. Graham's *Quickfilver Pendulum*.

After this, Mr. John Harrifon, of Barrow, in Lincolnfhire, one of the moft ingenious artifts of the age, and famous for his invention of the clock for finding the difference of longitude at fea, without having the leaft knowledge of what Mr. Graham had done before him, made feveral experiments upon wires of different metals, in order to find their different degrees of expanfion and contraction. He thought that by a proper combination of wires of two different metals, differing confiderably in their expanfion and contraction, he might be enabled to keep the center of ofcillation of a *Pendulum* always at the fame diftance, from the point of fufpenfion. In confequence of thefe experiments, he made a *Pendulum* confifting of one fteel wire, at the end of which is the bob or weight; and on each fide of this wire, four wires alternately brafs and fteel, fo difpofed and contrived, as to raife the *Pendulum* by the fame quantity that it is lengthened by heat, and to let down the *Pendulum* in the fame proportion as it is raifed by cold.

Mr. Harrifon, in his firft machine for meafuring time at fea, likewife applied this combination of wires of brafs and fteel, to prevent any alterations by heat and cold. And in the two machines or clocks he has fince made for the fame purpofe, a like method of guarding againft the irregularities arifing from this caufe is ufed.

Mr. Graham alfo made a *Pendulum* confifting of three bars, one of fteel between two of brafs, and the fteel bar acted upon a lever, fo as to raife the *Pendulum*, when lengthened by heat, and to let it down, when fhortened by cold; but he found this clock liable to fudden ftarts and jerks in its motion. See Mr. Short, in the Phil. Tranf. vol. 47. p. 517. feq. who there alfo mentions a *Pendulum* of this kind made by Mr. Fotheringham, a quaker in Lincolnfhire.

The ingenious Mr. Ellicot [a] has given a defcription of two methods ufed by himfelf, by which the irregularity of the motion of a clock, arifing from the influence of heat and cold, upon the rod of the *Pendulum*, may be prevented. Mr. Ellicot tells us, that having by many experiments with his pyrometer [b] found a great difference between the expanfion of brafs and iron, he made a *Pendulum* compofed of thofe two metals, and applied it fo fuccefsfully to regulate the motion of a clock, that he avoided all the jerks to which it was fufpected the motion of the machine would be liable. [[a] Phil. Tranf. vol. 47. p. 479. feq. [b] See the article PYROMETER, *Append.*]

Befides the irregularities arifing from heat and cold, *Pendulum*-clocks are liable to others from friction, and from foulnefs, owing to the oil ufed. But Mr. Harrifon has feveral excellent contrivances by which his clocks are almoft entirely free from friction; and therefore he ufes no oil, fo that there is no neceffity of ever cleaning. See Mr. *Short*, ubi fupra. See alfo Monf. Caffini, in Mem. Acad. Scienc. 1741.

PENGUIN, or PINGUIN, in botany, the name by which Dillenius calls the *Ananas* of Tournefort. See the article ANANAS, *Suppl.*

PENNY-*wort*, a name sometimes given to the *Cotyledon*, or navel-wort of botanical writers. See the article NAVELWORT, *Suppl.*

Marsh-PENNY-*wort*, the English name of a genus of plants, called by botanists *Hydrocotyle*. See the article HYDROCOTYLE, *Suppl.*

PENTELASMIS, in the history of shell-fish, the name by which Dr. Hill calls the *conchæ anatiferæ* of other writers. See the article ANATIFERA *concha*, *Suppl.*

The *Pentelasmis*, according to him, is a genus of animals, composed of a shelly body, affixed to a fleshy and soft pedicle; the body is composed of five valves, and the pedicle is sometimes short, and sometimes long. The animal itself belongs to the *Tritons*. See the article TRITON, *Append.*

PEONY, or PIONY, in botany, the English name of a distinct genus of plants, called by botanists *Pæonia*. See the article PÆONIA, *Suppl.*

PEPPER (*Suppl.*) — *Indian* PEPPER, or *Guinea* PEPPER, names by which some call the *Capsicum* of botanists. See the article CAPSICUM, *Suppl.*

Poor-man's-PEPPER, a name sometimes given to the *Lepidium*. See the article LEPIDIUM, *Suppl.*

Water-PEPPER, a name sometimes given to a species of *Sedum*, or House-leek. See the article SEDUM, *Suppl.*

PEPPER-*mint*, the name of a species of mint. See the articles MENTHA and MINT, *Suppl.*

PEPPER-*wort*, a name by which some call the *Lepidium*, or dittander. See the article LEPIDIUM, *Suppl.*

PEPPER-*bird*, the English name of the *Rhamphastos*, with a yellow rump, otherwise called *Toucan*. See the article TOUCAN, *Suppl.*

PERESKIA, in botany, a name given by Plumier to a genus of plants, comprehended under the *Cactus* of Linnæus. See the articles CACTUS, *Append.* and MELOCACTUS, *Suppl.*

PERSEA, in botany, the name given by Plumier to a species of the Laurel of Linnæus. See the article LAURUS, *Append.*

PERSIMON, in botany, a name sometimes given to the *Lachryma Jobi*, or Job's tears. See the article LACHRYMA, *Append.*

PESTILENCE-*wort*, a name sometimes given to the *Petasites*, or butter-burr. See the article PETASITES, *Suppl.*

PETAL (*Suppl.*) — The *Petal* of a plant is that part which, for want of a more distinct expression, we call in English the leaves of the flower. See the article FLOWER, *Suppl.*

That great botanist, the late Mr. Pitton Tournefort, fixed upon the most striking and shewy parts of vegetables, as the foundation of his method and generical divisions of the vegetable world; which he has accordingly rang'd into twenty-two classes.

The first is of the plants with a *monopetalous* or one-leaved flower, form'd like a bell; and the flowers of this class he afterwards subdivides into four kinds; first, the *bell-fashioned* flowers properly so called, as being very nearly of the regular shape of a bell: Secondly, the *tubulate bell-fashioned* flowers, which are narrow and oblong: Thirdly, the *expanded*, which open in form of a wide bason: And, fourthly, the *globose*; the mouth of which is narrower than the body. In this class he comprehends the *Mandrake*, *Lilly of the valley*, &c.

The second class is of the plants with *monopetalous funnel-fashioned*, and *rotated*, or wheel-like flowers. The flowers of this class he divides into two kinds only; the one representing at its mouth, the bottom of an inverted cone, the other a salver or sawcer; and these he distinguishes by the names of *funnel-fashioned* and *salver-like* flowers: Of this class are the *Tobacco*, *Henbane*, &c.

The third class is of what he calls the plants with *anomalous*, *monopetalous* flowers; of these he makes the variously-shaped *monopetalous* flowers of *Birthwort*, *Foxglove*, *Figwort*, and some others; some of which represent a face, and others the snout of an animal: To distinguish the plants of this class the author however is oblig'd fairly to confess the imperfection of the method of classing by the *Petals* alone, and call in the assistance of the different structure of the seed vessels. In this class he comprehends the *Toadflax*, *Butterwort*, &c.

The fourth class is of the plants, which have a *monopetalous*, *labiated*, or lipp'd flower; which he defines to be such an one as is narrow, like a pipe within, and expanded; and in form of lips at the mouth. In this class are comprehended the *Sage*, *Clary*, *Deadnettle*, *Mint*, *Baum*, &c.

The fifth class is of the plants with a *polypetalous*, *cruciform* flower; that is, such an one as is composed of a number of leaves, disposed in form of a cross; and these he afterwards more nicely defines to be such as are always composed of four *Petala*, or leaves only, and those ever disposed in form of a cross. Of this class are the *Cresses*, *Mustard*, *Scurvy-grass*, &c.

The sixth class is of the plants which have a *rosaceous*, or rose-like flower. This he defines to be such an one as is composed of many leaves or *Petals*, disposed like those of the rose into a round figure: The number of *Petals*, he adds, is uncertain and indeterminate in this class; and that they are frequently five, and more rarely four than two. Of this class are the *Chickweed*, *Orpine*, *Saxifrage*, *Rue*, &c.

The seventh class is of the plants with *umbelliferous* flowers. These he defines to be *polypetalous*, *rosaceous* flowers, whose cup goes off into a fruit composed of two seeds, cohering firmly together while green, but naturally separating, when ripe; and observes, that in this class the flowers are generally disposed in great numbers together, and in the form of what the ladies call an *umbrella*, us'd to be carry'd over them to keep off the sun; but he does not make this a necessary character of the class. The plants comprehended under this are *Carrots*, *Parsneps*, *Earth-nuts*, *Chervel*, *Fennel*, &c.

The eighth class is of the plants with a *caryophyllous* or pink-like flower, which he defines to be such an one as is composed of many *Petals*, disposed in an orbicular form, and arising each from the bottom of the cup, as from a tube, in the same manner as they do in the common pink. Of this class are the *Catchfly*, *Sea-lavender*, *Flax*, &c.

The ninth class is of the plants which have a *liliaceous*, or lilly-like flower, which he defines to be such an one as is composed of six *Petals*, sometimes indeed but three, but always divided however into six at the end. Here the author also again acknowledges the imperfection of classing by the *Petals*, since here he takes in the assistance of the figure and division of the seed vessel, which he says must always in this class be tricapsular, or divided into three cells; and plants which have this seed vessel, tho' their flowers are not strictly of the lilly shape, are allowed to be truly of the class. Of this are the *Asphodel*, *Saffron*, *Flower-de-luce*, *Tulip*, *Crown-Imperial*, &c.

The tenth class is of the plants with a *polypetalous*, *papilionaceous* flower, or one that is composed of many *Petals*, and in form resembles a butterfly. These flowers the author defines to be composed of four dissimilar *Petals*, which issue from a one-leaved cup, which is hollow, and like the conic paper-cases people twist up to put spices, &c. in; and divided into many segments at the rim; and from this cup arises also the *Pistil* of the flower. The upper leaf in these flowers which in some sort represents the colours carried by soldiers in battle, he calls the *Vexillum* or *Ensign*; the lower, which is hollow'd, and in form of a boat, the *Hulk*; and the two side ones the *wings*. The plants comprehended under this class are the *Liquorice*, *Peas*, *Fenugreek*, &c.

The eleventh class is of plants with an *anomalous* or irregular *polypetalous* flower. Among these he comprehends such of the *polypetalous* flowers as are of various shape, and composed of dissimilar or irregular *Petals*, and could not well be comprehended under any one expressive or determinate character. Of this class are the *Violet*, *Fumitory*, *Dier's-weed*, *Woolfsbane*, &c.

The twelfth class is of the plants with a *flosculous* flower. This he defines to be one composed of a number of small flowers, crowded close together, and comprehended in the same general *Calyx*, or cup; these flowers, which together compose this complex one, he observes are generally composed of only one *Petal*, which is wider at the mouth, than at the other end, and generally notched or divided there into many segments. He also has recourse to the other parts of the flower for farther descriptions; and comprehends under it the *Thistles*, *Knapweed*, *Bluebottle*, &c.

The thirteenth class is of the plants with a *semiflosculous* flower. These he defines to be composed of a multitude of half flowers, each composed of one *Petal*, hollow in its lower part, but in its middle and upper part flat and plain; and disposed into a single or manifold circle. He here also describes the fructification of the plants of this class, and comprehends in it the *Lettuce*, *Dandelion*, *Hawkweed*, &c.

The fourteenth class is of the plants with a *radiated* flower. These flowers the author describes to have two parts, a middle or *disk*, composed of small *fistular* flowers, and a *rim*, or *edge*, called the *corona*, which is made up of half flowers; and sometimes, though seldom, of plain flat *Petals*. Under this class are comprehended the *Starwort*, *Ragwort*, *Golden-rod*, *Sunflower*, &c.

The fifteenth class is of the plants which have flowers composed of *stamina* or *threads*, sustaining the *apices* or *capsules* of the fecundating farina. The author distinguishes these also by their *Pistil* changing into a single seed envelop'd in a husk, and of this class makes the *Sorrel*, *Arsmart*, *Orrach*, the *Grasses*, *Horsetails*, &c.

The sixteenth class is of those plants which the author supposes to have no flower at all; and yet to produce seeds. Of this class he determines the *Ferns*, *Liverwort*, and *Adder's-tongue*, to be.

The seventeenth class is of those plants whose flowers and fruit he says are both ordinarily wanting. These he afterwards divides into the earth and water plants; among the first he reckons the *Mosses*, *Mushrooms*, &c. And among the others the *Fucuses*, *Algas*, *Corallines*, &c. the flowers and seeds of which he observes we are as yet at least ignorant of.

The eighteenth class is of the trees and shrubs, which have *apetalous* flowers, or flowers without *Petals* or leaves at all. Of this class are the *Ash*, *Box*, &c.

The nineteenth claſs is of the trees and ſhrubs which have *Catkins* or *Iuli* for their flowers. Theſe the author ſays conſiſt either of *ſtamina* and *apices* alone, that is, of the threads or capſules of the farina; or they are compoſed of theſe with ſome little leaves affixed to a long ſlender axis: Theſe *Catkins* he obſerves are always in a different place from the fruit; and that, ſometimes on the ſame, ſometimes on different trees. Of this claſs are the *Walnut*, *Oak*, *Beech*, &c.

The twentieth claſs is of trees and ſhrubs, which have a *monopetalous* flower; and of this are the *Elm*, *Lilac*, *Storax*, *Olive*, &c.

The twenty firſt claſs is of the trees and ſhrubs which have a *roſaceous* flower; and among theſe are comprehended the *Lime*, *Sumach*, *Ivy*, *Vine*, &c.

And the twenty ſecond, or laſt claſs, is of the trees and ſhrubs with a *papilionaceous* flower; among which are reckoned the *Broom*, *Bean*, *Trefoil*, *Judas-tree*, &c.

It is very eaſily ſeen, that this is far from a ſtrictly accurate method; the author has indeed aſſiſted it with figures, which are very uſeful and inſtructive; and, as the judicious Linnæus obſerves, more is in reality to be learned from them, than from all the author has ſaid. *Linnæus* has well obſerved, that this method is neither perfect nor ſufficiently diſtinctive; the glory of inſtructing the botaniſt with truth and certainty was indeed reſerved for that author alone, who when he had ſhewn the imperfection and uncertainty of all the before eſtabliſhed methods, plan'd out an abſolutely new one, founded on the unalterable parts of plants, their organs of fructification. See the article FRUCTIFICATION, *Append.*

PETER'S *wort*, or ST. PETER'S-*wort*, the Engliſh name of a genus of plants, called by botaniſts *Hypericoides* and *Aſcyrum*. See the article ASCYRUM, *Append.*

PETOLA, in zoology, the name of a ſpecies of *coluber*, the ſcuta of whoſe abdomen are two hundred and nine, and the ſquamæ of the tail ninety. See the article COLUBER, *Suppl.*

PETREL, the name of a very remarkable bird, called *Procellaria*, by authors. See the article STORM-*finch*, *Suppl.*

The feet are large, the toes are ſlender, and connected by a fine, thin, black membrane; there is no hinder toe, but the claw in that part is ſmall, and connected immediately to the back of the foot. The middle toe is ſhorteſt, and has only two joints; the outer is longer, and has four; and the interior has three, and is longer than either. *Hill*, Hiſt. Anim. p. 514.

PETRIDIA, in Natural Hiſtory, the name of a genus of foſſils of the *Scrupi*-kind, of a plain uniform ſtructure, of no great variety of colours, and emulating the external form of pebbles. See the article SCRUPI, *Append.*

Of this genus the following are all the known ſpecies: 1. The various ſized, pellucid, colourleſs, cryſtalline *Petridium*, commonly called *Pebble-cryſtal*. 2. The purple, femipellucid, cryſtalline *Petridium*. 3. The ſnow-white, opake, cryſtalline *Petridium*. 4. The opake, whitiſh, reddiſh, or yellowiſh, cryſtalline *Petridium*, commonly called red, white, or yellow ſparry pebbles. 5. The yellowiſh-white pumicoſe, or ſpungy *Petridium*. 6. The hard, porous, whitiſh, cryſtalline *Petridium*. 7. The greyiſh-white, opake, ſtony *Petridium*. 8. The friable, ſhining, white, arenaceous *Petridium*. 9. The white, cryſtalline *Petridium*, ſpotted with ſmall yellow dots. 10. The whitiſh-brown, dull *Petridium*. 11. The bluiſh-white, hard, cryſtalline *Petridium*. 12. The browniſh white, hard, ſhining *Petridium*. Vid. *Hill*, Hiſt. Foſs. p. 563—572.

PETTY-*Whin*, a name by which ſome call the *Ulex*, or *Geniſta Spartium*. See the article GENISTA SPARTIUM, *Suppl.*

PHACA, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants, called by Tournefort *Aſtragaloides*. See the article ASTRAGALOIDES, *Suppl.*

PHALÆNÆ, in the hiſtory of inſects, the name by which zoologiſts call the night-butterflies, or moths, as they are vulgarly called. See the article PHALENÆ, *Suppl.*

PHASIANUS, the *Pheaſant*, in ornithology, the name of a genus of birds of the gallinaceous kind. See the articles GALLINÆ, and PHEASANT, *Suppl.*

The diſtinguiſhing characteriſtic of this genus of birds, is, that the area or ſpace about the eyes is naked, and that they have no wattles.

The ſpecies are theſe: 1. The common *Pheaſant*, with a blackiſh purple-colour'd breaſt. 2. The red, or ſcarlet-breaſted *Pheaſant*: This is nearly of the ſize of the common *Pheaſant*, and its breaſt is of a high ſcarlet, and the belly red, but not ſo bright. 3. The Eaſt-India *Pheaſant*: This is an extremely beautiful bird, the whole body of which is variegated with a profuſion of the brighteſt colours, yellow, red, bluiſh-green, and almoſt every other tinge. *Hill*, Hiſt. Anim. p. 486.

PHEASANT'S-*eye*, in botany, a name ſometimes given to the *Adonis*. See the article ADONIS-*flos*, *Suppl.*

PHEASANT'S-*eye Pink*, the name of a ſpecies of *Caryophyllus*. See the article PINK, *Suppl.*

PHOCA (*Suppl.*) — Dr. Parſons has lately given us a diſſertation upon the claſs of the *Phocæ marinæ*. See Phil. Tranſ. vol. 47. pag. 109.

Phoca is the generic name, and all the ſpecies have a great likeneſs to each other, and may all alike have the names *phoca*, *vitulus marinus*, *ſea-cow*, *ſea-lion*, &c. The *manati*, the *ſoil* or *ſeal*, the *walrus* or *mors*, are ſo many ſpecies of this genus. Phil. Tranſ. ib.

PHYSIC *nut*, the Engliſh name of a diſtinct genus of plants, called by botaniſts *Ricinoides*. See the article RICINOIDES, *Suppl.*

PHRYGANIUM, in the hiſtory of inſects, a genus of four-winged flies, of the *Neuroptera* claſs. See the article NEUROPTERA, *Append.*

The wings of the *Phrygania*, of which there are a great many ſpecies, are incumbent; they have four tentacula, two on each ſide.

PICKTOOTH (*Suppl.*)— *Spaniſh* PICKTOOTH, a name by which ſome call the *Viſnaga* of Ray, a ſpecies of *Daucus*. See the article DAUCUS, *Suppl.*

PIECES. Plants may be propagated from their cuttings, ſlips, or *Pieces*; and it has been found that ſome kinds of animals have the like property, which may be called a reproduction of the animal or plant from a part of it. See the articles REPRODUCTION and PLANT, *Append.* and POLYPE, *Suppl.*

PIGEON-*Pea*, a name ſometimes uſed for the *Cytiſus*, or ſhrub-trefoil. See the article CYTISUS, *Suppl.*

PILE (*Suppl.*) — To eſtimate the force of the rammer made uſe of to drive *Piles*, its weight ought to be multiplied into the velocity it acquires in falling. Thus, if a rammer which weighs 500 *lb.* be let fall from four feet, it will fall that height in half a ſecond, and have at the time of percuſſion a velocity capable to carry it eight feet in half a ſecond, without any farther help from gravity; ſo that we muſt multiply 500 by 16, or its weight by the number of feet it would fall in a ſecond, and the product 8000 gives the momentum of the ſtroke. If a capſtan, pullies, or windlas be made to raiſe the rammer to a conſiderable height, and then by an eaſy contrivance looſen it at once from its hook, the momentum of the ſtroke will always be as the ſquare root of the height from which the rammer fell. *Deſaguliers*, Experim. Phil. p. 336, ſeq.

But it is to be obſerved, that the effect of the blow of the rammer will be as the ſquare of its velocity; that is, as the height from whence it falls, and not as the ſquare root of that height. Thus if the blow of the rammer drive the *Pile* 6 foot deep; a blow given with twice the velocity, will, cæteris paribus, drive it four feet deep. This follows from the nature of the force of bodies in motion. See the article FORCE, *Append.*

We have the figure and deſcription of a new machine for driving *Piles*, invented by Mr. Vauloue, in Deſaguliers, Experim. Philoſoph. p. 417, ſeq.

PILE-*wort*, a name by which ſome call the *Ranunculus*, or Crowsfoot. See the article RANUNCULUS, *Suppl.*

PIMPILLO, a name ſometimes given to the *Opuntia* of botanical writers. See the article OPUNTIA, *Suppl.*

PIMPINEL (*Suppl.*) is alſo a name by which the *Sanguiſorba*, or burnet, of botaniſts is ſometimes called. See the article SANGUISORBA, *Suppl.*

PINASTELLA, in botany, the name by which Dillenius calls the *Hippuris* of Linnæus. See the article HIPPURIS, *Suppl.*

PINASTER, the name of ſeveral ſpecies of pine. See the article PINE, *Suppl.*

Ground-PINE, or *Dwarf*-PINE, names by which the *Chamæpitys* of botanical writers is ſometimes called. See the article CHAMÆPITYS, *Suppl.*

Wild-PINE, a name ſometimes given to the *Karatas*, or *Ananas*, of botanical writers. See the article ANANAS, *Suppl.*

PINQUIN, or PENQUIN, the names by which the *Ananas* of Tournefort is ſometimes called. See the article ANANAS, *Suppl.*

PINK (*Suppl.*) — *Sea*-PINK, a name by which ſome call the *Statice*. See the article STATICE, *Suppl.*

PINTLE (*Suppl.*)—*Prieſt's* PINTLE, a name ſometimes given to the *Arum*, or wake-robin. See the article ARUM, *Suppl.*

PIPE (*Cycl.*) — *Air*-PIPE, an invention of the late ingenious Mr. Sutton to clear ſhips of foul air. This he does by a *Pipe*, the branches of which are laid in the hold, and the extremity of which is fixed into the aſh-hole of the furnace. Mr. Watſon has ſhewn how theſe *Pipes* may be laid, ſo as to be no way inconvenient, and relates the ſucceſs of a trial of them, made on a hulk. See Phil. Tranſ. N° 462. p. 12.

We have now three different contrivances publiſhed for cleaning ſhips, and other cloſe places, of foul air.

One by Dr. Deſaguliers, which will change the air in the chamber of ſick people, in a little time; either by drawing out the foul air, or driving in freſh; or doing both ſucceſſively, without opening doors or windows. See Phil. Tranſ. N° 437.

The other by Mr. Sutton before mentioned; and the third by means of Dr. Hale's ventilators, which ſeems to be the moſt expeditious and ſimple method. See the article VENTILATORS, *Append.*

PIPE-*tree*, the Engliſh name of a genus of plants, called by botaniſts *Lilac* and *Syringia*. See the articles LILAC and SYRINGIA, *Suppl.*

Pudding-PIPE-*tree*, a name by which the *Caffia* of botanifts is fometimes called. See the article CASSIA, *Suppl.*

PIPER, in ichthyology, the Englifh name of a fpecies of *Trigla*, with a bifid roftrum, and tubulofe noftrils. It is called by the generality of authors LYRA. See the articles TRIGLA and LYRA, *Suppl.*

PIPERIDGE-*tree*, a name fometimes given to the *Berberis*, or barberry-bufh. See the article BERBERIS, *Suppl.*

PIQUET, a well-known game at cards, and which has in fome cafes been the object of mathematical computations.

Thus Mr. de Moivre has propofed and folved the following problems:

1° To find at *Piquet* the probability which the dealer has for taking one ace or more in three cards, he having none in his hands. He concludes from his computation, that it is 29 to 28 that the dealer takes one ace or more.

2° To find at *Piquet* the probability which the eldeft has of taking an ace or more in five cards, he having no ace in his hands. Anfwer; 232 to 91, or 5 to 2, nearly.

3°. To find at *Piquet* the probability which the eldeft has of taking both an ace and a king in five cards, he having none in his hand. Anfwer; the odds againft the eldeft hand taking an ace and a king are 331 to 315, or 21 to 20 nearly.

4°. To find at *Piquet* the probability of having twelve cards dealt to, without king, queen, or knave; which cafe is commonly called *cartes blanches*. Anfwer; the odds againft *chartes blanches* are 323 to 578956, or 1791 to 1 nearly.

5°. To find how many different fets effentially different from one another, one may have at *Piquet* before taking in. Anfwer; 28,967,278. This number falls fhort of the fum of all the diftinct combinations, whereby twelve cards may be taken out of 32, this number being 225,792,840; but it ought to be confidered, that in that number feveral fets of the fame import, but differing in fuit, might be taken, which would not introduce an effential difference among the fets.

Mr. de Moivre alfo gives fome obfervations on this game, which he had from an experienced player. See Doctrine of Chances, pag. 151 to 159.

Monf. de Monmort has alfo treated of *Piquet* in his Analyfe des jeux de Hazard, pag. 162.

PISHAMIN, or PERSIMON, names by which fome call the *Lacryma Jobi*, a diftinct genus of plants. See the article LACRYMA, *Append.*

PISTACHIA, in the Linnæan fyftem of botany, the name of a genus of trees, called by Tournefort *Terebinthus*. See the article TEREBINTHUS, *Suppl.*

Wild-PISTACHIA, a name given to the *Staphylodendron*, or bladder-nut-tree. See the article STAPHYLODENDRON, *Suppl.*

PISTON (*Cycl.*) — There are two forts of *Piftons* ufed in pumps; the one with a valve, which is called a *Bucket*; and the other without a valve, which is called a *forcer*. See the articles FORCER and PUMP, *Append.*

PITCH-*tree*, in botany, a name fometimes given to the *Fir-tree*. See the article FIR, *Suppl.*

PITCHING, a word fometimes ufed for paving. See the article PAVEMENT, *Cycl.*

PITH (*Suppl.*) — Dr. Hales fhews that the *Pith* ferves to fupply the dilating moifture for the tender fhoots of plants, and that the figure of thefe may be oblong, and not round, like the fruit, there are tough diaphragms, or partitions in the *Pith* at fmall diftances from each other, which check the lateral expanfion; as alfo horizontal fibres, which ferve for the fame purpofe.

Of the fame fort is the *Pith* in the large growing feathers of birds; being compofed of veficles that can be diftended lengthwife, but have fphincters at the ends, to prevent too large a lateral dilation. Vid. *Hales*'s Veget. Statics, vol 1. p. 337.

PLAGIURI. Under this clafs of fifhes are comprehended the following genera: The Phyfeter, Delphinus, Balæna, Monodon, Catodon, and Thrichechus; which fee under their refpective articles PHYSETER, &c.

PLANE-*tree* (*Suppl.*)— *Baftard* or *Palfe* PLANE-*tree*, a name by which fome call the *Acer*, or Maple-tree. See the article MAPLE, *Suppl.*

PLANETARIUM, an aftronomical machine, made to reprefent the motions of the planets, as they really are in nature, or at leaft agreeably to the Copernican fyftem, and commonly called an *Orrery*. See the article ORRERY, *Suppl.*

The moft remarkable of thefe machines was that invented by Huygens, and defcribed by himfelf. See Defcript. Automati planetarii, ap. *Huygen.* Opufcul. pofthum. Tom. 2. p. 157. edit. Amft. 1728.

In this *Planetarium*, the five primary planets perform their revolutions about the fun; and the moon performs her revolution about the earth, in the fame time that thefe revolutions are really performed in the heavens. The orbits alfo of the moon and planets are reprefented with their true proportions, excentricity, pofition, and declination, from the ecliptic or orbit of the earth: So that by this *Planetarium* the fituation of the planets, their conjunctions, oppofitions, &c. may not only be known for the prefent time, but for any time paft, or future, as in a perpetual ephemeris.

This machine is now preferved among the curiofities of the univerfity of Leyden.

But the *Planetariums* or Orreries now moft commonly ufed, do not reprefent the true times of the celeftial motions; but only their proportions; and are of ufe to beginners, to give them an idea of the planetary fyftems, as alfo, if conftructed with fufficient accuracy, to folve feveral queftions relating to the motions of the planets, and of the earth and moon, &c.

Thefe machines are made of various fizes, fome reprefenting more planets than others. However, thefe complex ones are far from being improvements upon the original *Planetarium*, or Orrery, which fhewed only the motion of the moon round the earth, and of the earth and moon round the fun. They give but very confufed, and even falfe ideas of the diftances and bignefs of the planets; which muft always be fo whilft the orbits of the moon, and other fecondary planets, are fixed to the fame machine, which contains the primary ones. In the original one, every thing was well and properly executed; as the phænomena of day and night, and their gradual increafe and decreafe, according to the feafons; the places of the earth where the fun is fucceffively vertical, and feems to defcribe its parallels; the real annual motion of the earth, which gives the fun an apparent annual motion; the rotation of the fun about its axis; the periodical and fynodical month; the folar and fydereal days; the fucceffive illumination of all the parts of the moon, &c.

It is therefore proper to have a machine for reprefenting the general folar fyftem by itfelf; the fun moon, and earth ought alfo to be fhewn feparately; and the fyftem of any other primary planet; as Jupiter, for inftance, with all its fatellites, fhould have a feparate machine fo contrived, as to reprefent in true proportion their magnitudes, diftances, and other phænomena.

As to the magnitudes of the primary and fecondary planets, if the fun's diameter be fuppofed 100, that of Saturn will be $7\frac{5}{10}$, of Jupiter 10, of Mars $\frac{53}{100}$, of the Earth 1, of Venus 1, of Mercury $\frac{54}{100}$, and of the Moon $\frac{285}{1000}$. As to the fatellites of Jupiter and Saturn, they are fuppofed to be about the bignefs of our Earth.

Again, if the diftance of the Earth from the Sun be divided into 10 parts, Mercury will be diftant from the Sun four of thefe parts, Venus feven, Mars fifteen, Jupiter fifty-two, and Saturn ninety-five.

Dr. Defaguliers defcribes a *Planetarium* of his own contrivance, the frame of which, containing the clock-work, is made of ebony; its outfide is adorned with twelve pilafters, between which are painted, on as many vertical planes, the twelve figns of the zodiac. The upper furface is flat, and made of polifhed brafs; on the outward circumference of which are fcrewed fix brafs pillars, fupporting a large flat filvered ring. On this ring, which reprefents the ecliptic, are drawn feveral circles; the three innermoft being divided into twelve parts for the figns of the zodiac, and each of thefe into 30 degrees; and among thofe degrees are graved in their proper places, the nodes, aphelia, and greateft north and fouth latitudes of the planets. The next three circles have the months and days of the months, exactly correfponding to the Sun's place at noon each day throughout the year; and upon the brafs furface of the machine graduated are filver circles, which carry the planets, reprefented by filver balls, and raifed upon arbors or ftems to the height of the ecliptic.

Above the ecliptic ftand fome of the principal circles of the fphere, according to their refpective fituation in the heavens, viz. the two colures, one half of the equinoctial circle, the tropic of cancer, the arctic circle, &c. The whole machine is alfo fo contrived, as to be fet to any latitude, without injuring any of the infide motions.

Within the ecliptic ftand the Sun and other planets; the Sun being in the center of the whole fyftem, and the reft reprefented agreeably to the above-mentioned magnitudes and diftances. When things are thus difpofed, by turning about the handle, or winch of the *Planetarium*, all the planets perform their revolutions round the Sun, according to their periodical times; and being furnifhed with indices of blued-fteel, thefe fhew the longitudes of the planets, by pointing to the divifions on the graduated filver circles, as they move round.

As the diftances of the planets are in their true proportions to each other, fo likewife are their magnitudes; but it cannot be expected, that the diameters of the planets fhould be in proportion to the diameters of their orbits; for to effect this, the machine muft either be made 3000 times bigger than ufual, or the balls reprefenting the planets 3000 times lefs than ufual; whereby they would all be rendered invifible, excepting the Sun, and even it would be lefs than $\frac{1}{100}$ part of an inch in diameter. For the fame reafon it is found impracticable to reprefent the fun by a ball, proportionally bigger than thofe reprefenting the other planets.

Now as the orbit of the Moon, as well as of the fatellites of Jupiter and Saturn, bear no manner of proportion to the orbit of the primary planets, the difproportion between thefe and their fatellites muft be ftill greater. Hence appears the abfurdity of crowding them all into one machine, as is the cafe in the common *Orreries*.

To give a right notion of the diftances and magnitudes of the fatellites with refpect to their primary planets, it will be neceffary to have a feparate machine for each fyftem; or, the

fame machine may be fo contrived, as to reprefent one fyftem after another, by fhifting and adjufting the magnitudes and diftances of the balls. In this manner, the general folar fyftem may be firft exhibited; then that of the Moon and Earth round the Sun; afterwards that of Jupiter and its fatellites: and, laftly, that of Saturn and its fatellites.

We have already taken notice of fome of the phænomena explained by the general *Planetarium*, as well as of that contrived to exhibit the revolution of the Earth and Moon round the Sun. By thefe is likewife plainly fhewn the caufes of eclipfes, as well as of the apparent ftationary and retrograde motions of the planets.

By the *Planetarium* adapted to the fyftem of Jupiter, and its fatellites, are exhibited the immerfion or entrance of a fatellite into the fhadow of Jupiter; its emerfion out of the fhadow; when thefe are vifible; when a fatellite is hidden by the body of Jupiter, before it comes into, or after it is gone out of the fhadow; when a fatellite may be feen to crofs the body of Jupiter; when a fatellite makes a folar eclipfe in Jupiter; and when fatellites eclipfe one another.

PLANT *(Suppl.)—Propagation of* PLANTS. Tho' the moft natural, as well as moft univerfal method of propagating *Plants*, is that of fowing the feeds of each kind in a proper foil; yet fuch is the prolific power of nature, that in fome inftances, like the polype-animal, they may be propagated by fets, pieces, flips, or cuttings taken from the parent tree, or *Plant*, and fet in fuch a foil as they are known to delight in. The whole family of willows are propagated in this manner with the greateft eafe. Thofe forts which grow to be large trees, and are cultivated for timber, are generally planted from fets of about feven or eight feet long, fharpened at their larger ends, which is thruft into the ground by the fides of ditches and banks where the ground is moift; in which places they make a confiderable progrefs, and are a great improvement to fuch eftates; becaufe their tops will be fit to lop every fourth or fifth year. The fallows are planted of leffer fets, only three feet long, thruft two feet into the ground, and one foot above it. The rows fhould be three feet afunder, and the fets in each row eighteen inches; obferving always to place the rows floping, in the fame manner as the ground. The beft feafon for planting thefe cuttings is in February; and if the foil be good, they will produce a great crop of fhoots every year, which will produce, at a moderate computation ten pounds per acre. See *Miller*'s Gard. Dict. in voc. *Salix*.

Befides the willow-kind, the plane-tree, mint, &c. may be propagated in this manner; only it ought to be remarked, that in providing the flips, fprigs, or cuttings, fuch branches as have knots or joints, fhould be cut off two or three inches beneath them; and that fmall top fprigs of two or three years growth, are the beft for this operation. Ruft. Dict. in voc. *Cuttings*.

Another way of propagating *Plants*, is by parting or dividing their roots, each part of which will, by proper management, thrive and fend out frefh roots, which may be feparated in the fame manner. See the article ROOT, *Cycl.* and *Suppl.*

The manner of propagating *Plants*, by laying the tops of branches in the ground, is defcribed under the head LAYER, *Cycl.* and *Suppl.* And the common way by fowing of the feeds, is fufficiently explained under the articles NURSERY, SOWING, SEED, &c. *Cycl.* or *Suppl.*

Syftems of PLANTS. Ray's Syftem of *Plants* is delivered in the Cyclopædia under this head PLANT. The fyftem of Linnæus is to be found in the Appendix, under the head FRUCTIFICATION; and the Syftem of Tournefort in the Appendix under the head PETAL.

Vegetation and œconomy of PLANTS. The theory of the growth and œconomy of *Plants* has received great improvmenets from the experiments of the ingenious Dr. Hales, in his vegetable ftatics.

It appears from a great number of experiments made by that gentleman, that *Plants* imbibe and perfpire moifture very copioufly.

As to the quantity of moifture perfpired by *Plants* and trees, there appears to be a very confiderable difference in different vegetables. The lemon-tree, which is an ever-green, perfpires much lefs than the fun-flower, or than the vine, or the apple-tree, whofe leaves fall off in winter. Thus, from equal areas, the lemon-tree was found to perfpire only $\frac{1}{248}$ of an inch in height, during twelve hours of the day in the month of July; the apple-tree $\frac{1}{102}$; a cabbage $\frac{1}{80}$; a vine $\frac{1}{191}$; and a fun-flower $\frac{1}{165}$ in a day and night. *Hale*'s Veget. Stat. Vol. 1. p. 20, feq.

In order to try what moifture *Plants* would imbibe, the Dr. cut off feveral branches of apple-trees, pear, cherry, and apricot-trees; and having immerfed them into a known quantity of water, he found fome of them imbibed 15 ounces, fome 20 ounces, and others 25 or 30 ounces in 12 hours day more or lefs, according to the quantity of leaves they had; and and yet when he weighed them at night, they were lighter than in the morning, which undoubtedly was owing to their perfpiration. The quantity imbibed decreafed very much every day, the fap veffels being probably fhrunk at the tranfverfe cut, and too much faturated with water, to let any more pafs; fo that ufually in four or five days the leaves faded and withered much. Id. ibid. p. 29.

The Doctor made the fame experiments with elm-branches, oak, ofier, willow, fallow, afpen, curran, goofberry, and philbert branches; but none of thefe imbibed fo much as the foregoing, and feveral forts of ever-greens very much lefs. Id. ibid.

He alfo made feveral experiments to afcertain the force with which *Plants* imbibe moifture. This he did by putting the ftump of a branch into one end of a glafs tube, cementing it faft; and then immerfing the other end of the tube, after being firft filled with water, into a ciftern of mercury; on which removing his finger that ftopped up the lower end of the tube, the ftump imbibed the water with fo much vigour, that in fix minutes time the mercury was raifed eight inches in the tube. It is obfervable, that in all the experiments of this fort, the mercury rofe higheft, when the fun was very clear and warm; and that it fubfided in the nighttime, and rofe again the next day, as the fun fhone upon the branch; only it was neceffary to fill the tube with water; otherwife it would not rife at all. It is alfo remarkable, that the top or fmall end of a branch imbibed the water as well as the ftump end. Id. ibid. p. 85, feq.

The imbibing force of a great variety of trees being tried in the fame manner, by immerfing branches of them in aqueo-mercurial gages, it was found that the pear, quince, cherry, walnut, peach, apricot, plum, black-thorn, white-thorn, goofeberry, water-elder, and fycamore, raifed the mercury from three to fix inches high. The elm, oak, horfe-chefnut, filbert, fig, mulberry, willow, fallow, ofier, afh, lynden, and curran raifed the mercury only one or two inches. But the ever-greens, and the following trees and plants, viz. laurel, rofemary, lauruftine, phyllerea, fuz, rue, barberry, jeffamine, cucumber-branch, pumkin, Jerufalem artichoak, &c. did not raife it at all. Id. ibid. p. 101.

In order to difcover with what force the fap of the vine is pufhed forth in the bleeding feafon, the following experiments were made. Dr. Hales cut off a vine on a weftern afpect, within feven inches of the ground; the remaining ftump having no lateral branches, and being four or five years old, and $\frac{3}{4}$ inch diameter. To the top of this ftump he fixed a glafs tube, twenty five feet high; fecuring the joint with ftiff cement made of bees-wax and turpentine, befides feveral folds of wet bladder faftened over it with Packthread. As the ftem did not at firft bleed into the tube, he filled the tube two feet high with water, which the fame afternoon was imbibed by the ftem within three inches of the bottom. Next day the ftem began to bleed, fo that the fap in the tube continued rifing daily, till it was above twenty-one feet high, and would very probably have rifen higher, if the joint had not feveral times leaked. In the chief bleeding feafon, it would continue rifing night and day; but much more in the day than night; and moft of all in the greateft heat of the day. When the fun fhone hot upon the vine, there was always a continued feries of air bubbles afcending from the ftem through the fap in the tube, in fo great plenty, as to make a large froth on the upper part of the fap, which fhews the great quantity of air drawn in through the roots and ftem. Id. ibid. p. 108.

This force of the rifing fap is five times greater than the force of the blood in the great crural artery of a horfe; feven times greater than the force of the blood in the like artery of a dog; and eight times greater than the blood's force in the fame artery of a fallow doe. Id. ibid. p. 114.

The free communication of the fap veffels of *Plants* appears from hence; that tho' deep gaps or notches be cut in a branch, it will neverthelefs imbibe water in the manner already mentioned. In order to try whether it would not be the fame in branches, as they grow on trees, the Dr. cut two fuch oppofite gaps in a duck-cherry-branch, three inches diftant from each other, notwithftanding which, the leaves of this branch continued green, within eight or ten days as long as the leaves on the other branches of the fame tree. Id. ibid. p. 129.

However, it is the opinion of this excellent author, that there is no uniform circulation of the fap in trees, like that of the blood in animals; for this reafon, that if there were fuch a circulation, the leaves of the ilex grafted upon the Englifh oak would fall in winter equally with thofe of the oak itfelf, which is not found to be the cafe. Id. ibid. p. 149.

And, that the fap does not defcend between the bark and the wood, as the favourers of a circulation fuppofe, feems evident from hence, viz. that if the bark be taken off for three or four inches breadth quite round, the bleeding of the tree above that bared place will much abate, which ought to have the contrary effect, by interrupting the courfe of the refluent fap, if the fap defcended by the bark. But the reafon of the abatement of the bleeding in this cafe may be accounted for, from hence, that the fap is ftrongly attracted upwards by the vigorous operation of the perfpiring leaves. Id. ibid. p. 150.

We have a great many other curious experiments and obfervations, in the fame book, relative to the vegetation and analyfis of *Plants*; which are compofed of the following principles, viz. fulphur, volatile falt, water, earth, and air. See the article AIR, *Suppl.*

The leaves of *Plants* ferve not only as excretory ducts to feparate and carry off the redundant watery fluid, which by being

being long detained in the *Plants*, would turn rancid and prejudicial to them; but likewise to imbibe the dew and rain, which contain salt, sulphur, &c. and to be of the same use to *Plants*, that the lungs are to animals. However, the Dr. remarks, that as *Plants* have not a dilating and contracting thorax, their inspirations and expirations will not be so frequent as those of animals, but depend wholly on the alternate changes from hot to cold for inspiration, and *vice versa* for expiration. Id. ibid. p 326.

But it is from the roots, that by far the greater part of the nourishment of *Plants* is derived. These, therefore, are always found to bear a considerable proportion to the body of the *Plant* above ground; the superficies of the former being about four tenths of that of the latter. Hence, appears the necessity of cutting off many branches from a transplanted tree; because in digging it up, a great part of the roots are cut off. See *Hales*'s Veget. Statics, vol. I. p. 6, 16.

Parasitical PLANTS, among botanists. See the article PARASITE, *Cycl.*

Sensitive PLANT, the English name of a distinct genus of *Plants*, called by botanists *Mimosa*. See the article MIMOSA, *Suppl.*

PLANTAIN-*tree*, the English name of a genus of trees, called by botanists *Plantago*. See the article PLANTAGO, *Suppl.*

PLANTAIN-*tree* is also a name given to the *Musa* of Linnæus. See the article MUSA, *Append.*

Buckshorn PLANTAIN, the name given by some to a species of *Coronopus*. See the article CORONOPUS, *Suppl.*

PLANTAIN-*shot*, a name by which some call the *Canna* and *Cannacorus* of botanists. See the articles CANNA and CANNACORUS, *Suppl.*

Water-PLANTAIN, a name given to several species of *Ranunculus*. See the article RANUNCULUS, *Suppl.*

PLANTATION (*Cycl.*) — As *Plantations* of trees are not only profitable to the owner, as well as ornamental to the country around them, but a national advantage, it may not be improper to give some directions concerning them.

First, then, care must be taken to prepare the ground before trees are taken out of the earth; because they should never be suffered to remain long out of the ground. Care likewise is to be taken not to tear or bruise the roots of the trees, in raising them in order to be transplanted. When taken up, the next thing to be done is to prepare them for planting; which is done by cutting off all the small fibres of the roots, and such roots as are any wise injured in pulling up, or which cross one another. The downright roots of fruit trees are likewise to be pruned off, as should all their irregular branches; that when agitated by the wind, they may not rub against or bruise each other. However, the main shoots ought by no means to be cut off, as is but too often injudiciously practised.

Having thus prepared the trees for *planting*, they are next to be fixed in the ground; in doing which, care must be taken to place them deeper or shallower, according to the nature of the soil; but the best method of all is to raise a hill of earth, wherein to *plant* them. They should be placed as erect as may be, and the earth gently pressed down about their roots; for it is a fault to make it too hard. Pales or stakes should be fixed round them, in order to prevent their being displaced or blown down by the wind.

When the trees are thus *planted* and secured, a little mulch should be laid upon the surface of the ground, to prevent its drying; and as to watering them, it ought to be done with great moderation, nothing being more hurtful to them, than over-watering.

The seasons for *planting* are various, according to the different sorts of trees, or the soil in which they are to be *planted*. For such trees whose leaves fall off in winter, the best time is the beginning of October, provided the soil be dry; but for a wet soil, it is better to defer it to the latter end of February, or the beginning of March; and for many kinds of evergreens, the beginning of April is by far the best season; tho' they may be safely removed at Midsummer, provided they are not to be carried far. They should always be removed in a cloudy moist season, by which means they will take root in a few days.

As the method of cultivating most trees, especially garden ones, is explained under their respective articles, there is the less reason to be particular on that head in this place. However one thing more deserves to be well attended to, as regarding *Plantations* in general. It is this; that *Plantations* should be raised always from trees transplanted from nurseries, and never from hedge-rows, or trees of a large size, because these last seldom come to good account, often dying after continuing alive for many years.

Another general rule in regard to *Plantations*, is, to keep the ground clear of weeds, at least for the space of seven years; for which purpose it should be annually dug, or plowed, where that can be done. This will encourage the roots of the trees to extend themselves, whereby they will draw a larger proportion of nourishment. *Miller*'s Gard. Dict.

PLANTING *Reverse*. It has been already observed, that the branches of trees may be made to serve instead of roots; the putting of which in practice is called *Planting Reverse*. See the article BRANCH, *Suppl.*

Mr. Fairchild of Hoxton gives the following directions on this head. When you have made choice of a young tree of one shoot, whether alder, elm, willow, &c. that will easily take root by layers, the top of the shoot is to be bent gently down into the earth, there to remain till it has taken root; the tree all the while resembling a bow or arch above ground. When the top end is judged to have struck sufficiently strong roots, the old root is to be gently raised out of the ground, and kept in an upright position; after which all the injured parts of the raised roots are to be pruned off, as well as the buds or shoots on the stem of the tree; taking care to rub over these pruned parts with a composition made of four ounces of tallow, as many of bees-wax, two ounces of rosin, and as many of turpentine, melted together in a pipkin; this to be used moderately warm. Vid. *Miller*'s Gardeners Dict.

PLATANOCEPHALUS, in botany, a name used by some botanical writers for the *Cephalanthus*. See the article CEPHALANTHUS, *Suppl.*

PLATANUS, the *Plane-tree* in botany. See the article PLANE-*tree*, *Suppl.*

PLAY (*Cycl.*) — See the article GAMING, *Cycl.*

Duration of PLAY, in the Doctrine of Chances is used for the probability of the play's ending in a given number of games.

In the Cyclopædia, under the article GAMING, the two last problems relate to the duration of *Play*; but this difficult subject has been further pursued by Mr. De Moivre in the second edition of his Doctrine of Chances, p. 162—211.

PLOVER (*Suppl.*)— *Bastard*-PLOVER, a name used in some parts of the kingdom for the *Capella*, or lapwing. See the article CAPELLA, *Suppl.*

PLOUGHMAN, in husbandry, the person who guides the plough in the operation of tilling, or tillage. See the articles PLOUGH and TILLAGE, *Cycl.* and *Suppl.*

PLOUGHMAN's *Spikenard*, the English name of a genus of plants, called by botanists *Conyza*; it is likewise called by us *Flea-bane*. See the article FLEA-*bane*, *Suppl.*

PLUM (*Suppl.*) — *American* PLUM, *Maiden* PLUM, or *Black* PLUM, names given to a distinct genus of plants, called by botanists *Chrysobalanus*. See the article CHRYSOBALANUS, *Suppl.*

Hog-PLUM, the English name of a distinct genus of plants, called by botanists *Spondias*. See the article SPONDIAS, *Suppl.*

Indian date PLUM, a name sometimes given to the *Diospyros* of Linnæus, and *Guajacana* of Tournefort. See the article GUAJACANA, *Suppl.*

PLUNGER, in Mechanics, a solid brass cylinder used as a forcer in forcing pumps. See the articles FORCER and *Forcing* PUMP, *Append.*

POCCOON, a name by which some call the *Sanguinaria*. See the article SANGUINARIA, *Suppl.*

POCK-*wood*, a name sometimes given to *Guaiacum*. See the article GUAIAC, *Cycl.*

PODARIA, in the history of insects, a classical name comprehending all such insects as have limbs, but no wings. See the article APTERIA, *Append.*

Of this class there are two subdivisions. I. Such *Apteria Podaria* as have oblong bodies with numerous legs, or more than six pair: These are the *Iulus*, or gally-worm; the *Scolopendra*, or *Centipes*; and the *Oniscus*, or wood-louse. 2. The *Apteria Podaria* with shorter bodies, and less numerous legs, or fewer than six pair; This subdivision contains numerous genera, as the Pulex, the Podura or Puceron, the Pediculi of various kinds, the Monoculi, the Acari, the Aranei, the Scorpio, and a great many others. See the articles GALLY-*worm*, SCOLOPENDRA, &c. *Suppl.*

PODOPHYLLUM, in the Linnæan system of botany, the name of a genus of plants, called by Tournefort *Anapodophyllum*. See the article ANAPODOPHYLLUM, *Suppl.*

PODURA, in the history of insects, the name by which Dr. Hill calls the *Pucerons*. See the article PUCERON, *Suppl.*

The body of these animals is short and roundish; the tail is crooked and forked, and assists them in leaping. They have three pair of legs, which serve only for walking. The eyes are only two, but each composed of eight others. *Hill*, Hist. Anim. p. 20.

They belong to the class of insects which have limbs, but no wings, and are called by the same author *Podaria*.

POET's *Rosemary*. See the article ROSEMARY, infra.

POINT (*Cycl.* and *Suppl.*)—In the Cyclopædia, a *Point* is defined to be a quantity, which has no parts, or which is indivisible; and Euclid's authority is quoted for this. But it ought to be observed, that the calling a *Point* a quantity; or speaking of indivisible quantities, are absurdities, of which Euclid was never guilty. As to the demonstrations of the proportions of mathematical *Points* to each other, mentioned in the Cyclopædia; they are mere paralogisms. Thus in Mr. Robartes's reasoning [a], supposing with him that the chord of a greater circle, touching a smaller circle at the extremity of its diameter, is $= z$, and the chord of the smaller circle cor-

responding to the common versed sine $= x$, the diameter of the greater circle $= R$, and the diameter of the lesser circle $= S$, it is certain, that $zz = 4R\,x, - 4\,xx$ and that $yy = 4\,S\,x - 4\,xx$, as Mr. Robartes says. But what follows from thence? No more than this, that the ratio of zz to yy is the same with the ratio of $4\,R\,x - 4\,xx$ to $4\,S\,x - 4\,xx$, or dividing both these terms by $4\,x$, as $R - x$ is to $S - x$; and that the ultimate or limiting ratio of zz to yy, is the same with the ultimate or limiting ratio of $R - x$ to $S - x$. But the ultimate ratio of $R - x$ to $S - x$ is the ratio of R to S, and consequently, the ratio of R to S is the ultimate ratio of zz to yy; or, the ratio of $\sqrt{R}$ to $\sqrt{S}$ is the ultimate ratio of z to y. But what then? Does it follow that the terms of this ultimate ratio must be conceived as *Points*? Nothing less. The ultimate ratio of z to y does not imply that the quantities z and y ever exist under this ultimate ratio of $\sqrt{R}$ to $\sqrt{S}$, but only that they may approach to this ratio, so as to differ from it by less than any assigned ratio. Mr. Robartes was misled by the too prevailing language of infinitesimals. See the article FLUXION and LIMITS, *Suppl.*—[a Phil. Transf. N°. 334.]

Singular POINT in geometry, is used for any *Point* of a curve, which has something peculiar to distinguish it from the other *Points* of the curve. *Cramer*, Analyf. des lign. courbes, p. 148.

Of these *Points* there are various kinds, such as *double*, *triple*, &c. or in general, *multiple Points*; *Points of Inflexion* or contrary flexure, &c.

Every *Point* of a curve is *simple*, or *multiple*.

A *simple* POINT, is that which belongs only to one branch of a curve.

A *multiple* POINT is that which is common to several branches of a curve, in particular:

Double POINT is that which is common to two branches of a curve. The conic sections or lines of the second order have no double *Points*; but we find them in the lines of the third order.

Triple POINT is that which is common to three several branches of a curve.

Hence the terms *quadruple*, *quintuple*, &c. *Point* are easily understood.

If a *Point* be supposed to describe a curve, it will pass twice thro' a *double Point*; thrice thro' a *triple Point*, &c.

A *simple* POINT is sometimes *singular*, as when it becomes a *Point* of contrary flexure, of double inflexion, and in many other cases; for a detail of which we refer to *Cramer*, Analyf. de lignes courbes, chap. x. p. 400. seq. and chap. xiii. p. 568. seq.

In the case mentioned in the Supplement, under the head POINT *of contrary Flexure*, where a double infinitely small flexure or inflexion is said to be formed in a *Point*, this *Point* is called by some a *Point of double inflexion*, and by Monsieur de Maupertuis[a], and Mr. Cramer[b], *Point de Serpentement*, and by others, *Point of rectitude*. — [a Mem. Acad. Scien. 1729. p. 277. Ed. Paris. b Analyf. des lignes courbes.]

POINT *of Rectitude*, is defined by Sir *Isaac Newton*, to be that in which the radius of flexure becomes infinite, or its center at an infinite distance: such it is at the vertex of the parabola $a^3x = y^4$.

The *Point of Rectitude* is commonly the limit of contrary flexure: but there are also *Points of Rectitude*, which do not come between the parts of contrary flexure. For the method of investigating these *Points*, see *Newton*'s Meth. of Flux. and Inf. Series. pag. 72.

These *Points of rectitude* are not found in lines of a lower order than the fourth. In lines of this, and of higher orders, a tangent at a *Point* of inflexion may also meet the curve in another *Point*, and if the distance between this *Point* and the *Point* of inflexion be supposed to be infinitely diminished, the secant will become a tangent, and the contact in this case will be equivalent to four intersections, in the same manner that the contact at a *Point* of contrary flexure is equivalent to three intersections. See *Cramer*, lib. cit. p. 403. and *Newton*, Method of Fluxions p. 72.

These *Points of double Inflexion*, are also called *Points of invisible Inflexion*; because in effect they are not sensible, but only known by their analytical properties. Analysts have considered several degrees of these *Points*. *Cramer*, loc. cit.

POINTERS, in ship-building, are pillars in an oblique position, from the floor-rider heads on each side, pointing or meeting each other at the middle of the gun-deck beams. *Blanckley*'s, Naval Expositor, p. 121.

POISON (*Suppl.*)—In the Philosophical Transactions vol. 47. pag. 75. seq. we have an account of several experiments made by Monsieur Herissan, on living animals, with the Indian *Poison* brought over by Monsieur de la Condamine; and mentioned in the Supplement under this head.

This *Poison* which seems to be of a very subtile and dangerous nature is extracted by fire from divers plants, especially from those which the French call Lianes. The Indians in various places of South America prepare this *Poison*, and make use of it for the killing of wild beasts, in this manner:

Those savages are very dextrous at making long trunks, which are the most common weapon used by them in hunting. To these trunks or tubes they fit little arrows made of palm-tree, on which they put a little roll of cotton exactly fitting the bore of the tube. They shoot these with their breath, and seldom miss the mark. They dip the points of these little arrows, as well as of those of their bows, in this *Poison*; which is so active, that in less than a minute, especially when fresh, it kills certain animals, from which the arrow has drawn blood.

Tho' a very small drop of this *Poison*, conveyed into the blood by puncture is sometimes sufficient to kill a man, or at least to cause great disturbance in the animal œconomy, it is quite otherwise when taken in at the mouth; for then it does no sort of mischief. See Phil. Transf. loc. cit.

POISON-*Bush*, a name by which some call the *Tithymalus*. See the article TITHYMALUS, *Suppl.*

POKE or PORK *Physic*, the name by which the *Phytolacca* of botanists is sometimes called. See the article PHYTOLACCA, *Suppl.*

POLE-*cat*, in zoology, the English name of a creature of the weasel-kind, called by authors *Putorius*. See the article PUTORIUS, *Suppl.*

POLEY-*Mountain*, in botany, the English name of a distinct genus of plants, called by botanists *Polium*. See the article POLIUM, *Suppl.*

POLYANTHES, in the Linnæan system of botany, the name of a distinct genus of plants, called by some *Tuberosa*, and *Tuberose Hyacinth*.

The characters are these: There is no cup; the flower consists of one leaf, of an infundibuliform shape; the tube is oblong and crooked; the limb is divided into six segments; the stamina are six subulated filaments, connivent, and of the length of the limb; the antheræ are linear; the germen is roundish, and stands in the bottom of the corolla; the style is filiform, and shorter than the corolla; the stigma is trifid, thick, and covered with a honey-like juice; the fruit is a capsule, of a roundish, but obtusely trigonal form, composed of three valves, containing three cells, and wrapped up in the base of the corolla; the seeds are numerous, semiorbicular, plane, and placed in a double series. *Linnæi* Gen. Plant. p. 140.

POLYANTHUS, the name by which the *primula veris* of botanists is sometimes called. See the article PRIMULA, *Suppl.*

POLYCNEMUM, in the Linnæan system of botany, the name of a distinct genus of plants, called by Tournefort *Camphorata*. See the article CAMPHORATA, *Suppl.*

The characters of it are these: The cup is a subulated, acute, and permanent perianthium, consisting of three leaves; the flower consists of five petals, extremely like those of the cup, only shorter; the stamina are three capillary filaments, shorter than the flower; the antheræ are obtuse; the germen of the pistil is roundish; the style is bifid, and of the length of the stamina; the stigmata are obtuse; the seed, which follows every flower, is single, and has scarce any covering, at most, only a very thin membrane. *Linnæi* Gen. Plant. p. 21.

POLYTRICHUM, πολύτριχον. See the article ADIANTUM, *Suppl.*

POND-*weed* (*Suppl.*)— *Water* POND-*weed*, a name sometimes given to a species of *Persicaria*. See the article PERSICARIA, *Suppl.*

POOR-*man's Pepper*, a name sometimes given to the *Lepidium* of botanical writers. See the article LEPIDIUM, *Suppl.*

POPPY (*Suppl.*)— *Prickly* POPPY, a name by which some call the *Argemone*, a distinct genus of plants. See the article ARGEMONE, *Suppl.*

Spatling POPPY, a name by which the *Lychnis* is sometimes called. See the article LYCHNIS, *Suppl.*

POPULUS, the *Poplar* in botany, the name of a genus of trees. See the article POPLAR, *Suppl.*

PORCUPINE-*fish*, in ichthyology, the English name of several species of *Ostracion*. See the article OSTRACION, *Suppl.*

POROPHYLLUM, a name given by Vaillant to a genus of plants, called by Linnæus *Kleinia*. See the article KLEINIA, *Append.*

POSSET (*Suppl.*) — *Beer*-POSSET. See the article ZYTHOGALA, *Suppl.*

POSTULATE, or POSTULATUM (*Cycl.*) — Authors are not agreed as to the signification of the term *postulatum*. Many, with whom the Cyclopædia agrees, make the difference between axioms and *postulata*, to be the same as that between theorems and problems; axioms, according to those authors, being indemonstrable theoretical truths, and *postulata* indemonstrable practical truths.

But others will have it, that axioms, or common notions are primitive, and common to all things partaking of the nature of quantity, and which therefore may become the objects of mathematical science, such as number, time, extension, weight, motion, &c. and that *postulata* relate particularly to magnitudes strictly so called, or to things having local extension,

fion, fuch as lines, furfaces and folids; fo that in this fenfe of the word *poftulatum*, Euclid, befides axioms, or thofe principles which are common to all kinds of quantity, has affumed certain *poftulata* to be granted him, peculiar to extenfive magnitude. Hence feveral of the principles affumed in his elements, and ranked among the axioms by the moderns, are by Proclus ranked among the *poftulata*; which has induced Dr. Wallis to judge, that the laft of the two fenfes given to the term *poftulatum* is moft agreeable to the meaning of the antient geometers. And thofe who contend for this fenfe of the word, add, that Euclid, in *poftulating* to draw a right line from one point to another, does not mean that any man can actually do this, but only that it may be conceived as poffible. So that *poftulata* are axioms no lefs than the other principles affumed in the elements of geometry, but axioms relating to a particular fubject, and not common to all. *Wallis's* Oper. Vol. 1. p. 667, 668. See the article PRINCIPLE, *Append.*

POTATOES, the Englifh name of the tuberofe-rooted, efculent *Lycoperficon* or *Solanum* of botanical writers. See the article SOLANUM, *Suppl.*

The Englifh name feems evidently formed from *Batatas*, the Indian name of the fame plant. See the article POTATOES, *Suppl.*

Spanifh POTATOE, the name by which fome call feveral fpecies of *Convolvulus*, or bindweed. See the article CONVOLVULUS, *Suppl.*

POTENTILLA, a name ufed by fome for feveral fpecies of *Cinquefoil*. See the article CINQUEFOIL, *Suppl.*

POUCH (*Suppl.*) — *Shepherd's*-POUCH, a name fometimes given to the *Alyffon*, or mad-wort. See the article ALYSSON, *Suppl.*

POWER (*Cycl.* and *Suppl.*) — *Arithmetical* POWER is ufed by Mr. Machin, for compofite numbers or quantities whofe factors are in arithmetical progreffion. See Phil. Tranf. N° 447, and Dr. Martyn's Abridg. Vol. 8. p. 78.

Mr. Machin ufes a particular notation for quantities of this kind. The quantity expreffed by this notation has a double index; that at the head of the root at the right hand, but feparated by a hook to diftinguifh it from the common index, denotes the number of factors; and that above, within the hook on the left hand, denotes the common difference of the factors proceeding in a decreafing or increafing arithmetical progreffion.

Thus the quantity $\overline{n+a}^{\,\overset{a}{\smile}(}$ denotes by its index ^{m} on the right hand, that it is a compofite quantity, confifting of fo many factors as there are units in the number ^{m}; and the index a above on the left, denotes the common difference of the factor's decreafing in an arithmetical progreffion, if it be pofitive; or increafing, if it be negative; and fo fignifies, in the common notation, the common number or quantity, $\overline{n+a}\,.\ \overline{n+a-n}\,.\ \overline{n+a-2a}\,.$ &c.

For example, $\overline{n+5}^{\,\overset{2}{\smile}(6}$ is $= \overline{n+5}\,.\,\overline{n+3}\,.\,\overline{n+1}\,.\,\overline{n-1}\,.\,\overline{n-3}\,.\,\overline{n-5}$, confifting of fix factors whofe common difference is 2. After the fame manner, $\overline{n+4}\,(^5 = \overline{n+4}\,.\,\overline{n+2}\,.\,n.\,\overline{n-2}\,.\,\overline{n-4}$, confifting of five factors. According to which method it will eafily appear, that if a be an integer, then $n\,\overline{+2a+1}^{\,\overset{2}{\smile}(2a+2}$ will be $= \overline{nn-1}\,.\,\overline{nn-9}\,.\,\overline{nn-25}$ continued to fuch a number of double factors as are expreffed by $a+1$, or half the index, which in this cafe is an even number. Thus alfo $\overline{n+2a}^{\,\overset{2}{\smile}(2a+1}$ will be equal to $n.\,\overline{nn-4}\,.\,\overline{nn-16}\,.\,\overline{n-36}$, and fo on, where there are to be fo many double factors, as with one fingle one n, will make up the index $2a+1$, which is an odd number.

If the common difference a be an unit, it is omitted: Thus $\breve{n}\,(^6 = n.\,\overline{n-1}\,.\,\overline{n-2}\,.\,\overline{n-3}\,.\,\overline{n-4}\,.\,\overline{n-5}$, containing fix factors. So $\breve{6}\,(^6 = 6.\ 5.\ 4.\ 3.\ 2.\ 1.$ and the like for others.

If the common difference a be nothing, the hook is omitted, and it becomes the fame with the geometrical *power*: Thus

$$\overline{n+a}^{\,\overset{o}{\smile}(m} = \overline{n+a|}^{\,m}$$ according to the common notation.

The learned author above quoted applies this doctrine of arithmetical *powers* to the inveftigation of the principal rule in the method of fluxions, and its inverfe, which is, that if the ordinate $y = m\,z^{m-1}$, then will the area, or rather the form of the quantity for the area, be $= z^m$; or vice verfa, that if the area be z^m, the ordinate will be $m^{z\,m-1}$; on which occafion he obferves, that the fymbol $\dot{z}$, confidered as a component part of the rectangle $\dot{z}$, may bear a plain interpretation, viz. that it is the meafure according to which the quantity z is meafured. See Phil. Tranf. loc. cit. in the poftfcript. See alfo FLUXION, *Suppl.*

2

PRECESSION (*Cycl.*) — The *preceffion* of the equinoctial points varies; nor are aftronomers entirely agreed as to the quantity of the variation, fo as to eftablifh what the mean *preceffion* is. Dr. Bradley affumes the mean *preceffion* to be one degree in feventy one years and an half. See Phil. Tranf. N° 485. p. 22.

According to this eftimate, the platonic or great year would be equal to 25740 folar years.

Sir Ifaac Newton, in determining the quantity of the annual *preceffion* from the theory of gravity, upon fuppofition that the equatorial is to the polar diameter of the earth, as 230 is to 229, finds the fun's action fufficient to produce a *preceffion* of $9''\frac{1}{7}$ only; and collecting from the tides the proportion between the fun's force and the moon's to be as 1 to $4\frac{1}{2}$, he fettles the mean *preceffion* refulting from their joint actions, at 50″. But fince the difference between the polar and equatorial diameter is found, by the late obfervations of the gentlemen of the Royal Academy of Sciences at Paris, to be greater than what Sir Ifaac had computed it to be; the *preceffion* arifing from the fun's action muft likewife be greater than what he has ftated it at, nearly in the fame proportion. From whence it will follow, that the moon's force muft bear a lefs proportion to the fun's, than $4\frac{1}{2}$ to 1. See Dr. *Bradley* in Philofoph. Tranf. N° 485, pag. 37.

PREVENTERS, on board a fhip of war, are ropes of different fizes, cut into fhort lengths, and knotted at each end, to be ready in cafe a fhroud fhould be fhot or broke, that they may be feized to them. *Blanckley's* Naval Expofitor, p. 123.

PRICKET, among fportfmen. See the article SPITTER, *Append.*

PRICK-*Madam*, the name of a fpecies of *Sedum*; the fame with the yellow houfe-leek, with fharp-pointed leaves. See the article SEDUM, *Suppl.*

PRICK-*Timber*, a name fometimes given to the *Euonymus*, or fpindle-tree. See the article EUONYMUS, *Suppl.*

PRIEST'S *Pintle*, in botany, a name by which *Arum*, or wake-robin is fometimes called. See the article ARUM, *Suppl.*

PRIMROSE, the Englifh name of a genus of plants, called by botanifts *Primula veris*. See the article PRIMULA VERIS, *Suppl.*

PRIMROSE-*tree*, or *Night*-PRIMROSE, the Englifh name of a genus of plants, known among authors by that of *Onagra*; See the article ONAGRA, *Suppl.*

PRINCIPLE (*Cycl.*) — Philofophers and mathematicians are generally agreed in admitting that there are axioms, that is, certain indemonftrable truths, which muft be reckoned among the principles of human knowledge in the ftricteft fenfe. Hobbes feems to advance the contrary, when he fays, in his logic, or firft part of his book de Corpore, that definitions, or their parts, are the only primary propofitions (*propofitiones primæ*) that is, *principles* in an abfolute and ftrict fenfe. But this doctrine of Hobbes cannot be admitted. For however true it may be in itfelf, and with refpect to the divine mind, it feems certain, that the human mind has never yet attained, and perhaps never will attain to a perfect analyfis of its own notions in all cafes. And wherever this analyfis ceafes, definitions ceafe with it; and where definitions ceafe, we are forced, if we would demonftrate any thing of the undefined fubject, to have recourfe to axioms, or to indemonftrable truths admitted by all men, tho' never yet demonftrated by any one. This will appear evident to thofe who attentively confider Euclid's Elements. This great geometer, it is known, does not, ftrictly fpeaking, define a right line; becaufe he could not probably, analyfe the notion of rectitude; for that which is commonly called his definition of a right line, in the beginning of his elements, is no definition, nor is it ever applied afterwards, as the definitions of an equilateral triangle, a fquare, and a circle are. But to fupply the place of a definition, he has affumed the axioms, that two right lines cannot comprehend a fpace; and that they cannot have a common fegment; and thefe axioms become of ufe more than once afterwards. No one has as yet been able to fupply with fuccefs what Euclid omitted to do; for tho' fome, both ancients and moderns, have demonftrated feveral very plain axioms, as that the whole is greater than its part, yet none have demonftrated all the principles of extenfive magnitude affumed by Euclid, which Proclus and others chofe to diftinguifh by the name of *Poftulata*. See the article POSTULATE, *Append.*

Hobbes brings this very inftance of the demonftration that a whole is greater than its part, to prove, that the propofitions commonly called axioms, are not, ftrictly fpeaking, primary, but only fecondary propofitions, and really deducible from definitions. Had he attempted the demonftration of all Euclid's axioms and poftulata, he would foon have found that he had made a rafh induction; and what he gives for a demonftration of the properties of parallels, evidently fhews, how little able he was to fupply what Euclid had omitted. What is here faid of Hobbes, may be applied to others who have attempted to refine upon Euclid, and who have been fond of carrying the analyfes of their demonftrations beyond him.

him. They have all shewn their inability of demonstrating, without taking some axioms or postulata for granted; and indeed most of them expresly admit this, only contending that the *principles* they assume are more evident than those of Euclid. But whether they be so, or not, is of no importance to the present question, which is, whether we are not often obliged to have recourse to axioms, that is, to self-evident, or indemonstrable truths, in the strictest sense; and whether these can be supplied by deductions, or syllogistic reasoning, from definitions only. We should not have taken any notice of this question, had not Hobbes and other metaphysicians and logicians of repute run counter to the common opinion.

But tho' we are forced to assume axioms and postulata in geometry, it may be a question, whether any thing of this kind be necessary in arithmetic, or the science of numbers; and whether the analyses of our notions may not here be carried up to the notions of unity, and of the act of addition, *tamquam possibilia prima*; and whether it was not some consideration of this kind that led Aristotle to say, that arithmetic was more accurate (ακριβέστερον) than geometry. It is certain at least, that the analysis may be, though it seldom is, carried farther in the former than in the latter of these sciences. Because the axioms commonly assumed, and peculiar to arithmetic, such as the addition and multiplication tables, are no more than the aggregates of the simple signs, or simple notations of numbers; and may easily be demonstrated from the definitions of the simple signs made use of; such as that $1+1=2$; $2+1=3$; $3+1=4$, &c.

Bishop Berkeley [a] observes very justly, that the *principles* of science are neither objects of sense nor imagination, but notions of relation, that is, acts of the mind. Thus, space, time, number [b] are not objects of sense or imagination, altho' the things coextended with space or time, or things numbered, be objects of sense. This is most evident in number, which is plainly different from the perception of the things numbered. Nor can the act by which we number be taught or exemplified. For instance, that act of the mind by which we conceive $1+1=2$, cannot be explained or analysed into others; and supposing it could, we must still stop somewhere, and wherever that be, there is something a disciple must have *a se, non a præceptore*, as Aristotle says. So that, strictly speaking, *principles* are not taught. And those who maintain them innate, are perhaps not so absurd as Locke pretends. [[a] Reflections on Tar-water, Art. 264. [b] Ibid. Art. 288.]

Leibnitz maintained, that the *principles* of contradiction, and of a sufficient reason, were the foundations of all science; that the first was sufficient for the demonstration of all necessary, and the other of all contingent, truths. But though it be true, that the *principle* of contradiction, that is, the *reductio ad absurdum*, often occurs expresly, and is oftner implied in geometry; yet by what has been said it appears, that this *principle* alone is not sufficient to demonstrate all the other universally received *principles* of that science. Far less is it true, that we are enabled by the *principle* of a sufficient reason, which amounts to the exclusion of pure chance out of the universe, to demonstrate all physics and morals; but additional *principles* derived from experience, must be assumed.

PRIVIES *of a Camp*. See the article CAMP, *Append.*

PRIVET (*Suppl.*) — *Mock* PRIVET, a name sometimes given to the *Phillyrea* of botanists. See the article PHILLYREA, *Suppl.*

PROCELLARIA, in ornithology, the name used in the Stockholm Transactions, and elsewhere, for the *storm-fink*, or *storm-bird*. See STORM, *Suppl.* and PETREL, *Append.*

PROBABILITY (*Cycl.*) — In the doctrine of *Probability*, one important observation may be made, *viz.* that if one premiss only of an argument be probable, the conclusion is necessarily probable. But if two or more premisses be *probable* the conclusion will not be necessarily *probable*. Thus for instance, supposing the *Probability* of each premiss expressed by $\frac{7}{10}$; the *Probability* of the conclusion will be but $\frac{49}{100}$, which shews it to be improbable. For we may call any thing *improbable*, if the measure of the chance for its happening is less than $\frac{1}{2}$. If there had been three premisses, and the *Probability* of each equal to $\frac{7}{10}$, the *Probability* of the conclusion would be $\frac{343}{1000}$, which is considerably improbable. Again, supposing the *Probability* of the truth of each premiss to be 2 to 1 or expressed by $\frac{2}{3}$, the probability of the conclusion in the case of the two premisses would be $\frac{4}{9}$. Where three premisses are assumed to infer a conclusion, this would be $\frac{8}{27}$; and in case of four premisses, the *Probability* of the conclusion would be but $\frac{16}{81}$, which is less than $\frac{1}{4}$, so that one might with advantage lay 4 to 1 against the truth of a conclusion founded on four probable premisses, for the truth of which separately taken 2 to 1 might be laid. It is to be observed in all these cases, that the premisses are supposed independent, that is, not necessarily connected with each other.

Hence it is easy to account, how it happens, that the most plausible political and physical reasonings, lead so often to conclusions false in fact.

Mr. de Moivre has solved two problems, tending to establish the degree of assent that ought to be given to experience. He determines from his solutions, that if after taking a great number of experiments, it should have been observed, that the happenings or failings of an event have been very near in a ratio of equality, it may safely be concluded, that the *Probabilities* of its happening or failing, at any one time assigned, are very near equal.

And if after taking a great number of experiments, it should be perceived, that the happenings and failings have been nearly in a certain proportion, such as 2 to 1, it may safely be concluded, that the *Probabilities* of happening or failing at any one time assigned, will be very near in that proportion; and that the greater the number of experiments has been, so much the nearer the truth will the conjectures be, that are derived from them.

Chance very little disturbs the events which, in their natural institution, were designed to happen or fail according to some determined law. For if in order to help our conception we image a round piece of metal, with two polished opposite faces, differing in nothing but their colour, whereof one may be supposed to be white and the other black, it is plain that this piece may with equal facility exhibit a white or black face; and we may even suppose that it was framed with that particular view of shewing sometimes the one face, sometimes the other; and that consequently, if it be tossed up, chance will decide the appearance. But altho' chance may produce an inequality of appearance, and that a greater inequality, according to the length of time in which it may exert itself, still the appearance, either one way or the other, will perpetually tend to a proportion of equality. This is, in like manner applicable to a ratio of inequality; and thus in all cases it will be found, that although chance produces irregularities, still the odds will be infinitely great, that in process of time, those irregularities will bear no proportion to the recurrency of that order which naturally results from original design. See *De Moivre*'s Doctrine of Chances, p. 231.—243.

PROBLEM (*Cycl.*) — *Kepler*'s PROBLEM (*Cycl.*) — As to the solution of this *problem*, the late excellent mathematician Mr. Machin observes, that many attempts have been made, at different times, but never yet with tolerable success, towards the solution of the *problem* proposed by Kepler: To divide the area of a semicircle into given parts, by a line from a given point of the diameter, in order to find an universal rule for the motion of a body in an elliptic orbit. For among the several methods offered, some are only true in speculation, but are really of no service. Others are not different from his own, which he judged improper. And as to the rest, they are all some way or other so limited and confined to particular conditions and circumstances, as still to leave the *problem* in general untouch'd. To be more particular, it is evident, that all constructions by mechanical curves are seeming solutions only, but in reality unapplicable; that the roots of infinite series are, upon account of their known limitations in all respects, so far from affording an appearance of being sufficient rules, that they cannot well be supposed as offered for any thing more than exercises in a method of calculation. And then, as to the universal method, which proceeds by a continued correction of the errors of a false position, it is, when duly considered, no method of solution at all in itself; because unless there be some antecedent rule or hypothesis to begin the operation (as suppose that of an uniform motion about the upper focus, for the orbit of a planet; or that of a motion in a parabola for the perihelion part of the orbit of a comet; or some other such) it would be impossible to proceed one step in it. But as no general rule has ever yet been laid down to assist this method, so as to make it always operate, it is the same in effect as if there were no method at all. And accordingly in experience it is found, that there is no rule now subsisting but what is absolutely useless in the elliptic orbits of comets; for in such cases there is no other way to proceed but that which was used by Kepler. To compute a table for some part of the orbit, and therein examine if the time to which the place is required, will fall out any where in that part. So that, upon the whole, it appears evident, that this *problem* (contrary to the received opinion) has never yet been advanced one step towards its true solution. Vid. *Machin*, in Phil. Transf. N° 447. and Martyn's Abridg. Vol. 8. p. 73.

Mr. Machin afterwards proceeds to give his own solution of this *problem*, which is particularly necessary in orbits of a great excentricity; and he illustrates his method by examples, for the orbits of Mercury, of Venus, of the Comet of the year 1682, and of the great Comet of the year 1680, all which shew the universality of that method. See Phil. Transf. loc. cit.

PROPERTY (*Cycl.*) — In the law of England, strictly speaking, that which is called an *estate* in lands and tenements, is termed a *property* in personal chattels, the law considering the first as permanent, the other as temporary and precarious. Peer Williams's Reports, p. 3.

PROSCARABÆUS, in zoology, the name by which some call the *Meloe*, a genus of four-winged flies. See the article MELOE, *Append.*

PSEUDO-*Fumaria*, in botany, a name used by some for a species of *Fumitory*. See the article FUMARIA, *Suppl.*

PSEUDO-*Lotus*, in botany, a name by which some call the *Guaiacana* of Tournefort. See the article GUAIACANA, *Suppl.*

PSEUDO-*Viburnum*, in botany, the name given by Rivinus to a species of *Lantana*. See the article LANTANA, *Suppl.*

PUDDING-*grass*, a name by which the *pulegium*, or pennyroyal, a species of mint, is called. See the articles MENTHA and MINT, *Suppl.*

PUDDING-*pipe-tree*, the English name of a genus of plants, called by botanical writers *Cassia*. See the article CASSIA, *Suppl.*

PUDENDUM-*regale*, a name used by Columna for the *Aphrodita*, a genus of sea-insects. See the article APHRODITA, *Append.*

PULEX-*Aquaticus*, the *water-flea*, a name sometimes used for the water beetles. See the article DYTISCUS, supra.

PULMONES-*marini*, in zoology, a name used by several authors for the *Urticæ marinæ*. See the article URTICA *marina*, *Suppl.*

PUMP (*Cycl.*) — The description of the *Forcing-pump*, given in the Cyclopædia, is erroneous. This kind of *Pump* consists of a barrel, in which there is a forcer, that is, a piston, or embolus without a valve, which moves up and down in the barrel. This communicates with two pipes, the one called a *sucking pipe*, which goes down into the well, and the other called a *forcing pipe*, which goes upwards. There are two valves; the one at any place of the sucking pipe, the other in the forcing pipe, both of which let the water go up, and hinder it from going down. Then when the forcer is moved upwards, as it rarifies the air in the sucking pipe (for the valve in the forcing pipe hinders the outward air, which presses upon it, from going through) the water rises in it, till after several strokes it comes to the forcer; then at every time the forcer goes down, the water that is pressed downwards, being hindered from going through the valves of the sucking pipe, opens and goes through the valves in the forcing pipe. When the forcer goes up again, then the water in the forcing pipe shuts the valves there by its pressure, and consequently the water in the well will rise up in the part of the forcing pipe, between that valve and the sucking pipe; and the same happens at every motion of the forcer.

It is to be observed in the *Forcing-pump*, that the nearer the forcer comes to the well, the better it is. See *Desagulier's* Course of Experim. Philosf. p. 160, 161.

As to the various kinds of *Forcers*, see the article FORCER *Append.*

The *Pump* described in the Cyclopædia, under the name *Forcing-pump*, is properly a *lifting-pump*; and the common *Pump*, which works by the pressure of the air, is called a *Sucking-pump*. Dr. Desaguliers, in his course of Experimental Philosophy, [a] has given a full account of the construction of all these kinds of *Pumps*, and of some others more complex; as also of their buckets, valves, and other parts belonging to them. [[a] Vol. 2. p. 152, to 166.]

Air-PUMP. See the article AIR-*pump*, *Cycl.*

There are several inconveniencies attending AIR-*pumps* of the common form, tho' much improved from what they used to be formerly. These inconveniencies are enumerated, and a method shewn to remedy them, by Mr. *Smeaton*, in the Phil. Transf. Vol. 47. p. 415, seq.

This ingenious artist has succeeded so well in his construction of the *Air-pump*, as to be able to rarify air a thousand times; whereas the best of the common *Air-pumps*, esteemed good in their kind, and in complete order, never rarified it above one hundred and forty times.

Mr. Smeaton's *Air-pump* acts also as a condensing engine, by the very simple apparatus of turning a cock. So that this *Air-pump* is an universal engine, for shewing any effect arising from an alteration in the density or spring of the air, and with a little addition may be made to shew the experiments of the air-fountain, wind-gun, &c. See the Phil. Transf. loc. cit. p. 422, seq.

PUMPELMOES, a name sometimes used for a species of Orange. See the article ORANGE, *Suppl.*

PURGING-*nut*, or *Physic-nut*, the name by which some call the *Ricinoides*, a distinct genus of plants. See the article RICINOIDES, *Suppl.*

PURPLE-*wort*, a name given to several species of trefoil, of a purple colour. See the article TREFOIL, *Suppl.*

PURSLAIN (*Suppl.*)—*Sea*-PURSLAIN, a name by which some call two very different genuses of plants, the *Atriplex* and *Chenopodium*. See the articles ATRIPLEX and CHENOPODIUM, *Suppl.*

PUTREFACTION (*Suppl.*) — It is an observation of Lord Bacon, that an inquiry into the means of preventing or staying *putrefaction*, is of excellent use in physic. Dr. Pringle has made a great many curious experiments and remarks on this subject, which are published by way of Appendix to his Observations on the Diseases of the Army.

Putrefaction is one of the instruments of nature, by which many great changes are brought about. With regard to medicine, we know that neither animal nor vegetable substances can become aliment, without undergoing some degree of *Putrefaction*. Many distempers proceed from a deficiency of this action. The crisis of fevers seems to depend upon it; and even animal heat, according to Dr. Stevenson, does the same. See the article HEAT, *Suppl.*

Now, that the concoction of the humours is nothing else but *Putrefaction*, seems probable from hence, that whenever they are in that state, they are always more fluid, and fitter to pass through the smaller vessels, where they stagnated before. Again, the offensiveness of the sweats, or other excretions consequent on a crisis, is likewise a sure sign of a high degree of corruption. The time of resolution or *Putrefaction* depends on the degree of heat, the habit of the patient, and on the part obstructed. Resolution is the *Putrefaction* of the impacted humour only, but suppuration implies a corruption of the vessels also. This manner of speaking, indeed, has been disused, from the prejudice that nothing was putrid but what was offensively so; whereas, in fact, every fibre becoming more tender, and humour thinner, may be considered as putrid in some degree, whether the change tends to the better health, or to the destruction of the person, or whether it becomes grateful or offensive to the senses. *Pringle*, Observ. on Diseas. of the Army. p. 337.

Mr. Boyle has used the words *fermentation* and *Putrefaction* of the blood promiscuously, in his treatise on the human blood. Stahl and other celebrated chemists likewise use the terms *putrid ferment*. See the article FERMENT, *Suppl.*

Putrefaction is always found to generate air. Hence, though flesh, as well as blood, be specifically heavier than water, yet dead bodies are found to float, after lying some time at the bottom, from air generated in the bowels by *Putrefaction*.

Now, as it has been found by experiments, that the blood and other animal substances begin to emit air, before they are so far corrupted, as the same frequently are in putrid diseases, it is probable that several of the symptoms in deep surfeits may be owing to the action of the confined air.

As all the humours of animal bodies become thinner by *Putrefaction*, so the solid or fibrous parts are thereby relaxed or rendered more tender. And hence the extraordinary bulk of the heart, liver, and spleen, incident to persons labouring under putrid diseases, may be accounted for. It is remarkable, that in dissections of people who die of the plague, the heart is almost always found of an uncommon bigness; and as to the scurvy, the liver and spleen are sometimes inlarged to such a degree, that the tumour may be seen outwardly. Id. ibid. p. 391, seq.

It being a received opinion, that bodies become highly alkaline by *Putrefaction*, the Doctor made the following experiments, in order to discover how far this might be true.

The serum of human blood *putrified*, made, with a solution of sublimate, first a turbid mixture, and afterwards a precipitation; which is indeed one of the tests of an alkali, but not to be admitted here, since the same thing was done with the recent urine of a person in perfect health, which is never accounted alkaline. The same serum did not tinge the syrup of violets green, and made no effervescence when the spirit of vitriol was poured upon it. The experiment was twice made upon portions of different serums, both highly putrid; and once on water, in which corrupted flesh had been sometime infused; and the most that could be found was, that a reddish cast having been previously given to the syrup with an acid, this colour was rendered fainter, but not destroyed by the *putrid* humours. And as to effervescence, the spirit of vitriol being dropped into those liquors unmixed, and also diluted with water, the mixture was quiet, and only a few air-bubbles appeared on shaking the glasses.

Upon the whole, though there were some marks of a latent alkali in the putrid serum, they were so very faint, that a quantity of water equal to that of the putrid liquors, mixed with only one drop of spirit of hartshorn, being put to the same trial, shewed more of an alkaline nature, than any of the other.

It has also been a maxim, that all animal substances, after *Putrefaction*, being distilled, send forth a great quantity of volatile salt in the first water; but Mr. Boyle found, that this held good only in urine; and that in the distillation of the serum of human blood *putrefied*, the liquor which came over first had little strength, either as to its smell or taste, and did not at first effervesce with an acid. And here it may be observed, that the chemists have generally applied those properties which they discovered in urine, to all the humours indifferently; whereas, in fact, there is a great diversity: for some animal substances, such as urine, the bile, and the crassamentum of the blood, soon putrefy; the serum, the saliva, and the white of an egg, slowly. Yet those that soonest corrupt, do not always arrive at the highest degree of *Putrefaction*: thus, the bile is soonest corrupted, but the rankness of it is not to be compared to that of flesh; and the white of an egg is not only much less disposed to putrify than the yolk, but when corrupted, yields a different and less offensive smell.

Doctor Pringle farther observes, that it seems peculiar to stale urine to contain an alkaline salt, which, without distillation, makes

makes a ſtrong effervefcence with acids. Whereas moſt other animal humours putrefied, though of a more intolerable fœtor, yet contain leſs volatile ſalt, leſs extricable, and then not effervefcing with acids. But, what makes the difference between ſtale urine, and other putrid ſubſtances ſtill more ſpecific, is its inoffenſiveneſs with regard to health; whilſt the ſteams of moſt other corrupted bodies are often the cauſe of putrid and malignant diſeaſes. So far then from dreading the volatile alkali as the deleterious part of corrupted bodies, it ſhould rather ſeem to be a corrector of *Putrefaction*. *Pringle* obſerv. on the diſ. of the army.

But ſtill there remains a prejudice, as if theſe ſalts being the produce of corruption, ſhould therefore haſten *Putrefaction*; and that not only in diſtempers where they are unwarily taken, but alſo in experiments out of the body. As to the effects ariſing from the internal uſe of them, little can be ſaid, unleſs the kind of diſeaſe were preciſely ſtated: for ſuppoſing theſe ſalts were by their nature diſpoſed to promote *Putrefaction*; yet if that is already begun, from a languor of circulation, and obſtruction, then may the volatiles, by their ſtimulating and apperient qualities, be the means of ſtopping its progreſs; and, on the other hand, though they were really antiſeptic, yet, if the humours are diſpoſed to corrupt, from exceſs of heat or motion, theſe very ſalts by adding to the cauſe, may augment the diſeaſe. So that upon the whole, it ſeems to be the faireſt criterion of the true nature of theſe volatiles, to enquire whether they accelerate or retard *Putrefaction* out of the body.'

In order to decide this queſtion, repeated experiments were made, by joining both the ſpirit and the ſalt of hartſhorn to various animal ſubſtances; and it was conſtantly found, that ſo far from promoting *Putrefaction*, they evidently hindered it, even more powerfully than common ſea-ſalt. Hence, the Doctor thinks it probable, that the ſame taken by way of medicine, will likewiſe prove antiſeptic; or at leaſt, that we cannot juſtly ſuppoſe them corrupters of the humours, more than fermented ſpirits or ſea-ſalt.

With regard to the *Putrefaction* of dead bodies, it is found that ſome parts corrupt much ſooner than others. Thus, as the abdominal viſcera and muſcles corrupt the ſooneſt, it is a rule with anatomiſts, to begin their diſſections and demonſtrations with thoſe parts, the quick *Putrefaction* of which may be aſcribed to the putrid ſteams of the fæces. Next to the abdominal viſcera and adjacent parts, the lungs are commonly ſooneſt tainted; either from the air ſtagnating in the veſiculæ bronchiales, or from ſome remains of perſpirable matter, that by acting as a ferment, may haſten the *Putrefaction*. Id. ibid. p. 392.

It is obſervable, that the *Putrefaction* of meat, and other ſubſtances, advances quicker in a confined than free air; for, as the moſt putrid parts are alſo the moſt fugitive, they inceſſantly iſſue from a corruptible ſubſtance, and diſperſe with the wind; but, in a ſtagnation of air, they remain about the body; and, in the nature of a ferment, excite its corruption.

Putrefaction is one cauſe of bilious and intermitting fevers, the dyſentery, malignant or peſtilential fevers, the ſcurvy, lepra Arabum, &c. See the articles Bilious, Dysentery, Malignant, &c. *Append.*

Thoſe ſubſtances which reſiſt *Putrefaction*, are called *Antiſeptics*, and the promoters of it *Septics*. See the articles Antiseptics and Septics, *Append.*

Putrefaction of the blood. See the article Blood, *Append.*

PUTRID *ferment.* See the article Ferment, *Suppl.*

Putrid *fever.* See the articles Bilious and Malignant.

PUTREFIERS, among phyſicians, the ſame with *Septics*. See the article Septics, *Append.*

PYE, or Magpye, in ornithology. See the article Pica, *Suppl.*

Sea-Pye, in ichthyology, the Engliſh name of the *Pica marina*. See the article Pica *marina*.

PYROMETER, the name of a machine contrived to meaſure the alteration of the dimenſions of metals, ariſing from heat.

Muſchenbroek, who was the original inventor of this machine, has given a table of the expanſion of the different metals, in the ſame degree of heat. See the article Heat, *Append.*

As to the conſtruction of the *Pyrometer*, the curious may conſult Deſagul. Experim. Philoſoph. p. 421, ſeq.

But it has been obſerved, that Mr. Muſchenbroek's *Pyrometer* was liable to ſome objections, and theſe have been removed, in a good meaſure, by Mr. Ellicott, who has given a deſcription of his improved *Pyrometer* in the Philoſophical Tranſactions, N° 443. This may alſo be ſeen in Dr. Martyn's Abridgment, vol. 8. p. 464.

In this *Pyrometer* the lengthening of a bar of metal by heat $\frac{1}{7\,2\,0}$ of an inch, will carry an index once round a circle divided into 360 degrees, ſo that if the metal lengthens the 7200th part of an inch, the index will move one degree. ibid.

By the help of this inſtrument Mr. Ellicott found, upon a medium, that the expanſions of bars of different metals, as nearly of the ſame dimenſions as poſſible, by the ſame degree of heat, were as follows:

Gold,	Silver,	Braſs,	Copper,	Iron,	Steel,	Lead,
73	103	95	89	60	56	149

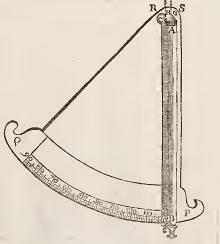
The great difference between the expanſions of iron and braſs, has been applied with good ſucceſs to remedy the irregularities in pendulums ariſing from heat. Phil. Tranſ. Vol. 47. p. 485. See the articles Heat and Pendulum, *Append.*

PYTHAGORIC, or *Abacus* table. See the article Table, *Cycl.*

QUADRANT (*Cycl.*) — *Davis*'s QUADRANT. When the horizon is obſcured by hazy weather, *Davis*'s *Quadrant* is of no uſe; and this often occaſions melancholy conſequences. Means have therefore been ſought after to remedy this defect. Mr. Leigh propoſes a water-level to be fixed to the *Quadrant*; and he likewiſe has given the deſcription and uſe of an apparatus to be added to this inſtrument, conſiſting of a mercurial level, which he prefers, no doubt juſtly, to a water-level. See Phil. Tranſ. N° 431. Sect. 1 and 2.

Hadley's QUADRANT, the common name for the juſtly eſteemed *Quadrant*, invented by the late John Hadley, Eſq; This *Quadrant*, which at firſt had the fate of all other ingenious inventions, to be neglected by ignorant and obſtinate men, even though highly uſeful to them in their profeſſion, ſeems at laſt to have made its way, in ſpite of habit and prejudice.

We cannot here inſert a full deſcription and draught of this inſtrument; but we muſt obſerve, that though the late Mr. Hadley was undoubtedly the inventor of it, yet the principle upon which his invention turns, had not eſcaped the ſagacity of Sir Iſaac Newton, long before, as appears from a paper in his hand-writing found among the papers of the late Dr. Halley. But this was totally unknown to Mr. Hadley, and ſeemed to have been forgot by Dr. Halley himſelf. The account of Sir Iſaac's invention is inſerted in the Philoſophical Tranſactions, N° 465, and in Dr. Martyn's Abridgment, vol. 8. p. 129. and is as follows:



P Q R S denotes a plate of braſs accurately divided in the limb D Q, into $\frac{1}{2}$ degrees, $\frac{1}{2}$ minutes, and $\frac{1}{12}$ minutes, by a diagonal ſcale; and the $\frac{1}{2}$ degrees, $\frac{1}{2}$ minutes, and $\frac{1}{12}$ minutes, counted for degrees, minutes, and $\frac{1}{6}$ minutes. A B is a teleſcope, three or four feet long, fixed on the edge of the braſs plate. G is a ſpeculum, fixed on the ſaid braſs plate perpendicularly, as near as may be to the object glaſs of the teleſcope, ſo as to be inclined 45 degrees to the axis of the teleſcope, and intercept half the light which would otherwiſe come through the teleſcope to the eye. C D is a moveable index, turning about the center C, and, with its fiducial edge, ſhewing the degrees, minutes, and $\frac{1}{6}$ minutes, on the limb of the braſs plate P Q; the center C, muſt be over-againſt the middle of the ſpeculum G. H is another ſpeculum, parallel to the former, when the fiducial edge of the index falls on $00^{d}\ 00'\ 00''$; ſo that the ſame ſtar may then appear through the teleſcope, in one and the ſame place, both by the direct rays and by the reflected ones; but if the index be turned, the ſtar will appear in two places, whoſe diſtance is ſhewed, on the braſs limb, by the index.

By this inſtrument the diſtance of the moon from any fixed ſtar is thus obſerved: view the ſtar through the perſpicil by the direct light, and the moon by the reflected (or, on the contrary) and turn the index till the ſtar touch the limb of the moon, and the index ſhall ſhew upon the braſs limb of the inſtrument, the diſtance of the ſtar from the limb of the moon; and though the inſtrument ſhake, by the motion of your ſhip at ſea, yet the moon and ſtar will move together, as if they did really touch one another in the heavens; ſo that an obſervation may be made as exactly at ſea as at land. And, by the ſame inſtrument may be obſerved, exactly, the altitudes of the moon and ſtars, by bringing them to the horizon; and thereby the latitude, and times of obſervations, may be determined more exactly than by ways formerly practiſed. In the time of obſervation, if the inſtrument move angularly about the axis of the teleſcope, the ſtar will move in a tangent of the moon's limb, or of the horizon; but the obſervation may notwithſtanding be made exactly, by noting when the line, deſcribed by the ſtar, is a tangent to the moon's limb, or to the horizon. To make this inſtrument uſeful, the teleſcope ought to take in a large angle: And to make the obſervation true, let the ſtar touch the moon's limb, not on the outſide of the limb, but on the inſide. Vid. Philoſoph. Tranſact. N° 465. p. 155, 156.

For the common uſes at ſea a teleſcope is not neceſſary; Mr. Hadley's Quadrants are therefore generally made without one, which renders the uſe of them much more ready. He has alſo added ſome contrivances to facilitate their uſe; which are deſcribed in the printed papers uſually ſold with the inſtrument.

Other *Quadrants* have been contrived ſince, by ſome ingenious artiſts, all of which have their merit, but the particulars of their conſtructions are too many for this place; and perhaps on the whole nothing preferable to Mr. Hadley's invention has yet been found.

Mural QUADRANT. Mr. Geiſten has lately given us a deſcription of a new aſtronomical *mural Quadrant*, which he ſays is free from many of the uſual inconveniencies attending the uſe of ſuch inſtruments. See Phil. Tranſ. N° 483. Sect. 18.

QUADRIGA, in ſurgery, otherwiſe called CATAPHRACTA, is a ſtrong bandage made uſe of in fractures of the *Sternum*. It is compoſed of a double headed roller about ſix Paris ells long, and three or four fingers broad. See *Heiſter*'s Surgery, P. III. Ch. 4. §. 14.

QUADRILLE, a well known game at cards; and which has been, in ſeveral caſes, the object of mathematical computations. See Mr. *De Moivre*'s Doctrine of Chances, 2d edit. p. 83 to 90.

QUAKING-*graſs*, in botany. See the article GRASS, *Append.*

QUANTITY (*Cycl.*) — The note in the Cyclopædia, from Mr. Machin's paper in the Phil. Tranſ. N° 447. ſhould have been extended, as it ſerves to render the notions of mathematical *Quantity* more diſtinct and adequate than any thing that is commonly to be met with in authors on this ſubject. Not to give the reader the trouble of turning to the Cyclopædia for the ſake of a few lines, we ſhall inſert the whole. Mr. Machin, in the poſtſcript to the ſolution of Kepler's problem, inſerted in the before cited number of the Phil. Tranſ. ſays,

That he takes a mathematical *Quantity*, and that for which any ſymbol is put, to be nothing elſe but number with regard to ſome meaſure which is conſidered as one. For we cannot know preciſely and determinately, that is, mathematically, how much any thing is but by means of number. The notion of continued *Quantity*, without regard to any meaſure, is indiſtinct and confuſed; and although ſome ſpecies of ſuch *Quantity*, conſidered phyſically, may be deſcribed by motion, as lines by points, and ſurfaces by lines, and ſo on; yet the magnitudes or mathematical *Quantities* are not made by that motion, but by numbering according to a meaſure.

Accordingly, all the ſeveral notations that are found neceſſary to expreſs the formations of *Quantities*, do refer to ſome office or property of number or meaſure; but none can be interpreted to ſignify continued *Quantity* as ſuch.

Thus ſome notations are found requiſite to expreſs number in its ordinal capacity, or the *numerus numerans*, as when one follows or precedes another, in the firſt, ſecond, or third place from that upon which it depends; as the *Quantities* $x^{\backprime}$, $x^{\backprime\backprime}$, x, x', x'', referring to the principal one x.

So, in many caſes, a notation is found neceſſary to be given to a meaſure as a meaſure; as for inſtance, Sir Iſaac Newton's ſymbol for a fluxion $\dot{x}$; for this ſtands for a meaſure of ſome kind, and accordingly he uſually puts an unit for it, if it be the principal one upon which the reſt depend.

So ſome notations are expreſly to ſhew a number in the form of its compoſition, as the index to the geometrical power x^{n}, denoting the number of equal factors which go to the compoſition of it, or what is analogous to ſuch.

But that there is no ſymbol or notation but what refers to diſcreet *Quantity*, is manifeſt from the operations, which are all arithmetical.

And hence it is, there are ſo many ſpecies of mathematical *Quantity* as there are forms of compoſite numbers, or ways in the compoſition of them; among which there are two more eminent for their ſimplicity and univerſality than the reſt; one is the *geometrical power*, formed from a conſtant root; and the other, though well known, yet wanting a name, as well

well as a notation, may be called the *arithmetical power*; or the power of a root uniformly increaſing or diminiſhing. This is the Power whoſe notation is deſigned in the article *Arithmetical* POWER, *Append.*

QUARTER (*Cycl.* and *Suppl.*) — QUARTER-*round*, in architecture, denotes any moulding whoſe contour is either a perfect quadrant, or *Quarter* of a circle, or that approaches near to that figure. Build. Dict. in voc.

QUARTERS, — *Winter*-QUARTERS, in military affairs. *Winter-Quarters*, when cold and moiſt, are productive of inflammatory diſorders, particularly hard coughs, with inflammations of the pleura and lungs. See the article BARRACKS, *Append.*

In very hot countries it has ſometimes been cuſtomary, to put armies into *Summers quarters.*

QUEEN'S *Gilliflower*, the name by which ſome call the *Heſperis* of botanical writers. See the article HESPERIS, *Suppl.*

QUICK, the name by which ſome call a ſpecies of *Meſpilus*, or medlar. See the article MESPILUS, *Suppl.*

QUICK-*beam*, a name ſometimes given to the *Sorbus*, or ſervice-tree. See the article SORBUS, *Suppl.*

QUICK-*graſs*, the Engliſh name of a genus of plants, called by Linnæus *Agroſtis.* See the article AGROSTIS, *Suppl.*

QUICKEN-*tree*, a name alſo given to the *Sorbus.*

QUICKSILVER-*water.* See the article WATER, *Append.*

R.

RADICULA, in botany, the name by which Dillenius calls the *Siſymbrium* of other botaniſts. See the article SISYMBRIUM, *Suppl.*

RADISH (*Suppl.*) *Horſe*-RADISH, a popular name for a ſpecies of *Cochlearia*, or ſcurvy graſs. See the article COCHLEARIA, *Suppl.*

Water-RADISH, the name by which ſeveral ſpecies of *Siſymbrium* are ſometimes called. See the article SISYMBRIUM, *Suppl.*

RADIUS *of Concavity*, in geometry, is ſometimes uſed [a] for the *Radius* or ray of curvature, or the *Radius* of the oſculatory circle. See the article CURVATURE, *Append.* [[a] De Moivre, Miſcel. Analyt. p. 231.]

RADIUS *of Curvature*, in geometry. See the article CURVATURE.

RADIUS *Oſculi* is alſo uſed in the ſame ſenſe.

RADIUS *Vector*, in mechanics, is uſed for a right line drawn from the center of force in any curve in which a body is ſuppoſed to move by a centripetal force, to that point of the curve where the body is ſuppoſed to be. See the article *Central* FORCE, *Append.*

RAGGED *Robin*, a name uſed ſometimes for the *Lychnis.* See the article LYCHNIS, *Suppl.*

RAIN (*Suppl.*) — Beſides the cauſes of rain mentioned in the Cyclopædia, Deſaguliers thinks it owing to the loſs of electricity in the vapours whereof the clouds are formed. See the articles VAPOUR and ELECTRICITY, *Append.*

RAISING *Pieces*, in carpentry, the pieces which lie on the tops of the poſts and punchions, and under the beams; thoſe lying on the brick work being called platbands. Build. Dict. in voc.

RAMMER *for piles.* See the article PILE, *Append.*

RAMPHASTOS, in ornithology, the name by which Dr. Hill calls the *Toucan* of other writers. See the article TOUCAN, *Suppl.*

The *Ramphaſtos* is a diſtinct genus of birds, of the *Pica*, or magpie kind. Its beak is remarkably large, equal, in moſt ſpecies to the whole body in magnitude. There are no viſible noſtrils. The feet have each four toes, two of which ſtand forward, and the other two backward, as in the parrot. *Hill*, Hiſt Anim. p. 381. The ſpecies are theſe: 1. The *Ramphaſtos* with a red rump. 2. The *Ramphaſtos* with a yellow rump. 3. The *Ramphaſtos* with a white rump. 4. The green *Ramphaſtos*, with a party-coloured beak.

Theſe birds have been called by Linnæus, and other writers, *Roſtratæ*, from the largeneſs of their beaks.

RAMPION is alſo a name given to the blue-flowered *Campanula*, or bell-flower, with an eſculent root. See the article CAMPANULA, *Suppl.*

RAMSONS, a name given to the broad-leaved wild *Allium*, or Garlick. See the article GARLICK, *Suppl.*

RANGLE, in falconry, is when gravel is given a hawk to bring her to her ſtomach. Dict. Ruſt. in voc.

RANUNCULUS (*Suppl.*) — *Globe*-RANUNCULUS, a name ſometimes given to a ſpecies of *Hellebore.* See the article HELLEBORUS, *Suppl.*

RAPE, a name ſometimes uſed for the *Napus*, or navew. See the article NAPUS, *Suppl.*

Wild-RAPE, the Engliſh name of a genus of plants, called by botaniſts *Rapiſtrum.* See the articles RAPISTRUM, *Suppl.*

RAPHIDIA, in the hiſtory of inſects, the name by which Dr. Hill calls a genus of four-winged flies, of the neuroptera-kind. See the article NEUROPTERA, *Append.*

The head of the *Raphidia* is of a horny ſubſtance, and is depreſſed. The tail is armed with a weapon of a ſlender form, ſharp, horny, and ſimple, not bifid at the extremity. *Hill*, Hiſt. Anim. p. 70.

RARATAS, in botany, the name by which Plumier calls the *Ananas*, or pine-apple of Tournefort. See the article ANANAS, *Suppl.*

RAT (*Suppl.*) — *Mountain*-RAT, the Engliſh name of a creature, otherwiſe called the *Marmotte.* See the article MARMOTTE, *Suppl.*

RATIO (*Suppl.*) — It is to be obſerved, that in this article of the Supplement the method deſcribed of inſerting ſecondary *Ratios*, gives two ſeries, the one containing the *Ratios* greater than the true, and the other the *Ratios* leſs than the true; and if we conſider each ſeries ſeparately, we ſhall always find, that the *Ratios* expreſſed by larger numbers, approach nearer the truth than thoſe expreſſed by ſmaller numbers. But if we compare the *Ratios* of one ſeries with thoſe of the other, it may often happen, that a *Ratio* expreſſed in ſmaller numbers, ſhall approach nearer the truth, than another expreſſed by greater numbers. For inſtance, let the *Ratio* 519529 to 328612, expreſſing the proportion of the ſemi-tone major to the ſemi-tone minor in muſic, be propoſed. The quotients, according to the method here deſcribed, will be 1. 1. 1. 2. 1, &c. Hence the *Ratios* greater than the true will be 2 : 1, 5 : 3, &c. and the *Ratios* leſs than the true will be 1 : 1, 3 : 2; 11 : 7, &c. Now, I ſay, that the *Ratio* 3 : 2, though expreſſed in ſmaller numbers approaches nearer to the truth than 5 : 3; for the exponent of the propoſed *Ratio* $\frac{519529}{328612} = 1.581$ and $\frac{3}{2} = 1.5$ alſo $\frac{5}{3} = 1.667$. Hence the exponent of the *Ratio* of 5 to 3 will exceed the truth by $0.086 = 1.667 - 1.581$; but the exponent of the *Ratio* 3 to 2 will be deficient by no more than $0.081 = 1.581 - 1.5$. Again, ſuppoſe the *Ratio* of 927707238 to 659826661, expreſſing the chance of the dealer's at whiſt having four trumps [a], were propoſed. Dividing the firſt term by the ſecond, &c. the quotients will be 1. 2. 2. 6. 3. 1. 1. 4, &c. which gives the *Ratios* greater than the true 2 : 1, 3 : 2, 10 : 7, 17 : 12, &c. and leſs than the true 1 : 1, 4 : 3, 7 : 5, 52 : 37, &c. And here the *Ratio* 7 : 5, tho' expreſſed in ſmaller numbers, approaches nearer to the truth, than either 10 : 7, or 17 : 12, as will eaſily appear by reducing their exponents to decimals. But no inconveniencies of this kind can happen, if we content ourſelves with the principal and primary *Ratios*, they being alternately greater and leſs, and continually approaching nearer to the truth. — [[a] See the article WHIST, *Append.*]

RATTLE-*graſs*, a name ſometimes uſed for a ſpecies of *Pedicularis*, or Louſe-wort. See the article PEDICULARIS, *Suppl.*

RATTLE-*net.* See the article WOLF-*net*, *Suppl.*

RATTLE-*ſnake-root*, in botany, a name ſometimes uſed for the *Polygala*, or Milk-wort. See the article POLYGALA, *Suppl.*

RAVEN (*Suppl.*) — *Indian*-RAVEN, the Engliſh name of the *Buceros.* See the articles BUCEROS, *Append.* and CORVUS-*Indicus*, *Suppl.*

RAY, in geometry, is often uſed for *Radius.*

RAY *of Curvature.* See the article CURVATURE.

RAZOR-*fiſh*, is a name frequently given to a ſpecies of *Coryphæna*, otherwiſe called *Novacula piſcis.* See the articles CORYPHÆNA and NOVACULA, *Suppl.*

REBUS (*Suppl.*) — REBUS, in heraldry, a coat of arms which bears an alluſion to the name of the perſon; as three caſtles, for Caſtleton; three cups, for Butler, three conies, for Coniſby; a kind of bearings which are of great antiquity.

RED-*breaſt*, in ornithology, the Engliſh name of a ſpecies of *Motacilla*, called alſo *Rubecula* and *Erithacus.* See the articles MOTACILLA and RUBECULA, *Suppl.*

REED (*Suppl.*) — *Indian flowering* REED, the name by which the *Canna* of botaniſts is ſometimes called. See the article CANNA, *Suppl.*

REEM-

REEMING-*irons*, a kind of chiſſels, broader than ordinary, uſed for opening the ſeams of ſhips, before they are caulked. *Blankley*'s Nav. Expoſ. p. 130.

REFRACTION (*Cycl.*) — The *Refraction* of the air has many times ſo uncertain an influence on the places of celeſtial objects, very remote from the zenith, that wherever *Refraction* is concerned, the concluſions deduced from obſervations that are much affected by it, will always remain doubtful, and too precarious in many caſes to be relied upon. See Dr. *Bradley*, in Phil. Tranſ. N° 485.

REGIMENTAL *Hoſpital*. See the article HOSPITAL, *Append.*

REIN-*deer*, the Engliſh name of the *Rangifer*, a creature of the deer-kind. See the articles DEER and RANGIFER, *Suppl.*

RELL-*mouſe*, the Engliſh name of the white bellied mouſe, with a blackiſh back, and long body. See the article GLIS, *Suppl.*

REPRESENTATIVE (*Cycl.*)—REPRESENTATIVE *Power*, in metaphyſics, a term introduced by Leibnitz, to ſignify that power of the human ſoul, by which it repreſents to itſelf the univerſe, according to the ſituation of the body in the univerſe. See the article IDEA, *Suppl.*

Wolfius calls this power *vis repreſentativa*, to denote its being an active power, or rather a force actually exerting itſelf. For he expreſly ſays, *quod vis conſiſtat in continuo agendi conatu*. And he thinks that from this principle of a *vis repreſentativa*, every phænomenon of the human mind may be accounted for. See his Phyſcholog. Ration. Art. 529.

But it may be preſumed, that many will find this principle too obſcure to be admitted.

When it is ſaid, that our ideas are *repreſentative* of things without us, or of the univerſe; it may be aſked in what ſenſe this is to be underſtood? Do they *repreſent* it 1° as a picture does its original? or 2° as an effect of a cauſe? or 3° as a ſign repreſents the thing ſignified? The firſt opinion is exploded in part by Locke and the Carteſians, and totally by Dr. Berkely, late Biſhop of Cloyne. The ſecond is admitted by Hobbes, but denied by Leibnitz himſelf, and the idealiſts. The third ſhould ſeem to be the opinion of Leibnitz, but he is not ſufficiently explicit.

Dr. Berkeley admits ideas to be ſigns; but according to him they are arbitrary ſigns, depending on the immediate will of the deity: hence the viſual language; and ideas, only ſignify or ſuggeſt each other, and ſpirits; but not bodies, the exiſtence of which is totally unknown.

REMITTENTS, or REMITTING *fevers*, the ſame with the bilious ones. See the article BILIOUS, *Append.*

REMOTION, *Remotio*, in rhetoric. See the article METASTASIS, *Suppl.*

REPETEND, in arithmetic, is uſed for that part of an interminate decimal fraction, which is continually repeated ad infinitum.

Thus in the interminate decimal fraction 317. 45 316 316 316, &c. the figures 316 are called the *Repetend*. *Cunn*, Treat. of Fractions.

Theſe *Repetends* often ariſe in the reduction of vulgar fractions to decimals, thus $\frac{1}{3} = 0.\ 3333$, &c. $\frac{1}{7} = 0.\ 142857\ 142857$, &c. $\frac{1}{11} = 0.\ 090909$, &c.

Single REPETEND, is that where one figure only is repeated, as in 0. 3 3 3, &c.

Compound REPETEND, is that where two or more figures are repeated, as in 0. 09 09, &c. or in 0. 142857 142857, &c.

Decimals with *Repetends* may always be reduced to vulgar fractions. For either the *Repetend* begins with the decimal, or not:

If the *Repetend* begins with the firſt place of decimals, make it the numerator of a vulgar fraction, and make the denominator conſiſt of as many 9's as the *Repetend* has figures, then will this vulgar fraction be equal to the decimal.

Thus, if the *Repetend* be ſingle, as in 0. 3 3 3 3, the vulgar fraction equal to it will be $= \frac{3}{9} = \frac{1}{3}$. So if the *Repetend* be compound, as in 0. 09 09, &c. the equivalent vulgar fraction will $= \frac{09}{99} = \frac{9}{99} = \frac{1}{11}$.

And in like manner 0. 142857 142857, &c. $= \frac{142857}{999999} = \frac{1}{7}$.

The reaſon is obvious from this conſideration, that the decimal 0. 3 3 3, &c. is $= \frac{3}{10} + \frac{3}{100} + \frac{3}{1000}$, &c. the ſum of which by the rule mentioned under FRACTION, *Suppl.* will be equal to $\frac{3}{10}$ divided by $1 - \frac{1}{10} = \frac{3}{9} = \frac{1}{3}$, and ſo of the reſt.

If the *Repetend* does not begin with the firſt place of decimals, but at ſome place farther on towards the right, as in the decimal 0. 8 3 3 3 3, &c. where the *Repetend* does not begin till the ſecond place of decimals, *obſerve*, that 0. 8333 + &c. $= \frac{8}{10} + \frac{3}{100} + \frac{3}{1000} +$ &c. $= \frac{8}{10} + \frac{1}{10} \times \frac{3}{10} + \frac{3}{10^2} +$ &c. But $\frac{3}{10} + \frac{3}{10^2} +$ &c $= \frac{3}{9} = \frac{1}{3}$, as before, therefore the propoſed decimal is $= \frac{8}{10} + \frac{1}{10} \times \frac{1}{3} = \frac{8}{10} + \frac{1}{30} = \frac{24+1}{30} = \frac{25}{30} = \frac{5}{6}$.

Thus alſo if the decimal 0. 2 27 27, &c. were propoſed, we ſhall find it $= \frac{2}{10} + \frac{1}{10} \times \frac{27}{100} + \frac{27}{100^2} +$ &c. And $\frac{27}{100} + \frac{27}{100^2} +$ &c. being $= \frac{27}{99} = \frac{3}{11}$, the decimal will be $= \frac{2}{10} + \frac{1}{10} \times \frac{3}{11} = \frac{2}{10} + \frac{3}{110} = \frac{22+3}{110} = \frac{5}{22}$. The reaſon of which is obvious from what has been ſaid.

It may perhaps be worth while to obſerve, that if the numerator of a vulgar fraction be unity, and the denominator any prime number, except 2 and 5, the decimal equal to the propoſed fraction will always be a *Repetend*, beginning at the firſt place of decimals; and this *Repetend* muſt neceſſarily be a ſubmultiple, or an aliquot part of a number expreſſed by as many 9's as the *Repetend* has figures; that is, if the *Repetend* have 6 figures, it will be a ſubmultiple of 999999; if four figures, it will be a ſubmultiple of 9999, &c. From whence it follows, that if any prime number be called p, the ſeries 9999, &c. produced as far as is neceſſary will always be diviſible by p, and the quotient will be the *Repetend* of the decimal fraction $= \frac{1}{p}$.

REPRODUCTION (*Cycl.*) — It is very well known, that trees and plants are to be raiſed from ſlips and cuttings, and ſome late obſervations have ſhewn, that there are ſome animals which have the ſame property.

The Polype was the firſt inſtance we had of this; but we had ſcarce time to wonder at the diſcovery Mr. Trembley had made, when Mr. Bonett diſcovered the ſame property in a ſpecies of water-worm. See the articles POLYPE and WATER-WORM, *Suppl.*

Amongſt the plants which may be rais'd from cuttings, there are ſome which ſeem to poſſeſs this quality in ſo eminent a degree, that the ſmalleſt portion of them will become a complete tree again. See the article PLANT, *Append.*

It deſerves enquiry, whether or not the great author of nature, when he ordained that certain inſects as theſe polypes and worms ſhould reſemble thoſe plants in that particular, allowed them this power of being *reproduced* in the ſame degree; or, which is the ſame thing, whether this *Reproduction* will or will not take place in whatever part the worm is cut: In order to try this, Mr. Bonett entered on a courſe of many experiments on the water-worms which have this property. Theſe are, at their common growth, from two to three inches long, and of a browniſh colour, with a caſt of reddiſh. From one of theſe worms he cut off the head and tail, taking from each extremity only a ſmall piece of a twelfth of an inch in length, but neither of theſe pieces were able to *reproduce* what was wanting. They both periſhed in about twenty-four hours; the tail firſt, and afterwards the head. As to the body of the worm from which theſe pieces were ſeparated, it lived as well as before, and ſeemed indeed to ſuffer nothing by the loſs, the head-part being immediately uſed as if the head was thereon, boring the creature's way into the mud. There are, beſides this, two other points in which the *Reproduction* will not take place, the one of theſe is about the fifth or ſixth rim from the head, and the other the ſame diſtance from the tail; and in all probability the condition of the great artery in theſe parts is the cauſe of this.

What is ſaid of the want of the *reproductive* power of theſe parts, relates only to the head and tail ends; for as to the body, it feels very little inconvenience from the loſs of what is taken off, and very ſpeedily *reproduces* thoſe parts. Where then does the principle of life reſide in ſuch worms, which after having their heads cut off, will have, not only the ſame motions, but even the inclinations, that they had before; and yet this difficulty is very ſmall, compared to ſeveral others, which at the ſame time offer themſelves to our reaſon? Is this wonderful *Reproduction* of parts only a natural conſequence of the laws of motion, or are there lodged in the body of the creature a chain of minute buds or ſhoots, a ſort of little embryos already formed and placed in ſuch parts where the *Reproductions* are to begin? Are theſe worms only mere machines, or, are they like more perfect animals, a ſort of compound, the ſprings of whoſe motions are actuated or regulated by a ſort of ſoul? And if they have themſelves ſuch a principle, how is it that this principle is multiplied and is found in every ſeparate piece? Is it to be granted, that there are in theſe worms not a ſingle ſoul (if it is to be ſo called) in each, but that each contains as many ſouls as there are pieces capable of *reproducing* perfect animals? Are we to believe with Malpighi, that theſe ſorts of worms are all heart and brain from one end to the other? This may be, but yet if we knew that it was ſo, we ſhould know in reality but very little the more for knowing it; and it ſeems after all, that in caſes of this kind we are only to admire the works of the great Creator, and ſit down in ſilence.

The nice ſenſe of feeling in ſpiders has been much talked of by naturaliſts; but it appears that theſe worms have yet ſomewhat more ſurprizing in them in regard to this particular. If a piece of ſtick, or any other ſubſtance, be brought near them, they do not ſtay for its touching them, but begin to leap and friſk about, as ſoon as it comes towards them. There want however ſome farther experiments to aſcertain whether this be really owing to feeling or to ſight; for tho' we can diſcover no diſtinct organs of ſight in theſe creatures, yet they ſeem affected by the light of the ſun or a candle, and always friſk about it in the ſame manner at the approach of either; nay even the moon-light has ſome effect upon them.

A twig of willow, poplar, or many other trees being planted in the earth, takes root, and becomes a tree, every piece of which will in the fame manner produce other trees. The cafe is the fame with thefe worms; they are cut to pieces, and thefe feveral pieces become perfect animals; and each of thefe may be again cut into a number of pieces, each of which will in the fame manner produce an animal. It had been fuppofed by fome, that thefe worms were oviparous; but Mr. Bonett, on cutting one of them to pieces, having obferved a flender fubftance refembling a fmall filament to move at the end of one of the pieces, feparated it, and on examining it with glaffes, found it to be a perfect worm of the fame form with its parent, which lived and grew larger in a veffel of water into which he put it. Thefe fmall worms are eafily divided, and very readily complete themfelves again, a day ufually ferving for the production of a head to the part that wants one, and in general the fmaller and flenderer the worms are, the fooner they complete themfelves after this operation. When the bodies of the large worms are examined by the microfcope, it is very eafy to fee the appearance of the young worms alive and moving about within them; but it requires great precifion and exactnefs to be certain of this; fince the ramifications of the great artery have very much the appearance of young worms, and they are kept in a fort of continual motion by the fyftoles and diaftoles of the feveral portions of the artery which ferve as fo many hearts. It is very certain, that what we force in regard to thefe animals by our operations, is done alfo naturally every day in the brooks and ditches where they live. A curious obferver will find in thefe places many of them without heads or tails, and fome without either; as alfo other fragments of various kinds, all which are then in the act of completing themfelves; but whether accidents have reduced them to this ftate, or they thus purpofely throw off parts of their own body for the *Reproduction* of more animals, is not eafy to determine. They are plainly liable to many accidents, by which they lofe the feveral parts of their body, and muft perifh very early, if they had not a power of *reproducing* what was loft; they often are broken into two pieces, by the refiftance of fome hard piece of mud, which they enter; and they are fubject to a difeafe, a kind of gangrene rotting off the feveral parts of their bodies, and muft inevitably perifh by it, had they not this furprizing property.

This worm was a fecond inftance after the polype, of the furprizing power in an animal of recovering its moft effential parts, when loft; but nature does not feem to have limited her beneficence in this refpect to thefe two creatures; Mr. Bonett tried the fame experiments on another fpecies of water-worm, differing from the former in being much thicker: This kind of worm, when divided in the fummer feafon, very often fhews the fame property; for if it be cut into three or four pieces, the pieces will lie like dead for a long time, but afterwards will move about again, and will be found in this ftate of reft to have recovered a head, or a tail, or both. After recovering their parts, they move very little, and according to this gentleman's experiments, feldom live more than a month.

It fhould feem that the more difficult fuccefs of this laft kind of worm, after cutting, and the long time it takes to recover the loft parts, if it do recover them at all, is owing to its thicknefs; fince we always find in that fpecies of worms which fucceeds beft of all, that thofe which are thinneft always recover their parts much fooner than the others.

The water infects alfo are not the only creatures which have this power of recovering their loft parts. The earth affords us fome already difcovered to grow in this manner from their cuttings, and thefe not lefs deferving our admiration than thofe of the water; the common earth worms are of this kind. Some of thefe worms have been divided into two, others into three or four pieces, and fome of thefe pieces, after having paffed two or three months without any appearance of life or motion, have then begun to *reproduce* a head or a tail, or both. The *Reproduction* of the anus, after fuch a ftate of reft is no long work; a few days does it, but it is otherwife with the head, that does not feem to perform its functions in the divided pieces, till about feven months after the feparation. It is to be obferved, that in all thefe operations both on earth and water-worms, that the hinder part fuffers greatly more than the fore part in the cutting, for it always twifts itfelf about a long time, as if actuated by ftrong convulfions; whereas the head ufually crawls away without the appearance of any great uneafinefs.

REVERSION *of Series (Cycl.)* — The problems mentioned under this head in the Cyclopædia may indeed be folved by the method of *Reverfion of Series*, but are only particular cafes of it, and not a general account of that method, which is to be underftood thus: The value of any indefinite quantity, y, for inftance, being expreffed by an infinite *Series* of fimple terms, including different powers of another variable quantity, x, the value of x is thence to be found, by a kind of reverfed operation, expreffed in a *Series* of fimple terms, including different powers of the quantity y. Thus, if $y = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \&c.$ by the *Reverfion of the Series*, we fhall have, $x = y + \frac{1}{2}y^2 + \frac{1}{6}y^3 + \frac{1}{24}y^4 + \frac{1}{120}y^5$. Thus alfo, if $dx + bx^2 + cx^3 + dx^4 + \&c. = gy + hy^2 + iy^3 + ky^4 + \&c.$ x may be found by this method, expreffed by the powers of y.

There are various ways of doing this. One, which is often convenient, is, by affuming a *Series* with indeterminate coefficients of a certain form; examples of which are given under the head FORM *of a Series*, *Append.* See Mac Laurin's Algebra, pag. 263. and Mr. De Moivre, in the Phil. Tranf. N° 240.

Other methods may be feen in Mr. Stuart's explanation of Sir Ifaac Newton's Treatife of Analyfis by equations of an infinite number of terms, p. 455.

RESERVATORY, a term fometimes ufed in a fynonymous fenfe with *Refervoir*, See the article RESERVOIR, *Cycl.*

RETURN, in the military language, denotes the lift of the fick, given in once a week by the furgeon to the commanding officer of a regiment.

Commiffioned officers are not put in the *Returns*, which, on that account, are but an imperfect lift of the fick.

Twelve fick, in a battalion of 780 private men, is the loweft *Return* that can be expected, even in the moft healthy feafon and climate, as well as beft quarters. *Returns* are often much higher, but feldom exceed feventy in a battalion.

It is to be obferved, that *Returns* include all accidents unfitting a foldier for duty. See *Pringle*, Obferv. on the Dif. of the Army, p. 12, 36.

RHAPONTICOIDES, in botany, a diftinct genus of plants, according to Vaillant, but efteemed only a fpecies of *Centauria* by Linnæus. See the article CENTAURIA.

RHAPONTICUM, a diftinct genus of plants, according to Vaillant, but comprehended under the *Centauria* by Linnæus. See the article CENTAURIA, *Append.*

RHETORICAL *Accent*, among Hebrew grammarians. See the article ACCENT, *Cycl.*

RHEUM, in botany, the name given by Linnæus to *Rhubarb.* See the article RHUBARB, infra.

RHEUMATISM *(Cycl.)* — This is a difeafe incident to winter, and owing, chiefly, to a fuppreffion of perfpiration.

In a complete and obftinate *Rheumatifm*, the joints are often confiderably fwelled and inflamed; but in fevers with *rheumatic* pains, this is feldom the cafe. Accordingly, in thefe laft, the cure may be effected in a few days, by twice or thrice bleeding, and promoting a diaphorefis by the cooler medicines, particularly vinegar-whey. But if the *Rheumatifm* be attended with violent pains or fwelling of the joints, fweating is reckoned improper; fo that the cure muft be obtained by repeated and almoft daily bleedings, till the fever is gone, and the pains either entirely removed, or rendered much eafier.

If the pain and fwelling of the joints remain after the fever is abated, three or four leeches may be applied to the part where the inflammation and tumour are greateft; letting the blood ooze, till it ftops of itfelf. As the relief hereby obtained is fometimes confiderable, and the evacuation but fmall, the repetitions need not be limited. But, then, no benefit is to be expected from leeches in any pains of the joints, not attended with both inflammation and fwelling.

In the true acute *Rheumatifm*, internal medicines avail little. The beft perhaps are the neutral falts, with very fmall dofes of camphor, fo as neither to heat or force a fweat. As to diet, it ought to be of the loweft kind. Outward applications are alfo to be omitted, as long as any fever or inflammation remains. The fpirituous and volatile liniments inflame, and the emolient fomentations, though they give eafe for the time, do harm by relaxing, unlefs very fparingly ufed. If there is no inflammation, the aking parts may be rubbed with flannel, and anointed with the linimentum volatile or faponaceum, according as the fkin is too much hardened or relaxed by the ufe of the one or other. After the patient has continued fome time in this courfe, his recovery will be quickened by the ufe of the cold-bath, or the bark; and to thofe who can afford it, riding is fpecific. *Pringle*, Obferv. on the Dif. of the Army, p. 152, feq.

RHUBARB, in botany, the Englifh name of a diftinct genus of plants, of which there is only one known fpecies. See the article RHABARBARUM, *Suppl.*

Monk's-RHUBARB, the name of a fpecies of *Lapathum*, or dock. See the article LAPATHUM, *Suppl.*

RIB-*wort*, a name fometimes given to the *Plantago* of botanifts, See the article PLANTAGO, *Suppl.*

RIBBAND-*Screw-fhell*, the Englifh name of the *Turbo*, with broad fpiral fafciæ, and a fmall mouth. See the article TURBO, *Suppl.*

RIBES, in botany, a general name given by Linnæus to the goofberry and currant bufhes, which he makes one genus of plants, called by others *Groffularia.* See the article GROSSULARIA, *Suppl.*

RICE, the Englifh name of a genus of plants, known among botanifts by that of *Oryza.* See the article ORYZA, *Append.*

RIFTS, a difeafe in horfes arifing from corruption lodged in the palate of the mouth. Ruft. Dict. in voc.

RIG, or Rigling, the fame with *Ridgling*. See the article Ridgling, *Cycl.*

RING-*Ouzel*, the Englifh name of the black *Turdus*, with a white ring round its neck. See the article Turdus, *Suppl.*

RIPENING *of fruit*, in gardening, may be forwarded feveral ways. The method practifed in the Levant, for maturating the domeftic fig-tree, has been already mentioned; alfo the great ufe of hot beds, for bringing to maturity many exotic plants, which could not be otherwife effected in cold climates. See the articles Caprification, *Suppl.* and Hot-*beds*, *Cycl.* and *Suppl.*

Several other methods of haftening the fructifications of trees, and other vegetables, have likewife been taken notice of under the article *Forcing*. See the article Forcing, *Suppl.*

ROBIN (*Suppl.*) — Ragged-Robin, a name fometimes ufed for the *Lychnis*. See the article Lychnis, *Suppl.*

Wake-Robin, the Englifh name of a genus of plants, called by botanifts *Arum*. See the article Arum, *Suppl.*

ROCK-*rofe*, a name fometimes given to the *Ciftus* of botanifts. See the article Cistus, *Suppl.*

ROCKET, in botany, the Englifh name of a genus of plants, called by botanifts *Eruca*. See the article Eruca, *Suppl.*

Corn-Rocket, or *fquare-podded* Rocket, a diftinct genus of plants, called by botanifts *Erucago*. See the article Erucago, *Suppl.*

Garden-Rocket, a name by which the *Hefperis* of botanifts is fometimes called. See the article Hesperis, *Suppl.*

Water-Rocket, or *Winter*-Rocket, the name of a fpecies of *Sifymbrium*. See the article Sisymbrium, *Suppl.*

ROD (*Suppl.*) — *Shepherd's*-Rod, *Dipfacus*, in botany, the Englifh name of a diftinct genus of plants. See the article Dipsacus, *Suppl.*

ROE-*buck*, the Englifh name of the *Cervus* with ramofe, cylindric, and erect horns. It is the fmalleft of the deer-kind, and has been called *Capreolus* and *Caprea*, tho' without the leaft refemblance of the goat-kind. See the article Capreolus, *Suppl.*

ROLLER (*Suppl.*) is alfo the name by which fome call the *Ampelis*, or *Garrulus Bohemicus*. See the article Ampelis, *Suppl.*

ROOT (*Suppl.*) — The *roots* of plants may be reverfed and turned into branches; and *vice verfa*, the branches into roots. This is called *Planting reverfe*. See the articles Plant and Planting *reverfe*, *Append.*

Seminal-Root. See the article Seminal, *Suppl.*

ROPE (*Cycl.* and *Suppl.*) — Though it be difficult to give a certain account of the forces required to bend *ropes* of different diameters, in making them go round bodies of different bigneffes, yet to make no allowance for the lofs of motion fuftained thereby, would be as prejudicial to the practice of mechanics, as it would be to overlook the friction of the parts of engines. The difficulty of afcertaining this force arifes from the different materials of which they are made, their different ftiffnefs, according as they are more or lefs twifted; and fometimes from the temperature of the air, as to moifture and drinefs.

Dr. Defaguliers has computed the forces required to bend *Ropes* of different diameters, ftretched by different weights, round rollers of different bigneffes: The refult of his experiments is expreffed in the following table.

Diameters of the *Ropes* of three ftrands, expreffed in tenth parts of an inch	Weights ftretching the *ropes*, expreffed in *lb.* avoirdupois.	Refiftance about a roller of half an inch diameter, in *oz.* avoirdupois	Refiftance about a roller of one inch diameter in *oz.* avoirdupois	Refiftance about a roller $1\frac{1}{2}$ inches diameter in *oz.* avoirdupois.
0, 5	60 *lb.*	225 *oz.*	$112\frac{1}{2}$ *oz.*	75 *oz.*
0, 2	60	90	45	30
0, 1	60	45	$22\frac{1}{2}$	15
0, 5	40	150	75	50
0, 2	40	60	30	20
0, 1	40	30	15	10
0, 5	20	75	$37\frac{1}{2}$	25
0, 2	20	30	15	10
0, 1	20	15	$7\frac{1}{2}$	*

On the whole, it has been found by experiments, that the difficulty of bending a *rope* round a roller decreafes directly as the diameter of the roller increafes; or is, inverfely, as the diameter of the roller. See *Defaguliers*, Experim. Phil. vol. 1. p. 233, feq.

ROSE (*Suppl.*) — *Bay*-Rose, the name of a genus of plants, called by botanifts *Nerium*, or *Nerion*. See the article Nerion, *Suppl.*

Campion-Rose, a name fometimes given to the *Lychnis*. See the article Lychnis, *Suppl.*

China-Rose, the name by which fome call the *Ketmia* of botanifts. See the article Ketmia, *Suppl.*

Mountain-Bay Rose, a name by which the *Chamærhododendros* of botanifts is fometimes called. See the article Chamærhododendros, *Suppl.*

Gelder-Rose, a name fometimes given to the *Opulus*, or water-elder. See the article Opulus, *Suppl.*

Rose of *Jericho*, a name by which fome call the *Hefperis*. See the article Hesperis, *Suppl.*

South-Sea Rose, a name fometimes given to the *Nerion* of botanifts. See the article Nerion, *Suppl.*

Rock-Rose, the name by which the *Ciftus* of botanifts is fometimes called. See the article Cistus, *Suppl.*

Rose-*Root*, a name by which fome call the *Anacampferos*, or Orpin. See the article Anacampseros, *Suppl.*

ROSEMARY (*Suppl.*) — *Spanifh*-Rosemary, a name fometimes given to the *Thymelæa* of botanifts. See the article Thymelæa, *Suppl.*

Poet's-Rosemary, a name fometimes given to the *Caffia* of botanifts. See the article Cassia, *Suppl.*

ROSTRATA, in zoology, a name ufed by feveral zoologifts for the *Ramphaftos* or Toucan, a genus of birds. See the article Ramphastos, *Append.*

ROTHER, a term ufed by *Blanckley*, in his Naval Expofitor, for *Rudder*. See the article Rudder, *Cycl.* and *Suppl.*

ROUCOU, in botany, a name given to a fpecies of Mitella.

ROVES, in fhip-building, fmall fquare pieces of iron, with a hole punched in the middle through which the nail goes, where it is clenched, and binds together the boards of pinnaces, yawles, &c. *Blanckley's* Naval Expofitor, p. 137.

ROUGHINGS, a word ufed in many parts of the kingdom for the grafs which comes after mowing. Ruft. Dict. in voc.

ROUP, in poultry, is a filthy boil or fwelling upon their rumps, known by the ftaring, or turning back of the feathers.

The *Roup*, if not foon remedied, will corrupt the whole body; to prevent which, the feathers are to be pulled away, the fwelling laid open, and the matter preffed out; after which the part is to be wafhed with falt and water, or brine. Ruft. Dict. in voc.

ROWLUCKS, among fhip-carpenters, fmall fpaces left in the gunwale, where two thoals are let in at fuch a diftance from each other, as to admit the oar, at the end of the loom to lie on to row the boat. *Blanckley's* Naval Expofitor, p. 188.

RUDBECKIA, in the Linnæan fyftem of botany, the name of a genus of plants, called by Vaillant *Obelifcotheca*, and in Englifh the *Dwarf-fun-flower*.

The characters are thefe: The common cup is compofed of a double order of leaves, fix in each order, and covered with plane, broad, but fhort fquamæ; the compofite flower is radiated; the proper one tubulofe, infundibuliform, with its mouth divided into five fegments; the ftamina are five very fhort, capillary filaments; the antheræ cylindric; the germen of the piftil is placed under the receptacle; the ftyle is filiform, and of the length of the flower; the ftigma is divided into two parts, which bend backwards; the receptacle is paleaceous and conic; the feeds are fingle and oblong. Vid. *Linnæi* Gen. Plant. p. 415.

The fpecies of *Rudbeckia* are thefe. 1. The *Rudbeckia*, with the lower leaves divided into three lobes, and the upper ones undivided. 2. The compofite laciniated-leaved *Rudbeckia*. 3. The oblong, hairy-leaved *Rudbeckia*. 4. The great, fcabrous *Rudbeckia*. 5. The broad-leaved, many-flowered *Rudbeckia*. 6. The tall *Rudbeckia*, with red ftalks. 7. The fmall, fhort-leaved *Rudbeckia*. 8. The great-flowered, hairy *Rudbeckia*. Vid. *Hill*, Hift. Plant. p. 584.

Rudbeckia is alfo a name ufed by Houfton for the *Conocarpus* of Linnæus. See the article Conocarpus, *Append.*

RUE (*Suppl.*) — *Dog's*-Rue, a name fometimes given to the *Scrophularia*, or fig-wort. See the article Scrophularia, *Suppl.*

Meadow-Rue, the Englifh name of a genus of plants, called by botanifts *Thalictrum*. See the article Thalictrum, *Suppl.*

Wall-Rue, the Englifh name of a diftinct genus of plants, called by botanifts *Ruta muraria*. See the article Ruta *muraria*, *Suppl.*

RULE (*Cycl.*) — Rule *of five*, or, *Compound* Rule *of Three*. What is faid in the Cyclopædia of this *rule's* being more eafily performed by two fimple *rules of three*, is fometimes true, but not always. In fome cafes, not only five, but feven, or nine terms may be given, from whence it is neceffary to determine an eighth, or a tenth, which indeed might be performed by repeated applications of the fimple *rule of three*, but not fo expeditioufly. Mr. Jones has therefore given a general *rule* by which all cafes of the *rule of Three* or of proportion may be folved.

The *rule* is, 1°. Set down the terms expreffing the condition of the queftion, in one line. 2°. Under each conditional term fet its correfponding one in another line. 3°. Multiply the *producing terms* of one line, and the produced term of the

the other line continually, and take the refult for a dividend. 4°. Multiply the remaining terms continually, and let the product of them be a divifor. 5°. The quotient of this divifion will be the term required.

By *producing terms* here, are meant, whatever neceffarily and jointly produce any effect; as the Caufe and the Time; length, breadth, and depth; buyer and his money; feller and his goods; all neceffarily infeparable in producing their feveral effects.

In a queftion where a term is underftood, and not expreffed that term may be expreffed by unity.

Example. If 250 *l.* ferve fix perfons for nine months; how long will 1000 *l.* ferve four perfons at the fame rate?

Here the terms which exprefs the condition are.

	£.	P.	M.
	250 :	6 :	9
correfponding terms	1000 :	4 :	Q

Where Q is put to reprefent the term required.

Among the conditional terms, fix perfons and nine months are producing, and 250 *l.* is produced: among their correfponding terms four perfons and Q are producing, and 1000 *l.* are produced.

But it being impoffible to multiply the producing terms in the fecond line, and the produced in the firft, becaufe Q is unknown; therefore multiply the producing terms of the firft line, by the produced in the fecond, and divide by the product of the reft.

Then will $Q = \frac{6 \times 9 \times 1000}{4 \times 250} = 6 \times 9 = 54.$

See Mr. *Dodfon*'s Anti logarithmic Canon, pag. 38. feq.

But if the notion of producing and produced terms fhould feem obfcure, thofe who have a knowlege of the doctrine of compound ratios, will eafily perceive that in the foregoing queftion, Q is to 9 months in the compound ratio of 4 perfons to 6 perfons inverfely, and of 1000 *l.* to 250 *l.* directly, that is, $\frac{Q}{9} = \frac{6}{4} \times \frac{1000}{250}$, therefore $Q = \frac{6 \times 9 \times 1000}{4 \times 250} = 54$ as before. And in like manner may other queftions, relating to the compound rule of proportion, be ftated and folved, however complex.

RUNT (*Suppl.*) — RUNT is alfo a name given to Scotifh or Welch neat, or cows of a fmall fize. Dict. Ruft. in voc.

RUPTURE, (*Cycl.*) in furgery. See the article HERNIA, *Cycl.* and *Suppl.*

RUPTURE-*Wort*, the Englifh name of a genus of plants, called by botanifts *Herniaria*. See the article HERNIARIA, *Suppl.*

RUSH (*Suppl.*) — *Flowering*-RUSH, the Englifh name of a genus of plants, called by botanifts *Butomus*. See the article BUTOMUS, *Suppl.*

RUSSET, a country word for a dark brown colour. Ruft. Dict. in voc.

RUT (*Suppl.*) — RUT is alfo the term ufed for the track or mark of a wheel in the road. Ruft. Dict. in voc.

RYE-*Grafs*, in botany, the fame with what is otherwife called *Rey-grafs*. See the article REY-*Grafs*, *Suppl.*

S.

S.

SAFFRON (*Suppl.*)—*Indian* SAFFRON, a name sometimes given to turmeric. See TURMERIC, *Cycl.*
Bastard-SAFFRON, the English name of a genus of plants, called by botanists *Carthamus*. See the article CARTHAMUS, *Suppl.*

SAGE (*Suppl.*)—SAGE *of Jerusalem*, a name sometimes given to a species of *pulmonaria*. See PULMONARIA, *Suppl.*

SAGE *of Jerusalem*, or SAGE-*tree*, names by which the *phlomis* of botanists is sometimes called. See the article PHLOMIS, *Suppl.*

Wild SAGE, a name sometimes given to the *lantana* of botanists. See the article LANTANA, *Suppl.*

Wood-SAGE, the name by which some call the *scordium* or *teucrium* of botanists. See the article TEUCRIUM, *Suppl.*

SAGITTA, in architecture, a name sometimes used for the key-piece of an arch. See KEY and ARCH, *Cycl.*

SAGREE, a name sometimes given to the *galeus spinax*, or prickly hound-fish. See the article GALEUS, *Suppl.*
It is a species of *squalus*. See the article SQUALUS, *Suppl.*

SAINT-*foin*, in botany, the English name of a genus of plants, called by botanists *onobrychis*. See the articles ONOBRYCHIS and SAINT-FOIN, *Suppl.*
This plant is propagated as clover for the food of cattle. It will hold well in the ground, and continue to grow and be of use for twenty years; but then the main crop is always to be mowed, and not to be eaten upon the ground.

SAKER (*Suppl.*) — SAKER, in ornithology, the same with *sacre*. See the article SACRE, *Suppl.*

SALACIA, in zoology, the name of a genus of insects of the *gymnarthria* kind; the body of which is ovato-oblong, and the tentacula are numerous, and disposed in little clusters. See GYMNARTHRIA, *Append.*
It is called by different authors *priapus marinus*, and *mentula marina*. See the article PRIAPE *de mer*, *Suppl.*

SALICORNIA, in botany, the name of a genus of plants, the characters of which, according to *Linnæus*, are these: the cup is of a tetragonal form, truncated, bellied out, and permanent. There is no corolla. The stamen is a single, simple, capillary filament. The anthera is roundish. The germen of the pistil is of an oblong ovated figure: the style is simple and placed under the stamen, and the stigma is bifid. There is no pericarpium, but the cup becomes more ventricose, and contains a single seed. Vid. *Linnæi* Gen. Plant. p. 4.
There are only two species of this genus, which are, 1. The short-jointed *salicornia*, and 2. The longer-jointed *salicornia*. *Hill*, Hist. Plant. p. 154.

SALIVA (*Cycl*)—Dr. *Pringle*, in the appendix to his observations on the diseases of the army, has given the result of several experiments made to ascertain the effects of the *saliva* in digestion.
By adding a small portion of it to some raw beef, he remarked, that this mixture putrefied slower than another which had no *saliva* in it; from whence he infers its antiseptic nature.
Another experiment, made to ascertain the fermentative power of *saliva*, was this: he took two drachms of fresh meat, the same quantity of bread, and to these added as much *saliva* as he supposed necessary to digestion. This mixture being beat in a mortar, was put into a close phial, and set in the furnace, where it remained about two days, with scarce any visible fermentation; but, on the third day, this action became manifest. The bread and flesh were then found risen in the water, a sediment forming, and bubbles of air continually mounting. In short, the fermentation was complete, being distinguished by a vinous smell, as in ordinary working liquors. The action continued about twice as long as when no *saliva* was used; it was likewise much more moderate, and generated air with little tumult. When the fermentation intirely ceased, the mixture had a pure acid taste; and what was equally remarkable, had no putrid smell during the whole process.
From these experiments the doctor concludes, that if the *saliva* is well prepared, is in a sufficient quantity, and well mixed with the aliment, it is qualified for resisting putrefaction, preventing immoderate fermentation, flatulence, and acidity in the primæ viæ. But if the *saliva* is deficient, unsound, or not well mixed with what is swallowed, that the aliment may first putrefy, then grow acid, and in that action ferment strongly, and generate much air in the stomach and bowels. *Pringle*, Observ. p. 355.
Accordingly, in surfeits, or upon swallowing without due mastication; when meats are eat tough and fat, or with farinaceous substances unfermented; or, when by any accident the *saliva* is vitiated, too scanty, or not intimately mixed with the food, the fermentation becomes tumultuous, the stomach swells with air; and this extraordinary commotion being attended with an unusual heat, brings on that uneasiness called the *heart-burn*, and occasions that excessive sourness of the stomach, whereby the teeth are not only set on edge, but the throat excoriated. This last, however, only happens when the stomach is relaxed, or any wise disabled from conveying the whole aliment into the intestines; for, what is left having time to undergo a complete fermentation, is thereby changed into a harsh sort of vinegar. Id. ibid. p. 368.
Since one great use of *saliva* is to moderate fermentation, it is probable, that such substances as resemble it most in this quality, will prove the best stomachics whenever that humour fails. Of this class are acids, wines, spirits, and bitters; but as all these retard as well as moderate fermentation, they may be frequently less proper than some of the antiscorbutics, as horse-radish, mustard, and garden scurvy-grass, which, at the same time that they moderate, retard fermentation but little. As to aromatics, however assisting they may be in digestion by their heat and stimulus, they promise less of a carminative quality than either the bitters or antiscorbutics; in as much as they are more disposed to increase than to moderate fermentation, and consequently to produce air instead of suppressing it. Id. ibid. p. 376.

SALLOW, a name by which several species of the *salix*, or willow, are frequently called. See the article SALIX, *Suppl.*

SALMON (*Suppl.*)—SALMON-*peel*, the name of a fish found in great plenty in the rivers of Wales, agreeing in the colour of its flesh, and perhaps in kind with the common salmon. Rust. Dict. in voc.

SALMON-*sewse*, a name sometimes used for the young fry of salmon.

SALOMON'S *seal*, in botany, the same with *solomon's seal*. See SOLOMON'S *seal*, infra.

SALT (*Suppl.*)—*Ætna* SALT. See the article ÆTNA, *Suppl.*

SALT-*wort*, a name sometimes given to the *salicaria* or willow-herb, of other writers. See the article SALICARIA, *Suppl.*

SAMPHIRE, the English name of a genus of plants, called by botanists *crithmum*. See the article CRITHMUM, *Suppl.*

Prickly SAMPHIRE, the name given by some writers to a species of *echinophora*. See the article ECHINOPHORA, *Suppl.*

SAND (*Suppl.*)—SAND-*eel*, in ichthyology, the English name of the *ammodytes*. See the article AMMODYTES, *Suppl.*

SAND-*snake*, a species of serpent. See the article AMMODYTES, *Suppl.*

SANICLE, the English name of a genus of plants, called *sanicula* by botanists. See the article SANICULA, *Suppl.*

Water-SANICLE, a name sometimes given to a genus of plants, called by botanists *geum*. See the article GEUM, *Suppl.*

Bear's ear SANICLE, the name by which some call the *cortusa* of botanists, a distinct genus of plants. See the article CORTUSA, *Suppl.*

SAPLING, among gardeners, a name by which they call any young tree that is full of sap. Rust. Dict. in voc.

SAPONARIA, *soap-wort*, in botany, the name of a genus of plants, the characters of which are these. The cup is a permanent perianthium, formed of a single leaf, oblong and divided into five segments at the edge. The flower consists of five petals: the ungues are narrow, angulated, and of the length of the cup: the limb is plane, the bracteæ broadest towards the extremity, and obtuse. The stamina are ten subulated filaments, of the length of the tube of the flower, alternately inserted into the ungues of the flower: the antheræ are oblong and incumbent. The germen of the pistil is cylindric; the styles are two, strait, parallel, and of the length of the stamina: the stigmata are acute. The fruit is a covered capsule, nearly of the length of the cup, and containing only one cell; in which are included numerous small seeds. The receptacle is free. The germen and capsule are, in some species, more short and rounded, and the segments of the cup are deeper in some than in others; in some they are almost five leaved. Vid. *Linnæi* Gen. Plant. p. 191.
Dillenius and others make this genus only a species of *spergula*. See the article SPERGULA, *Append.*

SAPPADILLA, a name used by some for the *cainito*, or *chrysophyllum*, of botanists. See the article CHRYSOPHYLLUM, *Append.*

SARACEN'S *consound*, a name sometimes given to the *solidago* or *virga aurea* of botanists. See the article VIRGA *aurea*, *Suppl.*

SARFE, the Engliſh name of a ſpecies of *cyprinus*, with the iris of the eye, and all the fins and tail red. See CYPRINUS, *Suppl.*

It is otherwiſe called *erythrophthalmus*, or the *red-eye*. See the article ERYTHROPHTHALMUS, *Suppl.*

SASSAFRAS-*tree*, in botany, the names of a ſpecies of *laurus*, according to Linnæus, with undivided and trilobate leaves. See LAURUS, *Append.*

It is a native of America, and called by C. Bauhine, *ſaſſafras arbor ficulneo folio.*

The bark of this tree is an excellent diaphoretic and attenuant, the wood is alſo in much eſteem. See SASSAFRAS, *Cycl.* and *Suppl.*

SATTIN (*Cycl.*)—*White* SATTIN, in botany, a name given by ſome to the *lunaria*. See the article LUNARIA, *Suppl.*

SATYRIUM, in the linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe: the cup is formed of vague ſpathæ. There is no perianthium. The flower conſiſts of five ovato-oblong petals. The nectarium is monophyllous. The ſtamina are very ſhort and ſlender filaments; the antheræ are ovated; the germen of the piſtil is contorted; the ſtyle is very ſhort; and the ſtigma compreſſed and obtuſe. The fruit is an oblong capſule, containing one cell; in which are numerous, very ſmall ſeeds, like ſawduſt. *Linnæi* Gen. Plant. p. 432.

This genus is called *orchis* or *trago-orchis* by other botaniſts. See the article ORCHIS, *Suppl.*

SAUCE-*alone*, a name ſometimes uſed for the *heſperis* of botaniſts. See the article HESPERIS, *Suppl.*

SAVIN (*Suppl.*)—*Indian* SAVIN, the name of a genus of plants, deſcribed by Linnæus under that of *bauhinia*. See the article BAUHINIA, *Suppl.*

SAW-*wort*, in botany, the Engliſh name of a genus of plants, known among botaniſts by that of *ſerratula*. See the article SERRATULA, *Suppl.*

SAXIFRAGE (*Suppl.*)—*Pimpernel*-SAXIFRAGE, or *burnet*-SAXIFRAGE, names uſed for the *tragoſelinum* of botanical writers. See the article TRAGOSELINUM, *Suppl.*

SCALD, a burn cauſed by ſome boiling liquor. See the article BURN, *Suppl.*

SCALE—*differential* SCALE, is uſed for the ſcale of relation ſubtracted from unity. See SERIES, *Append.*

SCALE *of relation*, in algebra, an expreſſion denoting the relation of the terms of recurring ſeries to each other. See the article SERIES, *Append.*

SCALLOP, in conchyliology, the Engliſh name of the *pecten*. See the article PECTEN, *Suppl.*

SCAMMONY (*Cycl.*)—SCAMMONIA, in botany, the name uſed in the ſhops and among medicinal writers for a ſpecies of bind-weed. See the article CONVOLVULUS, *Suppl.*

SCARE-*crow*, the Engliſh name of a bird of the *larus*, or gull kind, with grey wings, red legs, and the reſt of the body black. See the article LARUS, *Suppl.*

SCARLET *lychnis*, in botany, the name of a ſpecies of *lychnis*. See the article LYCHNIS, *Suppl.*

SCARLET *cardinals flower*, the name of a ſpecies of *rapuntium*. See the article RAPUNTIUM, *Suppl.*

SCARLET *oak*, the Engliſh name of a ſpecies of *ilex*, called by antient writers *ſmilax*. See the article ILEX, *Suppl.*

SCAVEL *ſpitter*, denotes a ſmall ſpade, ſhod only half way, and uſed in digging clay. *Blanckley*, Naval Expoſitor, p. 142.

SCELASIUS, in zoology, the name by which Dr. Hill has called a genus of animalcules with viſible legs.

It is common in ditch-water, and is leſs quick in its motions than moſt other animalcules. *Hill*, Hiſt. Anim. p. 10.

SCIATICA (*Cycl.*) See the article GOUT, *Cycl.* and *Suppl.*

SCIATICA-*creſs*, a name by which ſome call the *cardamine*, or ladies ſmock. See the article CARDAMINE, *Suppl.*

SCIATICA-*creſs* is alſo a name ſometimes given to a ſpecies of *lepidium*, or dittander. See the article LEPIDIUM, *Suppl.*

SCILLA, *ſquill*, in the linnæan ſyſtem of botany, the name of a diſtinct genus of plants, the characters of which are theſe; there is no cup; the flower conſiſts of ſix oval, deciduous, and very patent petals: the ſtamina are ſix ſubulated filaments, of half the length of the flower; the antheræ are oblong, and incumbent; the germen of the piſtil is roundiſh; the ſtyle is ſimple, of the length of the ſtamina, and deciduous; the ſtigma is ſimple: the fruit is a ſmooth capſule, of a ſuboval figure, marked with three furrows, formed of three valves, and containing three cells: the ſeeds are numerous and roundiſh.

This genus comprehends the *liliohyacinthus*, and the *hyacinthus ſtellaris* of other botanical writers; and is reckoned only a ſpecies of *ornithogalum* by Tournefort, Vid. *Linnæi* Gen. Plant. p. 145.

SCORCHING *fennel*. See FENNEL, ſupra.

SCORDIUM, in botany, the name by which ſome call the *teucrium* of other botanical writers. See the article TEUCRIUM, *Suppl.*

SCORPION-*inſect*, the Engliſh name of a ſpecies of *acarus*, called by ſome *Araneus coccineus*. See ACARUS, *Append.*

SCORPION-*ſhell*, the Engliſh name of a ſpecies of murex, otherwiſe called the *ſpider-ſhell*. See the article MUREX, *Suppl.*

Water-SCORPION, the Engliſh name of a genus of four winged flies, called by authors *nepa*. See the article NEPA, *Append.*

SCORPION-*graſs*, the Engliſh name of a genus of plants, called by botaniſts *ſcorpioides*. See the article SCORPIOIDES, *Suppl.*

SCORPION-*ſena*. See the article SENA, infra.

SCORPIURUS, in the linnæan ſyſtem of botany, the name of a genus of plants, called by Tournefort *ſcorpioides*, and in Engliſh *ſcorpion-graſs*. See the article SCORPIOIDES, *Suppl.*

SCOURINGS, among farriers, ſuch gentle purges as preſerve horſes from noxious humours. Vid. Ruſt. Dict. in voc.

SCREEN, an inſtrument for keeping off the wind, or the heat of the fire.

SCREEN is alſo uſed for a frame of laths to ſift earth, ſand, gravel, &c.

SCREEN likewiſe denotes a wire frame for ſeparating of corn from duſt, ſand, cockle, &c. Dict. Ruſt. in voc.

SCRUPI, in natural hiſtory, the name of a claſs of foſſils, formed in detached maſſes, without any cruſts; of no determinate figure, or regular ſtructure; and compoſed of a cryſtalline or ſparry matter, debaſed by an admixture of earth, in various proportions.

Under this claſs are comprehended, 1. The *telaugia*. 2. The *petridia*. 3. The *Lithozugia*. 4. The *Jaſpides*, or *Jaſpers*. See the articles TELAUGIA, PETRIDIA, &c. *Append.*

All theſe genera ſtrike fire with ſteel, only ſome more readily than others. Vid. *Hill*, Hiſt. Foſſ. p. 546, ſeq.

SCRY, in falconry, denotes a great flock of fowl. Ruſt. Dict. in voc.

SCULL-*cap*, a name ſometimes given to a genus of plants, called *ſcutellaria* or *caſſida* by botaniſts. See the article CASSIDA, *Suppl.*

SCUT, among ſportſmen, a term uſed for the tail of a hare or rabbit. Dict. Ruſt. in voc.

SEA-*apple*, or SEA-*egg*, the Engliſh name of the roundiſh *Centronia*, with crooked and faſciculated ſpines. See the article CENTRONIA, *Append.*

SEA-*dragon*, the Engliſh name of the *cottus*, with the ſecond back-fin white. See the article COTTUS, *Suppl.*

SEA-*eagle*, *aquila marina*, the Engliſh name of the *raja*, with a long ſerrated ſpine on a finny tail. See the articles RAJA, and AQUILA *marina*, *Suppl.*

SEA-*hare*, in the hiſtory of inſects, the Engliſh name of the *lernea*. See the article LERNEA, *Append.*

SEA-*horſe*, a name ſometimes, though improperly, given to the *Hippopotamus*, or river-horſe. See the article HIPPOPOTAMUS, *Suppl.*

SEA-*lungs*, in the hiſtory of inſects, the Engliſh name of a ſpecies of *meduſa*. See the article MEDUSA, *Append.*

SEA-*mouſe*, in the hiſtory of inſects, the Engliſh name of the *aphrodita*. See the article APHRODITA, *Append.*

SEA-*nettle*, in zoology, a name improperly given to the *meduſa*, a genus of naked-bodied inſects. See the article MEDUSA, *Append.*

SEA-*pearch*, *perca marina*, in ichthyology. See the article PERCA *marina*, *Suppl.*

SEA-*ſerpent*, *ſerpens marinus*, the Engliſh name of the cylindric *murœna*, with the tail naked and acute. See the articles SERPENT and MURÆNA, *Suppl.*

SEA-*water*. See the article WATER, *Append.*

SEA-*worms*, See the article WORMS *of the ſea*, *Append.*

SEAL (*Suppl.*)—*Ladies* SEAL, in botany, the name by which ſome call the *tamnus*, a diſtinct genus of plants. See TAMNUS, *Suppl.*

Solomon's SEAL, the Engliſh name of a diſtinct genus of plants, called by authors *polygonatum*. See the article POLYGONATUM, *Suppl.*

SEAMS, or SEYMS, in horſes, certain clefts in their quarters, occaſioned by the drineſs of the foot, or by riding upon hard ground. Ruſt. Dict. in voc.

SEAN, a kind of long and large net. Ruſt. Dict. in voc.

SECRETION (*Suppl.*)—It is the opinion of ſeveral authors that all *ſecretion* is performed by glands, but this ſeems very doubtful, not to ſay falſe.

SEELING (*Suppl.*)—SEELING, in falconry, is the running a thread through the eye-lids of a hawk, when firſt taken, to make her endure the head the better. Ruſt. Dict. in voc.

SELANDERS, in horſes, the ſame with the *malanders*. See the article MALANDERS, *Cycl.*

SELF-*heal*, a name by which the *prunella* or *brunella* of botaniſts is ſometimes called. See the article PRUNELLA, *Suppl.*

SELF-*heal* is alſo a name given to ſanicle, on account of its great efficacy in healing freſh wounds, ſtopping fluxes and the gonorrhœa. Ruſt. Dict. in voc. SANICLE.

SELINUM, a name given by ſome to a ſpecies of *ſium*. See the article SIUM, *Suppl.*

SEMENDA, in ornithology, a ſpecies of birds found in the inland parts of the Eaſt-Indies. Scaliger makes no doubt but it is the ſame with the *phœnix*. *Hofm.* Lex. in voc. See the article PHOENIX, *Cycl.*

SENA (*Suppl.*)—This genus of plants is comprehended by Linnæus under the *caſſia*. See CASSIA, *Suppl.* and *Append.*

Baſtard

Bastard SENA, in botany, a name by which authors call *cassia*. See the article CASSIA, *Suppl.*

Bladder-SENA, the English name of a genus of plants, called by botanists *colutea*. See the article COLUTEA, *Suppl.*

Podded-SENA, the name by which the *coronilla* of botanical writers is sometimes called. See the article CORONILLA, *Suppl.*

Scorpion-SENA, the name of a genus of plants, called by authors *emerus*. See the article EMERUS, *Suppl.*

SENGREEN, a name sometimes given to *sedum*, or houseleek. See the article SEDUM, *Suppl.*

SENNA, in botany, &c. See SENA, *Cycl.* and *Suppl.*

SENSITIVE *plant*, *mimosa*, in botany, the English name of a distinct genus of plants. See the article MIMOSA, *Suppl.*

SEPELAER. See PLATEA, *Suppl.*

SEPIA, in zoology, the name of a genus of sea-insects of the gymnarthria kind, called by us the *cuttle-fish*, and *ink-fish*. See INK-*fish*, *Append.*

The body of the *sepia* is of an oblong figure, and depressed; it is furnished with ten tentacula, two of which are longer than the others, and are pedunculated. It is often six inches in length, and three and a half in diameter.

It is supported by an oblong, light and spungy substance, of a friable texture, and lined with a light fungous pith. This is used by the silver-smiths, and as a dentifrice under the name of *os sepium*, *os sepiæ*, or cuttle-fish-bone. *Hill's* Hist. of Anim. p. 97.

SEPTICS, among physicians, an appellation given to all such substances as promote putrefaction. See PUTREFACTION, *Append.*

From the many curious experiments, made by Dr. Pringle to ascertain the *septic* and *antiseptic* virtues of natural bodies, it appears that there are very few substances of a truly *septic* nature. Those commonly reputed such by authors, as the alcaline and volatile salts, he found to be no wise *septic*. However, he discovered some, where it seemed least likely to find any such quality: these were chalk, common salt, and the testaceous powders. He mixed twenty grains of crabs eyes, prepared with six drachms of ox's gall, and an equal quantity of water. Into another phial he put an equal quantity of gall and water but no crabs-eyes. Both these mixtures being placed in the furnace, the putrefaction began much sooner, where the powder was, than in the other phial. On making a like experiment with chalk, its *septic* virtue was found to be much greater than that of the crabs-eyes: nay, what the doctor had never met with before, in a mixture of two drachms of flesh, with two ounces of water and thirty grains of prepared chalk, the flesh was resolved into a perfect mucus in a few days.

To try whether the testaceous powders would also dissolve vegetable substances, the doctor mixed them with barley and water, and compared this mixture with another of barley and water alone. After a long maceration by a fire the plain water was found to swell the barley, and turn mucilaginous and sour; but that with the powder kept the grain to its natural size, and though it softened it, yet made no mucilage and remained sweet.

Nothing could be more unexpected, than to find sea-salt a hastener of putrefaction; but the fact is thus. One drachm of salt preserves two drachms of fresh beef in two ounces of water, above thirty hours, uncorrupted, in a heat equal to that of the human body; or, which is the same thing, this quantity of salt keeps flesh sweet twenty hours longer than pure water. But then half a drachm of salt does not preserve it above two hours longer. Twenty five grains have little or no antiseptic virtue, and ten, fifteen, or even twenty grains manifestly both hasten and heighten the corruption. The quantity, which had the most putrefying quality, was found to be about ten grains to the above proportion of flesh and water.

Many inferences might be drawn from this experiment. One is, that since salt is never taken in aliment beyond the proportion of the corrupting quantities, it would appear that it is subservient to digestion, chiefly by it's *septic* virtue, that is, by softening and resolving meats: an action very different from what is commonly believed.

It is to be observed that the above experiments were made with the salt kept for domestic uses. See *Pringle*, Observ. on the diseases of the army, p. 848, seq.

SERAPH (*Cycl.*)—SERAPH is also the name of a Turkish gold-coin, worth about five shillings sterling. Dict. Rust. in voc.

SERCIL *feathers of a hawk*, the same with those called pinions in other fowl. Dict. Rust. in voc.

SERE, in falconry, the yellow between the beak and eyes of a hawk. Dict. Rust. in voc.

SERJEANT of the acatery, See ACATERY, *Cycl.*

SERIES, in algebra (*Cycl.*)—The notion of a *series* given in the Cyclopædia is too limited, when confined to ranks or progressions of quantities increasing or decreasing in some constant ratio: for the term *series* is indifferently used whether the terms of any number of quantities following each other have a constant ratio, or even relation or not. And, strictly speaking, a *series* of quantities increasing or decreasing in a constant ratio is no more than what is commonly called a geometric progression.

The doctrine of *series* is of extensive use in mathematics, and has been carried far; though not so far as could be wished. It would far exceed the limits of our design to enter into a detail of the discoveries relating to this subject. Something, however, should be added to what has been said in the Cyclopædia, to give a notion of the principal kinds of *series*, and the method of notation used in treating of them.

A *series* being proposed, one of the principal questions concerning it, is, to find the law of its continuation. For this no universal rule can be given; but it often happens, that the terms of the *series* taken two and two, three and three, or in greater numbers have an obvious and simple relation, by which the *series* may be determined and produced indefinitely. Thus if unity be divided by $1-x$, the quotient will be a geometric progression, any term of which will be to the next antecedent term as x to 1. And by this property the *series* $1+x+x^2+x^3+$ &c. may be distinguished and produced *ad infinitum*. In like manner in other cases of division, other *series's* will arise, the terms of which will have a constant relation to each other, and this relation recurring always throughout the *series*, they have been called recurring *series* by Mr. de Moivre, who first considered them, and applied them to the solution of several intricate problems. See *Recurring* SERIES, *infra*.

In many cases, the relation of the terms of a *series* is not constant, as it is in those arising from division. Yet this relation often varies according to a certain law obvious upon inspection. Thus in the *series* $1+\frac{2}{3}x+\frac{8}{15}x^2+\frac{16}{35}x^3+\frac{128}{315}x^4+$ &c. The terms may be continued indefinitely by the continued multiplication of these fractions $\frac{2}{3}$, $\frac{4}{5}$, $\frac{6}{7}$, $\frac{8}{9}$, &c. And the following *series*. $1+\frac{1}{6}x+\frac{3}{40}x^2+\frac{5}{112}x^3+\frac{35}{1152}x^4+$ &c. may be continued by the multiplication of the fractions $\frac{1\times 1}{2\times 3}$, $\frac{3\times 3}{4\times 5}$, $\frac{5\times 5}{6\times 7}$, $\frac{7\times 7}{8\times 9}$, &c.

Series's of this kind may be defined by *differential equations*. The equation defining a *series* is that which assigns the relation of the terms generally by their distances from the beginning. To do this Mr. Stirling conceives the terms of the *series* to be placed as so many ordinates on a right line given by position, and he, for the sake of simplicity, takes unity as the common interval of these ordinates. The initial terms of the *series* he denotes by the initial letters of the alphabet, A, B, C, D, &c. A being the first, B the second, C the third &c. And he denotes any term in general by the letter T, and the rest following it in order, T', T'', T''', T'''', &c. He denotes the distance of the term T from any given term, or from any given intermediate point between two terms, by the indeterminate quantity z: so that the distances of the terms T', T'', T''', &c. from the said term or point, will be, $z+1$, $z+2$, $z+3$ &c. for the increment of the abscis is the common interval of the ordinates, or terms of the *series* applied to the abscis.

These things being premised let this *series* be proposed, 1, $\frac{1}{2}x$, $\frac{3}{8}x^2$, $\frac{5}{16}x^3$, $\frac{35}{128}x^4$, $\frac{63}{256}x^5$ &c. in which the relations of the terms are $B=\frac{1}{2}Ax$, $C=\frac{3}{4}Bx$, $D=\frac{5}{6}Cx$, $E=\frac{7}{8}Dx$ &c. The relation in general will be defined by the equation, $T'=\frac{z+\frac{1}{2}}{z+1}Tx$, where z denotes the distance of T from the first term of the *series*. For by substituting 0, 1, 2, 3, 4, &c. successively in the place of z, the relations of the terms of the proposed *series* will arise. In like manner, if z be the distance of T from the second term of the *series*, the equation will be $T'=\frac{z+\frac{3}{2}}{z+2}Tx$, as will appear by substituting the numbers -1, 0, 1, 2, 3, 4, &c. successively for z. Or if the indeterminate z denotes the place of the term T in the *series*, its successive values will be 1, 2, 3, 4, &c. and the equation will be $T'=\frac{z-\frac{1}{2}}{z}Tx$.

It appears therefore that innumerable differential equations may define one and the same *series*, according to the different points from whence the origin of the abscissa z is taken. And on the contrary the same equation defines innumerable different *series's* by taking different successive values of z. For in the equation $T'=\frac{z-\frac{1}{2}}{z}Tx$, which defines the *series* above mentioned, when 1, 2, 3, 4, &c. are the successive values of the abscissæ; if $1\frac{1}{2}$, $2\frac{1}{2}$, $3\frac{1}{2}$, $4\frac{1}{2}$, &c. be successively substituted for z, the relations of the terms arising will be $B=\frac{2}{3}Ax$, $C=\frac{4}{5}Bx$, $D=\frac{6}{7}Cx$, &c. from whence the *series* A, $\frac{2}{3}Ax$, $\frac{8}{15}Ax^2$, $\frac{16}{35}Ax^3$, $\frac{128}{315}Bx^4$, &c. will arise, which is different from the former. But the equation will always determine the *series* from the given values of the abscissa and of the first term, when the equation includes but two terms of the *series*; as in the last example, where the first term being given, all will be given. But when the equation includes three terms, two must be given; and three must be given, when it includes four, and so forth.

If the *series* x, $\frac{1}{6}x^3$, $\frac{1}{40}x^5$, $\frac{5}{112}x^7$, $\frac{35}{1152}x^9$ &c. be proposed, where the relations of the terms are, $B=\frac{1\times 1}{2\times 3}Ax^2$, $C=\frac{3\times 3}{4\times 5}Bx^2$, $D=\frac{5\times 5}{6\times 7}Cx^2$, &c. the equation defining

this

this *series* will be $T' = \frac{\overline{2z-1} \times \overline{2z-1}}{2z \times \overline{2z+1}} T x^2$, or $T' = \frac{4zz - 4z + 1}{4zz + 2z} T x^2$, where the successive values of z are 1, 2, 3, 4, &c. See Mr. *Stirling*'s *methodus differentialis*, in the introduction.

This may suffice to convey a notion of these differential equations, defining the nature of *series's*. But as to the application of these equations in finding the sums of *series's*, it would require a treatise to explain it. We must therefore refer the curious to that excellent one just quoted, as also to Mr. de Moivre's *Miscellanea Analytica*; and several curious papers by Mr. Euler in the acta Petropolitana.

A *series* often converges so slowly as to be of no use in practice. Thus if it were required to find the sum of the *series* $\frac{1}{1.2} + \frac{1}{3.4} + \frac{1}{5.6} + \frac{1}{7.8} + \frac{1}{9.10} +$ &c. which lord Brounker found for the quadrature of the hyperbola true to 9 figures, by the mere addition of the terms of the *series*, Mr. Stirling computes that it would be necessary to add a thousand millions of terms for that purpose; for which the life of man would be too short. But by that gentleman's method the sum of the *series* may be found by a very moderate computation. See Meth. Diff. p. 26, seq.

Recurring SERIES, is used for a *series* which is so constituted, that having taken at pleasure any number of its terms, each following term shall be related to the same number of preceding terms according to a constant law of relation. Thus in the following *series*,

$$\begin{array}{cccccc} A & B & C & D & E & F \\ 1 + & 2x + & 3xx + & 10x^3 + & 34x^4 + & 97x^5 + \&c. \end{array}$$

in which the terms being respectively represented by the capitals A, B, C, D, &c. we shall have

$$D = 3Cx - 2Bxx + 5Ax^3$$
$$E = 3Dx - 2Cxx + 5Bx^3$$
$$F = 3Ex - 2Dxx + 5Cx^3 \text{ \&c.}$$

Where it is evident, that the law of relation between D and E is the same as between E and F, each being formed in the same manner from the three terms which precede it in the *series*.

The quantities $3x - 2xx + 5x^3$ taken together and connected with their proper signs is what Mr. de Moivre calls the *Index* or the *scale of relation*. Sometimes the bare coefficients $3 - 2 + 5$ are called the scale of relation. And this scale of relation subtracted from unity is called the *differential scale*. Thus in the foregoing *series* the scale of relation being $3x - 2xx + 5x^3$, the differential scale will be $1 - 3x + 2xx - 5x^3$.

On the subject of recurring *series* see Mr. de Moivre's Miscellan. Analytic. p. 27. seq. and p. 72. seq. as also his doctrine of chances 2d Edit. p. 193. seq. and Mr. Euler's analys. infinit. Tom. I. p. 175. seq.

A recurring *series*, with its scale of relation being given, the sum of that *series* continued *in infinitum* will also be given. For instance, suppose a *series* $a + bx + cxx + dx^3 + ex^4 +$ &c. where the relation of the coefficient of any term to the coefficients of any two preceding terms may be expressed by $f - g$; that is, $e = fd - ge$; and $d = fc - gb$ &c. Then will the sum of the *series* continued *in infinitum* be,

$$\frac{\begin{array}{c} a + bx \\ -fax \end{array}}{1 - fx + gxx}$$

To facilitate the intelligence of this rule by a particular example, assume any *series* whereof the two first coefficients are given, such as 2 and 5, and suppose f and g to be respectively 2 and 1; then we shall have the following *series*, $2 + 5x + 8xx + 11x^3 + 14x^4 + 18x^5 +$ &c.

And the sum $= \frac{2 + 5x - 4x}{1 - 2x + xx} = \frac{2 + x}{\overline{1-x}^2}$

For the proof divide 1 by $\overline{1-x}^2$

$$\begin{array}{ll} 1 - 2x + xx)\ 1\ (& 1 + 2x + 3xx + 4x^3 + \text{\&c. which} \\ \text{multiplied by} & \underline{2 + x} \\ & 2 + 4x + 6xx + 8x^3 + \text{\&c.} \\ \text{gives} & \underline{+ x + 2xx + 3x^3 + \text{\&c.}} \\ \text{the product} = & 2 + 5x + 8xx + 11x^3 + \text{\&c.} = \text{the given } series. \end{array}$$

Analogous rules might be derived for more complex cases; and Mr. de Moivre's general rule is,

1° Take as many Terms of the *series* as there are parts in the scale of relation. 2°. Subtract the scale of relation from unity, the remainder is the differential scale. 3°. Multiply the terms taken in the *series* by the differential scale, beginning at unity, and so proceeding orderly, remembring to leave out what would naturally be extended beyond the last of the terms taken. Then will the product be the numerator, and the differential scale will be the denominator of a fraction expressing the sum required.

But we must here observe that when the sum of a recurring *series* extended *ad infinitum* is found by Mr. de Moivre's rule, it ought to be supposed, that the *series* converges indefinitely, that is, that the terms may become less than any assigned quantity. For, if the *series* diverges, that is, if its terms continually increase, it is not true, that the rule gives the sum. For the sum in such cases is infinite, or greater than any given quantity, whereas the sum exhibited by the rule will often be finite. The rule therefore in this case only gives a fraction, the reduction of which into a *series* gives the proposed *series*. Thus $\frac{1}{\overline{1-x}^2}$ reduced to an infinite *series* gives the recurring *series* $1 + 2x + 3xx +$ &c. whose scale of relation is $2 - 1$, and its sum by the rule will be $\frac{a + bx - fax}{1 - fx + gxx} = \frac{1 + 2x - 2x}{1 - 2x + xx} = \frac{1}{\overline{1-x}^2} =$ the quantity from which the *series* arose. But this quantity cannot in all cases be deemed equal to the infinite *series* $1 + 2x + 3xx$ &c. For stop where you will, there will always be a supplement required to make the product of the quotient by the divisor equal to the dividend. When the *series*, indeed, converges infinitely, the supplement diminishing continually, it becomes less than any assigned quantity, and is therefore, without error, reputed nothing; but in diverging *series*, this supplement becomes indefinitely great, and the *series* deviates indefinitely from the truth. See Mr. *Colson*'s comment on Sir *Is. Newton*'s method of fluxions and infinite *series* p. 152. Mr. *Stirling*'s method. Differentialis p. 36. *Bernoulli*, de Serieb. infinit. p. 249. *Cramer*, Analyse des lignes Courbes, p. 174.

A *recurring series* being given, the sum of any number of the terms of that *series* may be found. This is prob. III. p. 73. Miscel. Analys. and prop. V. p. 196. of the Doctrine of chances. One solution of the simplest case will be sufficient to give an idea of the method there used.

Let there be a geometric progression $a + ax + ax^2 + ax^3 +$ &c: it is required to find the sum of a number n of its terms. Then will the last term be ax^{n-1}. Suppose the progression continued *ad infinitum*, and we shall have two infinite progressions, the first beginning with a and the second with ax^n. Now the difference of the sum of these two must be the sum of the number n of terms. By the rule the sum of the first infinite progression will be $\frac{a}{1-x}$; and the sum of the second will be $\frac{ax^n}{1-x}$. But $\frac{a}{1-x} - \frac{ax^n}{1-x} = \frac{a - ax^n}{1-x}$, which will therefore be the sum of a number n, of terms.

This quantity $\frac{a - ax^n}{1-x}$ is equal to $\frac{ax^n - a}{x - 1}$, which last expression, calling $ax^{n-1} = l$, will be equivalent to this, $\frac{lx - a}{x - 1}$, which is the common rule for finding the sum of any geometric progression of which a, the first term; x, the ratio; and l the last term are given.

The *series* resulting from the division of unity by $\overline{1-x}^p$ or $\frac{1}{\overline{1-x}^p} = \overline{1-x}^{-p}$ is $1 + px + p \times \frac{p+1}{2} xx + p \times \frac{p+1}{2} \times \frac{p+2}{3} x^3 +$ &c. And the sum of any number of terms expressed by n of this *series* will be $\frac{\overline{1-x}^n}{\overline{1-x}^p} - \frac{nx^n}{\overline{1-x}^{p-1}} - \frac{\frac{n}{1} \times \frac{n+1}{2}}{\overline{1-x}^{p-2}} x^n - \frac{\frac{n}{1} \times \frac{n+1}{2} \times \frac{n+2}{3}}{\overline{1-x}^{p-3}} x^n -$ &c. which is to be continued till the number of terms $= p$. See Miscel. Analys. pag. 167. Doctrine of chances. p. 196. This theorem is of use in finding the sums of progressions of figurate numbers, and others.

Suppose, for instance, it were required to find the sum of any number n of terms of the geometric progression $1 + x + xx + x^3 +$ &c. generated by $\frac{1}{1-x}$. Here $p = 1$. And the sum will consequently be $= \frac{1 - x^n}{\overline{1-x}^p} = \frac{1 - x^n}{1 - x}$.

Again, if the sum of a number n of terms of the *series* $1 + 2x + 3xx + 4x^3 +$ &c. were required. The *series* is generated from $\frac{1}{\overline{1-x}^2}$ Then $p = 2$. And the sum $= \frac{1 - x^n}{\overline{1-x}^2} - \frac{nx^n}{1-x}$. Suppose $x = 1$ then will the sum be $\frac{nn + n}{2} = n \times \frac{n+1}{2}$ which is the sum of the arithmetical progression $1 + 2 + 3 + 4 +$ &c. continued to the number n of terms. But it is to be observed that it requires a particular artifice to derive this sum from the general rule: for at first sight the sum appears under this form $\frac{1 - 1}{\overline{1-1}^2} - \frac{n}{1 - 1}$.

$\frac{n}{1-1}$ which determines nothing. See Miſc. Analyſ. loc. cit.

In like manner, the ſum of a number n of terms of the *ſeries* of triangular numbers will be found to be $n \times \frac{n+1}{2} \times \frac{n+2}{3}$, as in Miſcel. Analyſ. p. 168.

By the like methods the ſum of any number of ſquares, cubes, &c. of the natural *ſeries* of numbers may be found. Which may alſo be done by Sir Iſaac Newton's differential method. See DIFFERENTIAL *method*, *Append.*

3° In a recurring *ſeries* any term may be obtained whoſe place is aſſigned. For after having taken ſo many terms of the *ſeries* as there are terms in the ſcale of relation, the *ſeries* may be protracted till it reach the place aſſigned. But if that place be very diſtant from the beginning of the *ſeries*, the continuation of the terms will prove laborious: other methods have therefore been contrived. See Miſcel. Analyſ. p. 33, ſeq. and Doct. of chances, p. 197, ſeq.

Theſe queſtions have been reſolved in many caſes, beſides thoſe of *recurring ſeries*. But as there is no univerſal method for the quadrature of curves, neither is there one for the ſummation of *ſeries*; there being a great analogy between theſe things, and ſimilar difficulties ariſing in both. See the authors before cited.

The inveſtigation of Mr. Daniel Bernoulli's method for finding the roots of algebraic equations, which is inſerted in the article EQUATION, *Suppl.* depends upon the doctrine of *recurring ſeries*. See *Euler*, Analyſis infinitorum, Tom. I. pag. 276, ſeq.

In general algebraic quantities may be expreſſed by a *ſeries*, either by diviſion or by the extraction of roots, in a method analogous to that uſed in arithmetic for expreſſing vulgar fractions and roots by decimals. And the conſideration of this analogy ſeems to have given riſe to Sir Iſaac Newton's doctrine of infinite *ſeries*. See his method of fluxions and infinite *ſeries* in the beginning.

But the ſame great author had alſo another method of throwing quantities into an infinite *ſeries*, by means of a general form aſſumed for that purpoſe. See FORM.

Interpolation of a SERIES, ſee INTERPOLATION.

Interſcendent SERIES. See INTERSCENDENT *ſeries*.

Tranſcendental SERIES. See TRANSCENDENTAL *ſeries*.

Hyperbolic SERIES is uſed for a *ſeries* whoſe ſum depends upon the quadrature of the hyperbola. Such is the *ſeries* $\frac{1}{1}+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}+\frac{1}{5}+$ &c. *De Moivre*, Miſc. Analyſ. p. 111.

Circular SERIES, is uſed for a *ſeries* whoſe ſum depends on the quadrature of the circle. Such is the *ſeries* $1-\frac{1}{3}+\frac{1}{5}-\frac{1}{7}+\frac{1}{9}-$ &c. *De Moivre*, Miſc. Analyſ. p. 111. or the ſum of the *ſeries* $1+\frac{1}{4}+\frac{1}{9}+\frac{1}{16}+\frac{1}{25}+$ &c. continued *ad infinitum*, according to Mr. Euler's diſcovery.

Mixt SERIES, that *ſeries* whoſe ſum depends partly on the quadrature of the circle and partly on that of the hyperbola. *De Moivre*, Miſc. Analyſ. p. 111.

Determinate SERIES, a *ſeries* the terms of which proceed by the powers of a determinate quantity. If that determinate quantity be unity, the *ſeries* is ſaid to be *determined by unity*. *De Moivre*, Miſcel. Analyſ. p. 111.

Reverſion of SERIES. See REVERSION *of ſeries*.

Summable SERIES, is uſed when the ſum of the terms of a *ſeries* may be found. Such is the *ſeries* $\frac{1}{2}+\frac{1}{4}+\frac{1}{8}+$, &c. the ſum of which is ſaid to be equal to unity, or, to ſpeak more accurately, the limit of whoſe ſum is unity. See the article PROGRESSION, *Suppl.*

An indefinite number of ſummable infinite *ſeries's* may be found: ſuch are, for inſtance, all infinite recurring *ſeries*, when converging, and many others, for which Meſſieurs De Moivre [a], Bernoulli [b], Stirling [c], Euler [d], and Mac Laurin [e], may be conſulted.—[[a] Miſcel. Analyſ. p. 110, ſeq. [b] De Serieb. infinit. paſſim. [c] Method. Different. p. 34, ſeq. [d] Acta Petropolit. paſſim. [e] Fluxions, Art. 350, ſeq. See alſo PROGRESSION, *Suppl.*]

SERMOUNTAIN, a name ſometimes given to the plant called *ſeſili*, or *ſiler* by authors. See the articles SESILI and SILER, *Suppl.*

SERPENT'S *tongue*, or ADDER'S *tongue*, names by which the *ophiogloſſum* of botaniſts is frequently called. See the article OPHIOGLOSSUM, *Suppl.*

SERPYLLUM (*Suppl.*) is alſo uſed by ſome as the name of a ſpecies of *thymbra*. See the article THYMBRA, *Suppl.*

SERVICE-*tree*, in botany, the Engliſh name of a genus of trees, called by botanical writers *ſorbus*. See the article SORBUS, *Suppl.*

Wild SERVICE, a name by which ſome call the *cratægus* of botanical writers. See the article CRATÆGUS, *Suppl.*

SESAMUM, *oily grain plant*, in botany, the name of a genus of plants, the characters of which are theſe. The cup is a one-leaved perianthium, divided into five ſegments; the uppermoſt of which is ſhorteſt. The flower conſiſts likewiſe of one petal of a campanulated form, and divided into five ſegments; of which the loweſt is by far the longeſt. The ſtamina are four filaments, ſhorter than the flower; the antheræ are oblong, acute, and erect. The germen of the piſtil is oval and rough; the ſtyle is filiform; the ſtigma is lanceolated, and divided into two parts. The fruit is an oblong capſule, containing four cells, in which are numerous ſeeds of an oval figure. *Linnæi* Gen. Plant. p. 293.

SESSION (*Suppl.*)—The court of *ſeſſion*, otherwiſe called the *college of juſtice*, is the ſupreme court in Scotland for all civil cauſes. It conſiſts of one conſtant preſident and fourteen other judges, who are lords by their office, which they hold by patent *quamdiu ſe bene geſſerint*. The Lord High Chancellor preſides here when preſent. The king names ſeveral other extraordinary lords, who ſit, but are not obliged to attendance, becauſe they have no ſalaries; but they may vote among the reſt.

The court ſits from the firſt of November, old ſtyle, to the laſt of February, and from the firſt of June to the laſt of July, all incluſive; which holds of all the inferior courts or judicatories in Scotland. In time of *ſeſſion*, or term, they ſit from nine o'clock to twelve in the forenoon, every day in the week but Sunday and Monday: ſometimes they ſit in the afternoon, to end concluded cauſes, or to hear ſuch long debates as the forenoon was too ſhort to hear, which gives a great diſpatch to cauſes that come before them. The lords, both ordinary and extraordinary, when in the inner houſe, ſit on a ſemicircular bench in their robes; where the advocates debate their clients cauſes before them. There are ſix principal clerks belonging to this court. Nine of the lords make a quorum in the inner houſe, otherwiſe they cannot vote in any caſe, except ſuch as are referred to one or more of the whole lords; and one of the ordinary lords (the preſident being always excepted) is weekly appointed judge in the outer houſe, for diſcuſſing of ordinary actions, and has ſix under clerks to attend him. He meddles with no extraordinary caſes, except where it is remitted to him by all the lords to be diſcuſſed in the outer houſe for diſpatch.

That the lords may have time to read informations, petitions, &c. and the ſuitors be eaſed of the trouble of going with them to their houſes, every lord has a box ſtanding upon a table in the waiting room in the inner houſe from two to four o'clock in the afternoon every day; wherein all who have papers to offer, may put them by a ſlit in the cover. Each of the principal clerks have alſo a box, and parties muſt put their bills, anſwers, or informations of cauſes to be reported, into the clerk of the proceſs's box.

The rolls of the court bring in all cauſes in their due order. Cauſes of the greateſt conſequence are at firſt adviſed by the whole lords in the inner houſe. Other cauſes are called of courſe before an ordinary in the outer houſe, who decides the controverſy, if clear, without farther trouble or expence; and, in caſe of difficulty, takes ſome little time to adviſe it himſelf, or to adviſe with the whole lords upon it. And if any of the parties think themſelves wronged by the ſentence of the ordinary, they may complain to the lords, and get their anſwer upon a bill. See *Chamb.* Preſ. State of Gr. Brit. p. 381, ſeq.

An appeal lies from this court to the Houſe of Lords.

SETTER-*wort*, a name by which hellebore is ſometimes called. See the article HELLEBORUS, *Suppl.*

SETTING, (*Suppl.*) among cock-maſters, is the placing a cock, that has fought ſo that he cannot ſtand, beak to beak againſt the other cock, and if he does not ſtrike the battle is won. Dict. Ruſt. in voc.

SETTING *down*, in falconry, is when a hawk is put into the mew. Id. ibid.

SETTING-*dog*, one trained up to find out and diſcover to the ſportſman whereabouts fowl are.

SETTS *for ſaws*, inſtruments for ſetting their teeth when out of order. *Blanckley*, Nav. Expoſ. p. 145.

SETWELL, in botany, a name ſometimes uſed for a ſpecies of *valerian*. See the article VALERIAN, *Suppl.*

SEWEL, among ſportſmen, denotes any thing that is ſet or hung up, to keep a deer out of any place. Ruſt. Dict. in voc.

SEYMS, among farriers. See SEAMS.

SHADDOCK, in botany, the name by which ſome call a ſpecies of orange. See the article ORANGE, *Suppl.*

SHAKLES, aboard a ſhip. See SHACKLES, *Suppl.*

SHAKY, or SHAKEN, among builders, an appellation given to timber which is cracked either with the heat of the ſun, or the drought of the wind. Build. Dict. in voc.

SHAVE-*graſs*, a name ſometimes uſed for the *equiſetum*, or horſe-tail. See the article EQUISETUM, *Suppl.*

SHAVING-*irons*, among gardeners, tools to keep a garden free from weeds, otherwiſe called *edging-irons*. Ruſt. Dict. in voc.

SHAW (*Suppl.*)—SHAW-*fowl*, an artificial bird, made for fowlers to ſhoot at. Ruſt. Dict. in voc.

SHEAT, or SHUT, a name by which ſome call a young hog. Ruſt. Dict. in voc.

SHELDAPLE, a name uſed in ſeveral parts of the kingdom for the chaffinch. Ruſt. Dict. in voc.

SHELL (*Suppl.*)—*Caterpillar*-SHELL, the Engliſh name of a ſpecies of *turbo*. See the article TURBO, *Suppl.*

Crown imperial Shell, the Engliſh name of a ſpecies of *voluta*. See the article Voluta, *Suppl.*

Chalice-Shell, or *cup*-Shell, the Engliſh name of a ſpecies of *balanus*. See the article Balanus, *Suppl.*

Dog-tooth Shell, the Engliſh name of a ſpecies of *dentale*. See the article Dentale, *Suppl.*

Needle-Shell, the Engliſh name of a ſpecies of *centronia*. See the article Centronia, *Append.*

Needle-Shell. See the article Needle, ſupra.

Scorpion-Shell, or *Spider*-Shell, names uſed for a ſpecies of *murex*. See the article Murex, *Suppl.*

Tiger-Shell, the Engliſh name of the red *voluta* with large white ſpots. See the article Voluta, *Suppl.*

Toe-Shell, the Engliſh name of a genus of *ſhells*, otherwiſe called *pollicipes*. See the article Pollicipes, *Suppl.*

Turtle-Shell, the Engliſh name of two ſpecies of different kinds of *ſhells*, the *murex* and *voluta*. See the articles Murex and Voluta, *Suppl.*

Shell-*drake*, in zoology, a common Engliſh name for the *tadorna*. See the article Tadorna.

SHEPHERD, in country affairs, a perſon who keeps or looks after ſheep. Dict. Ruſt. in voc.

Shepherd's *needle*, a name by which the *ſcandex* of botaniſts is ſometimes called. See the article Scandex, *Suppl.*

Shepherd's *pouch*, *alyſſon*, in botany, the name of a diſtinct genus of plants, otherwiſe called *madwort*. See the article Alysson, *Suppl.*

Shepherd's *ſtaff*, or Shepherd's *rod*, in botany, names given to the *dipſacus* of botanical writers. See the article Dipsacus, *Suppl.*

SHERBET, or Sherbit, a compound drink, firſt brought into England from Turkey and Perſia, conſiſting of fair water, lemon juice, ſugar, amber, and other ingredients.

Another kind of it is made of violets, honey, juice of raiſins, &c.

The word *ſherbet*, in the Perſian language, ſignifies *pleaſant liquor*. Dict. Ruſt. in voc.

SHRIMP, the Engliſh name of the common *ſquilla* with a long tail, and the ſnout ſerrated above, and tridentated below. See the article Squilla, *Append.*

SHROVE, in zoology, the ſame with *ſhrew*. See the article Shrew, *Suppl.*

SHUT, among farmers. See Sheat, *Append.*

SICYANIA, the *gourd-worm*, the name of a genus of worms; the body of which is of an oblong form, flat on the belly, and rounded on the back; its ſkin is ſoft, and its mouth large, horizontal, and emarginated, or dented in the middle. It reſembles the common gourd in figure, and from thence has got this name of *vermis cucurbitinus*, or the *gourd-worm*. It is frequently found in the inteſtines of animals. *Hill*, Hiſt. Anim. p. 16.

SIDE-*ſaddle-flower*, a name ſometimes given to the *ſarracena* of botanical writers. See the article Sarracena, *Suppl.*

SIDEROCHITA, in natural hiſtory, a claſs of cruſtated ferrugineous bodies, of a moderately firm and compact texture, compoſed of ferrugineous mixed with earthy matter, and formed of repeated incruſtations, making ſo many coats or cruſts round a ſofter or harder nucleus, or round looſe earths, or an aqueous fluid. Vid. *Hill*, Hiſt. Foſſ. p. 531.

Under this claſs are comprehended the *empherepyra*, *heteropyra*, *geodes*, and *enhydri*. See the article Empherepyra, &c. *Append.*

SIDEROXYLUM, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants, the characters of which are theſe: the cup is a ſmall erect perianthium, compoſed of a ſingle leaf, divided into five ſegments, and permanent. The flower conſiſts of a ſingle petal, divided into five roundiſh, erect, concave ſegments; and, at the baſe of every one of theſe, there is placed a cuſpidated, ſerrated denticle, bending inwards. The ſtamina are five ſubulated filaments, of the length of the flower: the antheræ are ſimple: the germen of the piſtil is roundiſh; the ſtyle is ſubulated, and of the length of the ſtamina; the ſtigma is ſimple. The fruit is a roundiſh berry, containing only one cell. The ſeeds are four in number. *Linnæi* Gen. Plant. p. 81.

SILK-*graſs*, a name uſed for two very different genuſes of plants, the *aloe* and *dog's bane*. See the articles Aloe and Dog's Bane, *Suppl.*

Silk-*machine*. See the article Machine, *Append.*

SILVER-*bruſh*, a name ſometimes given to the *barba jovis* of botaniſts. See the article Barba-*jovis*, *Suppl.*

Silver-*weed*, *potentilla*, or *argentina*, in botany, the name of a diſtinct genus of plants. See the articles Argentina and Pentaphylloides, *Suppl.*

SILVERING (*Cycl.*)—This is a ſpecies of gilding, and may be done thus: take as much aqua fortis as you think there is occaſion for, put it into a glaſs, which ſet in warm aſhes; then put in your quantity of ſilver, after having beaten it very thin, and cut it into little ſhreads. When the ſilver is diſſolved, take it off the aſhes; and, mixing that liquid with as much white tartar as will make it like paſte; rub with this mixture the metal you want to ſilver. Copper, braſs, or any other metal may be thus made to appear like ſilver itſelf.

Copper, braſs, ſteel, or iron may be *ſilvered*, ſo as not to come off, unleſs made red-hot, in the following manner. Take urine which is made in the morning, cover it, and let it ſtand a whole month, and it will ferment; put it afterwards into an earthen pot, and let it boil; ſkim it, and when the third part is evaporated, take to two pints of urine one ounce of tartar, and one ounce of galiz-ſtone; mix them all together, and let them boil once up. When you would *ſilver* any metal, rub it well with brick-duſt on a wet woollen rag, till it is clean and fine, then put it twenty-four hours in the prepared urine; afterwards dry it, and where you deſign to *ſilver*, rub it over with quick-ſilver, which muſt be laid on thin with an iron ſpatula that has alſo lain two hours in urine. The quick-ſilver thus laid on, muſt be then rubbed on with a ſoft woollen rag, and it will make a fine *ſilvering*.

Braſs may be *ſilvered*, by boiling it with filings of good pewter and white tartar, in equal quantities. There are ſeveral other methods of *ſilvering*, for which ſee *Smith's* Laboratory, p. 37. ſeq.

SINGLE (*Suppl.*)—Single, among ſportſmen, the tail of a buck, or any of the deer kind. Ruſt. Dict. in voc.

SISON, the officinal name of a ſpecies of *ſium*. See the article Sium, *Suppl.*

SKEETS, in the ſea language, narrow oblong ladles, for wetting the ſails or ſides of a ſhip. *Blanckley's* Nav. Expoſ. p. 152.

SKEPE, or Skuttle, in country affairs, a ſort of flat, broad baſket for winnowing of corn. Dict. Ruſt. in voc.

SKIDS, wooden fenders laid on the outſide of a ſhip for the conveniency of hoiſting things into the ſhip. *Blanckley's* Nav. Expoſ. p. 152.

SKREEN. See Screen, *Append.*

SLEEPER, in zoology, a name peculiarly given to the dormouſe, or *mus avellanorum* of authors. See the article Mus, *Suppl.*

Sleeper, in building, a name uſed for the oblique rafter that lies in a gutter. Build. Dict. in voc.

SLIPPER (*Suppl.*)—*Lady's* Slipper, the Engliſh name of a genus of plants, called by botaniſts *helleborine*. See the article Helleborine, *Suppl.*

Slipper is alſo a name ſometimes uſed for a *plinth*. See the article Plinth, *Cycl.*

SLOTH, in zoology. See Sloath, *Suppl.*

SNAIL, in the hiſtory of inſects, the Engliſh name for the *limax*. See the articles Snail, *Suppl.* and Limax, *Append.*

Snail is alſo the name of the animal inhabiting many kinds of ſhells, as the patella, cochlea, nerite, buccinum, turbo, trochus, voluta, murex, purpura, lyra, and concha veneris. *Hill*, Hiſt. Anim. p. 114. See the articles Patella, Cochlea, &c.

Snail *trefoil*. See the article Trefoil, infra.

SNAKE (*Suppl.*)—*Coach-whip*-Snake, the name by which ſome call a ſpecies of *coluber*. See the article Coluber, *Append.*

Corn-Snake, the name of another ſpecies of *coluber*.

Necklace-Snake, the Engliſh name of the *natrix torquata* of zoologiſts. See the article Natrix, *Suppl.*

Sand-Snake, the Engliſh name of a kind of ſerpent found in Lybia, and ſome parts of Italy. See the article Ammodytes, *Suppl.*

Snake-*root*, *ariſtolochia*, in botany, the name of a genus of plants, otherwiſe called *birthwort*. See the article Aristolochia, *Suppl.*

Rattle-Snake-*root*, a name ſometimes given to *polygala*, a diſtinct genus of plants. See the article Polygala, *Suppl.*

SNAP-*tree*, *adhatoda*, in botany, the name of a diſtinct genus of trees. See the article Adhatoda, *Suppl.*

SNEAD, or Sneath, in country affairs, the handle of a ſcythe, or the like tool. Ruſt. Dict. in voc.

SNEEZE-*wort*, *ptarmica*, in botany, the Engliſh name of a diſtinct genus of plants. See the article Ptarmica, *Suppl.*

SNET, among ſportſmen, denotes the fat of all kinds of deer. Ruſt. Dict. in voc.

SNIPE (*Suppl.*)—*Mire*-Snipe, the name uſed in ſome parts of the kingdom for the *ardea ſtellaria*, or bittern. See the article Bittern, *Suppl.*

Snipe-*bills*, in the ſea language, a kind of hooks uſed for faſtening the axel-trees of the chain-pumps to the bitts. *Blanckley's* Nav. Expoſ.

SNOW-*drop*, the Engliſh name of a diſtinct genus of plants, according to Linnæus, who calls it *galanthus*, but is made only a ſpecies of *narciſſo-leucoium* by *Tournefort*. See the article Narcisso-Leucoium, *Suppl.*

Snow-*drop-tree*, the Engliſh name of a genus of trees, called by botaniſts *chionanthus*. See the article Chionanthus, *Append.*

SOAP-*berry-tree*, *ſapindus*, in botany, the name of a genus of trees. See the article Sapindus. *Suppl.*

Soap-*wort*, the Engliſh name of the *ſaponaria* of botaniſts. See Saponaria, *Append.*

SOAR (*Suppl.*)—Soar-*age*, in falconry, denotes the firſt year of a hawk's age. Ruſt. Dict. in voc.

SOLANDERS, in farriery. See MALANDERS, *Cycl.*

SOLANOIDES, in botany, the name of a genus of plants, called by Linnæus *rivinia*. See the article RIVINIA. *Suppl.*

SOLDIER (*Suppl.*)—Not only humanity but intereft require that great care fhould be taken of the health of *foldiers*. Much inftruction may be drawn for this purpofe from Dr. Pringle's excellent treatife, called obfervations on the difeafes of the army. He there remarks, that the circumftances of *foldiers* in time of war, differ from thofe of other people, in that they are more expofed to the injuries of the weather, and always crouded together, whether in camp, barracks, or hofpitals: wherefore the moft general divifion of thefe diftempers, may be into fuch as arife from the intemperature of the weather, and thofe from infection.

Military difeafes depending on the weather, are reducible to two forts, *viz.* to thofe of fummer, and to thofe of winter. However, as expofitions to cold are unavoidable upon the firft encampment, as alfo for fome time before the army ufually goes into winter-quarters, the winter diforders beginning about the end of autumn, will not entirely ceafe before the fummer is well advanced; and, on the other hand, as the heats of fummer and damps of autumn difpofe the body to ficknefs, the camp-diftempers are never quite over with the campaign, but continue fome time after the troops retire into winter-quarters.

The fummer difeafes are all of a bilious or putrid nature, as thofe of winter are inflammatory. See BILIOUS and INFLAMMATORY, *Append.*

Difeafes of SOLDIERS, arifing from heat and cold. See the articles HEAT and COLD, *Append.*

Diet of SOLDIERS. See DIET, *Append.*

Exercife of SOLDIERS. See EXERCISE. See alfo the articles CAMP, HOSPITAL, FEVER, &c.

Frefh-water SOLDIER, a name given in feveral parts of England to the *ftratiotes*, a diftinct genus of plants, called by Boerhaave *aloides*. See the article STRATIOTES, *Append.*

SOLEMN *acceptance*. See ACCEPTANCE, *Cycl.*

SOLIDAGO, in the Linnæan fyftem of botany, the name of a very comprehenfive genus of plants, taking in the *virga aurea* of Tournefort, with feveral fpecies of the *jacobæa* of the fame author. *Linnæi* Gen. Plant. p. 403. See the article VIRGA *aurea*, *Suppl.*

The great characteriftic of this genus, is, that the receptacle is naked, the down fimple, the fquamæ of the cup imbricated, and the radii of the corollulæ about five.

SOLINE, among carpenters, a joift, rafter, or piece of wood, either flit or fawed, wherewith the builders lay their ceilings. Build. Dict. in voc.

The word is French.

SOLOMON's *feal*, the Englifh name of a diftinct genus of plants, called by botanifts *polygonatum*. See the article POLYGONATUM, *Suppl.*

SOPES. See the article SOAP, *Cycl.* and *Suppl.*

SOPHIA *chirurgorum*, a name fometimes given to a fpecies of *fifymbrium*. See the article SISYMBRIUM, *Suppl.*

SORREL (*Suppl.*)—*Wood* SORREL, the Englifh name of a genus of plants, called by botanifts *lujula*, or *oxys*. See the article OXYS, *Suppl.*

Indian SORREL, a name fometimes given to *ketmia*. See the article KETMIA, *Suppl.*

SOURE-*fop*, or SOWRE *fop*, in botany, a diftinct genus of plants, called by botanifts *guanabanus* and *anona*. See the article ANONA, *Suppl.*

SPACE (*Cycl.*)—Some authors have afferted that *fpace* is a fubftance. The Cartefians, who do not allow of any diftinction between *fpace* and matter, were naturally enough led to the opinion, that *fpace* or extenfion was a fubftance. Others who admit a vacuum, and confequently an effential difference between *fpace* and matter, affert alfo that *fpace* is a fubftance. Among thefe we find *s'Gravefande*, Introd. ad Philof. fect. 19.

Others put *fpace* into the fame clafs of beings as time and number; that is, they make it to be no more than a notion of the mind. Hence, according to thefe authors, abfolute *fpace*, of which the Newtonians fpeak, is a mere chimera. See the writings of the late bifhop of Cloyne, *paffim.*

SPADE (*Suppl.*)—SPADE alfo denotes any gelded beaft, or a deer three years old. Ruft. Dict. in voc.

SPAID, or SPAYD, a term ufed by fportfmen for a red male deer that is three years old. Ruft. Dict. in voc.

SPANISH-*broom*, *fpartium*, in botany. See the article SPARTIUM, *Suppl.*

SPANSHAKLE, aboard a fhip, a large clafp of iron, which goes round the end of the davit upon the forecaftle. *Blanckley*, Naval Expofitor, p. 155.

SPARING, among cock-fighters. See the article SPARRING, *Suppl.*

SPARROW (*Suppl.*)—*Reed*-SPARROW, the Englifh name of a bird of the *picus*, or wood-pecker kind. See the article REED-*fparrow*, *Suppl.*

SPARROW-*hawk*, the Englifh name of the yellow-legged *falco*, with a white undulated breaft, and a fafciated brown tail. See the article FALCO, *Suppl.*

SPAT, a term ufed by the fifhermen for the fpawn of oyfters, which is caft in the month of May. Dict. Ruft. in voc.

SPEAR-*mint*, in botany, the Englifh name of the narrow-leaved, aromatic-fcented mint. See the articles MINT and MENTHA, *Suppl.*

SPERGULA, *fpurry*, in the Linnæan fyftem of botany, makes a diftinct genus of plants, but is comprehended by Tournefort among the *alfines*. See the article ALSINE, *Suppl.*

SPHERES, polifhed fpherical maffes of a mixt metalline compofition, ufed in optics. The manner of making them is as follows. Take of pure tin three pounds, copper one pound; melt thefe two metals together, and when in fufion caft upon the mafs fix ounces of burnt tartar, and an ounce and half of falt petre; and laftly, a quarter of an ounce of alum, and two ounces of arfenic: let all thefe matters evaporate and burn away, and then caft the pure metal into the figure of a *fphere*, and it will be capable of a high and elegant polifh. *Neri's* Art of Glafs, p. 166.

SPIDER-*fhell*, the Englifh name of feveral fpecies of *murex*. See the article MUREX, *Suppl.*

SPIDER-*wort*, (*Suppl.*) is alfo the name by which many call the *ephemerum* of botanical writers. See the article EPHEMERUM, *Suppl.*

SPIKES (*Suppl.*)—The word *fpikes*, among botanifts, denotes flowers fet thick above each other. Dict. Ruft. in voc.

SPIKE-*lavender*. See the article LAVENDULA, *Suppl.*

SPIKENARD, (*Cycl.*) *nardus*, in botany. See the article NARDUS, *Suppl.*

Ploughman's SPIKENARD, the Englifh name of a genus of plants, otherwife called *conyza*, and *flea-bane*. See the article FLEA-*bane*, *Suppl.*

SPILES, in a fhip, are fmall wooden pins, which are driven into the nail-holes, when a fhip's fheathing is taken off. *Blanckley*, Naval Expofitor, p. 156.

SPINACH (*Suppl.*)—*Strawberry*-SPINACH, a name fometimes given to *blite*. See the article BLITUM, *Suppl.*

SPINDLE (*Suppl.*)—The ftaff which fupports the vane at the maft-head, is likewife called a *fpindle*. *Blanckley*, Naval Expofitor, p. 156.

SPINDLE-*fhell*, the Englifh name of a fpecies of buccinum. See the article TRUMPET-*fhell*, *Suppl.*

SPINDLE-*tree*, the Englifh name of a genus of trees, called by botanifts *euonymus*. See the article EUONYMUS, *Suppl.*

African SPINDLE-*tree*, the Englifh name of a genus of plants, called *euonymoides* and *celaftrus* by authors. See the article CELASTRUS, *Append.*

SPINDLING, a term ufed by gardeners for the firft appearance or putting forth of flowers, ftems; or their running up in length. Ruft. Dict. in voc.

SPIRKETTING, among fhip-carpenters, denotes ftrakes of thick plank wrought from the lower edge of each port to each deck refpectively within fide of the fhip. *Blanckley*, Naval Expofitor, p. 156.

SPIT-*deep*, a term ufed among farmers for a foil as deep as can be dug up at once with a *fpit* or fpade. Dict. Ruft. in voc.

SPITTER, among fportfmen, a red male deer near two years old, whofe horns begin to grow up fharp and fpitwife. It is otherwife called a *brocket* and *pricket*. Ruft. Dict. in voc.

SPLEEN-*wort*, a name fometimes ufed for a genus of plants, called by botanifts *afplenium*, and in Englifh more commonly *milt-wafte*. See the article ASPLENIUM, *Suppl.*

SPOON-*bill*, in ornithology, the Englifh name of the *platea*. See the article PLATEA, *Suppl.*

SPOON-*wort*, a name by which fome call the *cochlearia*, or fcurvy-grafs. See the article COCHLEARIA, *Suppl.*

SPRAINTS, among fportfmen, a term ufed for the dung of the otter. Ruft. Dict. in voc.

SPRAT, the Englifh name of the little *clupea*, with the lower jaw longeft, and the belly very acute. See the article CLUPEA, *Suppl.*

SPROUTS, a word ufed by country people for fmall fhoots of old cabbage. Ruft. Dict. in voc.

SPUNK, a term ufed indifferently for half-rotten wood, match for guns, and a fubftance growing on the fides of trees. Dict. Ruft. in voc.

SPUR-*fhell*, a name fometimes given to the little elevated *cochlea*, with the edge of the volutions ferrated. See the article COCHLEA, *Suppl.*

SPURGE-*olive*, the Englifh name of a genus of plants, called by botanifts *chamelæa*. See the article CHAMELÆA, *Suppl.*

Sun-SPURGE, a name by which fome call feveral fpecies of *tithymalus*. See the article TITHYMALUS, *Suppl.*

SQUASH, the Englifh name of a genus of plants, called by authors *melopepo*. See the article MELOPEPO, *Suppl.*

SQUILL, *fquilla*, in zoology, a large genus of animals, comprehending the fhrimp or *fquilla*, properly fo called, the crayfifh, the crab, and lobfter: all which, according to Dr. Hill, make one genus of infects, of the podaria kind. See the articles INSECT, *Suppl.* and *Append.* and PODARIA, *Append.*

The characteriftics of this genus are, that they have ten legs, the foremoft pair cheliform, or made for pinching and holding

holding things; that they have only two eyes, and that the tail is foliated.

The *squillæ* may be conveniently arranged under three subdivisions. 1. The smaller long-tailed *squillæ*, commonly called *shrimps*. 2. The larger long-tailed *squillæ*, or the *lobster* and *cray-fish* kind. 3. The short-tailed kind, called also *canceres*, and in English *crabs*.

Of those denominated *shrimps* we have the following species. 1. The long-tailed *squilla*, with the snout serrated above, and tridentated below. This is the common *shrimp*. 2. The long-tailed *squilla*, with a smooth snout, called the smooth-nosed *shrimp*. 3. The long-tailed *squilla*, with a soft tail, and the right claw largest. This is called the *hermit*. 4. The larger, long-snouted sea-*squilla*. 5. The smaller, narrow-snouted sea-*squilla*. 6. The fresh-water small *squilla*.

Of the second order of *squillæ*, commonly called *lobsters*, or *cray-fish*, we have the following species. 1. The common *lobster*. 2. The thick-horned, slender-bodied *lobster*. 3. The short and broad-bodied *lobster*. 4. The very long-bodied *lobster*. 5. The small-bodied *lobster*. 6. The great sea *cray-fish*. 7. The *cray-fish* with the snout serrated above, and with a single denticulation at the base. This last species, though only three inches and an half in length, greatly approaches to the figure of the common *lobster*.

Of those *squillæ*, called *crabs*, *canceres*, there are the following species. 1. The common large *crab*. 2. The *wart-crab*, *cancer verrucosus*. 3. The *spider-crab*, or long-legged, short-tailed *squilla*. 4. The *king-crab*, or *molucca-crab*, called the *squilla clypeata*. 5. The rough-bodied, smooth-clawed *squilla*, called *cancer mœas*. 6. The smooth and long-clawed *crab*, called by Johnston the female of the common kind. 7. The little squall *crab*. 8. The little woolly *crab*. 9. The thick-bodied duck *crab*. 10. The round-bodied duck *crab*. 11. The common, or oval-bodied duck *crab*. 12. The very long-armed duck *crab*. 13. The very small-bodied, rough, long-armed *crab*. 14. The lunar *crab*. 15. The florid *crab*. 16. The frog *crab*. 17. The prickly and hairy, long-armed *crab*. 18. The great prickly, long-armed *crab*. 19. The short-bodied, reticulated *crab*. 20. The elliptic-bodied *crab*. 21. The smooth, long-legged *crab*. Vid. *Hill*, Hist. Anim. p. 28, seq. and Table of Crustaceous Animals, N° 18, 19, &c.

SQUILL, *scilla*, in botany, the English name of a distinct genus of plants. See the article SCILLA, *Append.*

SQUILL, *scilla*, in botany, the English name of a distinct genus of plants, according to Linnæus; but comprehended under the *ornithogala* by Tournefort. See the article ORNITHOGALUM, *Suppl.*

STAFF (*Suppl.*)—*Shepherd's* STAFF, or *shepherd's rod*, in botany, the name of a genus of plants, called by botanists *dipsacus*. See the article DIPSACUS, *Suppl.*

STAG-*beetle*, in the history of insects, the English name of a species of *scarabæus*, with ramose horns. See the article SCARABÆUS, *Suppl.*

STAG'S *horn-tree*, a name sometimes given to the *rhus*, or sumach, a distinct genus of plants. See the article RHUS, *Suppl.*

STAGGARD, among sportsmen, a young male deer only four years old. Rust. Dict. in voc.

STAINING (*Suppl.*)—STAINING *of horn*. See the article HORN, *Append.*

STAINING *of ivory*. See IVORY, *Append.*

STANDARD (*Suppl.*)—STANDARDS, in ship-building, a sort of knees fayed from the deck to the sides of the ship within board, to strengthen her. *Blanckley*, Naval Expositor, in voc.

STAPHYLÆA, in the Linnæan system of botany, the name of a genus of plants, called by Tournefort *staphylodendron*. See the article STAPHYLODENDRON, *Suppl.*

STAPHYLINUS, in zoology, the name of a genus of four-winged flies, the antennæ of which are slender and filiform. There are two vesicles situated above the tail. The exterior wings are dimidiated and short.

Of this genus there are a great many species, distinguished from each other by the colour of the several parts of their bodies. Vid. *Hill*, Hist. Anim. p. 57.

STAR (*Suppl.*)—Our excellent astronomer, Dr. Bradley, had no sooner discovered the cause, and settled the laws of the aberration of the fixed *stars* [b], than his attention was again excited by another new phænomenon, *viz.* an annual change of declination in some of the fixed *stars*, which appeared to be sensibly greater than a procession of the equinoctial points of 50″ in a year, the mean quantity now usually allowed by astronomers, would have occasioned.—[[b] See the article LIGHT, *Append.*]

This apparent change of declination was observed in the *stars* near the equinoctial colure; and there appearing at the same time an effect of a quite contrary nature, in some *stars* near the solstitial colure, which seemed to alter their declination less than a procession of 50″ required, Dr. Bradley was thereby convinced, that all the phænomena in the different *stars* could not be accounted for merely by supposing that he had assumed a wrong quantity for the procession of the equinoctial points. He had also, after many trials, sufficient reason to conclude, that these second unexpected deviations of the *stars* were not owing to any imperfection of his instruments. At length, from repeated observations, he began to guess at the real cause of these phænomena.

It appeared from the Doctor's observations, during his residence at Wansted, that some of the *stars* near the solstitial colure had changed their declinations 9″ or 10″ less than a procession of 50″ would have produced; and, at the same time, that others near the equinoctial colure had altered theirs about the same quantity more, than a like precession would have occasioned: the north pole of the equator seeming to have approached the *stars*, which come to the meridian with the sun, about the vernal equinox and the winter solstice; and to have receded from those, which come to the meridian with the sun, about the autumnal equinox and the summer solstice.

From the consideration of these circumstances, and the situation of the ascending node of the moon's orbit when he first began to make his observations, he suspected that the moon's action upon the equatorial parts of the earth might produce these effects. For, if the precession of the equinox be, according to Sir Isaac Newton's principles, caused by the actions of the sun and moon upon those parts; the plane of the moon's orbit being, at one time, above ten degrees more inclined to the plane of the equator, than at another; it was reasonable to conclude, that the part of the whole annual precession, which arises from her action, would in different years be varied in its quantity; whereas the plane of the ecliptic, wherein the sun appears, keeping always nearly the same inclination to the equator, that part of the precession, which is owing to the sun's action, may be the same every year; and from hence it would follow, that although the mean annual precession, proceeding from the joint actions of the sun and moon, were 50″; yet the apparent annual precession might sometimes exceed, and sometimes fall short of that mean quantity, according to the various situations of the nodes of the moon's orbit.

In the year 1727, the moon's ascending node was near the beginning of Aries, and consequently her orbit was as much inclined to the equator, as it can at any time be; and then the apparent annual precession was found, by the Doctor's first year's observations, to be greater than the mean; which proved, that the *stars* near the equinoctial colure, whose declinations are most of all affected by the precession, had changed theirs, above a tenth part more than a precession of 50″ would have caused. The succeeding year's observations proved the same thing; and in three or four years time the difference became so considerable, as to leave no room to suspect that it was owing to any imperfection either of the instrument, or observations.

But some of the *stars*, that were near the solstitial colure, having appeared to move, during the same time, in a manner contrary to what they ought to have done, by an increase of the precessions; and the deviations in them being as remarkable as in the others, it was evident that something more than a mere change in the quantity of the precession would be requisite to solve this part of the phænomenon.

Upon comparing the observations of *stars* near the solstitial colure, that were almost opposite to each other in right ascension, they were found to be equally affected by this cause. For whilst γ Draconis appeared to have moved northward, the small *star*, which is the 35th Camelopardali Hevelii, in the British catalogue, seemed to have gone as much towards the south; which shewed, that this apparent motion in both those *stars* might proceed from a nutation in the earth's axis; whereas the comparison of the Doctor's observations of the same *stars*, formerly enabled him to draw a different conclusion, with respect to the cause of the annual aberrations arising from the motion of light. For the apparent alteration in γ Draconis, from that cause, being as great again as in the other small *star*, proved, that that did not proceed from a nutation of the earth's axis; as, on the contrary, this may. Upon making the like comparison between the observations of other *stars*, that lie nearly opposite in right ascension, whatever their situations were with respect to the cardinal points of the equator, it appeared, that their change of declination was nearly equal, but contrary; and such as a nutation or motion of the earth's axis would effect.

The moon's ascending node being got back towards the beginning of Capricorn in the year 1732, the *stars* near the equinoctial colure appeared about that time to change their declinations no more than a precession of 50″ required; whilst some of those near the solstitial colure altered theirs above 2″ in a year less than they ought. Soon after the annual change of declination of the former was perceived to be diminished, so as to become less than what 50″ of precession would cause; and it continued to diminish till the year 1736, when the moon's ascending node was about the beginning of Libra, and her orbit had the least inclination to the equator. But by this time, some of the *stars* near the solstitial colure had altered their declinations 18″ less, since the year 1727, than they ought to have done from a precession of 50″. For γ Draconis, which in those nine years should have gone about 8″ more southerly, was observed

in 1736, to appear 10″ more northerly than it did in the year 1727.

As this appearance in γ Draconis indicated a diminution of the inclination of the earth's axis to the plane of the ecliptic, and as several astronomers have supposed that inclination to diminish regularly; if this phænomenon depended upon such a cause, and amounted to 18″ in nine years, the obliquity of the ecliptic would, at that rate, alter a whole minute in thirty years; which is much faster than any observations before made, would allow. The Doctor had therefore reason to think that some part of this motion at least, if not the whole, was owing to the moon's action upon the equatorial parts of the earth; which he conceived might cause a libratory motion of the earth's axis. But as he was unable to judge, from only nine years observations, whether the axis would entirely recover the same position that it had in the year 1727, he found it necessary to continue his observations through a whole period of the moon's nodes; at the end of which he had the satisfaction to see, that the *stars* returned into the same positions again, as if there had been no alteration at all in the inclination of the earth's axis: which fully convinced him that he had guessed rightly as to the cause of the phænomenon. This circumstance proves likewise, that if there be a gradual diminution of the obliquity of the ecliptic, it does not arise only from an alteration in the position of the earth's axis, but rather from some change in the plane of the ecliptic itself: because the *stars*, at the end of the period of the moon's nodes, appeared in the same places, with respect to the equator, as they ought to have done, if the earth's axis had retained the same inclination to an invariable plane.

The Doctor having communicated these observations, and his suspicion of their cause, to the late Mr. Machin, that excellent geometer soon after sent him a table, containing the quantity of the annual precession in the various positions of the moon's nodes, as also the corresponding nutations of the earth's axis; which was computed upon the supposition that the mean annual precession is 50″, and that the whole is governed by the pole of the moon's orbit only: and therefore Mr. Machin imagined that the numbers in the table would be too large; as, in fact, they were found to be. But it appeared that the changes which Dr. Bradley had observed, both in the annual precession and nutation, kept the same law, as to increasing and decreasing, with the numbers of Mr. Machin's table. Those were calculated upon the supposition, that the pole of the equator, during a period of the moon's nodes, moved round in the periphery of a little circle, whose center was 23° 29′ distant from the pole of the ecliptic: having itself also an angular motion of 50″ in a year, about the same pole. The north pole of the equator was conceived to be in that part of the small circle, which is farthest from the north pole of the ecliptic, at the time when the moon's ascending node is in the beginning of Aries: and in the opposite point of it, when the same node is in Libra.

If the diameter of the little circle, in which the pole of the equator moves, be supposed equal to 18″; which is the whole quantity of the nutation, as collected from Dr. Bradley's observations of the *star* γ Draconis; then all the phænomena in the several *stars* which be observed will be very nearly solved by his hypothesis. But for the particulars of his solution, and the application of his theory to the practice of astronomy, we must refer to the excellent author himself [b]; our intention being only to give the history of the invention.—[[b] See Phil. Transf. N° 485.]

The corrections arising from the aberration of light, and from the nutation of the earth's axis, must not be neglected in astronomical observations; since such neglects might produce errors of near a minute in the polar distances of some *stars*. See Phil. Transf. loc. cit. p 26.

As to the allowance to be made for the aberration of light, Dr. Bradley assures us, that having again examined those of his own observations, which were most proper to determine the transverse axis of the ellipsis, which each *star* seems to describe, he found it to be nearest to 40″; and this is the number he makes use of in his computations relating to the nutation. Ibid. p. 23.

Monsieur d'Alembert has published a treatise, intitled, *Recherches sur la precession des equinoxes et sur la nutation de la terre dans le systeme Newtonien*, 4to. Paris, 1749. The calculations of this learned gentleman agree, in general, with Dr. Bradley's observations. But Monsieur d'Alembert finds, that the pole of the equator describes an ellipsis in the heavens, the ratio of whose axes is as 4 to 3 [c]; whereas, according to Dr. Bradley, the curve described is either a circle, or an ellipsis, the ratio of whose axes is as 18 to 16 [d].
—[[c] Journal. Britan. par Monsieur *Maty*, Jan. 1750, p. 93.
[d] Phil. Transf. ibid. p. 35.]

Dr. Bradley [e] says, in general, that experience has taught him that the observations of such *stars* as lie nearest the zenith, generally agree best with one another, and are therefore the fittest to prove the truth of any hypothesis.—[[e] Phil. Transf. loc. cit. p. 29.]

From the result of the comparison of our best modern observations, with such as were formerly made with any tolerable degree of exactness, there appears to have been a real change in the position of some of the fixed *stars*, with respect to each other; and such as seems independent of any motion in our system, and can only be referred to some motion in the *stars* themselves. Arcturus affords a strong proof of this: for if its present declination be compared with its place, as determined either by Tycho or Flamsteed, the difference will be found to be much greater, than what can be suspected to arise from the uncertainty of their observations.

It is reasonable to expect, that other instances of the like kind must also occur among the great number of visible *stars*; because their relative positions may be altered by various means. For if our own solar system be conceived to change its place with respect to absolute space, this might, in process of time, occasion an apparent change in the angular distances of the fixed *stars*: and in such a case, the places of the nearest *stars* being more affected than of those that are very remote, their relative position might seem to alter, though the *stars* themselves were really immoveable. And, on the other hand, if our system be at rest, and any of the *stars* really in motion, this might likewise vary their apparent positions; and the more so, the nearer they are to us, or the swifter their motions are, or the more proper the direction of the motion is to be rendred perceptible by us. Since then the relative places of the *stars* may be changed from such a variety of causes, considering the amazing distance at which it is certain some of them are placed, it may require the observations of many ages, to determine the laws of the apparent changes, even of a single *star*: much more difficult, therefore, must it be to settle the laws relating to all the most remarkable *stars*.

When the causes which affect the places of all the *stars* in general are known; such as the precession, aberration, and nutation; it may be of singular use, to examine nicely the relative situations of particular *stars*; and especially of those of the greatest lustre, which, it may be presumed, lie nearest to us, and may therefore be subject to more sensible changes, either from their own motion, or from that of our system. And if, at the same time that the brighter *stars* are compared with each other, we likewise determine the relative positions of some of the smallest that appear near them, whose places can be ascertained with sufficient exactness; we may perhaps be able to judge to what cause the change, if any be observable, is owing. The uncertainty that we are at present under, with respect to the degree of accuracy wherewith former astronomers could observe, makes us unable to determine several things relating to this subject: but the improvements, which have of late years been made in the methods of taking the places of the heavenly bodies, are so great, that a few years may hereafter be sufficient to settle some points, which cannot now be settled, by comparing even the earliest observations with those of the present age. See Dr. *Bradley*, in Phil. Transf. N° 485.

STAR-*apple*, the English name of a genus of plants, called by botanists *cainito* and *chrysophyllum*. See the article CHRYSOPHYLLUM, *Suppl.*

STAR-*thistle*, the English name of a species of centaury, called by some *calcitrapa*. See the article CENTAUREA, *Append.*

STARCH (*Cycl.*)—In the history of the royal Academy of Sciences 1739, p. 24, Edit. Paris, a kind of *starch* is mentioned, made of potatoes and red truffles. By the short account there given, this *starch* seems not to be so good as the common, but might be of use in case of a scarcity of wheat.

STARLING, the English name of a genus of birds, called by authors *sturnus*. Some, erroneously, account it a species of *turdus*, or thrush.

Of this genus there is only one species, which is the *starling*, the beak of which is of a subulated figure, depressed in an angulated manner, and obtuse at the extremity; and it's tongue is marginated and acute. It is of the size of the common black-bird. The beak is near half an inch long, and is yellow in the male, and brown in the female. The general colour is black, but variegated with spots of grey; and the tips of the feathers of the neck and back are yellowish. It has also various other tinges, according to the light it is seen in. The wing and tail-feathers are brown, with some yellow at their edges. *Hill*, Hist. of Animals, p. 496.

STEEL (*Suppl.*)—The manner of hardening *steel* for magnetical bars, which Mr. Canton [a] says proved better than any other he could meet with, is as follows: Cut a sufficient quantity of the leather of old shoes into very small pieces; provide an iron pan, a little exceeding the length of a bar, and wide enough to lay two side by side without touching each other or the pan, and at least an inch deep. This pan is to be nearly half filled with the bits of leather, upon which the two bars are to be laid, a small wire being fastened to the end of each to take them out by. Then fill the pan quite with the leather, and place it on a gentle flat fire, covering and surrounding it with charcoal. The pan being brought to somewhat more than a red heat, and kept so for about

about half an hour, the bars are to be suddenly quenched in a large quantity of cold water.—[a See Method of making artificial magnets, Lond. 1751.]

For the expanſion of *ſteel* by heat, ſee the article HEAT, *Append.*

STELLULARIA, in the Linnæan ſyſtem of botany, the name of a genus of plants, called by Tournefort *alſine*. See the article ALSINE, *Suppl.*

STICK-*a-door*, a name ſometimes uſed for the *ſtoechas*. See the article STOECHAS, *Suppl.*

STILLATORY, a name ſometimes uſed for a ſtill-houſe. See the article STILL-*houſe*, *Suppl.*

STILOBATUM, in architecture, denotes the body of the pedeſtal of any column. See PEDESTAL, *Cycl.*

STIRK, or STURK, a word uſed among country people for a young ox or heifer. Ruſt. Dict. in voc.

STITCH-*wort*, a name ſometimes given to the *alſine*, or *ſtellularia* of botaniſts, otherwiſe called *chickweed*. See the article ALSINE, *Suppl.*

STITHY, or STUTHY, is uſed either for a ſmith's anvil, or a diſeaſe in oxen, cauſing the ſkin to ſtick ſo cloſe to the ribs that they cannot ſtir. Ruſt. Dict. in voc.

STIVER, a Dutch coin, twenty of which make a guilder. See the article COIN, *Cycl.*

STOCK-*July-flower* (*Suppl.*)—*Dwarf* STOCK-*July-flower*, a name given by ſome to the *heſperis*. See the article HESPERIS, *Suppl.*

STOECHAS, in botany, the name of a genus of plants, printed *ſtaechas* in the Supplement by an error of the preſs. See STÆCHAS, *Suppl.*

STOMATIA, in zoology, the name of a genus of ſhell-fiſh, frequently confounded with the *ear-ſhell*. See the article EAR-*ſhell*, *Suppl.*

The ſhell of the *ſtomatia* is formed of one piece, has no perforations in any part of its ſurface, and is of a depreſſed, flat figure; and its mouth is the moſt patent of all the univalve ſhells, the limpet only excepted. It has a ſhort ſpiral turn running into the mouth at the head.

There are ſeveral ſpecies of this genus. See *Hill*, Hiſt. Anim. p. 119, ſeq.

STONE (*Cycl.*)—We have not only accounts of *ſtones* of various degrees of hardneſs taken out of the bladders of perſons affected with this terrible malady, but even of extraneous matter lodged within, and ſerving for the nucleus of thoſe *ſtones*. Thus, in the Philoſophical Tranſactions, there is an account of a boy who for a long time voided hair by urine, and afterwards being troubled with the *ſtone*, on being cut for it, the *ſtone* taken away was very hard and heavy, and of the bigneſs of a gooſe's egg: it was covered with a cruſt, looking like the mortar of an old wall, and this was full of cracks and chinks, out of every one of which there was found to grow hair.

The hairs, which he had been uſed to void by urine, certainly grew alſo out of the clefts of this *ſtone*, for they would often hang out at the end of the penis; and on pulling them away, ſeemed to grow faſt to ſomething, and to be pulled out by the roots.

In another boy of about five or ſix years of age, who was cut for the *ſtone*, the *ſtone* taken out being broken by accident, there was diſcovered within it a piece of flint, of the ſhape and figure, as well as bigneſs, of a common piſtol flint. This ſerved as the nucleus to the other *ſtony* matter which encruſted it over. It is utterly impoſſible that a flint, of this ſhape, ſhould have been formed in the bladder, nor is it eaſy to account for its coming there; the boy muſt have ſwallowed it at ſome time, but then its making its way into the bladder, is a very hard matter to account for. A perſon, who uſed himſelf to ſwallow piſtol bullets, is recorded in the ſame place to have voided them by urine, cruſted over with *ſtony* matter; but all this is equally hard to account for. Philoſ. Tranſ. N° 266. p. 688.

Dr. Cheyne ſays, that ſoap lees, ſoftened with a little oil of ſweet almonds, drunk about a quarter of an ounce twice a day, on a faſting ſtomach; or ſoap and egg-ſhell pills, with a total milk and ſeed diet, and Briſtol-water; will either diſſolve the *ſtone* in the kidneys or bladder, or make it eaſy. See Nat. Meth. of Curing, p. 266.

We often meet with hiſtories, in medical writers, of the *ſtone*, or human calculus, making its way through unuſual places, as the perineum, ſcrotum, *&c.* See Philoſ. Tranſ. N° 456.

Mr. le Dran aſſures us, when a ſmall *ſtone* is lodged in the neck of the bladder, the patient only is pained in piſſing till the firſt drops of the urine come away; when the *ſtone* is large, his greateſt pain is while the laſt drops are evacuated; but when the difficulty of urining depends on the diſeaſes of the coats of the bladder, the pain continues all the time of the evacuation. By obſerving theſe ſymptoms, he has declared people to have no *ſtone* in the bladder, after ſeveral others had aſſured them there was a *ſtone*; and his opinion was confirmed by probing with the catheter. He names one inſtance of this, in a perſon who had laboured under what he calls a contracted hardened bladder, whom he cured after ſeveral bleedings and purges, by injecting into the bladder a decoction of marſh-mallow roots and linſeed, which he changed afterwards for barley-water, with ſome honey of roſes. By theſe he removed the pain, and brought the bladder, which at firſt could ſcarce contain two ſpoonfuls of liquor, to the ordinary capacity.

We have an account, in the Philoſophical Tranſactions, of a *ſtone* weighing above ten ounces, taken out of the bladder of a large maſtif: on cutting the *ſtone* aſunder, a piece of dog-graſs was found in its center. Vid. Philoſ. Tranſact. N° 482. ſect. 1.

We read of a *ſtone* in the bladder formed on a needle. See Med. Eſſ. Edinb. Vol. IV. art. 16.

Mr. Hales is of opinion that all paſſable *ſtones*, which have lately fallen from the kidneys into the bladder, and which have broken off from larger ones, might readily and eaſily be brought out thence, by conveying into the empty bladder, by a catheter, ſome very mucilaginous ſubſtance, ſuch as ſyrup of marſh-mallows, or a ſolution of gum arabic, or barley-water: ſuch ſubſtances would bring away the *ſtones* ſoon, and with great eaſe to the patient; and thereby not only prevent much pain by the fruitleſs endeavours to bring them away with the weak force of the urine, but alſo effectually ſecure the patient from the danger of their growing too big to come away, by long continuing in the bladder. Phil. Tranſ. N° 477.

Pitcarn recommends the uſe of milk for common drink, in the *ſtone*, with barley-water and a little ſugar. He adds, that he cannot give any better reaſon why milk is ſerviceable to nephritics, than becauſe the ſame is always found ſerviceable to gouty perſons. The ſymptoms of both diſeaſes are the ſame, excepting what relates to the parts affected.

Dr. Mead ſeems to think, that the proximate cauſe of this diſeaſe is a tartarous ſalt conveyed out of the blood into the ſmall ducts of the kidneys: for it is the nature of theſe ſalts to contain a conſiderable quantity of that ſubtile matter which Newton [a] has ſhewn to be the cauſe of the coheſion of bodies. Thus, the calculus is a ſubſtance compoſed of earth and a very large ſhare of air concreted in the renal ducts; and either remains therein, or drops down into the urinary bladder.

As to the method of cure the Doctor obſerves, to prevent thoſe ſalts from ſhooting into cryſtals, lixivial ſalts ſeem to be very proper. Next to keep the cryſtals from coaleſcing into a calculous ſubſtance, oily medicines are very efficacious; and this rule ought to take place with regard to diet as well as medicines.

But when calculous concretions are actually formed in the kidneys, and are to be brought away by the ureters, the caſe requires very prudent management. It is a very common error in practice to give ſtrong forcing diuretics with an imaginary view of driving out the gravel with the urine: whereas this intention is anſwered with greater ſafety in moſt caſes by relaxing and lubricating medicines; eſpecially, if in caſe of violent pain, bleeding be premiſed, and anodynes interſperſed. For a *ſtone* is never forced out while the patient is in great torture; though when the pain ceaſes it ſometimes comes away unexpectedly, and almoſt of its own accord, with the urine; and the reaſon of this is, that pain conſtringes the fibres of the parts, which reſume their natural ſtate, and perform their functions properly when the troubleſome ſenſation is over. Wherefore three or four grains of opium, diſſolved in five or ſix ounces of the common decoction, may be given by way of clyſter; which will greatly relieve the pain, and ſometimes procure greater advantages. However, there are conjunctures, after the pain is abated, when powerful diuretics may be adminiſtred; but with this precaution, that as ſoon as they have had their effect, they are no longer to be continued.—[a See Life of Mr. Boyle prefixed to his works.]

All this while the body ſhould conſtantly be kept open: wherefore, in caſe of coſtiveneſs, it will be expedient to give clyſters, and ſometimes to purge gently with infuſion of ſena and manna: but ſtrong cathartics are to be avoided.

Of the lubricating medicines abovementioned, the chief are oil of ſweet almonds, ſyrup of marſh-mallows, emulſions made with almonds, and the like; to which may be added, the uſe of the warm bath. But among the powerful diuretics, turpentine and ſoap are the beſt.

Such is the courſe to be purſued in the paroxyſm of the diſeaſe. But out of it the patient ſhould uſe bodily exerciſe, eſpecially riding every day, but ſo as not to fatigue: his food ſhould be mild, and of eaſy digeſtion; and his drink either ſmall wine and water, or new ſoft ale; which will be rendered better and wholſomer, if ground-ivy leaves be infuſed in it, while it is working. Mead is likewiſe a proper drink; for honey is an excellent diuretic. A ſpoonful alſo of honey in a glaſs or two of the infuſion of marſh-mallows roots, is an admirable cleanſer of the kidneys, if uſed for a conſtancy. The wines ought to be the ſofteſt and ſmootheſt that can be had; and the lighteſt, cleareſt river, or running water, is preferable to all other. For, as Pliny [b] ſays, thoſe ſprings are particularly condemned, the waters

of

of which line the vessels, in which they are boiled, with thick crusts.—[b *Plin.* Nat. Hist. lib. 31. cap. 3.] See the articles LITHONTRIPTIC and LITHOTOMY, *Append.*

But particular care should be taken, not to put the patient into a course of powerful diuretics, with a view of preventing the gravel from concreting in the kidneys: because, whatever great things may be said of this sort of medicines by ignorant pretenders, they certainly injure the parts by their heat and acrimony. *Mead*, Monit. & Pract. Med. p. 191, seq.

The Leipsic Acts give a very remarkable instance of *stones* in the blood vessels, discovered by accident on opening a vein in the arm: the surgeon finding it necessary to make a large orifice, several small but very hard *stones* were discharged at it with the blood. The patient was a man of seventy two years of age.

STONES *in animals*. We meet with great variety of forms and appearances in the *stones* produced by different animals, and in their different parts. Wedelius describes a vast number of various kinds taken from dogs, hogs, cows, and other animals which he had opened: but the most singular instance is of one which was taken from a cow, and was of the colour of burnished gold. Dr. Lister confirms this singular observation with another of a like kind, that came within his own knowledge: this was of two hundred small globular *stones*, the largest not exceeding the size of a small tare, and the smaller not bigger than pins heads. They were covered with a frothy substance in the bladder, and adhered to one side of it; but when cleaned and dried, they resembled seed pearl in shape, and were of a fine gold colour. They were finely polished, even when viewed by the microscope; and when broken, and examined in the same manner, it was found to be only a thin skin of gold colour that covered them in this manner, their inner substance being coarse and opake, somewhat resembling sugar-candy, but not so fine. *Wedel.* Observ. N° 106. Philos. Transf. N° 206.

Corner STONES. See the article CORNER, *Append.*

STONE-*break*, a name by which some writers call the *alchimilla*, or ladies mantle. See the article ALCHIMILLA, *Suppl.*

STONE-*crop*, a name sometimes given to the *sedum*, or houseleek. See the article SEDUM, *Suppl.*

STONE-*crop-tree*, in botany, the name by which some call the *blitum*, or blite, of other authors. See the article BLITUM, *Suppl.*

STOOK, a term used in many parts of the kingdom for a shock of corn, containing twelve sheaves. Rust. Dict. in voc.

STOOL, (*Suppl.*) in ship-building, the name of the supporters of the poop and top lanterns. *Blanckley*, Naval Expositor, in voc.

STORAX-*tree*, in botany, the English name of the *styrax*. See the article STYRAX, *Suppl.*

STORK, the name of a bird of the *ardea*, or heron kind. See the article HERON, *Suppl.*

The *stork* has been described under the name *ciconia* by several authors. See the article CICONIA, *Suppl.*

STOVE (*Suppl.*)—STOVES, at sea, are square boxes made of planks, and lined with brick, for burning charcoal in to dress the admiral's victuals. *Blanckley*, Nav. Expos.

STOVER, a word used by country people for straw or fodder for cattle. Rust. Dict. in voc.

STRATIOTES, in the Linnæan system of botany, the name of a distinct genus of plants, the characters of which are these. The cup is a two-leaved spatha, compressed, obtuse, connivent, and carinated on each side. Beside this, there is also a perianthium, which is formed of a single leaf, divided into three segments, and is erect and deciduous. The flower consists of three obversely cordated, erect and patent petals, of double the size of the cup. The stamina are twenty filaments, of the length of the perianthium, and inserted into the receptacle. The antheræ are simple. The germen of the pistil stands under the receptacle of the perianthium. There are six styles, divided each into two parts, and of the length of the stamina. The stigmata are simple. The fruit is an oval berry, attenuated at each end, somewhat hexaedral, and contains six cells. The seeds are numerous, oblong, crooked, and as it were alated.

There is only one known species of this genus. Vid. *Linnæi* Gen. Plant. p. 253.

STRATIOTES, in botany, is also a name by which some call the *hottonia* of Linnæus. See the article HOTTONIA, *Suppl.*

STRAWBERRY-*cinquefoil*, the name by which some call the *pentaphylloides* of botanists. See the article PENTAPHYLLOIDES, *Suppl.*

STRAWBERRY-*blite*. See the article BLITUM, *Suppl.*

STRAWBERRY-*spinach*. See SPINACH, supra.

STRICKLE, or STRICKLESS, an instrument for striking off the over-measure of corn, &c. Rust. Dict. in voc.

STUBBING, among farmers, is the pulling up of shrubs, broom, hops, or the like, out of lands. Rust. Dict. in voc.

STUBBLE, that part of the stalks of corn which remains on the land, after the corn is reaped.

STUFF, among joiners, &c. a term used for the wood they work on. Build. Dict. in voc.

STURGEON, the English name of the *sturio* of ichthyologists. See the article STURIO, *Suppl.*

STURK, the same with *stirk*. See the article STIRK, *Append.*

STURLING, the English name of a bird called by zoologists *sturnus*. See the article STURNUS, *Suppl.*

STUTHY, the same with *stithy*. See the article STITHY, *Append.*

STYE, in the management of swine, a place for keeping or fattening them. Rust. Dict. in voc.

STYLOBATUM, in architecture, the same with pedestals. See the article PEDESTAL, *Cycl.*

SUBSTANCE, (*Cycl.*) is usually distinguished into thinking and unthinking *substances*. Of the former class is the human soul; and of the latter, philosophers commonly consider matter only. But some b reckon space among *substances*. The Cartesians consider space and matter as the same. The Leibnitians put space in the same class of being with number and time, and make them all alike notional. Leibnitz said, *agere est character substantiarum.*—[b s'*Gravesande*, Introd. ad Philos. sect. 19.]

The idealists deny matter to be a *substance*, making it a mere phænomenon. See bishop *Berkley*'s Dialogues.

The materialists, on the other hand, deny spirit to be a *substance*. But as they cannot deny the existence of thought, as the idealists deny the existence of matter, the materialists are forced either to allow all matter to have perception, essentially; or to say, that it is superadded to matter, or a modification thereof. All which lead to inextricable difficulties.

SUCCORY (*Suppl.*)—*Gum*-SUCCORY, the name by which some call the *chondrilla* of botanists. See the article CHONDRILLA, *Suppl.*

SUCCULENT *plants*, among botanists, those which are plump and full of juice. Rust. Dict. in voc.

SUCKER, or SUCK-*fish*, in ichthyology. See the article REMORA, *Suppl.*

Stone-SUCKER, the English name of a genus of fishes. See the article PETROMYZON, *Suppl.*

Great SUCKER, the English name of a species of *hirundo*, or swallow, with an undivided tail, and bristles at the mouth. See HIRUNDO, *Suppl.*

The generality of authors have erroneously made this bird a species of owl; it much resembles the cuckow in shape, and has been called the *churn-owl*, and *caprimulgus*. See the article CAPRIMULGUS, *Suppl.*

SUDORIFICS (*Cycl.* and *Suppl.*)—*Sudorifics*, if taken in time, are the best medicines for preventing inflammatory and feverish disorders of all kinds. See the articles FEVER and INFLAMMATORY, *Append.*

Dr. Pringle condemns the use of treacle, given with this intention, on account of its heating quality. However, he observes, that it is rendered more *sudorific*, and less narcotic, by adding ten grains of salt of hartshorn to a common dose, and promoting the sweat by a large draught of vinegar-whey. Instead of this composition, two scruples of salt of hartshorn, saturated with about three spoonfuls of common vinegar, may be given at bed-time. *Pringle*, Observ. on the Diseases of the Army, p. 131.

SUGAR-*cane*, *saccharum*, in botany, the name of a distinct genus of plants, according to Linnæus. See the article SACCHARUM, *Suppl.*

SULL, a word used in the western parts of England for a plough. Rust. Dict. in voc.

SULPHUR-*wort*, the name by which *peucedanum*, or hog's fennel is sometimes called. See the article PEUCEDANUM, *Suppl.*

SULTAN-*flower*, a name sometimes used for the *cyanus*, or blue bottle. See the article CYANUS, *Suppl.*

SUMACH, the English name of a genus of plants, called by botanists *rhus*. See the article RHUS, *Suppl.*

Coriars SUMACH, or *myrtle* SUMACH, the name by which *coriaria*, a distinct genus of plants is sometimes called. See the article CORIARIA, *Append.*

Venetian SUMACH, a name by which some call the *coccygria*, or *cotinus* of botanists. See the article COTINUS, *Suppl.*

SUMMITS *of flowers*, the same with the antheræ, or tops of the stamina. See the article FLOWER, *Suppl.*

SUN-*flower* (*Suppl.*)—*Dwarf* SUN-*flower*, the English name of a genus of plants, called by botanists *rudbeckia*. See the article RUDBECKIA, *Append.*

SUN-*spurge*, in botany. See the article SPURGE, *supra.*

SUPERCILIUM *terræ*. See ADIANTUM.

SUPPLICATION, *supplicatio*, in antiquity, a religious solemnity observed on account of some remarkable success against an enemy; and especially when the army had conferred the title of *imperator* on their general, in whose name the senate ordered the temples to be opened for the reception of the people, and thanks to be rendered to the Gods.

On

On ſuch an occaſion the imperator ſent meſſengers crowned with laurel with letters to the ſenate, which were likewiſe adorned with laurel, to demand of them the title of *imperator*, and the honour of a *ſupplication*. This ſolemnity conſiſted in ſacrificing and feaſting in the temples, with giving thanks to the gods for the ſucceſs obtained, and praying for the continuance of their aſſiſtance. At firſt there were only a few days taken up in ſuch feſtivals; but afterwards they were increaſed gradually, till they came to no leſs than fifty. On ſubduing the Sabines, in the year of the city 304, a *ſupplication* of one day only was ordained; on the taking of Veii, Camillus had a *ſupplication* of four days decreed him; Pompey had twelve on putting an end to the Mithridatic war; Cæſar had fifteen, and afterwards twenty for reducing Gaul; Octavianus and Panſa had fifty days of *ſupplication* for delivering the colony of Mutina.

SWALLOW (*Suppl.*)—*Sea*-SWALLOW, the Engliſh name of a genus of birds, called by authors *ſterna*. See the article STERNA, *Suppl.*

SWARTH, among country people, the ſame with *ſwath*. See the next article.

SWATH, (*Cycl.*) a word uſed by country people for a row of graſs or corn, as laid by the mower. Ruſt. Dict. in voc.

SWEALING *a hog*, a word uſed in ſome parts of the kingdom for ſinging him. Ruſt. Dict. in voc.

SWEATH, the ſame with *ſwath*. See the article SWATH, ſupra.

SWEET-*apple*. See the article APPLE, ſupra.

SWEET-*Johns*. See the article JOHNS, ſupra.

SWEET-*William of Barbadoes*, the Engliſh name of a genus of plants, called by botaniſts *quamoclit*. See the article QUAMOCLIT, *Suppl.*

SWEET-*willow*. See the article WILLOW, infra.

SWINE's *creſs*, a name given to a ſpecies of *naſturtium*. See the article NASTURTIUM, *Suppl.*

SWIVELS, a kind of rings made to turn round in a ſtaple, or other ring. Theſe are uſed when a ſhip lies at her moorings; alſo in tedders for cattle, that they may turn round without unwarping the tedder.

SWORD-*fiſh*, the Engliſh name of the *xiphias*, a genus of fiſhes. See the article XIPHIAS, *Suppl.*

SWORD-*graſs*. See ACORUS, *Cycl.*

SYMPHORICARPOS, in botany, the name of a genus of plants, according to Dillenius, but made a ſpecies of *lonicera* by Linnæus. See the article LONICERA, *Append.*

T.

TADORNA, the name of a fpecies of duck, printed *tadoma* in the Supplement, by an error of the prefs. See the article TADOMA, *Suppl.*

TANNER, a perfon who dreffes hides by tanning. See the article TANNING, *Cycl.* and *Suppl.*

TANSEY, or TANZY, the Englifh name of a genus of plants. See the article TANACETUM, *Suppl.*

Wild TANSEY, a name by which fome call the *potentilla*. See the article POTENTILLA, *Suppl.*

TARE, *vicia*, in botany, the name of a genus of plants, otherwife called vetch. See the article VICIA, *Suppl.*

TARRAGON, a name fometimes given to *abrotanum*, or fouthernwood. See the article SOUTHERNWOOD, *Suppl.*

TEA, *thea*, in botany, is made a diftinct genus of plants. See the article THEA, *Append.*

TEDDER, or TETHER, a rope tied to a horfe's foot, that he may grafe within a certain compafs. Ruft. Dict. in voc.

TEG (*Suppl.*)—TEG, among fportfmen, denotes a doe of the fecond year. Ruft. Dict. in voc.

TELAUGIA, in natural hiftory, the name of a genus of *fcrupi*, of a glittering appearance, ufually containing flakes of talc, and emulating the ftructure of the granites. *Hill*, Hift. Foff. p. 547. See SCRUPI, *Append.*

Of this genus we have the following fpecies. 1. The hard, fhining, black and white *telaugium*. 2. The hard, fhining, red and white *telaugium*. 3. The red *telaugium*, variegated with white and black. 4. The hard, heavy *telaugium*, of a greyifh black, variegated with white. 5. The brownifh red *telaugium*, variegated with white and yellowifh. 6. The reddifh white *telaugium*, variegated with black and gold colour. 7. The hard, white *telaugium*, variegated with brown. 8. The bluifh white, brittle *telaugium*. 9. The brown, friable *telaugium*, variegated with yellow. 10. The hard, purplifh brown *telaugium*, variegated with white and yellow. 11. The heavy, red *telaugium*, variegated with black and white. 12. The hard, bluifh green *telaugium*, variegated with white. Id. ibid. p. 547—556.

TELEPHIASTRUM, *baftard orpine*, in botany, the name of a genus of plants, called by Linnæus *anacampferos*. See the article ANACAMPSEROS, *Suppl.*

TELESCOPE (*Cycl.*)—Mr. James Gregory was undoubtedly the firft inventor of reflecting *telefcopes*. The conftruction of his *telefcope* is different from that of Sir Ifaac Newton, and in fome refpects not fo advantageous, as is fhewn in Phil. Tranf. N° 83.

Mr. Gregory defcribes this *telefcope* at the end of his *Optica Promota*, publifhed in 1663; being led into the invention of it, not by the confideration of the different refrangibility of the rays of light, which was not then known, but by an inconvenience he forefaw would follow from an hyperbolic object-glafs. For he obferves, that if it be fufficiently broad to receive light enough into a *telefcope* that fhall magnify very much, it muft of confequence be very thick; in which cafe, the cleareft glafs would hinder too much of the light from being tranfmitted. He might alfo have added another inconvenience, that though it will collect a pencil of rays coming parallel to its axis into a fingle point, yet it cannot collect the rays of an oblique pencil fo accurately as a glafs confifting of fpherical furfaces will do, as has been found by experience; and therefore fpherical lenfes, upon this and fome other accounts, are fitter for optical ufes than thofe of any other figure.

Thefe reflecting *telefcopes* were not brought into practice till 1719, by Mr. John Hadley; Sir Ifaac Newton's firft, and that of Mr. Gregory foon after. This laft, in fmall lengths, has an excellent effect, and is exceeding commodious. We have a defcription of it by Dr. Smith [a], which differs from that of its inventor chiefly in this, that he directs his larger reflecting concave lens to be made of a parabolic figure, and his leffer of an elliptical one, inftead of the fpherical ones now ufed, as being the only figures that can be polifhed without infuperable difficulties.—[[a] Optics, in the remarks, fect. 137, feq.]

Reflecting *telefcopes* have been greatly improved by Mr. Short; but the particulars of his method are not publifhed. For the theory of thefe and other *telefcopes*, fee Dr. Smith's Optics.

TELESCOPE-*fhell*, the Englifh name of a fpecies of *turbo*, of a conic figure, with plane, ftriated, and very numerous fpires. See the article TURBO, *Suppl.*

TEMPERAMENT (*Suppl.*)—As Huygens has not given the names of all the intervals that occur in his *temperate* fcale, we fhall here infert them in the octave, from C to *c*, with their refpective meafures in commas, and tenths of a comma.

Intervals.		Names.	Meafures.
From C to D^{bb}.	1.	Diminifhed fecond, extreme flat fecond, or enharmonic diefis,	1.8.
C ♯.	2.	Semitone minor, or chromatic diefis,	3.6.
D^{b}.	3.	Flat fecond, or femitone major,	5.4.
C ♯♯.	4.	Double femitone minor,	7.2.
D.	5.	Second, or tone,	9.0.
E^{bb},	6.	Diminifhed third, or extreme flat third,	10.8.
D ♯.	7.	Superfluous fecond,	12.6.
E^{b}.	8.	Third minor, or flat third,	14.4.
D ♯♯.	9.	Extreme fuperfluous fecond,	16.2.
E.	10.	Third major, or fharp third,	18.0.
F^{b}.	11.	Diminifhed fourth,	19.8.
E ♯.	12.	Superfluous third,	21.6.
F.	13.	Fourth,	23.4.
G^{bb}.	14.	Extreme diminifhed fifth,	25.2.
F ♯.	15.	Falfe fourth, or tritonus,	27.0.
G^{b}.	16.	Falfe fifth, or femidiapente,	28.8.
F ♯♯.	17.	Extreme fuperfluous fourth,	30.6.
G.	18.	Fifth,	32.4.
A^{bb}.	19.	Diminifhed fixth, or extreme flat fixth,	34.2.
G ♯.	20.	Superfluous fifth,	36.0.
A^{b}.	21.	Flat fixth, or fixth minor,	37.8.
G ♯♯.	22.	Extreme fuperfluous fifth,	39.6.
A.	23.	Sharp fixth, or fixth major,	41.4.
B^{bb}.	24.	Diminifhed feventh, or extreme flat feventh,	43.2.
A ♯.	25.	Superfluous fixth,	45.0.
B^{b}.	26.	Flat feventh, or feventh minor,	46.8.
A ♯♯.	27.	Extreme fuperfluous fixth,	48.6.
B.	28.	Sharp feventh, or feventh major,	50.4.
c^{b}.	29.	Diminifhed octave,	52.2.
B ♯.	30.	Superfluous feventh,	54.0.
c.	31.	Octave,	55.8.

The *temperate* diefis enharmonica of Huygens being 1.8 comma, nearly, which is eafily remembred, the meafure of any interval in the octave may be found by multiplying it by the number denoting the place of that interval. Thus the fixth minor, being the twenty-firft interval, will be $= 1.8 \times 21 = 37.8$. The octave being the thirty-firft, will be $= 31 \times 1.8 = 55.8$, which does not differ from the truth by more than 0.00237, that is, not by $\frac{1}{400}$ of a comma, and therefore perfectly infenfible. See INTERVAL, *Suppl.*

All the intervals in the foregoing table, either have received names, or at leaft might receive them, from a perfect analogy to the names in ufe among practical muficians; but many of thefe intervals are as yet unheard of among practitioners. Perhaps, if all the genera of antient mufic were reftored, every interval here mentioned might be of ufe, either in melody or harmony, and thereby greatly add to the variety of compofition.

TENDERLINGS, a name given to the foft tops of deer's horns, when they begin to fhoot forth. Ruft. Dict. in voc.

TENDREL, a term peculiarly applied to the young fhoot, or fprig of a vine.

TENEBRIO, the *ftinking beetle*, the name of a genus of beetles, the antennæ of which are oblong, flender, and filiform.

It has no interior wings, in which fingular deficiency it differs widely from all other beetles; but the form and ftructure of all its other parts refer it to this clafs. See the article SCARABÆUS, *Suppl.*

Mouffet has called it the *blatta fœtida*. There are feveral fpecies of it.

TERRA *alana*, a name fometimes given to the yellowifh white *tripoli*. See the article TRIPOLI, *Cycl.* and *Supplement.*

TETHYS, in zoology, the name of a genus of naked fea-infects, the bodies of which are formed, as it were, of two lips, with an oblong cartilaginous body between them. They have four tentacula, fhaped like ears, and there are two perforations in moft fpecies near the tentacula.

There are feveral fpecies of this genus. Vid. *Hill*, Hift. Anim. p. 92.

THATCH, a common covering for houfes in moft parts of the country.

The beft kind of *thatch* is that called *helm*, or ftiff unbruifed wheat-ftraw, with the ears cut off, and bound up in bundles. This being difpofed in an uniform and longitudinal

order on the roof, is fixed on with laths, withies, or ropes. Ruſt. Dict. in voc.

THEA, the *tea-tree*, in botany, the name of a genus of plants, the characters of which are theſe. The cup is a very ſmall, plane, permanent perianthium, divided into ſix roundiſh, obtuſe leaves. The flower conſiſts of ſix large roundiſh, concave, and equal petals. The ſtamina are numerous filaments, about two hundred, and are very ſlender, capillary, and ſhorter than the flower. The antheræ are ſimple. The germen of the piſtil is globoſe and trigonal. The ſtyle is ſubulated, and of the length of the ſtamina. The ſtigma is ſimple. The fruit is a capſule, formed of three globular bodies, growing together: it contains three cells, and opens into three parts at the top. The ſeeds are ſingle, globoſe, and internally angulated. *Linnæi* Gen. Plant. p. 233.

Of this genus there is only one known ſpecies, which is the tree whereon our common *tea* is produced. See the article Tea, *Cycl.*

THEAVE, among country people, denotes an ewe lamb of the firſt year. Ruſt. Dict. in voc.

THERMOMETER (*Cycl.*)—In the Philoſophical Tranſactions [b] we have the deſcription of a *thermometer*, made with a rod of metal, either braſs or iron.—[[b] N° 485. p. 128—130.]

This inſtrument is compoſed of an upright ſtaff or bar of the beſt iron, four feet long, and an inch and a quarter broad, having a poliſhed braſs bar of the ſame length and width ſcrewed to it before it, with four ſteel ſcrews, and being alſo capped with ſteel, and thereon a lever moving upon a ſtud of ſteel, which communicates with another leſs lever, which is alſo upon a ſtud, having a chain at the end of it, which laps round an axis, whereto the index is fixed, which ſhews the degrees marked on a ſemicircular arch. Under the ſteel ſcrew heads there are ſmall ſlits in the braſs bar, except the lowermoſt which is fixed, which admit of its expanding, whereby it protrudes and operates on the firſt mentioned lever, which being raiſed moves the leſs lever, and thereby draws the chain which turns the axis affixed to the index, which ſhews the degree of warmth of the weather marked on the ſemicircular arch. There is a ſcrew through two ſtuds to draw the great lever backwards and forwards, as occaſion may be; and there is alſo a counterbalance to the ſmall lever, to draw the hand back when the braſs bar ſhrinks.

Dr. Mortimer laid claim to a like invention, and gave the deſcription of his *thermometer* in the Phil. Tranſ. N° 484, in the Appendix, p. 672.

The late Dr. George Martine, in his Book of Eſſays printed at London 1740, has treated the ſubject of *thermometers* very fully. Among other curious things, he has given a plate of ſeveral *thermometers*, which he compares, in order to ſhew the correſponding degrees in each.

As a fixed and unalterable point of heat is not yet found, the conſtruction of *thermometers* ſtill remains imperfect. For the heat of boiling water is not always preciſely the ſame, neither can we depend abſolutely on the point of freezing. Fahrenheit has placed the freezing point at 32, and that of boiling water at 212; ſo that he divides the diſtance between the freezing point and that of boiling water into 180 degrees.

Sir Iſaac Newton [c], in his ſcale of the degrees of heat, marks the freezing point 0, and that of boiling water 34. Hence one of his degrees correſponds to $5\frac{5}{17}$ degrees of Fahrenheit's *thermometer*.—[[c] See Phil. Tranſ. N° 270.]

It is to be obſerved, that if two *thermometers* be filled with different ſpirits, they cannot be adjuſted to correſpond by comparing together their ſcales: for example, if the firſt *thermometer* riſes 4 diviſions, when the ſecond riſes but 3, it is not to be expected that the ſecond ſhall juſt riſe 6, 9 or 12 diviſions, when the firſt riſes 8, 12 or 16; becauſe the ſpirit will not dilate in one in the ſame proportion that it does in the other; ſo that unleſs the liquor be made to go its whole range in each of them, and the one be new marked for every degree of the other, they will not be brought to correſpond. Mr. de Reaumur being aware of this, attempted in a very ingenious way to eſtabliſh a general conſtruction of ſuch *thermometers*, which might be copied at all times, and in all countries; and ſo to ſettle a general correſpondence of obſervations to be made by ſuch inſtruments. He took a large ball and tube, and knowing well the contents of the ball and that of the tube in every part, he graduated the tube, ſo that the ſpace from one diviſion to another might contain $\frac{1}{1000}$ part of the liquor, which contained 1000 parts when it ſtood at the freezing point. Then putting the ball of his *thermometer* and part of the tube into boiling water, he obſerved whether it roſe 80 diviſions, which if it exceeded, he changed his liquor, and adding water to it lowered it ſo, that on the next trial from the freezing point to the point of boiling water it ſhould only riſe 80 diviſions: but if the liquor being too low, fell ſhort of 80 diviſions, he raiſed it by adding rectified ſpirit to it. The liquor thus prepared fitted his purpoſe, and would ſerve for making a *thermometer* of any ſize, whoſe ſcale would agree with his ſtandard. Such liquor or ſpirits being nearly of the ſtrength of brandy may be eaſily had, and may be made of a proper degree of denſity by raiſing or lowering it.

Dr. Martine finds ſome faults in this *thermometer*; one of which is, that the ball or bulk of the *thermometer* being large, is not heated or cooled ſoon enough to ſhew the quick variation of the weather. And, indeed, this is a fault common to all *thermometers*, which have bulbs to hold their liquor; a cylinder being much better, whatever liquor is uſed, except where great degrees of heat are to be meaſured, as in Sir Iſaac Newton's linſeed-oil *thermometer*. For though moſt ſpirit *thermometers* have the degree of the heat of boiling water marked upon them, as one of their boundaries; yet the heat of boiling water is always greater than that of boiling ſpirits, and therefore they are unfit to meaſure that degree of heat. But linſeed-oil is capable of ſuſtaining much greater degrees of heat; for it will bear a greater degree than what will melt lead, without firing or having the glaſs ball of the *thermometer* melted. Whereas water is only capable of a certain degree of heat, much lower, at which it will evaporate; but this is only when water boils in open veſſels. Of late years quickſilver has been made uſe of for *thermometers*, and theſe are found to be the moſt uſeful of any; becauſe they will bear ſuch degrees of heat or cold as will burſt ſpirit-*thermometers*, or freeze the liquor in them. This laſt inconveniency happened to the French philoſophers, who went to the north polar circle to examine into the figure of the earth; for the ſpirit in their *thermometers* froze, but their mercurial ones were as uſeful as any where elſe. Fahrenheit of Amſterdam may be looked upon as the inventor of this *thermometer*; and though Prins, and ſome others in England, Holland, France, and other countries, have made this inſtrument as well as Fahrenheit, yet ſtill they may be called Fahrenheit's, as being graduated according to his ſcale.

For the different kinds of theſe *thermometers*, ſee *Deſaguliers*, Exper. Phil. Vol. II. p. 295. See alſo Dr. *Martine's* Eſſays before mentioned.

Sir Iſaac Newton filled his *thermometer* with linſeed-oil, which will bear a very great heat. He aſſumes the rarefaction of the oil to be proportional to its heat [d]; and this aſſumption ſeems juſt from his experiments. However, it were to be wiſhed that this ſubject were farther examined. —[[d] See the Phil. Tranſ. loc. cit.]

Dr. Hales places the freezing point at 0, and the heat of water on which floating wax begins to melt at 100. In his *thermometer* the heat of boiling water anſwers to $146\frac{1}{3}$.

We ſhall here inſert a table of ſome obſervations made, with the *thermometers* of Fahrenheit, Reaumur, Sir Iſaac Newton, and Dr. Hales, communicated by Mr. Labelye.

1. *Obſervations by Fahrenheit*'s thermometer.

Deg.	
at 212	Boiling water.
190	Brandy boils.
174	Alcohol boils.
156	Serum of blood, and white of eggs hardens.
146	Killing heat for animals, in a few minutes.
108	A hen hatching eggs, but ſeldom ſo hot.
from 107 to 103	Heat of ſkin in ducks, geeſe, hens, pigeons, partridges and ſwallows.
at 106	Heat of ſkin in a common ague and fever.
from 103 to 100	Heat of ſkin in dogs, cats, ſheep, oxen, ſwine and other quadrupeds.
from 99 to 92	Heat of the human ſkin, in health.
at 97	Heat of a ſwarm of bees.
96	A perch died in three minutes, in water ſo heated.
80	Heat of the air in the ſhade, in very hot weather.
74	Butter begins to melt,
64	Heat of the air in the ſhade, in warm weather.
48	Temperate air, in England and Holland.
43	Oil of olive begins to ſtiffen and grow opaque.
32	Water juſt freezing, or ſnow and ice juſt thawing.
30	Milk freezes.
28	Urine and common vinegar freezes.
25	Blood out of the body freezes.
20	Good Burgundy, ſtrong claret and Madera freezes.
7	One part of ſpirits of wine mixt with three parts water freezes.
5	Greateſt cold in Penſilvania in 1731-2, 40° lat.
4	Greateſt cold at Utrecht in 1728-9.
0	A mixture of ſnow and ſalt, which is able to freeze oil of tartar *per deliquium*, but not brandy.

We muſt here obſerve, that the heat of a hen hatching chickens is placed, by this table, at 108 of Fahrenheit's *thermometer*; but it appears from Mr. Reaumur's experiments, that eggs will hatch in a heat no greater than that of the human ſkin. See Hatching, *Append.*

2. *Obſervations by Reaumur*'s thermometer.

$97\frac{1}{2}$	Anſwers to the heat of boiling water.
80	Spirit of wine in Reaumur's *thermometer* boils.

Deg.	
at $29\frac{2}{3}$	Greateſt heat of the air in the ſhade; obſerved at Paris in 1706, 1707, 1724.
$10\frac{1}{4}$	Conſtant heat of the caves of the obſervatory at Paris.
0	Artificial congelation of water.
$14\frac{1}{4}$	Lower than (0) greateſt cold at Paris, in 1709.

3. *Obſervations by Sir Iſaac Newton*'s thermometer.

34	Water boils vehemently.
$28\frac{6}{11}$	Heat between water boiling and wax melting.
24	Heat of water on which floating wax melts.
$20\frac{2}{11}$	Heat of water on which floating melted wax begins, by cooling, to loſe its fluidity and tranſparency.
17	Heat of a bath ſupportable to the hand at reſt.
$14\frac{3}{11}$	Heat of a bath ſupportable to the hand in motion. The heat of blood juſt let out, is almoſt the ſame.
12	Heat of *thermometer*, in contact with a human body. The heat of a bird hatching her eggs much the ſame.
6, 5, 4	Heats of the air in the ſummer.
4, 3, 2	Heats of the air in ſpring and autumn.
2, 1, 0	Heat of the air in the winter.
0	Water begins to freeze.

4. *Obſervations by Dr. Hales*'s thermometer.

$146\frac{1}{3}$	Anſwers to the heat of boiling water.
100	Heat of water on which floating wax begins to melt.
59	Leaſt proper heat for the melon-thiſtle.
56	——————— ananas, or pine-apple.
53	——————— pimiento.
51	——————— euphorbium.
48	——————— cereus.
45	——————— aloes.
43	——————— Indian fig.
40	——————— ficoides.
38	——————— orange.
36	——————— mirtle.
0	Freſh water juſt freezing.

THICKET, a thick huſh, or place full of buſhes and brambles. Ruſt. Dict. in voc.

THILL, the beam, or draught-tree of a cart or waggon, upon which the yoke hangs. Ruſt. Dict. in voc.

THILLER, or THILL-*horſe*, the horſe that is put under, or immediately yoked to the *thill*. Ruſt. Dict. in voc.

THIMBLE, a cover for the finger, made of braſs, ſteel or ſilver, and uſed by all people who ſow, as taylors, milliners, &c.

THIMBLE, in the ſea language, a ſort of ring, the outſide of which is conſiderably hollowed to receive ropes. *Thimbles* are fixed as loops, to prevent the tackle-hook from galling the rope. *Blanckley*, Naval Expoſ. p. 169.

THIRDENDALE, a liquid meaſure in uſe at Saliſbury, containing three pints. Ruſt. Dict. in voc.

THIRST (*Suppl.*)—We find warm druggs, as liquorice, ſometimes effectual in allaying *thirſt*: nay pepper will, in ſome caſes, have a like effect, by cauſing a more plentiful flow of the ſaliva.

In feveriſh diſorders, the patient is frequently tormented with a violent *thirſt*, which is moderated by acidulating the barley-water, or ſage-tea, with ſpirit of vitriol, or with lemon-juice; but by nothing ſo much, as allowing the patient ſome ſlices of an orange. *Pringle*, Obſerv. on Diſeaſ. of Army, p. 135.

THISTLE (*Suppl.*)—*Bleſſed* THISTLE, a name by which ſome call the *cnicus*, or ſaffron-flower. See the article CNICUS, *Suppl.*

Carline-THISTLE, *carlina*, in botany, the name of a genus of plants. See the article CARLINA, *Suppl.*

Diſtaff-THISTLE, in botany, the name of a genus of plants, called by botaniſts *atractylis*. See ATRACTYLIS, *Append.*

Fiſh-THISTLE, a name ſometimes uſed for the *cinara*, or artichoak. See the article CINARA, *Suppl.*

Fuller's THISTLE, the name by which ſome call the *dipſacus*, or teaſel. See the article DIPSACUS, *Suppl.*

Melon-THISTLE, or *Torch*-THISTLE, the Engliſh name of a genus of plants, called by botaniſts *cactus*. See the article CACTUS, *Suppl.* and *Append.*

Melancholy-THISTLE, the ſame with the *gentle thiſtle*, or *cirſium*. See the article *gentle*-THISTLE, *Suppl.*

Sow-THISTLE, the Engliſh name of a genus of plants, called *ſonchus* by botaniſts. See the article SONCHUS, *Suppl.*

Star-THISTLE, the name by which ſome call the *calcitrapa*, a ſpecies of *centauria*. See the article CENTAURIA, *Appendix.*

THORN, a name denoting, or characterizing ſeveral different genera of prickly plants. Thus:

THORN-*apple* is the Engliſh name of the *ſtramonium* of botaniſts. See the article STRAMONIUM, *Suppl.*

Black-THORN, the name by which ſome call the *prunus ſylveſtris*, or wild plum, more uſually called *ſloe*. See the article PRUNUS, *Suppl.*

Box-THORN, or *Avignon*-THORN, names given to the *lycium* of botanical writers. See the article LYCIUM, *Append.*

Buck-THORN, the name of a genus of plants. See the article RHAMNUS.

Chriſt's THORN, the Engliſh name of a genus of plants, called *paliurus* by botanical writers. See PALIURUS, *Suppl.*

Egyptian-THORN, a name ſometimes given to *acacia*. See the article ACACIA, *Suppl.*

Goat's THORN, the Engliſh name of a genus of plants, called by botaniſts *tragacanth*. See the article TRAGACANTH, *Suppl.*

Haw-THORN, *White*-THORN, *Ever-green*-THORN, &c. names given to the *meſpilus*. See the article MESPILUS, *Suppl.*

Purging-THORN, a name ſometimes given to the *rhamnus*. See the article RHAMNUS, *Suppl.*

THORNBACK, the Engliſh name of a ſpecies of ray-fiſh, prickly on the back, and with tuberculoſe teeth, and a tranſverſe cartilage in the belly. See the article RAIA, *Suppl.*

THOROUGH-*wax*, in botany, a name by which ſome writers call the *bupleurum*, or hare's ears. See the article HARE's *ears*, *Suppl.*

THREE-*leaved graſs*. See the articles TREFOIL and TRIFOLIUM, *Suppl.*

THRICHECUS, in zoology, the name uſed by Dr. Hill for the *manati*, or ſea-cow. See the article MANATI, *Suppl.*

THROAT-*wort*, a name given to ſeveral ſpecies of *campanula*. See the article CAMPANULA, *Suppl.*

THROPPLE, among country people, denotes the windpipe of a horſe. Ruſt. Dict. in voc.

THROSTLING, a diſeaſe of black cattle, proceeding from humours gathering under their throats; by which means their throats are ſo dangerouſly ſwelled, that they will be choaked unleſs ſeaſonably relieved by bleeding. Ruſt. Dict. in voc.

THRUSH, in ornithology, the Engliſh name of a large genus of birds, called by authors *turdus*. See the article TURDUS, *Suppl.*

THYME (*Suppl.*)—*Wild* THYME, *Lemon*-THYME, or *Mother-of*-THYME, names uſed for a diſtinct genus of plants, called by botanical writers *ſerpyllum*. See the article SERPYLLUM, *Suppl.*

Maſtich-THYME, a name uſed for the *marum*, *maſtichina*, or *thymbra*. See the article THYMBRA, *Suppl.*

THUYA (*Suppl.*)—The leaves of this tree ſmell like ointment, and in fact prove an excellent one for freſh wounds, cloſing them ſpeedily. Ruſt. Dict. in voc. *lignum*.

TICK, in the hiſtory of inſects, the name of the ſheep-louſe, called by authors *acarus*. See the article ACARUS, *Suppl.*

TIER, in the ſea language, the name of the ſeveral ranks of guns; which, according as they are placed on the lower, middle, or upper decks, are called the lower, middle, or upper *tier*. *Blanckley*, Nav. Expoſ. p. 169.

TIERCEL, in falconry, a name given to a male hawk, as being a third part leſs in ſize than the female. Ruſt. Dict. in voc.

TIGER (*Suppl.*)—The ſkull of this creature, both as to the teeth and other particulars, very much reſembles that of the cat, except that, in the room of the tranſverſe futures of the cat's, there is in the *tiger*'s one in the figure of a great Y, ſo cloſe and firm, that the bones ſeem contiguous.

Its tuſks are a little crooked, like thoſe of the dog and cat; their exerted part very white, and the bow of ſome of them very long, not leſs than five inches. Its claws are whitiſh, and ſemitranſparent, very flat, ſharp and pointed, and extremely hooked; every way in colour and ſhape like the claw of a cat. Uſually, on the fore paws of the larger *tigers*, theſe are at the baſis an inch broad, and are two inches and a half long. The bone on which the claw is ſet receives it into a little groove, and is by a double epiphyſis itſelf inſerted into the claw; by which means the claw is firmly held in its place. *Grew*'s Muſ. p. 13.

TIGER-*ſhell*, the Engliſh name of the red *voluta*, with large white ſpots. See the article VOLUTA, *Suppl.*

TIKE (*Suppl.*)—TIKE is alſo uſed for a ſmall bullock or heifer, and for a ſort of worm. Ruſt. Dict. in voc.

TILLER, (*Cycl.*) a term uſed by farmers to ſignify, that the produce of the grain branches out into ſeveral ſtalks. In which ſenſe, it denotes the ſame thing with the Latin word *fruticare*. Vid. *Tull*'s Horſe-hoeing Huſbandry, p. 105.

TILTH, a country term for tillage, manuring, or improving of ground. Ruſt. Dict. in voc.

TIMBER (*Suppl.*)—*Prick*-TIMBER, a name by which ſome call the *euonymus*, or ſpindle-tree. See the article EUONYMUS, *Suppl.*

TIN, how expanded by heat. See the article HEAT, *Append.*

TIPULA (*Suppl.*)—*Waſp*-TIPULA, in natural hiſtory, the name of an inſect, the deſcription of which ſee under the article WASP-*tipula*, *Suppl.*

TIRING, in falconry, is the giving a hawk a leg or pinion of a pullet to pluck at. Dict. Ruft. in voc.

TIT-*lark*. See ALAUDA, *Suppl.*

TOBACCO, *nicotiana*, the Englifh name of a diftinct genus of plants. See the article NICOTIANA, *Suppl.*

TOE-*fhell*, the Englifh name of a genus of fhells, called by authors *pollicipes*. See the article POLLICIPES, *Suppl.*

TOFT (*Cycl.*)—TOFT alfo fignifies a grove of trees. Dict. Ruft. in voc.

TOLK, in ornithology, a name fometimes given to the black, brown, and white, mottled *tringa*. See the article TRINGA, *Suppl.*

TONGUE (*Suppl.*)—To the inftances briefly mentioned under this head in the Supplement, we may add the following account of a man at Montagu, in the Bas Poictou, who being feized with the fmall-pox in his fifth or fixth year, loft his whole *tongue* by gangrene, or putrefaction; yet, notwithftanding, performed in perfection the five actions belonging to the *tongue*, viz. fpeaking, tafting, fpitting, chewing, and fwallowing [a]; nature having, with infinite artifice, given a new conformation to the mouth, proper to fupply the want of the laft organ.—[[a] *Jac. Rolandi Aglosftomographia, five defcriptio oris fine lingua quod perfecté loquitur et reliquas fuas functiones naturaliter exercet*; firft publifhed in French, at Saumur, in 1630; tranflated into Latin by Car. Ruygerns, and publifhed in the Ephem. German. D. an. 3. p. 481—513.]

For fpeech, inftead of the ordinary provifion, the little flefhy part of the *tongue* remaining was inflected in the middle towards the palate, the teeth inverted, and long inwards, the mufculi buccinatores eafily contracting between the dentes molares. In fine, there was a difpofition in all the organs to produce fpeech without a *tongue*: for the breath iffuing at the oval aperture of the larynx, was further broken, and rendered vocal by the inflation of the flefhy body, the motion of the lips, the retraction of the buccinatores, the tremulous agitation of the uvula, and the commotion of the lower jaw. Laftly, by the inverfion of the teeth, the depreffion of the palate, the abundance of faliva, and the capacity of the mouth, the found was ftill further modified and determined, fo as to render it articulate. Habit too, and the repeated attempts to fpeak at an age when the parts were eafily flexible, had contributed greatly to the diftinctnefs of it. For tafting, it is evident from this, as well as other confiderations, that the *tongue* is not the only organ of it, but that the palate is alfo a feat of this fenfe. For chewing, the office of turning the meat in the mouth was here performed by the lips and cheeks, the mufcles whereof repelled towards the maxillares; fuch parts, as in maftication might fall from one fide to the other. For the firft morfel he took, he could only chew on that fide into which he put it with his hand; the fecond he put in like manner on the other fide; and thus varied and fupplied each alternately. For fwallowing, the gravity of the food contributed fomething to this; which he further promoted by ftretching out his neck, inclining his head, and drawing back the buccinatores within his teeth; all which were feconded by the mouth and fauces, being well moiftened with plenty of faliva. In effect, divers animals, as the tortoife and the crocodile, ftork, &c. fwallow without any *tongue*; and fifhes, though their *tongue* is fixed immoveable to their palate. For fpitting, it was performed by the lips, aided by the internal contraction of the mouth, and the retraction of the buccinatores over the grinders.

Roland's inftance was fingular at that time, but a parallel one has been fince obferved in a girl at Lifbon fifteen years old; of which an account was given in 1718 to the Royal Academy of Sciences, by M. de Juffieu [b]. Upon infpecting the mouth of this girl, there appeared nothing in all that part ordinarily poffeffed by the *tongue*, but a little eminence in form of a papilla, between three and four lines high, in the middle of her mouth, fcarce perceivable by the eye. Upon preffing this with the finger, a kind of motion of contraction and dilatation was perceived in it; which fhewed, that though the *tongue* was wanting, the mufcles of which it was formed, and which are deftined to give it motion, were neverthelefs there. With the help of thefe fhe fpoke as diftinctly and eafily, as if nothing had been wanting: fhe diftinguifhed taftes like other people. For maftication, it was chiefly effected by the motion of the lower jaw, which fhe drew nearer to, or further from the grinders of the upper, under which the food to be chewed was. In this action fhe fometimes alfo made ufe of her fingers, but much more in the action of fwallowing, in order to protrude the mafticated food towards the orifice of the œfophagus. For drinking, fhe performed it like other people, excepting the attention fhe employed to prevent the liquor going down too faft; in order to which, fhe kept her head a little inclined forwards. Laftly, the action of fpitting was fupplied by the mufcles of the papilla, which filled the lower part of her mouth: thefe rifing almoft to a level with the teeth of the lower jaw, and the buccinatores approaching towards both jaws, expreffed the faliva, and conducted it to the fphincter of the lips, from whence the air, driven with violence from the larynx, ferved as a vehicle to expel it out of the mouth [c].—[[b] Mem. de l'Acad. Scienc. an. 1718. p. 6—16. [c] *Juffieu*, loc. cit. p. 7, feq.]

Serpent's TONGUE, or *Adder's* TONGUE, names given to the *ophioglosfum*, a diftinct genus of plants. See the article OPHIOGLOSSUM, *Suppl.*

TONIC *accent*. See the article ACCENT, *Cycl.*

TOOTH-*pick*, a name by which fome call the *vifnaga*, a fpecies of *daucus*, according to Linnæus. See the article DAUCUS, *Suppl.*

TOOTH-*wort*, the Englifh name of a genus of plants, called by botanical writers *dentaria*. See the article DENTARIA, *Suppl.*

TORROCK, a bird of the larus or gull kind, with a white head, and a fpot of black on each fide. See the article LARUS, *Suppl.*

TOUCH-*me-not*, the name of a fpecies of *balfamine*. See the article BALSAMINA, *Suppl.*

TOURNEFORTIA, in botany, a name given by Pontedera to a genus of plants, called by Linnæus *anthofpermum*. See the article ANTHOSPERMUM, *Append.*

TOWER-*muftard*, the Englifh name of a genus of plants, called *turritis* by botanifts. See the article TURRITIS, *Suppl.*

TRACES (*Suppl.*)—*Ladies* TRACES, in botany, the name of a diftinct genus of plants, called by botanifts *orchis*. See the article ORCHIS, *Suppl.*

TRACHELIUM (*Suppl.*) is alfo a name ufed by many for feveral fpecies of *campanula*. See the article CAMPANULA, *Suppl.*

TRADESCANTIA, in the Linnæan fyftem of botany, the name given to the *ephemerum* of Tournefort. See the article EPHEMERUM, *Suppl.*

TRAGO-*orchis*, in botany, a name ufed by fome authors for the *fatyrium* of Linnæus. See the article SATYRIUM, *Append.*

TRAJECTORY (*Cycl.*)—This term is often ufed, in general, for the path of any body moving either in a void, or in a medium that refifts its motion; or even for any curve paffing through a given number of points. Thus Newton, Princip. lib. 1. prop. 22. propofes to defcribe a *trajectory* that fhall pafs through five given points.

TRAVE, among farriers, the fame with *travice*. See the article TRAVICE, *Suppl.*

TRAVELLER's *joy*, a name by which the *clematitis*, or virgin's bower, is fometimes called. See the article VIRGIN's *bower*, *Suppl.*

TREACLE-*muftard*. See the article MUSTARD, fupra.

TREE (*Suppl.*)—*Cork*-TREE, the Englifh name of a genus of plants, called by botanifts *fuber*. See the article SUBER, *Suppl.*

Chafte TREE. See the article VITEX, *Suppl.*

Germander TREE. See the article TEUCRIUM, *Suppl.*

White-leaf, or *mealy* TREE, a name by which fome call the *viburnum*. See the article VIBURNUM, *Suppl.*

TREE *of life*, the Englifh name of a genus of *trees*, called *thuya* by botanifts. See the article THUYA, *Suppl.*

TREE-*loufe*. See the article LOUSE, fupra.

TREFOIL (*Suppl.*)—*Bean* TREFOIL, a name fometimes given to the *cytifus*. See the article CYTISUS, *Suppl.*

Bird's foot TREFOIL, a name given by fome writers to the *lotus*. See the article LOTUS, *Suppl.*

Marfh-TREFOIL, the name of a genus of plants, called by botanifts *menyanthes*. See MENYANTHES, *Suppl.*

Moon-TREFOIL, the name by which many call the *medicago* of botanical writers. See the article MEDICAGO, *Suppl.*

Shrub-TREFOIL, a name given to very different plants; as the *ptelea* of Linnæus, the *cytifus*, and *dorycnium*, or the filvery *convolvulus*. See the articles PTELEA, CYTISUS, &c. *Suppl.*

Snail TREFOIL, *medica*, in botany, the name of a diftinct genus of plants. See the article MEDICA, *Suppl.*

TRELLIS, an affemblage of wooden bars, croffing one another, either in a ftrait line, or flopewife, defigned to fupport wall-trees.

There is another kind of *trellis*, made of iron-wire. See Build. Dict. in voc.

TRILATERAL, in geometry, an appellation given to all three-fided figures. See TRIANGLE, *Cycl.*

TRILOCULAR, in botany, is applied to a capfule having three cells. See CAPSULE, *Append.*

TRIM, in carpentry, is to fit one piece of timber into another. Build. Dict. in voc.

TRIOSTEOSPERMUM, in botany, the name by which Dillenius calls a fpecies of *lonicera*. See the article LONICERA, *Append.*

TRIPETALOUS *plants*, fuch whofe flower confifts of three petals or leaves. Ruft. Dict. in voc.

TRITON, in zoology, the name by which Dr. Hill calls a genus of infects of the *gymnarthria*, or naked kind.

The body of the *triton* is oblong; the roftrum at the mouth is of a fpiral form; the tentacula are fourteen in number, and twelve of them cheliferous. Vid. *Hill*, Hift. Anim. p. 89, feq.

TROAT, among sportsmen, the cry of a buck in rutting time. Dict. Rust. in voc.

TROCHING, the small branches on the top of a deer's head. Rust. Dict. in voc.

TROPÆOLUM, in the Linnæan system of botany, the name of a genus of plants, called by Tournefort *cardamindum*, and by C. Bauhine *nasturtium indicum*.

The characters are these: The cup is a deciduous perianthium, composed of a single leaf, divided into five segments, erecto-patulous, acute, coloured, and the two lower ones narrower than the rest. The flower consists of five roundish petals, inserted into the divisions of the cup; the two upper petals are sessile; the three others have very long and barbated ungues. The stamina are eight short, subulated, declinated, unequal filaments. The antheræ are erect, oblong, quadrilocular, and assurgent. The germen is roundish, striated, and formed of three lobes. The style is simple, erect, and of the length of the stamina. The stigma is trifid and acute. The fruit consists of three capsules, convex, fulcated, and striated on one side, and angular on the other. The seeds are three in number, gibbous on one side, and angulated on the other; but, upon the whole, somewhat roundish, and striated deeply. Vid. *Linnæi* Gen. Plant. p. 158. See the article CARDAMINDUM, *Suppl.*

TROPHY (*Cycl.*)—TROPHY, in architecture, an ornament representing the trunk of a tree, charged or encompassed all round with arms, or military weapons, both offensive and defensive. Build. Dict. in voc.

TROUGH, (*Cycl.*) a hollow wooden vessel for kneading bread in, or to beat apples in for cyder; also a piece of the trunk of a tree made hollow, to feed swine in, or an open pipe or channel, made of boards, for the conveyance of water. Dict. Rust. in voc.

TRUE-*love*, or *Herb* TRUE-*love*, the name of a genus of plants, called *herba Paris* by botanists. See the article HERBA *Paris*, *Suppl.*

TRUG (*Cycl.*)—TRUG is also a country word for a milk-tray, or a hod to carry mortar in.

TRUMPET (*Cycl.*)—The usual sounds of the *trumpet* are represented by the following musical notes.

1. 2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. 13. 14. 15. 16.

Here the lowest sound being denoted by 1, the pitch of the rest, or the number of their respective vibrations, during the time that C vibrates once, will be expressed by the numbers denoting the order of the sounds, 2, 3, 4, 5, &c. The sounds expressed by the musical numbers, that is, by 2, 3, 5 [a], and their composites, which are 4, 6, 8, 9, 10, 12, 15, 16, are all perfectly in tune; but the sounds expressed by numbers not musical, as 7, 11, 13, 14, are false. Three of these, *viz.* B♭, its octave, and A, distinguished by *f* placed over them, are too flat; and the remaining note F, marked with an S, is too sharp.—[[a] See MUSICAL *numbers*, *Suppl.* and *Append.*]

The reason of which is, that B♭ ought to be a tone major below C; that is, its pitch to that of C will be as 8 to 9; but the proportion given by the *trumpet* is as 7 to 8; which being a less proportion than that of 8 to 9, it follows, that B♭ will be too flat. The same holds true of its octave. And A being a tone minor above G, it ought to be to G as 10 to 9: but in the *trumpet*, it is to G as 13 to 12; which being less than the proportion of 10 to 9, it follows, that A will be too flat. On the other hand, F ought to be a semitone major above E; that is, F ought to be to E, as 16 to 15; but, in the *trumpet*, F is to E, as 11 to 10; which being a greater proportion than that of 16 to 15, it follows that F is too high or too sharp.

This system of *trumpet* notes is an effectual confutation of those who are for introducing 7, 11, 13, and other primes into music.

TRUMPET-*honeysuckle*. See the article HONEYSUCKLE, supra.

TRUNK (*Suppl.*)—TRUNK is also used for a strong chest, or box, of a roundish form, at least on the upper side. Rust. Dict. in voc.

TUBEROSA, a name given by Heister to a genus of plants, called by Linnæus *polyanthes*. See POLYANTHES, *Append.*

TUE-*iron*, in smithery, the iron through which a smith's bellows blow. *Blanckley*, Naval Expos. p. 178.

TUEL, among sportsmen, denotes the fundament of a horse, or wild beast. Dict. Rust. in voc.

TULIP (*Suppl.*)—*African* TULIP, or *Cape* TULIP, names used by some for the *hæmanthus*, a distinct genus of plants. See the article HÆMANTHUS, *Suppl.*

TULIP-*tree*, the English name of a genus of trees, called by botanists *tulipifera*, and *liriodendrum*. See the article LIRIODENDRUM, *Suppl.*

Laurel-leaved TULIP-*tree*, a name sometimes given to the *magnolia* of botanical writers. See the article MAGNOLIA, *Suppl.*

TUMPING, the making a kind of fence in the fields, by setting trees almost on the surface of the ground, and covering their roots with mould. Rust. Dict. in voc.

TUN-*hoof*, a name sometimes used for ground-ivy. See the article IVY, *Suppl.* and *Append.*

TURBITH, in botany, a name used by many for the *thapsia*, or deadly carrot. See the article THAPSIA, *Suppl.*

Mineral TURBITH (*Cycl.*)—We read of this preparation's being given to the quantity of ten grains, with the same quantity of camphor, and fifteen grains of the pilul. ex duob. to remove the swelling of the testicles. This medicine, which in the beginning vomited and purged, at last operated chiefly as an alterative. It is said to be successful in obstinate venereal and scrophulous disorders. See Medic. Ess. Edinb. Vol. IV. art. 4.

TURCOIS (*Cycl.*)—This gem has many virtues attributed to it; but all that we know of it at present is, that, like other bodies which contain copper, it is a violent emetic, and not at all fit to be received into practice.

TURCOIS *colour*, the pale blue of the natural *turcois* gem. This is a very favourite colour in the glass trade, and is given to glass in the following manner. First calcine common sea-salt, and beat it to a fine powder; then make a pot of the sea-green glass, of a fair and full colour: to this, when in fusion, throw in at times the powder of salt, till the mass has lost all its transparence, and is become paler and opake; then add, by very small quantities at a time, more and more salt, till the colour is exactly that of the *torcois* gem; and when it is so work it immediately, for the salt is soon burnt off, and the glass becomes transparent, and of its green colour. If it become transparent while working, more salt must be thrown in, and that will reduce it to the same opacity again. *Neri's* Art of Glass, p. 57.

TURCOIS *enamel*, an enamel exactly of the colour of the *torcois* gem, and very much resembling it in many respects. It is made in the following manner: Take of the common matter of enamels six pounds, melt it, refine it, and cast it into the furnace again; when it is melted and refined put in, of thrice-calcined brass three ounces, zaffer prepared ninety-six grains, wherewith mix well forty-eight grains of manganese; mix these well, and put them into the matter at four times; let the whole incorporate, and afterwards take a proof to see if it be right, or if it require more of any of the powders. *Neri's* Art of Glass, p. 149.

TURK's *cap*, a name used by some for a species of lilly. See the article LILIUM, *Suppl.*

TURK's *head*, a name sometimes used for the *cactus*, a distinct genus of plants. See the article CACTUS, *Append.*

TURKY-*baum*. See the article BAUM, supra.

TURKY-*wheat*, a name sometimes given to *maiz*, or *yucca*. See the articles YUCCA and MAIZ, *Suppl.*

TURNEP (*Suppl.*)—*French* TURNEP, the name by which some call the *napus* of botanical writers. See the article NAPUS, *Suppl.*

TURNEP-*cabbage*, in botany. See the articles BRASSICA and CABBAGE, *Suppl.*

TURTLE-*shell*, (*Suppl.*) is also the name of several species of the *testudo*, or tortoise. See the article TESTUDO, *Supplement.*

TUSK (*Cycl.*)—TUSK, in carpentry, a bevel shoulder, made to strengthen the iron of the joist, which is let into the girder. Build. Dict. in voc.

TWITCH-*grass*, the same with *quick-grass*, a weed very hurtful to the farmers. Rust. Dict. in voc.

TWYBLADE, a name used by some for the *ophris* of botanical writers. See the article OPHRIS, *Suppl.*

TYPH-*wheat*, a kind of corn very like rhye. Rust. Dict. in voc.

U.

VACCA *marina*, in zoology, a name fometimes ufed for the *manati*, or fea cow. See the article MANATI, *Suppl.*

VALERIAN (*Suppl.*)—*Greek* VALERIAN, a name frequently ufed for the *polemonium* of botanifts. See the article POLEMONIUM, *Suppl.*

VALERIANOIDES, in botany, a name given by Petiver to the *cephalanthus* of Linnæus. See the article CEPHALANTHUS, *Append.*

VALLEY (*Cycl.*)—VALLEYS, in building, denote the gutters over the fleepers in the roof of a building. Build. Dict. in voc.

VALLOR, VALLOW, or VATE, among country people, a hollow mould, in which a new-made cheefe is preffed. Ruft. Dict. in voc.

VARVELS, in falconry, fmall filver rings about a hawk's leg, with the owner's name on them. Ruft. Dict. in voc.

VATE, in the making of cheefe. See VALLOR, fupra.

VAULT (*Suppl.*)—*Going to the* VAULT, a term ufed by fportfmen for a hare's taking the ground like a coney, which fhe fometimes does. Ruft. Dict. in voc.

VEGETABLE (*Suppl.*)—*Perfpiration of* VEGETABLES. See PERSPIRATION, *Append.*

VELLICULA, a name fometimes ufed for the *forficula*, an infect called in Englifh the *ear-wig*. See the article EAR-WIG, *Append.*

VELLING, a term ufed by hufbandmen in the weft of England for plowing up by the turf. Ruft. Dict. in voc.

VENTILATOR, a machine by which the noxious air of any clofe place, as an hofpital, gaol, fhip, chamber, &c. may be changed for frefh.

The noxious qualities of bad air have been long known, tho' not fufficiently attended to in practice; but it is to be hoped, that the indefatigable pains taken by Dr. Hales to fet the mifchiefs arifing from foul air in a juft light, and the eafy remedy he has propofed by the ufe of his *ventilators*, will at length prevail over that unaccountable floth, or obftinacy, which, where particular interefts are not immediately concerned, feems to poffefs the generality of mankind, and which rarely allows them to give due attention to any new difcovery.

The *ventilators* invented by that ingenious author confifts of a fquare box of any fize; in the middle of one fide of this box a broad partition, or midriff is fixed by hinges, and it moves up and down by means of an iron rod, fixed at a proper diftance from the other end of the midriff, and paffing through a fmall hole in the cover of the box. Two boxes of this kind may be employed at once, and the two iron rods may be fixed to a lever moving on a fixed center; fo that by the alternate raifing and preffing down of the lever, the midriffs are alfo alternately raifed and depreffed, whereby thefe double bellows are at the fame time both drawing in air, and pouring it out through apertures with valves made on the fame fide with, and placed both above and below the hinges of the midriffs. For a farther account of this machine we refer to the author himfelf, who gives a full detail of it, and of its manner of working. See Defcription of *Ventilators*, by Stephen Hales, D. D. Lond. 1743, 8vo.

The Doctor has fhewn the ufe of his *ventilators* very fully. As to fhips, in particular he obferves that the wind-fail, made ufe of at fea to introduce frefh air between decks, is far from being fufficient for that purpofe; nor can it be ufed with equal fafety to the fick, and thofe who are fleeping, by means of the ftrength of the wind which conveys the air with too much violence. But when the foul air is carried off by means of *ventilators*, notwithftanding the great velocity with which they throw out the air, which they may do at the rate of fixty tuns in a minute, yet the motion of it downwards into the hold, to fupply what is carried off, is fo very gentle, that it cannot be perceived; becaufe the fum of all the open paffages for it through the deck exceeds the opening of the trunk of the *ventilator*, in fo great a proportion as 100 to 1, or more. Befides, in a calm the wind-fail can do little or no good; nor when the fhip is under fail, at which time the wind-fail is not ufed. And it is to be obferved, that it is not the *ventilating* of a fhip now and then with a wind-fail, when wind and weather ferve, that will fuffice; it ought to be done daily, if due regard be had to the health of the fhip's crew. The great quantity of rancid noxious vapours, which are inceffantly exhaling from a number of live human bodies, the ftench that inceffantly arifes from the bilge water, and from the hot, ftagnant, putrid air in the hold, makes it very advifeable to refrefh fo bad an air continually, either with the wind-fail, when that can be properly ufed, or elfe with *ventilators*, which are intended to fupply the defects of the wind-fail.

Ventilators muft alfo be of particular fervice in new fhips, which are obferved to be more unhealthy, on account of a greater quantity of fappy wreak which arifes from new timber, and makes the confined air the more unwholefome.

They will alfo be an effectual prefervative of horfes in tranfports, where they are fometimes fuffocated, when in a ftorm there is a neceffity to fhut the hatches down.

Thefe *ventilators* will alfo drive out of the hold of a fhip that dangerous vapour which arifes from corn, which is fo noxious, that fometimes they dare not venture into the hold, till after the hatches have been opened for fome time.

Ventilation will not only be of fervice to preferve feveral kinds of goods, but alfo the timbers and planks of the hold itfelf, when laid up in ordinary, as well as when in ufe, and will make the air in the hold lefs noxious, though it will ftill be offenfive to the fmell, by reafon of the bilge water. But this may be made lefs offenfive, by often letting in fweet water from the fea, and then pumping it out; which good practice ought to be continued, notwithftanding the ufe of the *ventilators*.

What is here faid of the foul air of fhips may be applied to that of mines, gaols, work-houfes, barracks and hofpitals. In mines, *ventilators* may guard againft the fuffocations, and other terrible accidents arifing from damps. The air of gaols has been often known to be infectious; and we had a fatal proof of this, by the accident that happened a few years ago at the feffions at the Old-Bailey. To guard againft the like for the future, as well as to preferve the health of the prifoners, a worthy magiftrate, in 1752, had *ventilators* placed in Newgate, which are wrought by a wind-mill: and in the beginning of the prefent year, 1753, Dr. Hales gave an account of the good fuccefs attending the ufe of thefe machines, by a remarkable decreafe in the ufual mortality and ficknefs of that place.

The Doctor is alfo of opinion, that a *ventilation* of warm dry air from the adjoining ftove, with a cautious hand, might be of fervice to trees and plants in green-houfes; where it is well known that an air full of the rancid vapours, which perfpire from the plants, is very unkindly to them, as well as the vapours from human bodies are to men. For frefh air is as neceffary to the healthy ftate of vegetables, as of animals.

The larger kinds of *ventilators*, ufed by the Doctor, are ten feet long, five feet broad, and two feet high, in the clear within. Thofe he ufed by way of experiment on board the Captain, a feventy gun fhip, were ten feet long, four feet three inches wide, in the clear within, and thirteen inches deep; one inch of which being occupied by the midriff, there remained a foot depth for it to rife and fall in. A *ventilator* of thefe dimenfions will, through a trunk of a foot fquare, drive the air at the rate of twenty-five miles in an hour, which is double of what Mariotte affigns for the velocity of a pretty ftrong wind.

But befides thefe large *ventilators*, the Doctor made a fmaller fort, four feet in length, fixteen inches in breadth, and thirteen inches, all in the clear within. This fmaller *ventilator* may be very ufeful in preferving the bread, in the bread-room of a fhip, fweet and dry. Peafe alfo, and oatmeal, which are apt to heat and fpoil in cafks, may be preferved, by putting them into a large bin, with a falfe bottom of hair cloth laid on bars, whereby frefh air may be blown upwards through them with thefe fmall *ventilators*.

Ventilators are alfo of excellent ufe for the drying of corn, hops, and malt. *Hales*, lib. cit. p. 100, 108, 129, 151. Gunpowder may be thoroughly dried, by blowing air up through it by means of *ventilators*. *Hales*, ib. p. 119, feq. What advantage dry gunpowder has over that which is damp, may be feen by the experiment mentioned in the article GUNPOWDER, *Append.*

VENUS (*Cycl.*)—Signior Bianchini has given the defcription of a globe for *Venus*, the principal properties of which are, that the plane of the ecliptic makes an angle of 15° with the axis, the tropics are 75° from the equator, and the polar circles only 15° from it. For a farther account of it, fee *Defaguliers*, Experim. Philofoph. Vol. II. p. 552, feq.

Venus's *comb*, the Engliſh name of a genus of plants, called by botanical writers *ſcandix*. See the article Scandix, *Suppl.*

Venus's *looking-glaſs*, a name ſometimes uſed for the *campanula*, or bell-flower. See the article Campanula, *Suppl.*

Venus's *navel-wort*, the name by which ſome call the *omphalodes*, a diſtinct genus of plants. See the article Omphalodes, *Suppl.*

VERGE, among gardeners, generally denotes the edge or outſide of a border; but more particularly, is uſed for a ſlip of graſs adjoining to gravel-walks, and dividing them from the borders in the parterre-garden. *Miller*, Gard. Dict.

VERMIS *aureus*, the name by which Bartholine, and others, call the *aphrodita*, a genus of ſea-inſects. See the article Aphrodita, *Append.*

VERVAIN *mallow*, the Engliſh name of a diſtinct genus of plants, called by botanical writers *alcea*. See the article Alcea, *Suppl.*

VESSEL (*Cycl.*)—*Chemical* Vessels. The article of *chemical* Apparatus, *Suppl.* having been accidentally forgot, we are forced to inſert it under this title Vessel, though ſomewhat improperly, the word Apparatus being of much more extenſive ſignification.

Dr. Shaw, in his Eſſay on the uſe of a portable laboratory, has given a liſt of all the apparatus neceſſary for it, which will ſerve alſo, in general, for a complete chemical apparatus for all ordinary caſes, and common courſes of chemical experiments: for extraordinary purpoſes it may be enlarged at diſcretion, according to the views of the operator.

The chemical apparatus may be divided into two kinds, the remote and immediate; or, in other words, ſuch as are preparatory to the operations, and ſuch as are actually employed in them. The remote apparatus conſiſts of ſeveral particulars. Among theſe are firſt ſuch as are neceſſary to the exactitude of the proceſs, for every chemical operation is to be performed in an exact manner. Good ſcales and weights are neceſſary for the exactly determining the quantity of the ſubject to be employed, weight being the true index of the quantity of matter in bodies; but in common caſes, or where water, or other liquors of nearly the ſame ſpecific gravity with water are uſed, the work is conſiderably ſhortened by the uſe of a meaſure, which in water very nearly correſponds to weight in the common acceptation, a pint of it very nearly anſwering to a pound in weight. Hence the next thing to a ſet of ſcales and weights, in the chemical apparatus, is a ſet of nice meaſures; but they muſt be uſed with great diſcretion, and though ever ſo exact as to their contents, they muſt not be truſted to in the nicer operations. A pint of ſpirit of wine falls conſiderably ſhort of a pound, and a pint of quickſilver weighs fourteen pounds; between the ſeveral weights of theſe there is a great variety.

Many ſolid ſubſtances require to be reduced into ſmall parts, before they can be made the ſubjects of chemical operations; and for this reaſon there will be a neceſſity for mortars, ſieves, raſps, files, hammers, ſlicers, and forceps. Next to theſe come the inſtruments uſed in the management of the fire; theſe are ſhovels, hooks, tongs, and blow-pipes: and for charging the veſſels with the ſubject matters to be worked upon in the operations, there are required hollow ſhells, horns, tin plates, bruſhes, hares feet, ſpoons, and ſpatulas. Rounds are alſo required to ſet certain glaſſes on; and for emptying their contents, and thoſe of other veſſels, hooked tongs, cones, ingots, baſons, funnels, and ſtore-glaſſes, furniſhed, according to the nature of the things to be kept in them, with common cocks, wax ſtopples, and glaſs ſtopples; and for the tying down of theſe, bladders, leather, and the like. In the laſt place come the inſtruments for making certain utenſils, as moulds for muffles, teſts, crucibles and melting-pots, and iron rings for cutting glaſſes and the necks of retorts.

The more immediate apparatus, or that employed in the operations themſelves, are veſſels containing the ſubjects to be wrought upon; particularly glaſs eggs, and bodies for digeſtion; retorts and receivers for diſtillation; blind heads for bodies in ſublimation; ſtone pans and cut glaſſes for evaporation; peculiar ſpout-receivers, and glaſſes for ſeparation; ſtrainers for percolation; paper for filtration; muffles and teſts for cupellation; crucibles for melting; pots for cementing; and lutings to cloſe the junctures of the veſſels whenever neceſſary. *Shaw*'s Chemiſtry, p. 384.

See Tab. of Chemical Furnaces, Veſſels, and Utenſils.

VESTIBLE (*Cycl.*)—Vestible is alſo uſed for a kind of little antichamber before the entrance of an ordinary apartment.

VETCH (*Suppl.*)—*Ax*-Vetch, in botany, the Engliſh name of a genus of plants, called by authors *ſecuridaca*. See the article Securidaca, *Suppl.*

Bitter-Vetch, the Engliſh name of a genus of plants, known among botanical writers by that of *orobus*. See the article Orobus, *Suppl.*

Bindweed-leaved-Vetch, a name ſometimes given to the *vetchling*. See the article Vetchling, infra.

Chickling-Vetch, the Engliſh name of the *lathyrus*, a diſtinct genus of plants. See the article Lathyrus, *Suppl.*

Crimſon-graſs-Vetch, a name ſometimes uſed for the *niſſolia*; a diſtinct genus of plants. See the article Nissolia, *Suppl.*

Hatchet-Vetch, the name by which ſome call the *ſecuridaca* of botanical writers. See the article Securidaca, *Suppl.*

Kidney-Vetch, the name by which ſome call a ſpecies of *vulneraria*. See the article Vulneraria, *Suppl.*

Liquorice-Vetch, the Engliſh name of a genus of plants, known among botaniſts by that of *glycine*. See the article Glycine, *Suppl.*

Medic-Vetch, the name by which many call the *onobrychis*, a diſtinct genus of plants. See the article Onobrychis, *Suppl.*

Milk-Vetch, the Engliſh name of a genus of plants, called by botanical writers *aſtragalus*. See the article Astragalus, *Suppl.*

Vetch-*graſs*, in botany. See the article Grass, *Append.*

VETCHLING, the Engliſh name of a diſtinct genus of plants, known among botaniſts by that of *aphaca*. See the article Aphaca, *Suppl.*

VIGILIA, *watch*, in antient chronology. See the article Watch, *Append.*

VINE (*Suppl.*)—*Black*-Vine, a name by which the *tamnus*, or black briony is ſometimes called. See the article Tamnus, *Suppl.*

Spaniſh-arbor-Vine, a name by which ſeveral ſpecies of *convolvulus* are ſometimes called. See the article Convolvulus, *Suppl.*

White-Vine, or *Wild*-Vine, a name ſometimes given to the *bryonia alba*. See the article Bryonia *alba*, *Suppl.*

VINEGAR (*Suppl.*) is ſaid to be a good remedy for the ſting of waſps. Perhaps it might alſo be ſucceſsfully applied to the ſting of bees, gnats, &c. A late author pretends, that taken internally, eſpecially if mixed with the powder of cantharides, *vinegar* is a remedy againſt the hydrophobia. *Vinegar* and honey, or oxymel, of the conſiſtence of a ſyrup, ſwallowed warm, is very good in many caſes of ſore throats ariſing from colds.

VIOLET (*Suppl.*)—*Dame*'s, or *Queen*'s Violet, the Engliſh name of a diſtinct genus of plants, called by botaniſts *heſperis*. See the article Hesperis, *Suppl.*

Bulbous-Violet, a name ſometimes given to the ſnow-drop, a plant which Linnæus makes a diſtinct genus under the name *galanthus*; but which Tournefort comprehends among the *narciſſo-leucoiums*. See the article Narcisso-*leucoium*, *Suppl.*

Corn-Violet, a name ſometimes given to the *campanula*, or bell-flower. See the article Campanula, *Suppl.*

Dog's tooth Violet, the name by which ſome call the *dens canis* of botanical writers. See the article Dens *canis*, *Suppl.*

VIPER's *bugloſs*. See the article Bugloss, ſupra.

Viper's *graſs*, the Engliſh name of a diſtinct genus of plants, called by botanical writers *ſcorzonera*. See the article Scorzonera, *Suppl.*

VIS *viva*, in mechanics, a term uſed by Leibnitz and his diſciples for *force*, which they diſtinguiſh into two kinds, *vis mortua*, and *vis viva*; underſtanding by the former any kind of preſſure, and by the latter that force or power of acting, which reſides in a body in motion. See Force.

VISNAGA, in botany, a genus of plants, according to Ray, but comprehended by Linnæus under the article *daucus*. See the article Daucus, *Suppl.*

Visnaga is alſo uſed by J. Bauhine as the name of a ſpecies of *fœniculum*. See the article Foeniculum, *Append.*

VITRUM *Archimedeum*, *Archimedes's glaſs*, a name given by Swedenborg to an inſtrument which he invented for the examination of mixt metals, and by means of which he could diſcover the quantities, without the trouble of the apparatus, and calculation commonly uſed for this purpoſe.

VIXEN, or Fixen, among ſportſmen, denotes a fox's cub. Ruſt. Dict. in voc.

UMBER (*Cycl.* and *Suppl.*)—This earth when burnt makes a good ſhade for gold. It need only be put into the naked fire in large lumps, which ſhould not be taken out till they be thoroughly red hot. Build. Dict. in voc.

UNACCENTED *part of a bar*. See Accent, *Cycl.*

UNILOCULAR, in botany, is applied to a capſule having but one cell. See Capsule, *Cycl.*

UNRECLAIMED *hawk*, in falconry, one that is wild and untamed. Ruſt. Dict. in voc.

UNSUMMED, a term uſed by falconers for a hawk's feathers before they have arrived at their full length. Ruſt. Dict. in voc.

VOLUBILIS, in botany, the name of a genus of plants, according to Dillenius; but comprehended by others under *convolvulus*, or bind-weed. See the article Convolvulus, *Suppl.*

VOMIT (*Suppl.*)—*Black*-Vomit, a diſtemper frequent in the Weſt-Indies, particularly at Carthagena. The following account of this diſtemper has been communicated to us by a friend.

The city of Carthagena is ſituate 10 degrees 25 minutes $48\frac{1}{2}$ ſeconds of north latitude. The weather there is always ſultry hot. A thermometer conſtructed by Monſieur de Reaumur gave on the 19th of November, 1735, one of their winter months, the degree of the warmth of the air 1025 diviſion

divifions and a half; and this with little variation both night and day. The greateft height to which the fpirit afcended at Paris the fame year by a thermometer, graduated in the fame manner, was $1025\frac{1}{2}$ divifions; fo that the heat of the cool nights at Carthagena was nearly equal to that of the hotteft days at Paris.

As the heats in this climate are fo great without receiving any mitigation from the night, it is no wonder that the perfpiration of the inhabitants is very great. From this it comes about, that all thofe who make their abode there any time appear pale and weakly, as though newly recovering from a fit of illnefs. You remark in all their actions, even fo far as in their fpeaking, a certain idlenefs, and, as our author expreffes himfelf, a disjointednefs: notwithftanding this they are in good health, though their afpect indicates the contrary. The people who arrive there from Europe, hold their appearance of ftrength and colour in their countenances during three or four months; but after that time they lofe both one and the other from the quantity of fweat, until they become like the former inhabitants. Thefe effects are moft obfervable in younger people: on the contrary, thofe who are further advanced in life when they go thither, preferve their former appearance better, and enjoy fo good a ftate of health, that they live commonly to more than eighty years of age.

As the temperament of this country is particular, fo are fome of its diftempers. Thefe may be confidered of two kinds, *viz.* thofe diftempers to which the Europeans newly arrived there are liable, and they only; and thofe which are common to all perfons there, as well Criollos as Chapetones.

The diftempers of the firft clafs are many, as the refort of the Europeans there is very great. They are very dangerous, and often mortal. They frequently deftroy a great part of the people, both failors and others, who arrive there from Europe. The continuance of thefe diftempers is very fhort: they laft but three or four days, in which time the fick either die, or are out of danger. The particular diftemper, to which they are moft liable, is very little known, though it takes its rife in fome from taking cold, in others from indigeftion; but from whichfoever of thefe, or what other caufe it takes its rife, it becomes in the fhort time before mentioned the *vomito prieto*, or *black vomit*, which is what kills them; it being very rare that thofe who have it efcape. It is obferved in fome that their delirium is fo violent, that they are obliged to be tied down in their beds, that they may not tear themfelves to pieces, and they often die raving with the greateft degree of agony.

It is to be remarked, that thofe only are fubject to this diftemper who are lately arrived from Europe, the inhabitants of the country, as well as thofe who have lived there any time, are by no means liable to it, and enjoy perfect health during its greateft violence. As the crews of fhips are very liable to this diftemper, and more fo than the officers and paffengers, who have greater variety of food and liquor; it has been conceived that the great exercife and labour of thefe people, and their feeding upon falt provifions, prepares their conftitutions to be liable in this climate to corruption of the blood and humours, from whence is fuppofed to proceed the *vomito prieto*. What muft be obferved, is, that although the crews of fhips fuffer the greateft mortality, neverthelefs paffengers and others, who go the voyage under the greateft advantages with regard to the conveniences of life, are not free from being expofed to it. It muft be remarked alfo, that thofe perfons, who after having been ufed to this climate, go from thence, and are abfent even three or four years, are not liable to it at their return, but retain their health like the other inhabitants, although in their way of living they have not obferved the moft exact regimen.

The defire of knowing the caufe of this terrible calamity has occupied from time to time the minds of the furgeons who make this voyage in the galleons, as well as thofe of the phyficians of the country; and their opinion has been, that it chiefly takes its rife from the labour, to which the fhips crews are conftantly expofed, and their manner of living. There is no doubt but thefe may greatly contribute thereto; but then it will be difficult to conceive why perfons, who are better circumftanced, are likewife liable to it: and it is fomewhat extraordinary, that notwithftanding many endeavours have been made towards finding out remedies equal to this difeafe, none have been difcovered either as fpecifics or prefervatives; for the inconftancy of the fymptoms is fo great, that they are not in the beginning to be diftinguifhed from thofe, which are in common to this with flighter diftempers; but the principal complaints at firft are a wearinefs and great diforder in the head.

This diftemper does not always attack the fhips of Europe at their arrival in the bay of Carthagena, nor is it very antient in that country; for what they heretofore called *chapetonada*, fo denominated, as thofe from Europe were only liable to it, were indigeftions; and though they were in that climate always attended with danger, the women of the country, as they do now, cured them with eafe, efpecially when they were taken in time. The fhips afterwards going from Carthagena to Porto Bello, it was there fucceeded the great mortality, which was always attributed to the unfeafonablenefs of the climate, and to the fatigue of the fhip's crew in unloading their fhips, and in the bufinefs of the fair there.

The *black vomit* was not known at Carthagena, nor in its neighbourhood, until the years 1729 and 30; when firft it carried off a great part of the crews of the fhips of war, which Don Domingo Juftiniani then commanded, and were then there as guarda coftas. Thefe fhips were firft attacked at Santa Martha, where the feverity of this diftemper, and its great flaughter, had caft a great terror upon their crews. The fecond attack of this diftemper was on board the galleons commanded by Don Manuel Lopez Pintado, when its mortality was highly formidable; and death followed the attack fo quick, that perfons who were one day feen walking at large, were next day met carrying to their graves.

Our author is of opinion that this, as well as fome other diftempers, to which Europeans are liable to at, or foon after their arrival at Carthagena, and other places under the fame circumftances, fhould be confidered as arifing from the great alteration that happens in their conftitutions there: and this change, which from the climate is foon brought about, makes them fuffer this and other diftempers, which either deftroy them, or generate in them a difpofition to bear the heats; after which, being as it were naturalifed, they enjoy the fame fhare of health with the natives.

Our author remarks, that at Carthagena, when the fhips from Spain fail in their arrival, the European productions, which at all times are dear and much valued there, are fometimes quite expended. Thefe more particularly are wine, oil and raifins. When this is the cafe with regard to wine, the people there fuffer much in their health; as every body, except the negroes and thofe who ufe brandy, accuftom themfelves to drink it with their food. From the want of this their ftomachs fail, they grow fick, and this ficknefs becomes general. This want of wine happened when our author arrived at Carthagena, and the ficknefs in confequence was fo general in that city, that mafs was celebrated only in one of their churches.

URSUS, the *bear*, in zoology. See the article BEAR, *Suppl.*

URUBU, in ornithology, the name by which Marcgrave calls a fpecies of *vultur*. See the article VULTUR, infra.

VULTUR, in ornithology, the name of a genus of birds of the falcon, or hawk-kind. See the article FALCO, *Suppl.*

The neck of the *vultur* is long, and almoft bare of feathers; the legs are covered with feathers down to the feet, or nearly fo; under the throat there is a fpace covered with hair, inftead of feathers; the head alfo, in many fpecies, is naked, or has, at the utmoft, only a downy matter on it.

Of this genus of birds we have the following fpecies. 1. The greyifh black *vultur*, with a fhort tail. This is of the fize of a full grown turkey. 2. The chefnut-coloured *vultur*, called alfo the *Bætic vultur*, with a fhort tail. This is equal in fize to a full grown hen. 3. The yellow-legged, crefted *vultur*, called *leporarius*, or the hare-catcher. This is of the bignefs of a goofe. 4. The golden-breafted, blue-legged *vultur*, with a blackifh back. Its fize is equal to that of a turkey-cock. 5. The tawney brown *vultur*, with yellow legs. This is of the bignefs of a large capon. 6. The Brafilian, white-legged *vultur*, called by fome authors *urubu* and *aura*. In fize it is equal to the common kite.

W.

WAAL, in the sea language, the same with *wale*. See the article WALE, *Suppl.*

WAG-*tail*, in ornithology, the English name of the *motacilla* with a black breast. See the article MOTACILLA, *Suppl.*

WAIL, in the sea language, the same with *wale*. See the article WALE, *Suppl.*

WALL-*wort*, a name sometimes given to the *sambucus*, or dwarf-elder. See the article SAMBUCUS, *Suppl.*

WARDS *of hospitals*. See HOSPITAL, *Append.*

WARREN (*Suppl.*)—WARREN is also used for a contrivance to preserve fish in the midst of a river, to be taken at pleasure. Rust. Dict. in voc.

WART-*wort*, the name sometimes given to two very different genuses of plants, the *tithymalus* and *lampsana*. See the articles TITHYMALUS and LAMPSANA, *Suppl.*

WASHING (*Cycl.* and *Suppl.*)—The *washing* or cleansing of some colours may be thus performed: take the colours to be *washed*, and put them into a vessel of fair water; stir it about till the water be all coloured therewith, and if any filth swim on the top of the water, scum it clean off; and when you think the grossest part of the colour is settled at the bottom, then pour off that water into another earthen vessel, that is able to contain the first vessel full of water four or five times; then pour more water into the first vessel, and stir the remaining colour till the water be thick; and after it is a little settled, pour that water also into the second vessel. Let this be repeated till all the finest of the colour is drawn off, and nothing but course gritty stuff remains behind. Then letting the water in the second vessel stand to settle, till it is perfectly clear, pour it off, and reserve the *washed* colour in the bottom of the vessel for use.

The colours to be thus *washed* are red lead, blue and green bice, verditer, blue and green smalt, Spanish brown, yellow ochre, *&c.* Build. Dict. in voc.

WASP. The application of vinegar is said to be good against the sting of these creatures.

WATCH (*Cycl.*)—WATCH, *vigilia*, in Roman antiquities, a division of their night; being the fourth part of the space of time between sun-set and sun-rising, and consequently varying according to the season of the year. See the articles DAY, HOUR, *&c. Cycl.*

Death-WATCH. See the article DEATH, supra.

WATER (*Cycl.*)—It has been proved by many instances, that *water* alone is capable of sustaining human life a long time. Physical writers give us many accounts of people's living four or five days on it, but the Philosophical Transactions furnish us with a much more memorable instance.

Some people at work in a deep coal-pit near Liege, had the misfortune to pierce into a subterranean current of *water*, of such force that it instantly filled a great part of the works. The person who struck the blow into it was drowned, and some that were near the mouth of the pit escaped very narrowly by being drawn up; but twenty-four days after, when the mine was cleared of the *water*, and people came down to work in it again, four of the persons, who had been supposed drowned, were found alive: they had saved themselves by climbing into a place above the reach of the *water*; they had not the least morsel of bread with them, but had lived all this time on the *water* of a little spring which broke out by them. This *water* was examined, and found to have no peculiar matter contained in it, but only the common sparry substance found in all *water*, and that not in any abundance. Phil. Transf. N° 159.

We have also an account in the Philosophical Transactions of a man who lived for eighteen years on no other aliment than *water*, and now and then, though seldom, clarified whey. The man was pretty healthy. See N° 466. sect. 7.

The Italian physicians have talked much of cures performed by means of cold *water*, which they esteem almost an universal remedy; giving in a day fifteen, twenty, or twenty-five pounds of *water*, made cold by ice, and applying at the same time cold *water*, or snow, to several parts of the body. By this method they treat fevers, small-pox, dropsy, *&c.* See Commerc. Norimb. 1736. hebd. 8. sect. 2.

Water, when applied to animal bodies, and when nearly of the same heat with these, relaxes their solids, and dilutes their fluids.

Water putrifying by stagnation is extremely dangerous to health. Thus in the holds of ships, the bilge *water*, if the ship is tight, and the *water* not pumped out often, soon becomes so extremely poisonous, as frequently to suffocate those seamen, who, as the pumps are subject to be clogged with filth, venture down to cleanse them; and also to affect persons at a distance with violent head-achs, cold sweats, and frequent vomitings, which continue more or less, in proportion to the distance from the well of the ship when the injury was received, and the degree of putrefaction in the *water* and air. Phil. Transf. N° 463. p. 63.

To prevent the above mentioned inconveniences many schemes have been thought of, particularly the machines of Dr. Hales [a], and Dr. Desaguliers [b]; the first by an instrument, which he calls the ventilator, and may not improperly be called the ship's lungs; see VENTILATOR; and the latter by a machine, which is an improvement of the Hessian bellows.—[[a] In his Treat. of Ventilators. [b] Phil. Transf. N° 437.]

Putrified *water* being thus noxious, a method of preventing its putrefaction would be very desirable, and this seems now to be found in the use of lime. See LIME-*water*, *Append.*

Rough *waters*, that will not bear soap, may often be corrected by letting them stand a few days. See *Boyle*'s Works abr. Vol. I. p. 141.

It has been said that Thames *water* has a peculiar property of recovering after putrefaction; but others have the same. See *Boyle*'s Works abr. Vol. I. p. 141.

Mr. Boyle tells us, he prepared a salt of the same nature with Glauber's sal mirabile, which seemed to have a power of coagulating common *water*; for being dissolved in a proper quantity of it, the whole mixture shot together into fine crystals, apparently of an uniform substance, and so brittle, as to be reducible into powder. See *Boyle*'s Works abr. Vol. I. p. 332.

Water may be used with good success in taking the height of any accessible object, as it naturally becomes parallel to the horizon. The manner of performing this operation is exactly the same as with a mirror. Tr. Pract. Geom. p. 19. See the article MIRROR, *Cycl.*

Water by its fall may be made to afford wind enough to blow a fire. This is practised in the brass works of Tivoli near Rome. See Phil. Transf. N° 2.

Chalybeate, or *Steel*-WATERS. The learned Mr. Monro of Edinburgh has an inquiry into *steel*, or *chalybeate waters*, where he considers them with regard to their medical use, in order to discover what their real or comparative strength is, how they bear carriage, and how long they retain their virtues; that physicians may judge which of them is most proper in the various diseases and circumstances of patients, which must be drank at the fountain-head, and which might be conveniently drank at a distance from it. See Medical Essays, Vol. III. art. 7. Abr. Vol. I. p. 126.

Chalybeate waters strike a red, purple, violet, or black colour with galls; and it is said by several writers, that this change of colour is a certain mark of a *chalybeate water*, and that the deepest colour shews the greatest proportion of steel. Mr. Monro, to satisfy himself of the truth of this, made a weak solution of sal martis in *water*, and found that, with a tincture of galls, he could form all the different colours, the larger quantity of the solution always requiring the greater number of drops of the tincture to bring it to all the colour it would take; and that it was deeper, in proportion to the quantity and strength of the solution and tincture employed. If words could express the various shades of colours betwixt the pale red and the black, the simple experiment of bringing *steel-waters* to the deepest colour they could strike with galls, might determine the proportions of steel in each. But as this is impracticable, and as it is necessary to know the quantity of steel contained in any given quantity of *water*, some general standard must be appointed, to which all may be brought. To obtain this, he made several experiments to find out the quantity of steel in its artificial salt, and found it to be a little more than a third part. He dissolved some of the salt in *water*. Twenty ounces of the solution contained an ounce, except a scruple, which was precipitated; one hundred and forty-two drops of this solution weighed two drachms; every drop therefore contained one twenty-fifth of a grain of salt, or one seventy-fifth of a grain of steel. To compare a *chalybeate water* with this solution, into a known quantity of such *water* drop a strong clear tincture of galls, allowing a sufficient time between each drop for its full effect, till the addition of more tincture makes no change. This experiment should be repeated, to come at the exact number of drops requisite. Then mix the same number of drops of tincture with as much common *water*,

water, as there was mineral *water*, in a glafs, exactly like that made ufe of in the preceding trial. Drop in the folution of fteel cautioufly, till the colour is the fame with that of the mineral water. By this means, the due proportion of the folution to imitate any *fteel-water* may be known. He has thus made fpring *water* fo like to feveral *chalybeate waters*, that none could diftinguifh them. Med. Eff. Edin. Vol. I. p. 126.

Galls in tincture are more convenient than in fubftance for making thefe experiments, for it acts much fooner, and more equally, and can be added in lefs quantities, which deferves to be regarded; for too large a proportion of galls poured at once into *fteel-waters*, will be fo far from ftriking the colour ftronger or fooner, that no change will happen for feveral hours after, and at laft the *water* gradually becomes of a deep fea-green colour, inftead of a purple or violet. Good *chalybeate waters* may have been condemned as containing no iron, or as being impregnated with copper, from an addition of too much galls. Frefh tincture of galls is preferable to that which has been long kept; but even fuch as was grown mouldy, and had a thick fediment, anfwered the common trials. Frequent trials fhould be made, at different times, with *water* bottled at different feafons, in order to afcertain the proper feafons for bottling mineral *waters*, and to find out the time each will keep. It is alfo requifite to obferve what time it is before the galls ftrike the full colour, and how long it remains in an open glafs; for Mr. Geoffroy's fuppofition appears reafonable, that both thefe effects will be moft flowly produced, when the fteel is moft intimately blended with the other principles of the *water*. Med. Eff. Edinb. Vol. I. p. 127.

There is a ftrong refemblance between our *fteel-waters* and common *water*, in which fal martis is diffolved, but the natural fpaw expofed to the air foon lofes its chalybeate tafte, and will not ftrike a purple colour with galls; expofed to heat its virtues are fooner loft, and it becomes vapid in no long time in the clofeft veffels; but a folution of fal martis bears heat, and being expofed to the air, without alteration; it may be fufpected that this difference depends upon the fmall proportion of the vitriolic principles, and fome change they may thereby undergo in the *water*; and therefore Mr. Monro having added as much fal martis to fome bottles of *water*, as had been found to make it of the fame tafte, and to ftrike the fame colour with *chalybeate waters*, he corked fome carefully, others lefs carefully, and a third fort he left open. The *water* in thefe laft loft its tafte and virtues in a fortnight, became muddy, and had a faffron-coloured powder at the bottom. The fecond kind kept longer, but had a ftinking fmell before it became vapid. The *water* which was carefully corked and rofined kept well, but acquired a ftrong fmell of rotten eggs, like to what feveral fpaws have when kept; when the bottle was left open, the ftinking fmell went off; foon after, the chalybeate virtues were not to be obferved, and the bottom of the bottle was covered with the faffron-coloured powder, which is generally to be feen in bottles where *chalybeate waters* have been kept. The difference therefore between the natural and artificial *fteel-waters* confifts in the greater volatility of the former. Med. Eff. Edinb. Vol. I. p. 128.

Spaw and Pyrmont, and fome of our own *chalybeate waters*, feem an exception to the refemblance between the diluted folution of falt of fteel and the natural *fteel-waters*; for the colours they ftrike with the galls is faint, while their tafte and other effects are ftrong. This produced another experiment to imitate them, by mixing filings of iron, oil of vitriol, and *water*, in a Florence flafk, which being laid on its fide, and another, in which was fome fountain *water*, immediately fitted to it. The fumes which arofe upon the effervefcence of the oil of vitriol with the fteel, came over into this. After the effervefcence was over, on taking away the glafs with the *water*, it was found limpid, but with a ftrong empyreumatic fmell; its tafte at firft was pungent, and then the acidulous tafte prevailed. When tincture of galls was mixed with it, it became of a purple, but faint colour, which held many days without precipitation. Next morning the empyreuma was gone, and the *water* had an agreeable fpaw tafte. In lefs than a day this went off, a fmall quantity of faffron-coloured powder fell to the bottom, and the galls had no effect on the *water*. Med. Eff. Edinb. Vol. I. p. 129.

This *water* gives no fign of acidity, as might be fufpected, when mixed with fyrup of violets and clove-july-flowers, in the colour of which it makes no alteration; neither do the more fpirituous fpaws; whereas the folution of falt of fteel, and fome fpaws, appear alkaline, from changing the colour of both the fyrups green.

The fuccefs of this experiment produced fome others, to difcover what it was that evaporated, and what precipitated in thefe *waters*. Oil of vitriol poured on the faffron-coloured refiduum made no effervefcence; upon the addition of a little *water*, fome of the powder feemed to be diffolved. Tincture of galls did not change the colour, but upon adding fpirit of hartfhorn, a great effervefcence arofe, and a deep purple coagulum was made. The fame experiments fucceed with ruft of iron, which refembles this powder. Neither ruft, nor the powder, when fufpended in *water*, ftrike any colour with galls, although crocus martis does. What evaporates is the menftruum, which carries away fome of the principles of the iron with it. From feeing the effects of acid, and of the air upon iron, and finding vitriol naturally formed, it may reafonably be fuppofed, that the menftruum of the irony particles in thefe *waters* is an acid. From confidering how much fulphur is in iron, what a ftinking fmell mineral *waters* have before they turn vapid, and how much the fulphur of iron is deftroyed before the iron turns into ruft, which again refembles the powder precipitated in thefe *waters*, we may fairly fuppofe that the menftruum carries the fulphur along with it, and leaves only the earthy parts with a fmall proportion of fulphur. Med. Eff. Edinb. Vol. I. p. 130.

It may hence be fufpected, that *fteel-waters* are impregnated with common grofs vitriol, or with the more fubtile fumes of iron diffolved in the natural menftruum; or with both in different proportions. The quicker precipitation, and lefs volatility of *chalybeate waters*, feems to fhew that the fulphur is not fo much freed from the earthy particles, as in others which precipitate more flowly, and are more volatile. The common obfervation of air generated in all effervefcences, fermentations, putrefactions, and wherever a confiderable change is produced in the compofition of bodies, feems to account for the quantity of elaftic air, obferved in *chalybeate waters*, in the more fpirituous when recent, and in others, when the putrid fmell fhews the fulphur to be more difengaged.

It feems alfo, that the different kinds of *fteel-waters* fhould be prefcribed, according as there is occafion for a fubtile, penetrating fulphureous fpirit, to pervade the fmalleft veffels, or according to the quantity of an abforbent aftringent earth, which is required to be joined with this fpirit.

Where different fpaws are not to be had, the fame *water* perhaps may be made to anfwer each of thefe intentions, according to its being more or lefs kept, or expofed to the air or heat. Med. Eff. Abr. Vol. I. p. 131.

The ingenious author, from whom thefe obfervations and conjectures have been taken, feems to think that the menftruum really flies off from mineral *waters*; but this, as is obferved in a note added by his learned abridger [a], has not yet been made appear by any fatisfactory experiments. It is certain, that fome mineral *waters*, when carefully bottled at the well-head, and oiled at top, after the manner of Florence wine, and then well corked and cemented, have been found to continue many months poffeffed of their properties of ftriking black or purple with galls; and hence it appears that the irony particles, or mineral fpirit of the *water*, cannot eafily efcape through the pores of glafs; at leaft not while the *water* remains in a found ftate. When the *water* begins to corrupt, as in time it will, though thus fecured, it tinges lefs and lefs with galls, and at length affords no red, purple, or dufky colour therewith. Whence we are led to conclude, that the irony particles make their efcape through the pores of the glafs, or of the oil, the cork and cement; or elfe are fo changed, as no longer to retain their irony nature, and ftrike with galls. But that the latter feems rather to be the truth of the cafe, is fupported by this, that during the diminution of the tinging faculty, there appears to be a manifeft change in the natural texture of the *water*; for a vifible feparation of parts enfues, the whole grows fetid, a grofs matter falls to the bottom, the oil that was liquid before, now becomes almoft as hard as tallow, and appears tinged black to a confiderable height: but what is remarkable, the *water* now affords manifeft figns of its containing actual brimftone, not the leaft indication whereof appeared before. It feems therefore that the *water*, as taken from the well, is a compound liquor, gradually tending to an alteration in its parts, as if there was a flow fermentation among them, whereby the natural texture of the whole is broke in time, even though the external air be kept from communicating therewith; but if external air be admitted, remarkable changes muft fooner begin, and finifh their period [b].—[[a] Ibid. p. 130. [b] *Shaw's* Enq. into Scarb. *Wat.* p. 160, feq.]

There is commonly fuppofed to be fomething fo very volatile in many *fteel-waters*, as well as of thofe of Liege and Pyrmont, that it difappears upon the leaft accefs of air, after they are taken up from the well, efpecially in hot weather; yet it does not feem clear from experiments, that the alterations which fpaw *waters* undergo, by being expofed to the air, is owing to the diffipation of any volatile part. Ibid. p. 109, and note *.

Though *chalybeate waters* are commonly fuppofed to contain vitriol, and to be of a ferruginous nature, and have from thence obtained their name, yet it is not eafy to determine what falts they contain, or whether they be all impregnated with the fame kind of falts. Mr. Du Clos could neither find alum nor vitriol in any of the French wells, only in one he found fome refemblance of the latter. All the other wells gave a falt, anfwering to a compofition of nitre and fea falt mixed in various proportions, which probably is the natural falt of the earth difcovered by Tournefort [c], refem-

 bling,

bling, in moft trials, the nitrum of the Levant, which is neither acid nor alcali, but approaching moft to the latter [d]. —[[c] Pref. to Hift. of Plants near Paris. [d] Medic. Eff. Abr. Vol. I. p. 108.]

Chalybeate waters often break the bottles into which they are put, and many of them foon lofe their chalybeate properties when bottled. To prevent the former inconvenience, Dr. Hales put a fmall glafs tube through the cork of the bottles, filling them fo, as to leave no air bubbles between the cork and the *water*. In other bottles he put very foft compreffible corks. By both thefe means the *water* was allowed to rarify, without burfting the bottles. By mixing very few drops of an acid, fuch as oil of fulphur, with the *fteel-waters*, they long retain their chalybeat properties. See *Hales*, Philofoph. Experiments.

Mineral-Waters. The method of analyfing *mineral-waters*, according to Dr. Shaw, fhould be this. Firft, let it be tried what changes they will fuffer by mere ftanding; let fome of the *water* be put into open glaffes, and fome into fuch as are ftopt, and after fome hours keeping, examine by the tafte whether it be any way different from that frefh drawn from the fpring; after this let it ftand fome days or weeks, and finally compare it with frefh *water* of the fame fpring, and obferve whether it have any fcum at top, or fediment at bottom, or fides of the glaffes.

2. Let fome of the *water* be kept in open cylindrical glaffes in a warm place till it is wholly evaporated, the dry fubftance left behind muft be carefully preferved, to be compared with the refiduum to be afterwards made by fire.

3. Put a quantity of the *water* at the fpring-head into a glafs retort, and a receiver being luted on, let the whole be carefully diftilled over, and both the *water* and the dry refiduum weighed, and carefully preferved. If during this operation a vapour is feen to force its way out at the joints, it fhews there is a fpirit, or light fubtile matter. In the *water* too fine to be feparated this way, the *water* feparated by diftillation is to be tried feveral ways, to fee whether it differs from common diftilled *water* or not, and whether it have the fame mineral particles that the *water* itfelf had before diftillation. If it contains any fea falt, it will turn white with a folution of filver; if any vitriol of iron, it will turn black with powdered galls; and if any fulphur united with an alkaline falt, it will turn black in time with any of the metallic folutions. The dry matter left in the retort is to be boiled in fix times its own weight of pure diftilled *water*, this being afterwards filtered and fet to cryftallize, will give, after a proper evaporation, its own peculiar falt in cryftals; and if more forts of falt than one fhould be contained in the *water*, they will be all thus feparated by repeated evaporations and cryftallizations.

Whether thefe falts be acids or alkalis, is eafily found by the common experiments, the acid turning fyrup of violets red, and the alkali turning a folution of corrofive fublimate yellow. The neutral falts, wafhed out of the earth by *waters*, are chiefly fea falt, and fuch as confift of a vitriolic falt, and a falt or earth of an alkaline nature. Sea falt is difcovered by its tafte, by the white fume it yields on being mixed with oil of vitriol, and by its figure in cryftallization: and the other neutral falts are difcovered by their property of producing, or regenerating fulphur, upon being mixed and melted with falt of tartar and powdered charcoal. Thus, if two ounces of fuch falt be mixed with one ounce of falt of tartar, and an ounce of powdered charcoal, and the whole put into a crucible, there will be produced a reddifh-coloured mafs of a fulphureous alkaline tafte, and giving a high yellow colour to fpirit of wine, which will turn filver black; and being precipitated by an acid affords a true lac fulphuris, which may be fublimed, and melted into brimftone like the common.

What remains of the refiduum, after *water* has feparated the falt, is properly earth: this is often of more kinds than one, and may be feparated by repeated wafhings into bole, ochre, fand, and whatever elfe it confifts of; and thefe may afterwards be tried, as to their nature, by fire in the common ways, the firft and readieft of which is the feeing whether they will calcine or vitrify; and the next, with proper additions, to try whether they contain any metalline or mineral particles, which may be feparable by the feveral fluxes: and if the quantity of metalline matter be too fmall to be collected into a regulus, or fhew itfelf in the common way, it may be melted with chryftalline glafs, and from the colour it gives that glafs, the metal it contains may be known.

It is generally fuppofed, that the *mineral-waters* receive their virtue from the falts they contain. Dr. Lifter is of opinion that thefe are principally two, the one common fea falt, and the other the nitrum calcarium; and found, on experiment, that from thofe very *waters*, which others had boldly affirmed contained nitre of the common kind, vitriol, alum, and the reft, he only could feparate thefe two falts.

Thefe falts mixed with ochres make the various kinds of our *mineral-waters*, as they happen to be mixed in various proportions.

Monfieur Du Clos obferves of the examining the virtues of *mineral-water*, that moft of them are liable to great errors. The French Academy, after long deliberation, propofed to themfelves a method of examining the *waters* of their own country, by which they arrived at a more thorough knowledge of their virtues than was had before, and which may ferve as a leffon to all other experimenters in the fame way. They have found by all their enquiries, that the principal things giving virtues to *waters* are falts and earths, and thefe give very different qualities to them, as they differ in quantity or in quality in the feveral fprings. The falts, which they procured by a flow evaporation or diftillation, proved to be of two kinds: the one the nitre of the antients, a fulphureous mineral falt, much refembling the alkali of plants; the other the common culinary falt. This confifts of two parts, an alkaline bafis and an acid. Thefe two principles are fometimes combined in the *waters*, and then it is abfolute falt that they contain, and eafily feparated and known: but it fometimes alfo happens, that thefe principles are feparated, and only the one or the other contained in a *water*; thefe therefore, when procured in the analyfis, are not eafily known, and when they are, as it very often happens, blended with the difunited principles of other falts, they form together a fort of concretes, yet more hard to be known than the other. It is generally fuppofed, that in almoft all medicinal *waters* there is either alum or vitriol; but this is an opinion taken up too much at random, and it appeared, on the examination of all the mineral fprings of France, that no one of them contained either the one or the other of thefe falts, except that of Vahls in Dauphiné, which contained a falt fomewhat refembling white vitriol. The tafte and the mixture with acids, alkalis, and tinctures of vegetables, are the great means of knowing thefe falts; for as to their figures they vary greatly, even in the fame portion of falt, according to the different degree of the evaporation of the *water* they were diffolved in. *Du Clos*, Exam. des Eaux Min.

Earths are found in different quantities in the different *waters*, and fo confufed by being blended with one another, and with other foffils, that it is much more difficult to afcertain their fpecies, than thofe of earths in any other form, or than thofe of the falts in the fame *waters*. The colours of the earths are very various, but this is the leaft variety; for fome of them form themfelves into fhapes and appearances fo different from the others, that it is hard to fay what they are like, or to what fuch fingularities in their concretions fhould be attributed. Some float about in the almoft evaporated *water* in form of films and clouds; fome like flocks, fome appear in the form of mucilages, others like little flaccid clods of clay, and others like grains of fand; fome are foluble in acids, fome only in part foluble, and fome not at all fo; fome will give a tincture to diftilled vinegar, others not; and in the fire fome run to glafs, and others calcine to lime.

The great quantity of the *mineral-waters*, which phyficians ufually prefcribe to be taken by thofe they recommend them to, feems to prove that they expect the principal benefit from them by their cleanfing the vifcera by this internal ablution; and this effect is indeed no trifling one, fince moft of thofe ftubborn difeafes, which they recommend thefe *waters* in, are owing to obftructions of the vifcera, which the large quantities of thefe *waters* may eafily remove: but it were well, if the phyficians would be more accurate in diftinguifhing the different properties of them, and not give them at random, as is too often done, to the no fmall detriment of the patient.

The vinous fharp tafte of fome of thefe *waters* which evaporate with the leaft heat, or on being expofed to the air, feems to be owing to that matter which is the firft ftate or being of fulphur, and of all the concretions thence refulting; fuch as the various vitriols, and the like. There are found earths impregnated with this acid volatile fulphureous matter, of the concretions of which are fometimes made fulphureous and vitriolic minerals. This vaporous and indigefted matter may very well be the bafis of vitriol; but in this its firft ftate it cannot be a vitriolic concretion, if it be found in earths where there is yet no vitriol. It is more eafy to obferve it in its products, when it has received fome mineral concretion, than in its natural ftate; though in this latter ftate it is as likely to impregnate *waters* as in any other. The moft probable opinion, as to the heat of thefe *waters*, is, that there are in certain deep receffes of the earth hot vapours, which continue at all times fo, becaufe there is no accefs of the external air to cool them; and where thofe rarified matters have not room to become more rarified, and fo to become lefs hot, or more diffipated; and that fuch collections of hot vapours are what give heat to the warm baths, and hot *medicinal-waters*. *Du Clos*, Exam. de les Eaux Min.

Many *mineral-waters* evidently contain a large quantity of fpar, which though fufpended in them in an abfolutely pellucid ftate, may yet be regularly feparated from them by evaporation in its own figure. The *waters* of the fountain de Salut, and thofe of the fpring du Pied, and feveral other in Gafcony, have been tried, and are found, if gradually evaporated to a certain degree, to yield a fcum, which, when examined

examined by the microfcope, is found to confift of oblique parallellopiped parts; and if they are evaporated wholly to drynefs, there is found at the bottom a fhining duft, which, when examined in the fame manner, is found to contain many particles of the fame kind, all bright as fragments of the pureft fpars.

As to the ufe of *mineral-waters* the learned Heifter [a] obferves, that in general they are found to agree much better with perfons in the middle ftages of life, than with the very old or very young. If any general rule can be given in this cafe, it is, that people fhould not take them when younger than eighteen, or when older than fixty. Young people, efpecially fuch as are under ten years old, fhould by no means be allowed to drink the chalybeate *waters*, becaufe of the tender ftate of their vifcera; and older people than thofe of fixty are never found to receive any benefit from them, unlefs they are of very robuft conftitutions, or have been long accuftomed to the drinking them: in fome cafes however, particularly in hectics, young people may be allowed to drink the milder kinds mixed with an equal quantity of milk, and often find great benefit from them.—[[a] Compend. Medic. Pract. cap. 20.]

In confirmed confumptions and ulcers of the lungs, the ftronger chalybeate *waters* are found to do no fort of fervice, but rather hurt; but in cafes where the ulcers are but beginning, the drinking the weaker ones with milk has been known to do great good. In fpittings of blood arifing from ulcerations of the lungs, the ftronger cold chalybeate *waters* do nothing but harm; but in the fame cafes, where the milder kinds are taken warm, and mixed with an equal quantity of milk, they are found to be very beneficial. They muft never be taken in cafes of dyfenteries in confirmed dropfies, nor where there is a ftone in the bladder or kidneys; but in œdematous fwellings of the legs and feet, they are often found highly ufeful. In venereal cafes, whether recent, or of long ftanding, they do not cure, but they difpofe the body the more readily to be cured: but in a fimple gonorrhœa, where there is no venereal taint, they have been often known to cure, when all other methods have failed.

Method of taking them. All people who are of a plethoric habit ought to be blooded before they begin to take them, for by this means there is a freer accefs given them into the veffels, and they become much more able to correct the whole mafs. Perfons who are not of a plethoric habit have no occafion to bleed before they take them, but all ought to take a gentle purge to clear the primæ viæ; and to this purpofe nothing is more proper than the common purging falts of Epfom, or Glauber's: but all the draftic purges are carefully to be avoided on this occafion, fuch as fcammony, refin of jalap, and the like. If there be indications for vomiting in the patient, fuch as pains, and a fenfation of weight at the ftomach, with bitternefs in the mouth, naufeas, and reachings to vomit, then it is extremely proper to give, a day or two before the beginning the courfes of the *waters*, a gentle dofe of ipecacoanha.

Time moft proper. The beft hour of drinking them is early in the morning; fix or feven o'clock is very proper, becaufe they then have time to finifh their operation before dinner, but earlier than this is not fo proper; and thofe who go to the wells or fprings at three or four in a morning, are expofed to all the injuries of a cold and damp air, which prevents perfpiration, and often brings on coughs and other diforders of the breaft and head. It was formerly a cuftom to drink them in an afternoon, but this is at prefent left off, as found to produce many diforders of the ftomach; and fuch as are defirous of having the utmoft effects of the *waters*, content themfelves at this time of the day with drinking them at home in fmall quantities, and mixed with wine.

Seafon moft proper. The fummer is the feafon in which the *mineral-waters* are to be drank with the greateft advantage. The months of June, July and Auguft, are more proper for the taking them than any other time of the year; but upon urgent occafions, the courfe of them may be begun in May, and continued till September; and in fome extraordinary cafes, the ufe of them may be allowed even in winter.

Method of drinking them. It is always proper to begin the ufe of them by fmall quantities, and gradually increafe them to larger. Thus the firft day it may be proper to drink about a pint and half at four draughts, the fecond day a quart may be drank, and on the third or fourth three pints: after this the quantity may be increafed to two quarts a day, and more than this it is not proper to take, unlefs the perfon be of a very robuft habit; for many people have injured themfelves by taking too large quantities. The quantity that is taken as the moft the ftrength will bear, whether it be two, three or four pints, is to be continued every day for a fortnight or three weeks, or longer, if the nature of the difeafe requires it; and when the courfe is to be finifhed, it muft be done in the fame manner in which it was begun, by taking lefs and lefs every day, till the ufe is gradually worn off, and no purge or other medicine is neceffary afterwards.

The *mineral-waters* in general operate in fome conftitutions by ftool, and in others by urine fingly; but in moft they operate both ways together. Thefe are both very proper ways of excretion, and whichever nature choofes the *waters* fhould pafs off by, it is to be judged proper and falutary, and by no means to be checked. If the difcharge by urine be plentiful, and the bowels are moved but once a day, it is very well in many conftitutions; but where, as in fome conftitutions, it happens that the *waters* actually act as aftringents in the bowels, this is to be prevented, and a fmall dofe of the common purging falts is to be taken in the firft draught of the *waters* every morning.

In the taking them it is to be obferved, that they are not to be poured down as it were all at once, for the ftomach is often loaded and injured by this, but the firft glafs fhould be fuffered to pafs off, and then, after walking about for ten minutes or longer, a fecond is to be taken, and fo on; and no draught fhould exceed half a pint in quantity; fo that the taking the whole quantity in this manner fhould be the bufinefs of an hour and half, or two hours. After this it is proper to ufe moderate exercife by walking, or otherwife, till dinner time; and in the mean time, if the *waters* would pafs off by urine or ftool, this muft be by no means repreffed. People who have very weak and tender ftomachs, or who have diforders of the breaft, and drink the *waters* in a rainy feafon, fhould have them gently warmed before they take them: this is beft done by fetting a glafs of them in a veffel of hot *water*, and they are only to be fuffered to ftand thus till moderately hot, and then immediately drank off; for if heated to too high a degree, they eafily lofe their virtues by evaporation.

All perfons are to regulate the quantity of the *waters* they drink to the ftrength of their own conftitution; however fmall a quantity they perceive to be enough, and to operate in the manner they expect, they are to be contented with that, and never to teize nature to make her bear more.

It is a certain rule, in regard to all *mineral-waters*, that they are much the beft when drank at the place, though fome of them bear carriage much better than others. It is a neceffary caution, that the motion of the body be never violent in the time of taking the *waters*, for if it produce fweat it always obftructs, in fome degree, their operation by urine or ftool; and if flatulences are troublefome at the time, it will be proper to take candied orange-peel, or fome other carminative at the time. In order to have all the good effects of the *waters*, a regulation of diet is extremely neceffary; it is proper to dine and fup early, and the dinner fhould not be too heavy. It is a good rule indeed, under fuch a courfe as this, never to eat or drink fo much as one can, but always to rife with an appetite. The foods principally to be avoided, during fuch a courfe, are fuch as are dried in the fmoak, or have been long kept in falt, and the flefh of young animals is in general to be greatly preferred to that of old ones; and in general, a too great quantity of vegetables, efpecially of the flatulent ones, is to be avoided. Lamb, chickens, veal, and the like, are moft proper for the diet at this time; and to thefe are to be added the tender river fifh, as trout and pike: broths alfo of all kinds are good; and peas, kidney-beans, fpinach, and afparagus, are all very proper. The bread that is eaten under the courfe fhould never be ftale; the moft proper drink at the time is good wine, and if the perfon is not over thirfty, it is beft to drink this pure, not mixed with *water*: but in this cafe it is only to be allowed within the bounds of moderation; half a pint, at the utmoft, at a meal to thofe who have not been habituated to it; and to thofe who have, fomewhat lefs than their cuftomary quantity. The liquor next proper after wine, is found and well-bodied ale; but fuch as is either new and fermenting, or fo old as to be ftale, is by no means to be ufed.

Violent exercife is wrong, but different conftitutions will bear different degrees of it, and thofe of cold and pituitous habits fhould ufe confiderably more than others. The feafon of the year is alfo to be regarded, for the fame degree of exercife that is good in a cooler, is too much in a hotter air. The greateft caution, in the courfe of the taking thefe *waters*, is to avoid too much fitting ftill, either after the taking them, or after meals; for the *waters* remaining in the body, or the food remaining undigefted, from thefe caufes the confequence is, that the patient is fubject to flatulencies, colics, diarrhœas, and pains of the ftomach. Sleeping immediately after meals is alfo improper, as it occafions at this time diforders of the head, and many other complaints.

There are fome cafes, however, in which the *mineral-waters* may be drank with great advantages by perfons confined to their bed: thus gouty, paralytic, and other extremely emaciated, or weak perfons, have often found great benefit by this method. Slare even goes fo far, as to advife this as the beft method of taking them in all cafes; but the more judicious writers all judge him in an error in this, becaufe there are very many reafons why motion and bodily exercife, after the drinking them, muft be beneficial. It is proper to abftain, as much as poffible, from all forts of paffi-

paſſions, during the courſe of taking theſe *waters*. Violent anger, grief, or terrors and frights, have been known to occaſion more miſchief at ſuch a time than they would otherwiſe have done; and all people are to abſtain as much as may be from venery during the time, leſt it too much debilitate the body, already weakened by the diſcharges occaſioned by the *waters* by ſtool and urine. Suppers ſhould be moderate during the courſe, and the wine drank at that meal ſhould be diluted with *water*: it is always very adviſeable in this caſe alſo to walk for ſome time after ſupper, that the ſleep may be more quiet, ſound, and refreſhing. And the cold air of the night, eſpecially if it be a damp ſeaſon, is cautiouſly to be avoided, leſt it occaſion catarrhs and other diſorders; for this reaſon, it is proper to ſup early all the while.

Symptoms attending the taking theſe waters. Theſe are of many kinds, and differ greatly from the ſame *waters* drank at the ſame ſeaſon, in perſons of different habits and conſtitutions. One of the moſt common, is a binding of the bowels; and from this there often ariſe pains in the bowels, colics and vomitings, with other the like diſorders. People of melancholy, hypocondriac, and hyſteric habits, are more ſubject than any others to this complaint from them: this is a ſymptom eaſily removed by any of the mild cathartics, and nothing in particular is more proper for that purpoſe than a decoction of ſena, tamarinds, and rhubarb, to be taken a few ſpoonfuls at a time, as occaſion ſhall require. A ſmall doſe of the cooling ſalts may alſo be taken, but all the hot and reſinous purges are apt to occaſion hypercatharſes. On the other hand, ſome are thrown into a diarrhœa by them, and this is often a ſalutary ſymptom; and while the patient's ſtrength is unhurt, and he is not found to ſuffer any great inconvenience from it, this is by no means to be checked, for very often the patient is greatly relieved by a copious diſcharge of the noxious humors this way, and by a continuance in the ſame courſe, becomes abſolutely cured by this means: but when the perſon is perceived to be greatly weakened by this ſymptom, and it is attended with nauſeas, vomitings, and pains in the bowels, it muſt be carefully checked or reſtrained. This is often done by drinking the ſame *waters* in a ſmaller quantity, and warm inſtead of cold; but if this do not prove ſufficient, ſmall draughts of cinnamon-*water* are to be allowed, and, if neceſſary, ſmall doſes of diaſcordium every night. In caſes where the *waters* take this turn violently, it is proper to abſtain from them for ſome days, and then to take to them again with great caution, and in ſmall quantities.

Some perſons, at their firſt entering on a courſe of the *mineral-waters*, are thrown into vomitings by them; and theſe are ſometimes ſalutary, ſometimes merely ſymptomatic. If it be ſalutary, the perſon is always the better for it, and the noxious humors are very happily attenuated and diſcharged this way by the *waters*: in this caſe, all the cautions neceſſary is not to drink too much of them at a time, and ſometimes, between whiles, to take a little of ſome bitter tincture. But if, on the contrary, the patient is greatly weakened by this vomiting, the method is to drink ſmaller quantities, and to eat and drink more ſparingly at meals. Sometimes this ſymptom ariſes from a redundance of bile, or of pituitous humors from the ſtomach and bowels, not having been emptied by a purge before the entering on the courſe: in this caſe a gentle purge is to be given, and after that the common ſtrengthening and bitter ſtomachics, and the *waters* are afterwards to be cautiouſly taken in ſmall quantities.

When the patient is attacked with violent colic pains, and the common method of eating candied orange-peel, and the carminative ſeeds, does not take effect, a gentle purge is to be given to evacuate the humors which occaſion them, and after this, tincture of cardamum ſeeds, or ſome other ſuch carminative, uſually takes effect. In caſes where the pains are more violent and obſtinate, a glyſter of camomile flowers boiled in milk, with a little ſugar, may be given at times, and the *waters* afterwards muſt be drank in ſmall quantities, and always warmed.

If an immoderate flux of the menſes or hæmorrhoids ſhould happen during the time of taking the *waters*, it will be proper to abſtain from the uſe of them on that occaſion for a few days; but if theſe evacuations are in a moderate degree, the *waters* may be continued, only taking them in ſmaller quantity, and not quite cold. Sometimes intermittent fevers come on while perſons are drinking the *waters*; but theſe are not to be regarded as any very bad caſe; for if the uſe of the *waters* be continued, and the carminatives and bitters of the common kind taken at times with them, they are uſually ſoon cured. Pains of the gout, rheumatiſm, ſciatica, and teeth, alſo ſometimes return upon people accuſtomed to them, while they are in a courſe of the *waters*; but theſe are not to be greatly regarded, for they uſually go off again very eaſily, only by continuing the uſe of the *waters*, and require no peculiar cure: only, during the time the pains laſt, ſome comforting cordial may be taken at times; and if they are violent, a few drops of laudanum may be taken every night going to reſt, or a few grains of the ſtorax pill. See *Heiſter*, loc. cit.

Bath and *Briſtol*-WATER. Dr. Guidot pretends that the *Bath* and *Briſtol-waters* are of the ſame virtues, but in a different degree; that both are impregnated with the ſame principles, but the *Bath-waters* containing a much greater ſhare of them, and therefore capable of doing that in a little time which thoſe of *Briſtol* could only do in a much longer. But this ſeems to be far from a true ſtate of the caſe.

The due ſecretions of the blood, and their proper diſtributions, are as neceſſary to the preſervation of life, as the circulation itſelf; and the greateſt part of diſeaſes take their origin from the glandular ſecretions being either too much increaſed or diminiſhed. The blood is ſometimes too thin, and then a too great quantity of its ſerous part is ſeparated either by the glands of the ſkin, guts, or kidneys, as in colliquative ſweats, fluxes of the belly, and diabetes. Some times the blood is too thick and viſcous, and by this means occaſions obſtructions, not only in its own canals, but in the glands; and then the ſecretions are as much leſs than they ſhould be, as in the former inſtance they were greater, and hence ariſe as long a train of diſeaſes. In ſome caſes there is alſo a too great fullneſs of blood, and in others a deficiency, both which hinder the proper ſecretions.

In theſe different caſes the *Bath* and *Briſtol-waters* have their ſeveral uſes: the *Bath-waters* are beneficial when the ſecretions are diminiſhed, the *Briſtol-waters* when they are too much increaſed: the *Bath-waters* powerfully attenuate, the *Briſtol* not leſs powerfully incraſſate: the *Bath-waters* are ſpirituous, and help in deficiences of the blood; the *Briſtol-waters* are cooling, and ſuppreſs plenitude with its ſeveral conſequences, ſuch as inflammations, hæmorrhages, *&c.*

The *Briſtol-waters* are ſuppoſed by many a modern diſcovery, and their uſe but of late date, but this is a very erroneous opinion. Dr. Venner, near eighty years ago, has written profeſſedly of them, and given them their true character, and proper commendations in all the diſeaſes in which they are at this time found effectual, the diabetes ooly excepted, in which their uſe has not been known ſo long. They were not indeed much frequented at that time, nor of ſome years afterwards; but that was merely from the want of the neceſſary accommodations at the place. Dr. Maplet, in the year 1639, writes largely of their virtues, particularly in diſorders of the urinary bladder and kidneys, and adds great praiſes of their external efficacy in curing cancerous ulcers; but with all this praiſe, they never came into an univerſal repute, till their character was eſtabliſhed by Dr. Mead and Dr. Lane.

The diſeaſes in which the *Briſtol-waters* are found moſt ſucceſsful, are internal hæmorrhages and inflammations, ſpitting of blood, dyſenteries, and immoderate fluxes of the menſes, and purulent ulcers of the viſcera. Hence they are given in conſumptions, ſcurvies, rheumatiſms, diabetes, ſlow fevers, atrophy, gleets, and even in ſcrophulous caſes, with very happy effects: and in all theſe caſes the *Bath-waters* are not only improper, but hurtful; for they rouſe and quicken the circulation, whereas theſe allay the heat, and reſtrain the too rapid motion of the blood. *Bath-waters* ſeem to be adapted to the diſorders of the ſtomach, guts, and nerves; *Briſtol* to thoſe of the lungs, kidneys, and bladder. *Bath-waters* are at variance with a milk courſe, and the *Briſtol-waters* can never be judiciouſly directed, but where milk may be joined with ſucceſs. This is ſo great a truth, that it holds good even in caſes of the diabetes, in which milk is of great ſervice, and has been preſcribed almoſt from the earlieſt times.

The *Briſtol* and *Bath-waters* are both preſcribed by different phyſicians in dropſies. No one can doubt, but that diuretic and drying medicines are of ſervice in this diſeaſe, and as the *Briſtol-waters* poſſeſs theſe virtues in a much larger degree than the *Bath*, they are certainly the moſt adviſeable, unleſs in caſes where a jaundice is joined with the dropſy; in which caſe the *Bath-waters* claim the preference, from their great efficacy in opening obſtructions of the viſcera, where there is no formidable inflammation.

The efficacy of the *Briſtol-water* in the diabetes, has procured it the name of a ſpecific in that diſeaſe; and it certainly much better deſerves that title than moſt of the medicines which have, at one time or other, been honoured with it, for it cures this terrible diſeaſe almoſt infallibly, and that in a very ſhort time, and without any ſenſible evacuation. The patient in this caſe may drink it in as large quantities as he pleaſes. The time for drinking the *Briſtol-waters* medicinally, is from April to September. The *Bath-waters* may be drank the whole year, but the colder months are much the beſt for them, or at leaſt the very heat of ſummer is leſs eligible than any other ſeaſon; and perhaps the beſt months for them are April, May, September, and October.

Buxton-WATERS, the *waters* of medicinal ſprings near Buxton in the Peak of Derbyſhire.

Theſe *waters* are the hotteſt of any in England, except thoſe of

of Bath. The *Buxton-waters* break out in several places thereabouts; what is called Buxton-bath takes in several warm springs. Thirty-two yards north east of this is St. Anne's well, which is chiefly supplied from a spring on its north side. Twenty yards south east of St. Anne's, in another close, is a place where a hot spring and a cold one rise in the same receptacle. About sixty-three yards south east of this is that called Bingham's well, called also Leigh's *water*, from the great benefit a neighbouring gentleman of that name received from it. A little way east of this is another; and in the streams of the level that carries the *water* from the bath, there rises another very plentiful one; and about four yards farther east there arise three or four other small ones. From this account, it may easily be conceived that there can be no great difference between the *waters* of these several springs, though on trials they seem to yield different portions of salts and sediments; at the utmost, their difference can be only in degree.

The distempers they are recommended in, are the rheumatism, gout, scurvy, wandering pains, cramps, convulsions, dry asthmas, want of apetite, indigestions, contractions, stiffness and lameness of the limbs, suppression of the menses, and all stoppages and beginning obstructions.

As to the difference of age and sex in patients, there is little caution required in the drinking them, except that they should be taken more sparingly by young people, between the ages of twenty-three and thirty, if very full of blood and juices, and by women with child in their first and last months.

As to the method of using them, except the body be costive, and the first passages furred up with gross humors, it is not only unnecessary, but hurtful, to prepare the body for them, as it is called, by purging; or at least by any stronger purges than manna, cream of tartar, and the like.

The heat of *Buxton-waters*, in frosty weather, is equal to that of common river *water* with which two fifths of boiling *water* has been immediately mixed. See *Short*'s Hist. of Min. *Wat.*

Sea-Water. Authors, who write with accuracy of *sea-water*, distinguish it as to its degrees of saltness and virtues, according to the nature of the seas where it is taken, and the depths from which it is drawn up. Count Marsigli always divides the *waters* of a deep sea into three portions, the upper, the middle, and the deep: each of these, according to him, reach to one third of the depth of the bed of *water* from the superficies to the bottom. The upper *water* he finds greatly to differ from the lower or deep *water* in its qualities and strength, but the middle portion to be always more nearly allied to one of the others; he therefore never takes any notice of the middle portion, but makes all his observations of the differences of *sea-water* from the upper and lower portions.

The *sea-water* is brighter and clearer than that of any river or pond, but this is not seen, as the whole body of it is viewed together, because then many various colours are reflected from its surface; but on taking up a large glass of it, and setting it in a still place, it is seen to have none of all the whole series of its colours when viewed at sea, being intirely owing to its motion, and the different reflections its waves have in different angles and directions.

The *sea-water* appears indeed coloured in its superficial part in some places, particularly about the mouths of large rivers; but this is not of its own nature, but is merely owing to the foul *water* of these rivers mixing itself with it, they being frequently yellowish or bluish, sometimes blackish, from the quantity of dirt they contain, or the various earthy particles which they wash off from their banks and bottoms in their passage.

As these fresh *waters* principally mix themselves with the superficial part of the *sea-water*, they extend themselves a great way, and give a foulness to the upper part of a vast quantity of *sea-water*, whose bottom part is all the while perfectly clear. These foul *waters* of rivers extend themselves also farther, or a less way into the sea, according to the way the wind sits; for if the wind blows directly into the mouth of the river, the surface is disturbed in such a direction, that the fresh *water* is beaten under, and blends itself below as well as above, and therefore tinges the surface for a much less extent: but if, on the contrary, the wind sits directly from the river, all its *waters* are blown on, without sinking so deep as they otherwise would, and the foulness is extended over a large surface, though it is not so considerable in degree.

The *water* of the sea taken up at great depths, is generally clear and bright, as has been observed; but this is not always the case, for in some places a quantity of it taken up in very deep *water*, and that near the bottom, is found fouled in the same manner as the superficial part is near the mouths of large rivers; and this, when strictly inquired into, is found to proceed from the same cause, the mixing of a foul river *water* loaded with particles of earth, which it has washed off from the substances it passed through, and containing large quantities of blue, black, or yellow earth, all which it would suffer to subside, if set by for a time in a still place. Count Marsigli has proved, that as rivers burst up in many places out of the surface of the dry ground, so they do also in several parts of the bottom of the sea: in these places they pour in their whole body of fresh *water*, which is fouler than that of our common rivers, because, in its subterranean passage, it has been surrounded on all parts with earth, and confined to a much fouler channel. The foul *waters* these mouths of rivers discharge from the bottom upwards into the *sea-water*, cannot but act upon that clear liquor, in the same manner as the superficial *waters* do on the surface, and both must be fouled alike. This author has particularly described one of these subterranean rivers opening into the sea from his own observations. This foulness in shallow *water* is sometimes seen through the clearer superficial part by the naked eye, and often, beside this, an observer thinks he sees many other colours in mid-*water*; but these are, for the most part, not inherent in the *water*, but are formed by the reflections of the clouds, *&c.* The *sea-water* being naturally clear, in deep places where it is not disturbed it appears blue, but in shallower *water* it often has different colours, which are owing to the reflections of the coloured matter at the bottom, which will give a tinge to the *water* in places, where not so near the eye as to be distinctly seen themselves. The clouds also give a sort of coloured appearance to the surface of the *sea-water*, in regard to our eye, though the *water* itself be really colourless as that of the purest spring. We have a familiar instance of this in the white look of the *sea-water* in the south seas at certain times: and, on the cuntrary, when any thing fouls the *sea-water*, and gives it a dusky colour, the clouds above add greatly to that appearance. This we see in the Euxine, which being very deep would naturally appear blue if the *water* were clear, but as it is often fouled with dusky matter, and clouds are frequent over it, it appears for a great part of the year absolutely black, and has thence obtained the name of the Black sea.

Count Marsigli commemorates also another singular instance of this effect of the clouds on the colour of the *sea-water*, which fell within his own observation. Being at the port of Cassis on the seventeenth of December, in the year 1706, at about an hour before sun-set, there arose a large cloud of a blood-red colour, of the nature of those usual in some evenings about sun-set, but accidentally very large, and strongly coloured: as this extended itself above, the *sea-water* under it appeared of the same colour, and looked as red as blood for a great extent, still spreading the same blood colour farther as the cloud extended. This remarkable phænomenon lasted till the darkness hid it; and the people of the place, who saw the sea blood coloured, paid no attention to the cloud above that caused this colour, but looked on it as a miraculous presage of war and bloodshed.

As the clouds in many cases thus evidently give colour to the *sea-water*, in regard to our eye, so the sun does the same thing in many others: but in all these cases it is to be observed, that the colours are so far from being real, that the *water* is all the time clear, pellucid, and colourless; only its different reflections, from these different occasions, present our eyes with colours, as the colourless glass prism, or the cut side or edge of a common looking-glass does.

The sun, as it shines with different force at different times, gives different tinges to the *water*, by shewing more or less plainly the substances which are at its bottom. This is evident from a familiar experiment of this author's, who fishing on the coasts with a live bait, which was a small red fish, and with a red line, observed, that when he let down his bait into the *water*, in places where the rocks kept off the sun's rays, he could only see his fish at the depth of seven yards; but that even there the fish and the line both appeared white, having lost to the eye their natural red colour: and that, on the contrary, when he let down the bait on the other side of the rock where the sun shone, he could see it perfectly plain at the depth of eleven yards; and at that greater depth, both the fish and the line appeared of their natural red colour. It is evident from this, in how great a degree the sun's rays affect the *water* in the shewing its contents; and it is very evident also, that upon this principle alone the same sea, with a coloured bottom, at some moderate depth, must appear coloured by that bottom in sunshiny weather, and not at all so in cloudy.

Beside the clouds, the sun, the foulness of rivers, and the different bottoms, it is certain that the winds also contribute greatly to give the colours we observe in *sea-water*. A tempest in the winter season, an hour or two before sunset, will shew all the colours that *sea-water* is capable of giving, and that without any other accident whatever to assist in it. The waves in this case striking violently against one another, beat off from each other a great number of globules of *water*, and these are thrown up to different heights and distances; then as the sun, now low and near the horizon, darts its rays obliquely upon them, they form several little rainbows, which are of greater and less extent, and of more or less duration, according to the circumstances of their ascent. The fresh *water* of some large rivers is also found to have, in particular places, the same effect where the

the ſtones lie high, and the waves break upon them; the globules of *water* are in the ſame manner raiſed from their ſurface, and little rainbows of ſhort duration are formed. Near the ſhores the *ſea-water*, inſtead of appearing of all this variety of colours, generally looks white: this is owing to the violent motion of the waves, in which they beat one againſt another, as alſo againſt the rocks and ſands, and by the mere agitation of their parts put on this colour. The *water* at theſe times ſeems, in theſe places, really of a milky nature, but as ſoon as it ſettles again into a calm, the clearneſs of the *water* returns, and no ſettlement happens in the whole body of it; which ſhews that it was not made white by the addition of any other matter to it, but only by the diſturbing of its own particles.

Theſe are all the various colours and appearances that the *ſea-water* puts on in different places, and on various occaſions; and we ſee, in the whole, that theſe differences are in general owing not to the alteration in its nature, but only in its change of parts in their directions to the eye, and in their breaking one againſt another, or receiving more or leſs light, or that from a clear or from a cloudy ſky. *Marſigli*, Hiſt. Phyſ. de la Mer.

Count Marſigli has gone through a long courſe of experiments upon *ſea-water*, and after a thouſand tedious proceſſes has obſerved, that three liquors alone are of power to ſhew the different nature of the *ſea-water* in various places, and that very readily: theſe only need, therefore, be carried abroad by thoſe who intend to make experiments of this kind. Theſe are an infuſion of mallow-flowers in *water*, made ſo ſtrong, as to be of a violet colour, ſpirit of ſal armoniac, and oil of tartar. The two laſt of theſe will always keep as long as there is occaſion; the other may be preſerved from decay by ſugar diſſolved in it in different quantities, according to the time it is to be kept, and the climate it is to be carried to; for this ingredient, if added in ſo large a quantity as twice the weight of the liquor, ſo as to make it a true ſyrup, does not prevent it from performing its office in theſe experiments; and in this ſtate it will keep every where, and ever ſo long. When intended for leſs ſevere trials, it may have a ſmaller proportion of the ſugar, and its effects will be then more ſudden and more manifeſt. This infuſion of mallow-flowers mixed with *ſea-water*, turns it to a greeniſh yellow colour, like that of the chryſolite. The ſpirit of ſal armoniac mixed with *ſea-water*, renders it turbid and muddy, and after a time a white ſediment is formed, and ſubſides by ſmall pieces at a time to the bottom of the glaſs. Oil of tartar occaſions the ſame change, but it does it with much more violence.

By mixing theſe liquors with *ſea-water*, taken up in different places, and at various depths, we ſee the different quantity of ſalt it contains manifeſted, by the more or leſs ſudden productions of theſe changes, and by the deepneſs or paleneſs of the colour, and the quantity of matter precipitated. The common attempts of ſweetning *ſea-water* are alſo eaſily proved by this means, for the more ſalt it contains, after theſe pretended ſweetnings, the more colour or precipitation it will occaſion in theſe mixtures; and the mixing them with it, if perfectly freed from its ſalt, will produce no change at all, as is evident by mixing them ſeverally with *ſea-water* carefully diſtilled; for as this proceſs intirely robs it of its ſalt, there is no ſort of alteration made in it by the mixing theſe liquids. Id. ibid.

The ſudden and ſurpriſing clearneſs of *ſea-water*, on certain occaſions, is a thing not yet accounted for: we have many inſtances given of the fact by the writers of voyages and travels, but one of the moſt remarkable is recorded in the Philoſophical Tranſactions, as having happened on the ſhores of Iceland. On the 13th of May, in the year 1642, all the ſea that beats upon the promontories of that coaſt, and which is uſually very thick and turbid, was for two days together ſo perfectly pellucid and ſhining, that the ſmalleſt ſtones and plants, and the ſea ſhells, where the *water* was forty fathom deep, were ſeen in ſo diſtinct a manner, that they appeared not more than four feet from the ſurface. The fiſhermen who were out in their boats, were ſo terrified at the unuſual appearance, that they left their buſineſs, and the whole country looked on it as a prodigy. Philoſ. Tranſ. N° 110.

In the making of common ſalt from *ſea-water*, it appears that there are other ſubſtances beſide ſalt contained in it, as there is a ſtony cruſt formed on the ſides of the pans, and a powder precipitated to the bottom at the corners; beſide theſe, there are ſome ſubſtances ſeparated from the *water* before it is let into the pan, during its ſubſidence in the ciſtern, and there alſo remain ſome afterwards mixed in the bittern, after all the ſalt is extracted from it. Vid. *Brownrig* of Salt, p. 74.

The *ſea-water* in its motion gathers up mud, ſand, and many other impurities, which ſoon ſubſide in the ciſtern; others, ſomewhat more intimately mixed, are ſeparated with the ſcum raiſed by the whites of eggs in clarifying the brine. But beſide theſe groſs ſubſtances, *ſea-water* contains a glutinous matter of a much finer texture, which is more intimately mixed in it: this Count Marſigli ſays is ſo light, as to riſe with the *water* when diſtilled in a ſand-heat, and therefore may eaſily be raiſed in vapour by the ſun, and falling may fecundate the fields, and promote the growth and nouriſhment of plants. This viſcous matter ſeems earthy, ſaline, and oleaginous; and this is the ſubſtance which, in ſtormy weather, forms a thick ſcum upon the ſurface of the waves; and to this viſcous part is chiefly owing the putrefaction of *ſea-water*, when ſuffered to ſtagnate: for it is evident that the whole ſea in any place will become fetid, when it has been calm for ſome time together, ſo that in ſhips becalmed people have often been threatened with ſickneſſes from the ſtench. Mr. Boyle records two inſtances of this, one in the African ſeas, the other near the Azores iſlands. In the putrefaction of *ſea-water* this ſlimy matter is attenuated, and its texture deſtroyed, and part of it flies off in fetid exhalations, while part ſubſides to the bottom. *Marſigli*, Hiſt. Phyſ. de la Mer. *Boyle* on the Saltneſs of the Sea.

Beſide this viſcous matter, *ſea-water* probably alſo holds an earthy ſubſtance, ſo very bright and ſubtile, that it is elevated in the foregoing proceſs along with the *watery* vapours, as well as the ſlimy matter. The walls of the houſes where ſalt is boiled are covered with this earth, and it ſeems of the nature of that earth contained in clear lime-*water*, which is known to ſubſide from it by proper methods, even after it has been raiſed in diſtillation.

Beſide this light earth, *ſea-water* contains another very coarſe one; this the ſalt-workers call *ſcratch*, and find it on the ſides and at the bottom of the corners of their pans. And it is very probable that this would be ſeparated from *ſea-water* by congelation, for if Briſtol-*water* be frozen, and thawed again, there is always an earth of this kind ſeparated from it; and the petrifying *water* at Knareſborough being frozen in the ſame manner, depoſits its ſtony or calcarious ſediment. Theſe earthy particles are not ſeparated from the *water* in the ſame ſtate in which they were ſuſpended in it, for when the *watery* particles are evaporated, then ſtony ones get together, and concrete in cluſters; and in this ſtate they can no more be diſſolved in *water*, unleſs they are again ſeparated into the ſame minute maſſes which they were in before. It is evident that this powder can riſe in vapour from the experiments of diſtillation, and accident has proved this yet clearer; for in the boiler of a fire-engine, if *water* be uſed which is highly impregnated with this ſtony matter, as is uſually the caſe with that which ariſes from among ſtrata of freeſtone, and the like, the cylinder into which the vapours riſe will be ſo filled with ſtony matter, that the piſton cannot riſe in it.

This powder is properly a ſparry matter, and is in general the ſame ſubſtance which forms incruſtations on the vegetables, &c. in ſprings. It has been found, and deſcribed by all authors who have analyſed *waters* of any kind. Dr. Collins, in his Diſcourſe on Salt and Fiſheries, calls it ſtone-powder; Dr. Liſter calls it *arena alba*, and *lapis albus* [a], white ſand and white ſtone; and Dr. Hoffman *pulvis candidus*, and in ſome other parts of his works *ſuccus maris ſalino-terreus calciformis* [b]. [a] *Liſter*, de Font. Med. Angl. [b] *Hoffman*, Oper. Tom. III.

Theſe particles are extremely ſmall and minute while ſuſtained in the *water*, as appears by their paſſing through paper with it in filtration, as has been proved by Dr. Plot in his experiments on it; and hence it is able to enter the veſſels of plants and animals, particularly the teſtaceous fiſhes, the ſhells of which it has great affinity to. It alſo forms the ſtalactitæ in caverns, and many other of the cruſtaceous foſſils. *Plot*, Hiſt. Staffordſhire, cap. 2. p. 109.

This earth is capable of being diſſolved in *water* in very conſiderable quantities, ſome of our ſalt ſprings affording a *water* which contains it in the proportion of one thirty-ſixth part of its own weight, which is nearly the ſame proportion in which common ſalt is found diſſolved in *ſea-water* in general. *Liſter*, de Font. Med. Angl. lib. 1. cap. 6. The great ſolubility of this earth in *water*, ſhews that it very nearly approaches to the nature of ſalts; and it is even found to enter into the compoſition of perfect ſalts, for being long expoſed to the open air, it imbibes the aerial vitriolic acid, and with it is converted into a neutral ſalt, which Liſter ranks among his calcarious nitres. This ſalt nearly reſembles the bitter purging ſalt of the Epſom-*waters*. It is of a highly alkaline quality, and turns a mixture of ſyrup of violets and *water* green.

The next ingredient of *ſea-water*, that offers itſelf in an analyſis of it, is ſalt: this is the moſt obvious of all others, and is contained in it in very different quantities at different times, and in different places. The Baltic ſea is very weakly impregnated with ſalt; the Engliſh and German ſeas are much more ſtrongly ſo, and the Mediterranean much more ſo than any other; and finally, the *water* on the coaſt of Moſambique is ſuppoſed much ſalter even than this. Mem. Acad. Par. 1711.

Father Feuillee, in paſſing through the Straits of Gibraltar towards America, obſerved the *ſea-water* to diminiſh in gravity as he approached the line. Dr. Hales found the *water* of the ſea, taken up near the buoy of the Nore, to contain $\frac{1}{29.5}$ of its whole weight in ſalt, and that of the Mediterranean contained $\frac{1}{27.5}$; and Count Marſigli found the

the *water*, taken from the ſurface of the Gulf at Lyons, to contain only $\frac{1}{32}$ of ſalt, while that of the ſame place, taken at a greater depth, contained $\frac{1}{29}$. From this that author argues for the ſeas being ſalter at greater depths than near the ſurface, but this might be owing to the falling in of the freſh-*water* rivers near that place; for Mr. Boyle found the *ſea-water* of our own ſeas to be of the ſame ſaltneſs at all depths: and indeed there is great reaſon for ſuppoſing, that in many places, where there falls in little freſh *water*, and where the ſun daily raiſes a great deal of *water* in vapour, it may remain much more ſalt near the ſurface than at great depths, juſt contrary to the foregoing ſuppoſition. *Hales*, Exper. on diſtilled *Sea-water*.

From late experiments it appears, that *ſea-water* is heavieſt and ſalteſt at great depths, and that it is of a temperate heat there; that is, 53 degrees of Fahrenheit's thermometer. See Phil. Tranſ. Vol. 47. p. 213, 214.

It is to be obſerved, that all the authors who have made experiments of this kind have evaporated *ſea-water*, and given the weight of the dry remainder as the quantity of ſalt contained in it; but this is not the true ſtate of the caſe, for this dry reſiduum always contains a quantity of the calcarious earth, or ſcratch, and of the ſalts of the bittern: beſide this, a certain quantity, more or leſs, of aqueous moiſture will remain in the ſalt, and this will alter its weight, as it will be in a greater or leſs proportion, according to the degree of fire uſed; and Mr. Boyle found that his reſiduum of the *water* of the Nore, which, when in the form of what he called a dry ſalt, was $\frac{1}{30}$ part of the *water*, when it had been well dried in a crucible, was but $\frac{1}{37}$ of the *water* uſed. *Boyle* of the Saltneſs of the Sea.

Beſide common ſalt, the *ſea-water* contains other ſalts, which are found in the bittern, or bitter brine remaining after the ſea ſalt is extracted. Firſt it contains a bitter purging ſalt, known in the ſhops under the name of *Epſom-ſalt*. This was firſt extracted from the Epſom, Dullwich, and other purging *waters*, but is now made only from the bittern at Newcaſtle, and other places; and it is chiefly to this bitter ſalt that the *ſea-water* owes its bitter taſte, though that has been ſuppoſed to proceed from bituminous matter contained in it, and often found on its ſurface, or lodged upon the rocks by its motion. Philoſ. Tranſ. N° 377, 378.

Another ſalt is alſo found in bittern, which is called a muriatic calcarious ſalt, its acid principle being ſpirit of ſea ſalt, and its baſis an earth nearly allied to quickſilver. This ſalt remains in the bittern after the purging ſalt has been extracted from it, and though it is a neutral ſalt, it cannot be made to ſhoot in cryſtals, but may be procured in a dry form by fire; but it is very difficultly kept in this form, being, of all other ſalts, the moſt ready to imbibe the *watery* particles of the air, and run *per deliquium*. *Hoffman*, Obſ. Chym. de Lixiv. a Sale relict.

Beſide theſe ſalts, the bittern contains a conſiderable portion of a fixed mineral alkali. Theſe principles are all found in boiling the *ſea-water* into ſalt. But beſide theſe there muſt be many other ſubſtances, which eſcape our ſearch in this manner, ſuch as the ſeeds and excrements of innumerable plants and animals, and the tinctures which thoſe plants and animals impart to it in their decay. Theſe, together with divers ſaline and ſulphureous particles, will naturally fall under the obſervation of thoſe who ſhall attempt a perfect analyſis of *ſea-water* by the nicer methods of chemiſtry; a thing yet much wanted in the learned world. *Brownrig* of Salt, p. 92.

Many ways have been attempted to arrive at the art of making *ſea-water* freſh and potable; the advantages of ſuch a thing are evident enough, but the difficulties very great. Liſter propoſes the doing it by means of ſea plants; theſe vegetables, like other plants, continually exhaling a large quantity of *water* in form of vapour, and that being all freſh, he propoſes on this baſis a diſtillation, without fire, in this manner. The body of a large ſtill, or alembic, is to be filled three parts with *ſea-water*, ſeveral freſh and growing ſea plants are to be put into this in their growing poſture, and the head being then fitted on, and a receiver adapted to the noſe, there will be a continual aſcent of vapours from the plant, which will condenſe into *water* in the head, and this will be thence conveyed into the receiver ſweet, clear, and every way fit for drinking. The quantity thus procured, however, though conſiderable in regard to the manner of its being obtained, can be but ſmall in proportion to the wants of a ſhip's company.

Mr. Kanton therefore attempted a more general method of doing it in quantities; to this purpoſe a large quantity of *ſea-water* is to be taken up in a proper veſſel, and as much oil of tartar *per deliquium* is to be added to this, as will render it turbid, and cauſe a large precipitation. After this the *water* is to be diſtilled, the furnace of the ſtill being ſo contrived as to take up very little room, and conſume but a ſmall quantity of fuel; the ſea itſelf may ſerve for a worm-tub, the worm paſſing out of the ſhip, and in again at another place. When the *water* is thus diſtilled, it is to be mixed with an alkaline earth, and after ſtirring thoroughly about, the earth is to be ſuffered to ſubſide to the bottom, and the *water* poured off clear; it is then ſaid by the inventor of this ſcheme to be perfectly ſweet, and no way diſtinguiſhable from the very pureſt river *water*. Phil. Tranſ. N° 67.

Another method of ſeparating ſalt from *ſea-water* without fire is propoſed in the Philoſophical Tranſactions: take a veſſel of wax, hollow within and every where tight, plunge it into the ſea, or other ſalt *water*, and there will be made ſuch a ſeparation, that the veſſel ſhall be full of ſweet *water*, the ſalt ſtaying behind. But though this *water* have no ſaltiſh taſte, yet a ſalt will be found in the eſſay. Philoſ. Tranſ. N° 7. p. 128.

To obtain freſh wholeſome *water* from *ſea-water*, Dr. Hales's method is to keep the *ſea-water* cloſe ſhut up till it has putrefied, and has again become ſweet, then to diſtill, three fourths of the *ſea-water* will be free both of the bittern and acid. Mr. Hales enters into a particular detail of the circumſtances which may make the practice of this ſupply of freſh *water* eaſy. Philoſ. Experim.

Drinking *ſea-water* with ſome wine, is ſaid to prevent people from being ſick at ſea. Act. Phyſ. Medic. Acad. Nat. Curioſ. Vol. V. Obſ. 84.

Sea-water, drank to the quantity of a pint, is a moderate purgative to moſt people. It has been of late much in faſhion, and is ſaid to be very beneficial in many caſes, particularly in glandular diſorders.

Simple-WATERS. In the diſtillation of *ſimple-waters*, a good general rule is this: take as much of the dried herb, as when cut ſmall will fill two thirds of the ſtill to be uſed; pour upon this as much rain *water* as will make the plant float commodiouſly, leaving however a fourth of the ſtill empty; digeſt this a while in a gentle heat, and then give fire enough to work the ſtill, and draw off ſo long as the *water* appears thick or milky, and taſtes of the herb. *Shaw's* Lect. p. 198.

It is a principal caution in this operation to remove the receiver before the more pellucid, acid, faint, and dead *water* comes over, as it will at length do, and by mixing with the reſt will ſpoil the whole, by giving it a vapid or faint taſte, and ſometimes a degree of acidity or vitriolic ſtypticity, or emetic quality; for part of the eſſential ſalt of the plant now riſing, corrodes the head of the ſtill, and carries over with it ſome particles of the metal: for which reaſon, ſuch *waters* ſhould be either diſtilled with a glaſs head, or a pewter one, or elſe the laſt running carefully watched, and not ſuffered to come over and mix with the firſt; for want of this caution, children, and perſons of tender habits, have been often vomited, purged, &c. contrary to the intention of the preſcriber, by a *ſimple-water*.

The *ſimple-waters* diſtilled by this method may often be too ſtrong to give alone, but then it is eaſy to let them down to a proper ſtrength with common *water*; which is beyond all compariſon better than to mix them with their own faints, or the liquor of their ſecond running.

There are yet however two methods of improving the common *ſimple-waters*, which might eaſily be put in practice: the firſt is the cohobating, and carefully digeſting the plant; the ſecond the fermenting it. With regard to the firſt, if the liquor remaining in the ſtill be expreſſed from the herb, and returned, along with all the *water* that came over, upon a freſh quantity of the ſame ſubject, and they be digeſted together in a gentle heat for two days, and then diſtilled as before, the *water* thus obtained will be much richer, and more efficacious than before; and if the ſame operation be repeated two or three times, thoſe who have not tried it cannot eaſily conceive how very rich a *ſimple-water* may by that means be made: and this is moſt neceſſary in diſtilling the *ſimple-waters* of roſes, elder-flowers, balm, and the like ſubjects, which afford but little oil, and otherwiſe make but weak *waters*.

The other method recommended, *viz.* by fermentation, is performed by adding to the plant and *water*, put together as for diſtillation, a tenth or twelfth part of ſugar or honey, or elſe a fortieth part of yeaſt; then ſetting the whole in a warm place to ferment for three or four days only, ſo that the herb may not fall to the bottom, nor the fermentation be above half finiſhed; then the whole being committed to the ſtill, a *water* may be procured at one operation, extremely rich, or impregnated with the whole virtue of the plant; and thus may *ſimple-waters* be made fit for long keeping without ſpoiling, the ſmall quantity of inflammable ſpirit generated in the fermentation ſerving excellently to preſerve them. *Shaw's* Lectures, p. 199.

Diſtilled-WATERS. To procure the *diſtilled-waters* of vegetables, or other ſubjects, pure and free from all mixture of the other principles of the body it was extracted from, let the *water*, as diſtilled, be put into a funnel lined with paper to be filtred, and the funnel being kept continually filled up, that the lighter oil may not come in contact with the paper, the *water* will be tranſmitted through, in a great meaſure, without the oil; but there ſtill remains ſome proportion of oily, and commonly of ſaline matter alſo in it. If the ſaline matter be acid, the way to deſtroy it is by mixing chalk, or any alkaline ſalt with the *water*, which being afterwards diſtilled again, will then riſe pure. If the plant were alkaline, and an alkaline ſalt be ſuſpended in the *water*, let it

be

be made a neutral one, by mixing fome acid, and then the *water* filtred and diftilled again. By thefe methods the *water* of vegetables is procured pure; and this is the way of proving, that the chemical principle *water* is lodged in, and may be feparated from all fuch fubftances. *Shaw's* Lectures, p. 150.

Cordial-WATERS. In the making of all compound fpirituous liquors, or, as they are called by the apothecaries, *cordial-waters*, the great care is to ufe a pure and well-rectified fpirit, as nearly infipid as poffible, that the flavour of it may not mix among the flavours of the other ingredients. It is the general cuftom to ufe the proof-fpirit, but it would be infinitely better to ufe the alcohol, or totally inflammable; partly, as the ftrength of the *water* would be much better afcertained that way, the proof ftrength determined by the crown of bubbles being very vague and uncertain, and that of the alcohol or totally inflammable fpirit perfectly fixed and certain; and becaufe this fpirit is always more free from the oil of the ingredient it is made from, and on that account not only approaches more to that fo much defired thing, a pure and taftelefs fpirit, but being free from oil of its own is the more hungry, the more ready to imbibe that of the ingredients added to it, and has no overpowering tafte to give of its own.

If the method of ufing alcohol be not chofen, let a fine, clear, and pure melaffes fpirit of the proof ftrength be ufed, without any farther addition of *water* in the ftill, an additional quantity of *water* only taking up room to very bad purpofe, and prolonging and prejudicing the operation; and when alcohol is employed, it fhould only be mixed with an equal quantity of pure *water*, to reduce it to the proof ftrength. When the choice of a fpirit is thus fettled, the next thing to be had regard to is the matter of digeftion, for without this many ingredients will not part with their flavour and virtues at all, and many others but very imperfectly. Cinnamon in particular, if not macerated in the fpirit a long while before diftillation, will not part with its heavy oil, which will therefore be left in the ftill, and thrown away, while the flightly impregnated fpirit is faved.

When the ingredients have ftood a due time in digeftion, according to their feveral natures, the fpirit is to be drawn from them in the manner that beft tends to bring over their virtues, whereon the character and expectation of the *water* is founded; fo if the ingredients naturally abound in a heavy vifcous oil, the operation fhould be performed with a brifker fire, than when the oil is thin, light, and etherial. Thus ftrong cinnamon-*water*, after a fufficient digeftion to loofen the oil, may be drawn over fmarter, or with a brifker fire, than citron-*water*, the fpirit of mint, or the like, in which the oil of the ingredient is thin, and will eafier afcend with the fpirit.

The capital thing in this compound diftilling refts here, that a fufficient quantity of the fine effential oil of the ingredients be received into, and mixed with the fpirit, while the groffer, lefs fubtile, and lefs agreeable oil is thrown out. To effect this to any degree of perfection, requires that the operation be well conducted from the beginning, that the receiver be changed in due time, and that the fpirit be prudently made up.

When no regard is had to thefe three particulars, as is ufually the cafe among the apothecaries, the confequence is, that the *cordial-water* becomes a thick, turbid, and milky liquor, and taftes more like what the diftillers call faints, than like a *cordial-water*, and is fitted to give ficknefs rather than to cure it. At leaft, before it can be ufed, it muft either ftand a long time to fine itfelf, if ever it will fine, or have its grofs and terreftrial parts precipitated by art. On the contrary, when thefe rules are prudently obferved, the *water* proves, without farther trouble, clean tafted, clear, brifk, pleafant, and refrefhing.

The diftillers in general make their compound *waters* in a much neater manner than the apothecaries; and what has led them into the way of doing fo, is their ftrict obfervance of the bubble proof, a thing which the apothecaries feem either not to underftand, or to pay very little regard to.

The diftillers, in the making of their compound *waters*, find, that if they let the faints run in among the clear fpirit, it kills the proof, as they call it, before the time; hence they are inftructed to leave the faints out, and to make up the fpirit with pure *water*, referving the faints to other ufes, to which they are better adapted, as containing a copious oil; or they let the ftill work longer than the procefs for making the *water* would require, and by this means obtain a larger quantity of oil than is commonly imagined: this they preferve feparate, if the oil of only fome one ingredient; and they fell large quantities of the oils of juniper, anife and caraway, and the like, to the druggifts, chemifts, and apothecaries. But this is a very fcandalous cheat on the buyer, for there is a very great difference between a pure and clear effential oil, that is perfect and intire, and fuch a one as has, in this manner, been robbed of its lighter and finer parts by diftillation with a fpirituous menftruum.

It is a general rule in this bufinefs to change the receiver as foon as the fpirit runs proof, and make up the quantity with *water*: in this cafe, the whole is certain to be clean and fine; but there are fome cafes, as in particular in the diftilling of cinnamon-*water*, where a fmall quantity of the faints ought to be fuffered to come into the fpirit: but this is to be obferved by way of ftint, that fo much is never to be allowed of the faints as will make the *water* milky; for the *water* fhould always be kept in the ftate of full proof, as it mellows and ripens, as they exprefs it, much fooner in this than in any other ftate. But if the cuftom could be univerfally introduced, it would be better that all the *waters*, kept by the apothecaries, fhould be juft in the ftate in which they came over, that is, three fifths of the quantity of the proof fpirit put into the ftill: if this were generally brought about, it would be eafy for the phyficians to regulate the dofes in their prefcriptions accordingly; every draught and julep that they entered into would be the better for it. *Shaw's* Effay on Diftillery.

Dr. Shaw in another treatife, after obferving that the apothecaries ufually fucceed but ill in diftilling *cordial-waters*, lays down the four following rules, by the obfervance of which the art of making thefe *waters* might be brought to great perfection.

The firft is, to ufe a well-cleanfed fpirit that is freed from its own effential oil, for as the defign of compound diftillation is to impregnate a fpirit with the effential oil of the ingredients, it ought firft to be deprived of its own.

The fecond rule is, to fuit the time of the digeftion of the ingredients to their tenacity, or the ponderofity of their oil: thus rhodium wood and cinnamon require to be longer digefted, before they are diftilled, than calamus aromaticus, or lemon-peel. Sometimes alfo cohobation, or the pouring of the fpirit already diftilled back upon the ingredients, proves neceffary, as particularly in making the ftrong cinnamon-*water*, where the effential oil is extremely ponderous, and difficultly rifes along with the fpirit without this cohobation.

The third rule is, to fuit the degree of fire, or ftrength of the diftillation, to the ponderofity of the oil intended to be raifed with the fpirit: thus ftrong cinnamon-*water* fhould be diftilled off brifker than the fpirit of mint or balm.

The fourth rule is, that a due proportion of only the finer effential oil of the ingredients be thoroughly united, or incorporated with the fpirit, fo as to keep out the groffer and lefs fragrant oil. This may chiefly be effected by leaving out the faints, and making up to ftrong proof with fine foft *water* in their ftead.

The addition of fugar to *cordial waters* is a thing of little moment, and may therefore be omitted. If the four rules before laid down be duly obferved, there is no occafion for diftilling in balneo mariæ, nor for fining down *waters* with alum, whites of eggs, ifinglafs, or the like, for they will be prefently bright, fweet, and pleafant tafted, without any farther trouble. *Shaw's* Lectures, p. 127.

Motion of WATER, in hydraulics. The theory of the motion of running *water* is one of the principal objects of hydraulics, and many eminent mathematicians have applied themfelves to this fubject. But it were to be wifhed that their theories were more confiftent with each other, and with experience. The curious may confult Sir *Ifaac Newton's* Principles, lib. 2. prop. 36. with the comment. *Dan. Bernoulli's* Hydrodynamica. *Jo. Bernoulli*, Hydraulica, Oper. Tom. IV. p. 389, feq. Dr. *Jurin*, in the Philof. Tranfactions, N° 452, and in Dr. *Martyn's* Abridg. Vol. VIII. p. 282, feq. *'sGravefande*, Phyfic. Elem. Mathemat. lib. 3. pars 2. *Polenus*, de Caftellis, and others. Mr. Mac Laurin, in his Fluxions, art. 537, feq. has illuftrated Sir Ifaac Newton's doctrine on this intricate fubject, which ftill, notwithftanding the labours of all thefe eminent authors, remains in a great meafure obfcure and uncertain. Even the fimpleft cafe of the motion of running *water*, which is when it iffues from a hole in the bottom of a veffel kept conftantly full, has never yet been determined, fo as to give univerfal fatisfaction to the learned. We fhall here mention fome of the phænomena of this motion, as ftated by Dr. Jurin from Polenus.

1. The depth of the *water* in the veffel, and the time of flowing out being given, the meafure of the effluent *water* is nearly in proportion to the hole.

2. The depth of the *water*, and the hole being given, the meafure of the effluent *water* is in proportion to the time.

3. The time of flowing out, and the hole being given, the meafure of the effluent *water* is nearly in a fubduplicate proportion to the height of the *water*.

4. The meafure of the effluent *water* is nearly in a ratio compounded of the proportion of the hole, the proportion of the time, and a fubduplicate proportion of the depth of the *water*.

5. The meafure of the *water* flowing out in a given time, is much lefs than that which is commonly affigned by mathematical theorems. For the velocity of effluent *water* is commonly fuppofed to be that which a heavy body would acquire in vacuo in falling from the whole height of the *water* above the hole; and this being fuppofed, if we call the area of the hole F, the height of the *water* above the hole A, the velocity which a heavy body acquires in falling in

in vacuo from that height V, and the time of falling T; and if the *water* flows out with this conſtant velocity V, in the time T, then the length of the column of *water*, which flows out in that time will be 2 A, and the meaſure of it will be 2 AF. But if we calculate from Poleni's [a] accurate experiments, we ſhall find the quantity of *water* which flows out in that time to be no more than about $\frac{571}{1000}$ of this meaſure 2 AF.—[[a] *Polen.* de Caſtellis, art. 35, 38, 39, 42, 43.]

Poleni alſo found, that the quantity of *water* flowing out of a veſſel through a cylindrical tube far exceeded that, which flowed through a circular hole made in a thin lamina, the tube and hole being of equal diameter, and the height of the *water* above both being alſo equal; and he found it to be ſo when the tube was inſerted, not into the bottom, which others had obſerved before, but into the ſide of the veſſel.

6. Since the meaſure of the *water* running out in the time T, is 2 A F $\times \frac{571}{1000}$, the length of the column of *water* which runs out in that time, is 2 A $\times \frac{571}{1000}$. Therefore if each of the particles of *water*, which are in the hole in the ſame ſpace of time, paſſes with equal velocity, it is plain that the common velocity of them all is that with which the ſpace 2 A $\times \frac{571}{1000}$ would be gone over in the time T, or the velocity V $\times \frac{571}{1000}$. But this is the velocity with which *water* could ſpring in vacuo to near $\frac{1}{3}$ of the height of the *water* above the hole.

7. But when the motion of *water* is turned upwards, as in fountains, theſe are ſeen to riſe almoſt to the entire height of the *water* in the ciſtern. Therefore the *water*, or at leaſt ſome portion of the *water*, ſpouts from the hole with almoſt the whole velocity V, and certainly with a much greater velocity than V $\times \frac{571}{1000}$.

8. Hence it is evident, that the particles of *water*, which are in the hole in the ſame point of time, do not all burſt out with the ſame velocity, or have no common velocity; though ſome mathematicians have hitherto taken the contrary to be certain.

9. At a ſmall diſtance from the hole, the diameter of the vein of *water* is much leſs than that of the hole. For inſtance, if the diameter of the hole be 1, the diameter of the vein of *water* will be $\frac{21}{25}$, or 0.84, according to Sir Iſaac Newton's meaſure, who firſt obſerved this phænomenon; and according to Poleni's meaſure $\frac{20}{26}$, or $\frac{20\frac{1}{2}}{26}$, that is, taking the mean diameter 0.78, nearly.

As to the manner of accounting for theſe phænomena we have already obſerved that authors are not agreed; and it would be far beyond our deſign to ſtate their different theories, we muſt therefore refer to the originals above quoted.

Neither are authors agreed as to the force with which a vein of *water*, ſpouting from a round hole in the ſide of a veſſel, preſſes upon a plane directly oppoſed to the motion of the vein. Moſt authors agree that the preſſure of this vein, flowing uniformly, is equal to the weight of a cylinder of *water*, the baſis of which is the hole through which the *water* flows, and the height of which is equal to the height of the *water* in the veſſel above the hole. The experiments made by Mariotte and others ſeems to countenance this opinion. But Mr. Daniel Bernoulli rejects it, and eſtimates this preſſure [b] by the weight of a cylinder, the diameter of which is equal to the contracted vein, (according to Sir Iſaac Newton's obſervation above mentioned) and the height of which is equal to twice the height of the *water* above the hole, or, more accurately, to twice the altitude correſponding to the real velocity of the ſpouting *water:* and this preſſure is alſo equal to the force of repulſion [c], ariſing from the reaction of the ſpouting *water* upon the veſſel. For he ſays that he can demonſtrate, that this force of repulſion is equal to a preſſure exerted by a vein of ſpouting *water* upon a plane directly oppoſed to its motion, if the whole vein of *water* ſtrikes perpendicularly againſt the plane. From whence it would follow, that the preſſure or force of the vein will be greater in proportion, as its contraction is leſs; and this contraction vaniſhing, as it does when the *water* ſpouts thro' a ſhort tube, and the vein being at the ſame time ſuppoſed to have the whole velocity it can acquire by theory, the ſpouting *water* will then exert a preſſure double to what is commonly ſuppoſed. But the actual velocity of the *water* being always ſomething leſs than it ought to be by theory, and the vein of *water* being not uncommonly contracted to almoſt one half, experiments have led authors to think that the preſſure, exerted by ſpouting *water*, was equal to the weight of a cylinder of the ſame diameter with the vein, and of the height of the *water* above the hole. The ingenious author remarks, that he ſpeaks only of ſingle veins of *water*, the whole of which are received by the planes upon which they preſs: for as to the preſſures exerted by fluids ſurrounding the bodies they preſs upon, as the wind, or a river, the caſe is different, though confounded with the former by writers on this ſubject.—[[b] Hydrodynamica, ſect. 13. p. 289. [c] Ib. p. 279.]

Mr. Bernoulli endeavours to confirm his theory by a diſſertation in the eighth volume of the Acta Petropolitana [d]; where he obſerves, that the experiments formerly [e] made before the Academy of Sciences at Paris, to eſtabliſh the quantity of the preſſure exerted by a vein of ſpouting *water*, are very far from proving the truth of the rule they are brought to eſtabliſh. For inſtance, in one of thoſe experiments, the height of the *water* in the veſſel above the hole from whence the vein ſpouted was two feet Paris meaſure, the diameter of the circular hole which was cut in the horizontal bottom of the veſſel was four lines, and the force of the vein of *water* was obſerved to be one ounce and three quarters. But the weight of a cylinder of *water* of the diameter of the hole, and of the height of the *water* in the veſſel, is ſcarce equal to one ounce and three eighths. The difference therefore is at leaſt $\frac{3}{8}$ of an ounce, which is about $\frac{3}{11}$ of the whole weight of the beforementioned cylinder of *water*. So that it is ſurpriſing, that this difference ſhould have been aſcribed to the removal of the plane, receiving the impulſe, to ſome diſtance from the hole; for this cauſe, ſuppoſing the plane removed to the diſtance of two inches, could not produce an increaſe of $\frac{1}{18}$ of an ounce. It appears therefore, that the common opinion is rather overturned, than confirmed by experience.—[[d] P. 114. [e] *Du Hamel*, Hiſt. Acad. Paris, An. 1679. ſect. 3. cap. 5.]

Mr. Bernoulli, on the other hand, thinks his own theory ſufficiently eſtabliſhed by the experiments he relates; for the particulars of which, we refer to the Acta Petropolitana, Vol. cit. p. 122, ſeq.

This ingenious author thinks, that his theory of the quantity of the force of repulſion, exerted by a vein of ſpouting *water*, might be uſefully applied to move ſhips by pumping; and he thinks the motion produced by this repulſive force would fall little, if at all, ſhort of that produced by rowing. He has given his reaſons and computations at length in his Hydrodynamica, p. 293 to 302.

The ſcience of the preſſures exerted by *water*, or other fluids in motion, is what Mr. Bernoulli calls *hydraulico-ſtatica*. This ſcience differs from hydroſtatics, which conſiders only the preſſure of *water* and other fluids at reſt; but hydraulicoſtatics conſiders the preſſure of *water* in motion. Thus the preſſure exerted by *water* moving through pipes, upon the ſides of thoſe pipes is an hydraulico-ſtatical conſideration, and has been erroneouſly determined by many, who have given no other rules in theſe caſes, but ſuch as are applicable only to the preſſure of fluids at reſt. See Hydrodynam. ſect. 12. p. 256, ſeq.

Raiſing of WATER, in hydraulics. The great uſe of raiſing *water* by engines for the various purpoſes of life are well known. Machines have in all ages been contrived with this view, a detail of the beſt of which, with the reaſons of their conſtructions, would be very curious and inſtructive. Monſieur Balidor has executed this in part in his Architecture Hydraulique, and it is to be hoped that he will ſoon finiſh that uſeful undertaking. Dr. Deſaguliers has alſo given us a deſcription of ſeveral engines to raiſe *water*, in his Courſe of Experimental Philoſophy, Vol. II. not to mention the compilers of treatiſes under the title of Theatres of Machines, &c.

Dr. Deſaguliers [f] has ſettled the maximum of engines for raiſing *water* thus: a man with the beſt *water*-engine cannot raiſe above one hogſhead of *water* in a minute, ten feet high, to hold it all day; but he can do almoſt twice as much for a minute or two. [[f] Experim. Philoſ. Vol. II. p. 498.]

Dr. Deſaguliers obſerves [g], that when we come to examine the beſt engines, and thoſe that are moſt cried up, if we look narrowly into them, and meaſure the *water* they deliver, and at what height they deliver it; or bring to calculation the beſt atteſted relations concerning them, we ſhall find that they do not exceed this maximum, though they may far outdo ſome very bad engine that they are compared with. —[[g] Ibid.]

The famous machine at Marli, though it has many ingenious contrivances, muſt yet be reckoned a bad one, if we conſider the vaſt loſs of force in it. This loſs, according to Mr. Daniel Bernoulli's [h] computation, is not leſs than $\frac{55}{56}$ of the abſolute force of the machine.—[[h] Hydrodynam. p. 182.]

Mr. Daniel Bernoulli [i] thinks that a man may, with the moſt perfect machine, raiſe one cubic foot of *water*, in one ſecond of time, to the height of one foot. But by an experiment he made at Geneva with a good pump, he found that a man could not raiſe above four fifths of that quantity. —[[i] Hydrodyn. p. 199.]

Yet the greateſt quantity, mentioned by Mr. Bernoulli, falls ſhort of Dr. Deſaguliers's maximum: for according to the Doctor's rule, one hogſhead being equivalent to eight cubic feet, and the raiſing one hogſhead of *water* to the height of 10 feet being equivalent to the raiſing 10 hogſheads of *water*, or 80 cubic feet, to the height of one foot, it follows, that a man may raiſe 80 cubic feet of *water*, in one minute, to the height of a foot. But by Mr. Bernoulli's rule, he can only raiſe 60 cubic feet of *water* to that height in the ſame time.

Engines for raiſing *water* are either ſuch as throw it up with a great velocity, as in jets; or ſuch as raiſe it from one place to

to another by a gentle motion. For the general theory of theſe engines, ſee *Daniel Bernoulli*'s Hydrodynamica, ſect. 9.

WATERS, among farriers, the name given to a diſtemperature of horſes. The hinder legs of theſe creatures are very ſubject to a defluxion of certain white, ſharp and corrupt humours, or *waters*, as they call them, which happen very rarely to the fore legs.

This diſeaſe is diſcovered by ſearching the paſterns, where, if a moiſtneſs is felt beneath the hair, and is extremely ſtinking, there is danger of its growing to the utmoſt height of this diſeaſe, in which it will grow all round the paſtern and paſtern joint, and ſometimes almoſt up to the very ham. Theſe *waters* frequently cauſe the paſterns to ſwell, keeping the legs ſtiff, and making the horſe lean; finally, they often ſeparate the fleſh from the coronet near the heel. This diſeaſe is very obſtinate and ſtubborn when once rooted in the horſe. It may eaſily be ſtopt in the beginning, but when of any continuance, it is an error to attempt to ſtop it, for if dried up ever ſo often, it will always return again. It is in vain to attempt a cure of this diſeaſe in the winter, unleſs it be but juſt begun; but in the ſummer ſeaſon all attempts ſucceed better, and what the farriers call the white honey charge has ſurpriſing effects, often performing a cure alone.

Some farriers diſtinguiſh between the *waters* and what they call *watery ſores*, though others call them only degrees of the ſame diſtemper. Thoſe who diſtinguiſh them, deſcribe the *watery* ſore as a white, corroſive, and malignant matter, iſſuing out of the pores of a horſe's leg, uſually on the lower part only, but ſometimes all over it; and beginning from a ſtinking matter, deadening the ſkin of the paſtern and fetlock, and by degrees looſening the hoof from the coronet at the heel. The breaking out of this matter is always uſhered by a ſwelling of the lower part of the leg, and attended with pain; and the humour at length acquiring a ſharp and venomous quality, it is attended with warts, clefts, and nodes, which in proceſs of time over-run the whole part, and render the cure very difficult.

This diſeaſe generally appears firſt on the outſide of the paſtern, and by degrees riſes up to the middle of the leg, peeling off ſome part of the hair all the way. The method of cure ſhould be this: as ſoon as a horſe is ſiezed with the diſtemper, he ſhould be blooded ſparingly, at the utmoſt not exceeding two pounds; after this he ſhould take large doſes of a decoction of guaiacum, or of box-wood, twice every day for eight days; after this he is to take three or four briſk purges, and then to have recourſe to the decoction again. In the interim, the hair muſt be all clean ſhaved off from the diſtempered part of the leg, and it muſt be rubbed with a wiſp of hay very often, and the *watery* ſores in it anointed with the following ointment. Take a pound of black ſoap, three ounces of ſpirit of wine, two ounces of common ſalt, and three ounces of burnt alum; there is to be as much meal or flower added to theſe, as will make the whole into a proper conſiſtence: this is to be laid on all the ſores without any covering or bandage, and the next morning it is to be waſhed off with a lee of aſhes freſh made. This anointing and waſhing is to be repeated every day, and between the effect of this, and of the internal remedies, the diſeaſe ſeldom fails of a cure, if it be not very obſtinate, or of very long ſtanding.

Bird-lime-WATER. See LIME-*twigs*, *Suppl.*

Citron-WATER. See the article CITRON-*water*, *Append.*

Diſtilled-WATERS. See the article DISTILLED, *Suppl.*

Diſtilled-WATERS of laurel-leaves poiſonous. See the article LAUROCERASUS.

Egra-WATER. See the article EGRANA *aqua*, *Suppl.*

Hay-WATER. See the article HAY, *Suppl.*

Montroſe-WATERS. See the article MONTROSE, *Suppl.*

Pepper-WATER. See the article PEPPER, *Suppl.*

Pyrmont-WATER. See the article PYRMONT, *Suppl.*

Quickſilver-WATER is made with four ounces of quickſilver to two quarts of ſpring *water* boiled to one quart.

This is reckoned an efficacious medicine in ſeveral caſes, as the worms and the itch in children, by Dr. Cheyne and others.

Rain-WATER. See the article RAIN, *Suppl.*

Sorrance-WATERS. See the article SORRANCE, *Suppl.*

Spa-WATER. See the article SPA-*water*, *Suppl.*

Tar-WATER. See the article TAR, *Suppl.*

Tiberiades-WATER. See the article TIBERIADES, *Suppl.*

Vitriolic-WATER. See the article VITRIOLIC, *Suppl.*

Ziment-WATER. See the article ZIMENT, *Suppl.*

WATER-*bellows*. See the article BELLOWS, *Suppl.*

WATER-*calaminth*, the name uſed by ſome for a ſpecies of *mint*. See the articles MINT and MENTHA, *Suppl.*

WATER-*creſs*, the name by which ſome call the *ſiſymbrium*, a diſtinct genus of plants. See the article SISYMBRIUM, *Suppl.*

WATER-*drop-wort*. See the article DROP-*wort*, ſupra.

WATER-*engine*, in mechanics. This term is ambiguous; for it may either ſignify an engine to raiſe *water*, or any engine that moves by the force of *water*.

WATER-*germander*. See the article GERMANDER, ſupra.

WATER-*hemp-agrimony*. See the article *Water*-HEMP, ſupra.

WATER-*lilly*. See the article LILLY, ſupra.

WATER-*parſnep*. See the article PARSNEP, ſupra.

WATER-*pepper*. See the article PEPPER, ſupra.

WAX (*Suppl.*)—*Thorough*-WAX, in botany, the name by which ſome call the *bupleurum*, or hare's ears. See the article HARE's *ears*, *Suppl.*

WAY, (*Suppl.*) the ſame with *weigh*. See WEIGH, *Cycl.*

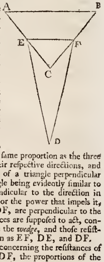
WAYFARING-*tree*, a name ſometimes given to the *viburnum*. See the article VIBURNUM, *Suppl.*

WEATHER (*Cycl.* and *Suppl.*)—WEATHER-*boarding*, among carpenters, &c. denotes the nailing up of boards againſt a wall, and ſometimes the boards themſelves when thus nailed up. Build. Dict. in voc.

WEATHER-*tiling*, among workmen, the covering the upright ſides of houſes with tiles. Id. ibid.

WEB-*caſe*, in natural hiſtory, the Engliſh name for what zoologiſts more uſually call *aurelia*, or *chryſalis*. See the article CHRYSALIS, *Append.*

WEDGE (*Cycl.*)—The effect of the *wedge* may be thus explained: Let ABC repreſent a *wedge* driven into the cleft EDF, of which DE and DF are the ſides; and if we ſuppoſe thoſe ſides DE and DF to react upon the *wedge* with directions perpendicular to DE and DF, let the horizontal line EF meet DF in F: then when the force impelling the *wedge*, ſuppoſed perpendicular to the horizon, is in equilibrio with the reſiſtances of the ſides of the cleft DE and DF, theſe three powers are in the ſame proportion as the three right lines EF, DE, and DF. But it follows from the compoſition of motion, that when three powers are in equilibrio with each other, they are in the ſame proportion as the three ſides of a triangle parallel to their reſpective directions, and conſequently, as the three ſides of a triangle perpendicular to their directions; ſuch a triangle being evidently ſimilar to the former. But EF is perpendicular to the direction in which the weight of the *wedge*, or the power that impels it, is ſuppoſed to act; and DE, DF, are perpendicular to the directions in which their reſiſtances are ſuppoſed to act, conſequently the power that impels the *wedge*, and thoſe reſiſtances, are in the ſame proportion as EF, DE, and DF.



If other ſuppoſitions are made, concerning the reſiſtances of the ſides of the cleft DE and DF, the proportions of the powers may be determined from the ſame principles. See *Mac Laurin*'s Account of Sir Iſaac Newton's Philoſophical Diſcoveries, p. 168, ſeq.

Mechanical writers have differed very much in determining the properties of the *wedge*, or the proportion between the moving force, and the reſiſtance the *wedge* meets with. In ſplitting of timber, the proportion here mentioned ſeems to take place, and that mentioned in the Cyclopædia wrong. In other caſes, different proportions might obtain; for a detail of which *Varignon*'s Nouvelle Mechanique, ſection 8. Vol. II. p. 149, ſeq. may be conſulted. See alſo 's*Graveſande*, Phyſ. Elem. Mathem. lib. I. cap. 14. ſchol. I.

WEED (*Suppl.*)—*Dyer*'s WEED, the Engliſh name of a genus of plants, known among botaniſts by that of *luteola*. See the article LUTEOLA, *Suppl.*

Silver-WEED, *pentaphylloides*, in botany, a diſtinct genus of plants. See the article PENTAPHYLLOIDES, *Suppl.*

WELL (*Suppl.*)—WELL, in ſhip-building, a ſquare place parted off and planked round the main-maſt, from the gun-deck down to the foot-waaling, to keep the ballaſt, &c. from the pumps placed therein. *Blanckley*'s Naval Expoſitor, in voc.

WHEAT, in botany, the Engliſh name of a diſtinct genus of plants, called by authors *triticum*. See the article TRITICUM, *Suppl.*

Cow-WHEAT, the Engliſh name of a diſtinct genus of plants, called *melampyrum* by botanical writers. See the article MELAMPYRUM, *Suppl.*

French-WHEAT, or *Buck*-WHEAT, in botany, a genus of plants, called by botaniſts *fagopyrum*. See the article FAGOPYRUM, *Suppl.*

Indian-WHEAT, a name ſometimes given to the *maiz* or *yucca*. See the articles MAIZ and YUCCA, *Suppl.*

WHEE, or WHEY, a word uſed in the northern parts of the kingdom for a heifer, or young cow. Ruſt. Dict. in voc.

WHEELS (*Cycl.*)—The *wheels* of all carriages ought to be exactly round, and the fellies ſhould be at right angles to the naves, according to the inclination of the ſpokes; that is, the plane of the curvature of the *wheel* ſhould cut the nave at right angles, though it need not paſs through the place where the ſpokes are inſerted into the nave.

The reaſon why the ſpokes ought to be inclined to the nave, ſo as the *wheels* may be diſhing, or concave, is this: in paſſing over unequal ground, that *wheel* which is in the rut bears

bears a greater part of the weight than the other, as being lower; now, in ſuch a caſe, the ſpokes of a diſhing *wheel* become perpendicular, and therefore have the greateſt ſtrength; whilſt the oppoſite *wheel*, being upon higher ground, bears a leſs part of the weight, and conſequently the ſpokes need not be at their full ſtrength. Indeed, if *wheels* always turned upon ſmooth and level ground, the ſpokes ought to be ſtrait upon the naves, or at right angles to their axes.

As to the axel-trees of *wheels*, they ought to be ſtrait in all reſpects, and at right angles to the ſhafts, or to the pole. It would alſo be much more advantageous to make the four *wheels* of a coach or waggon large, and nearly of a height, than to make the fore-*wheels* of only half the diameter of the hind-*wheels*, as is uſual in many places. Carriages too with four *wheels* have greatly the advantage of thoſe with two: for in applying horſes to a cart, or chaiſe with two *wheels*, it is plain that the tiller carries part of the weight, in what manner ſoever it be kept in equilibrio upon the axel-tree. In going down a hill, the weight bears upon the horſe; and in going up hill, the weight falls the other way and lifts the horſe, by which means part of his force is loſt. Beſides, as the *wheels* ſink into the holes in the road, ſometimes on one ſide, ſometimes on the other, the ſhafts ſtrike againſt the tiller's flanks, which is the deſtruction of many horſes. Add to this, that when one of the *wheels* ſinks into a hole or rut, half the weight will fall that way, whereby the cart will be in danger of being overturned.

We have a great many more obſervations concerning *wheel*-carriages in *Deſaguliers*'s Experim. Philoſoph. p. 201, ſeq.

Blowing-WHEEL, (*Suppl.*) a machine contrived by Dr. Deſaguliers for drawing out the foul air of any place, or for forcing in freſh, or doing both ſucceſſively without opening doors or windows. See Phil. Tranſ. N° 437.

The intention of this machine is the ſame as that of Dr. Hales's ventilator, but not ſo effectual, nor ſo convenient. See *Deſagul.* Courſe of Exper. Philoſ. Vol. II. p. 563—568. This *wheel* is alſo called a *centrifugal-wheel*, becauſe it drives the air with a centrifugal force.

Water-WHEEL *of a mill*, that which receives the impulſe of the ſtream by means of ladle-boards or float-boards. See the article FLOAT-*boards*, *Append.*

Mr. Parent, of the Academy of Sciences, has determined the greateſt effect of an under-ſhot *wheel* to be, when its velocity is equal to the third part of the velocity of the water that drives it. See MACHINE, *Append.*

In fixing an under-ſhot *wheel*, the workmen ought to conſider whether the water can run clear off, ſo as to occaſion no back-water to ſtop its motion. For a farther account of *water-wheels*, ſee *Deſaguliers*, Experim. Philoſ. Vol. II. p. 422, ſeq.

WHICKEN, a name ſometimes uſed for the *ſorbus*, or quick-beam. See the article SORBUS, *Suppl.*

WHIN, or GORSE, a name uſed in ſeveral parts of the kingdom for the *ulex* or *geniſta ſpartium* of botaniſts. See the article GENISTA *ſpartium*, *Suppl.*

WHIST, or WHISK, a well known game at cards. Several caſes of this game have been the objects of mathematical computations. Thus Mr. de Moivre has ſolved this problem: To find the odds that any two of the partners, that are pitched upon, have not the four honours? Mr. de Moivre concludes from his ſolution,

1°. That it is 27 to 2, nearly, that the dealers have not the four honours.

2°. That it is 23 to 1, nearly, that the eldeſt have not the four honours.

3°. That it is 8 to 1, nearly, that neither one ſide nor the other have the four honours.

4°. That it is 13 to 7, nearly, that the two dealers do not reckon honours.

5°. That it is 25 to 16, nearly, that either one ſide or the other do reckon honours, or that the honours are not equally divided.

The ſame learned author alſo determines, that the odds for the partners who are eight of the game, if dealers, againſt thoſe who are nine, is nearly as 17 to 11. But if thoſe who have eight of the game are eldeſt, the odds will be 34 to 29. And that without conſidering whether thoſe who are eight are dealers, or eldeſt, there is one time with another 7 to 5, nearly. But thoſe who have furniſhed the author with the data for the ſolution, not having ſtated them ſufficiently, the concluſion is deemed erroneous; but we know no body that has endeavoured to rectify it.

We ſhall here inſert another problem.

To find the chance of the dealer's having four trumps. One trump being certain, the problem is reduced to this, to find what probability there is that in taking at random 12 cards out of 51, whereof 12 are trumps, and 39 not trumps, 3 of the 12 ſhall be trumps.

By Mr. de Moivre's rules it will be found, that the total of the chances for the dealer = 92770723800; and that the total of the chances for taking any 12 cards out of 51 = 158753389900. The difference of theſe two numbers = 65982666100. The odds therefore will be 9277 &c. to 6598 &c.

Or we may compute the chance of three players having 10, 11, or 12 trumps among 39 cards. Then we ſhall find that the total of chances for taking 10, 11, or 12 trumps among 39 cards = 65982666100; and that all the chances out of 51 = 158753389900. The difference = 92770723800 = all the chances for the dealer, and the odds will be 9277 &c. to 6598 &c. as before.

The approximating ratios to the ratio of 9277 &c. to 6598 &c by Mr. Cotes's method, (ſee RATIO, *Suppl.*) are,

Ratios greater than true 2:1, 3:2, 10:7, 17:12, 24:17, &c.

leſs than true 1:1, 4:3, 7:5, 52:37, 97:69, &c.

But it is to be obſerved that the ratio 24 : 17, though expreſſed in much greater terms than 7 to 5, is extremely little nearer the truth; and the ratio 17 to 12 is not ſo near as 7 to 5; which ſhews that in practice we ſhould only retain the primary approximations of Cotes's method, for the ſecondary may lead us into error.

The bets for the dealer in this caſe, among the members of a great club, were formerly laid equal. But the vaſt odds of above 40 *per cent.* may ſhew how cautious gentlemen ought to be in laying bets without previous computation.

The odds in money in this caſe, is,

	l.	*s.*	*d.*	
more than	140	11	11½	to 100*l.*
leſs than	140	11	11¾	

WHORTLE, or WHORTLE-*berry*, the Engliſh name of a genus of plants, called by botaniſts *vaccinium*, or *vitis idæa*. See the article VITIS *idæa*, *Suppl.*

WIDGEON, in ornithology, the Engliſh name of a bird of the duck kind, with a brown head, a white front, and a tail black underneath. See the article DUCK, *Suppl.*

WIDOW-*wail*, a name by which ſome call the *cneorum* of botanical writers. See the article CNEORUM, *Suppl.*

WILLIAM, or *Sweet*-WILLIAM. See SWEET-*William*, ſupra.

Sweet-WILLIAM *of Barbadoes*. See SWEET, ſupra.

WILLOW (*Suppl.*)—*Dutch* or *Sweet*-WILLOW, the name by which the *myrica* of botaniſts is ſometimes called. See the article MYRICA, *Suppl.* and *Append.*

French-WILLOW, or *Podded* WILLOW-*herb*, names given to the *epilobium* or *chamænerium* of botanical writers. See the article CHAMÆNERIUM, *Suppl.*

WILLOW-*herb*, the Engliſh name of a genus of plants, called by botaniſts *ſalicaria*. See the article SALICARIA, *Suppl.*

WINCH, a popular term for a windlaſs. See the article WINDLASS, *Cycl.*

WINCH alſo denotes the crooked handle for turning round wheels, grind-ſtones, &c. *Blanckley*'s Naval Expoſitor.

WINCHING, in the manege, is ſaid of a horſe when he kicks, ſpurns, or throws out his hind feet. Ruſt. Dict. in voc.

WIND-*flower*, the Engliſh name of a genus of plants, called by writers on botany *anemone*. See the article ANEMONE, *Suppl.*

WIND-*ſeed*, the name by which ſome call the *arctotis* of botanical authors. See the article ARCTOTIS, *Suppl.*

WINDING *of ſilk*. We have an excellent machine for this purpoſe at Derby, contrived by Meſſieurs Thomas and John Lombe; but as the proprietors are not willing that a deſcription of it ſhould be made public, the following general account of it muſt ſuffice.

It conſiſts of no leſs than 26586 wheels, and 97746 movements. One water-wheel communicates motion to all the reſt of the wheels and movements, of which any one may be ſtopped ſeparately and independently of the reſt. One fire-engine conveys air to every part of the machine; and one regulator governs the whole work. 73728 yards of ſilk are *wound* every time the water-wheel goes round, which is three times every minute; ſo that 318,504,960 yards of ſilk may be *wound* every day and night, and conſequently 99,373,547,550 yards of ſilk in one year. See *Deſaguliers*, Experim. Philoſoph. Vol. I. p. 70.

WINTER-*cherry*. See the article CHERRY, ſupra.

WINTER-*creſs*. See the article CRESS, ſupra.

WINTER-*green*. See the article GREEN, ſupra.

WITCH-*hazel*. See the article HAZEL, ſupra.

WITHERING *of a cow*, is when, after calving, ſhe does not caſt her cleanſing, which if not timely remedied will kill her. Ruſt. Dict. in voc.

WITHY, a large ſpecies of willow, fit to be planted upon high banks and the ſides of ditches, within reach of the water, or on the weeping ſides of hills. Ruſt. Dict. in voc.

WOLF (*Suppl.*)—WOLF-*fiſh*, the Engliſh name of the *lupus marinus* of authors. See the article LUPUS *marinus*, *Suppl.*

WOOD (*Suppl.*)—*Almiggim*-WOOD. See the article ALMIGGIM, *Suppl.*

WOOD-*bine*, or WOOD-*bind*, the Engliſh name of a genus of plants, called by Tournefort *periclymenum*, but comprehended by Linnæus among the *loniceras*. See the articles PERICLYMENUM, *Suppl.* and LONICERA, *Append.*

WOOD-*men*, certain foreſt-officers appointed to take care of the king's *woods*. Ruſt. Dict. in voc.

WOOD-*roof*, or WOOD-*ruffe*, the Engliſh name of a genus of plants, called by botaniſts *aſperula*. See the article ASPERULA, *Suppl.*

WOOD-*ſage*. See the article SAGE, ſupra.
WOOD-*ſorrel*. See the article SORREL, ſupra.
WOODMEIL, a coarſe, hairy kind of ſtuff, made of Iceland-wool, with which the ſhip-carpenters, in ſome of his majeſty's yards, line the ports of ſhips of war. *Blanckley's* Naval Expoſitor, in voc.
WOODY-*nightſhade*. See the article NIGHTSHADE, ſupra.
WOOLDING, in the ſea language, denotes the winding of ropes, at certain diſtances, about a maſt, in order to ſtrengthen it. *Blanckley's* Naval Expoſitor, in voc.
WORM (*Suppl.*)—*Earth*-WORM. See the articles LUMBRICUS, *Append.* and WORMS, *Suppl.*
Golden-WORM, *vermis aureus*, a name ſometimes given to the *aphrodita*, a genus of ſea inſects. See the article APHRODITA, *Append.*
Guinea-WORM, or *Hair*-WORM, names uſed for the *chætia* of naturaliſts. See the article CHÆTIA, *Append.*
Sea-WORM. See the article LUMBRICUS, *Append.*
Tape-WORM. See the article TAPE-*worm*, *Suppl.*
WORMING *of a dog*, is the cutting out a nerve from under his tongue; by which means, it is ſaid, that if ever he runs mad, he will be rendered incapable of biting. Query the fact.
WOULD, a name uſed ſometimes by the farmers for the *luteola*, or dyer's weed. See the article LUTEOLA, *Suppl.*
WOUND-*wort*, the name of a genus of plants, called by botaniſts *vulneraria*. See the article VULNERARIA, *Suppl.*
WOUND-*wort* is alſo the name of the *ſolidago*, another genus of plants, called by Tournefort *virga aurea*, or golden rod. See the article VIRGA, *Suppl.*
WOUND-*wort of Achilles*, a name ſometimes given to the *millefolium*, or yarrow. See the article MILLEFOLIUM, *Suppl.*
WREN. See JENNY-*wren*, *Suppl.*
WYTHERS, the ſame with *withers*. See WITHERS, *Cycl.*

XIPHOS, Ξιφος, among the Athenians, a capital puniſhment by beheading with the ſword. *Potter*, Archæol. Græc. Tom. I. p. 133. See the article PUNISHMENT, *Cycl.*

XYLOSTEUM, in botany, the name of a genus of plants, according to Rivinus, but comprehended under the *lonicera* by Linnæus. See the article LONICERA, *Append.*

Y.

YAMS, in botany, a name ſometimes uſed for the *rhizophora* of Linnæus. See the article RHIZOPHORA, *Append.*

YARD (*Suppl.*)—The *yards* of ſhips are uſually faſhioned into eight ſides in the middle, and from thence taper to the ends in ſixteen.

The top and top-gallant *yards* are generally made out of Gottenburg, or Norway maſts: all which are made of ſuitable dimenſions, both in diameter and length. *Blanckley's* Naval Expoſitor, in voc.

YARN (*Suppl.*)—*Marking*-YARN, in ſhips of war. See the article MARKING, *Append.*
YARROW, the Engliſh name of a genus of plants, called by botaniſts *millefolium*. See the article MILLEFOLIUM, *Suppl.*
Water-YARROW, the Engliſh name of the *hottonia*, a diſtinct genus of plants. See the article HOTTONIA, *Suppl.*
YEANING, a term uſed for an ewe's lambing, or bringing forth a lamb. Ruſt. Dict. in voc.
YEARNING, the ſame with *earning*. See EARNING, *Append.*
YEOMAN *of the ſalt ſtores*. See ACATARY, *Cycl.*

ARTICLES omitted.

ELECTRICITY (*Cycl.*)—A body in which *electricity* may be excited by some action upon that body, as rubbing, patting, or warming it, and sometimes only exposing it to cold and dry air, after it has been covered, is called an *electric per se*: such are glass, crystals, and pretious stones; resins, gums, sulphur, sealing wax, and most dry parts of animals, as silk, hair, and the like.

Electrics per se are also called original *electrics*.

A *non-electric per se* or simply a *non-electric*, is a body in which *electricity* cannot be excited by any action upon the body itself; or at least one in which that property, if at all, is very slightly perceptible. Of this kind are wood, animals, living or dead, vegetable substances, water and metals.

But *non-electrics* receive *electricity*, when brought near to *electrics per se*, in which *electricity* has been excited.

In order to know that *non-electrics* have received the communicated *electricity*, they must be insulated; that is, they must not be suspended from, or supported by any bodies, but what are *electrics per se*: for if one *non-electric* be touched by another, and this by a third, &c. all the *electricity* received by the first will go to the second, and from this to the third &c. till at last it be lost upon the ground. But if several *non-electrics* touching one another, are at last terminated by *electric* bodies, in that respect they make but one body, and receive and retain *electricity* for some time. However it must be observed, that bodies slightly *non-electric*, such as dry wood, may serve for supporters to those bodies which are very highly *non-electric*, as metals.

Electricity may be communicated to *non-electrics* by applying a glass tube or globe, excited by friction, to one end of those bodies; and there are several ways of finding when the *non-electrics* have received the *electricity*. Thus, if an iron bar be suspended horizontally by two silken strings that are very dry, and the rubbed tube be applied, or brought near to one of the ends of the bar, and then some leaf-gold, or leaf-brass, or any other light bodies, placed upon a small stand, or a plate, be brought near the other end, they will be alternately attracted and repelled by the bar. Likewise, if the finger be brought near the end, or other part, of the bar, the *electrical* effluvia will give a very sensible and sometimes painful stroke, with a snapping noise, and produce a flash of light. If the communicated *electricity* should prove too faint to be tried this way, a small flaxen thread, suspended by a stick, may be brought near the body that has been *electrified*; and if the *electricity* has been communicated, even in a small degree, the thread will be attracted without destroying the *electricity* received by the body till after some time. This thread Doctor Desaguliers calls the *thread of trial*.

It is to be observed, that an *electric per se* does not receive this virtue from another *electric per se*, though excited, till it is become a *non-electric*; which happens when it is made wet or moist; and then it will be made *electric* only by communication. *Electric* bodies, in which it is difficult to excite *electricity*, may be looked upon as *non-electrics*, when their *electricity* is not excited; and then they will be in the same condition as *non-electrics per se*, and be liable to receive *electricity* by communication in the same manner.

From what has been said, it appears that *non-electrics* are conductors of *electricity*. Water conducts it very well, but metals are the most convenient conductors.

These things being premised, we shall here add some of the principal phænomena of *electricity*; that is, such as seem to give some light towards a theory of this wonderful property of bodies.

1. When the *electricity* of a glass tube has been excited by rubbing, if you move your fingers long-wise from one end of the tube to the other, but without touching it, you will hear a continued snapping, like a distant noise of thorns burning; and if the room be darkened, you will see sparks of light wherever the tube snaps; and likewise a light following the hand that rubs the tube.

2. A down feather being tied to the top of a wooden broach or skewer, of about six or seven inches in height, and fixed upright upon a foot, if you bring the excited tube near it, all the fibres of the feather stretch out towards the tube; but as soon as you remove the tube, the fibres of the feather turn back, and stick strongly to the skewer. If you bring your finger near to the feather, while its fibres are tending towards the tube, the finger will repel them; but as soon as you remove the tube, they are attracted by the finger. If you cover the feather with a very dry glass recipient, such as is used on the air-pump, the tube will attract the feather in the same manner through the glass: and this happens, even when the recipient has been exhausted of its air by the pump. When the tube is rubbed near the recipient, whether it be full of air or empty, the fibres of the feather follow the motion of the hand along the tube, arising upon the broach or skewer.

3. Without making use of the tube, if you rub the recipient that covers the feather with both hands, the fibres of the feather will stretch themselves out towards the glass, like the rays of a sphere. If you rub but with one hand, the fibres will stretch themselves towards that part of the glass which is rubbed; and when you blow against the glass, those fibres will be repelled, notwithstanding the interposition of the glass: which happens also, when you strike the air with the hand towards the feather, without touching the recipient.

4. After the tube has been rubbed, if any assistant lets go a down feather in the air, at the distance of a foot or two from the tube, the feather will jump towards the tube with an accelerated motion, and adhere to it for some time; and then of a sudden it will be repelled from the tube, and will fly about the air in such manner, that the nearer you bring the tube to it, the more it will be repelled, till it has touched some other body; and then it will be drawn again by the tube; which after some time will drive it away again. Sometimes, when the finger is held at eight or ten inches from the tube, the feather will jump from the tube to the finger, and from the finger to the tube, thirty or forty times together.

5. If a string of any kind be stretched horizontally, and from the string you hang a thread of silk about three foot long, and very dry, and to the lower end of that thread you fasten a down feather; then, at the distance of about two or three feet, you hang up another feather, but by a flaxen thread; the rubbed tube being brought near will attract the first feather, which, when it has adhered to it a little while, will fly from the tube, and then be repelled by it every time the tube is brought near, till it has touched some other body, as in the preceding experiment, and then it will be attracted anew. But the feather, which is suspended by the flaxen thread, will always be attracted at the approach of the tube, and never repelled. And if you wet the silken thread, the feather hanging at it will be repelled no more, but always attracted by the tube.

6. If you make use of a tube which is hermetically sealed at one end, and has at the other end a brass ferril with a screw, by which means the air may be pumped out of it; if you rub the tube, after the air is exhausted, it does not attract any more, as has already been taken notice of in the Cyclopædia, N° 7; nor does the tube give the light before mentioned, N° 2, but it gives much more light within. Then if, by opening the cock a little way which is fastened to the tube, the air be let in slowly, while the tube is rubbed, the light diminishes; and being interrupted by the air, as it comes in, looks like lightning at a distance, till all the air is come in, and then there is no more light within; but the light goes all to the outside, and the attraction returns.

7. If two small boards, or two small octavo books, be set edge wise, parallel to each other, and about the distance of ten inches asunder, upon a stand of seven or eight inches diameter; little pieces of leaf gold, or brass, laid upon the stand between those boards, will not be attracted by the rubbed tube held near them, till it be brought quite between the said boards, as near to the stand as half the distance of the boards from each other: that is, when the tube is so held, that a circle described round the axis of the tube, with the distance that is between that axis and the stand, passes between the boards or books without touching them. But when the rubbed tube being held horizontally, at the distance of a foot from the stand, seems to have no virtue, because the leaf-gold has no motion, if an assistant snatches away the boards, all on a sudden the pieces of gold will be attracted and repelled several times, without giving any new friction to the tube.

8. When the air is very dry, and the rubbed tube can attract the leaf-gold laid on a small stand, to the distance of three foot or beyond; if the same leaf-gold be laid upon a table, or any large surface, the excited tube must be brought very near before it can produce its effect.

9. When the air is moist, the experiment, N° 4, does not succeed well: for after the feather in the air has been some time driven about by the tube, it comes back of itself to the tube, without having touched any other body; and sometimes after having adhered to the tube, towards the middle of it, it flies off from it, and comes again immediately to the tube, sticking to that part of it which is farthest from the hand. It happens also, when the air is very dry, and the tube repels the feather, after having attracted it, to the distance of two or three feet, that if you wet the top of the tube at the end, for the length of six or seven inches, the feather will come and stick to that end of the tube, without having touched any other body.

10. Having

10. Having filled with water a ſmall drinking glaſs, of about an inch diameter, when you bring the rubbed tube near it, the water riſes in a little hill, accumulated at the edge of the glaſs; ſometimes jumping towards the tube in a little jet, ſo ſmall that you can hardly ſee it, though you may find the tube wholly wet with it. One may alſo obſerve, that this accumulated water riſes in the ſhape of a ſmall cone, whoſe axis is ſometimes ſtretched out horizontally towards the tube, then ſnaps and falls down again flat upon the reſt of the water. If this experiment be made in the dark, a flaſh of light accompanies the ſnapping.

11. If by means of an artificial fountain, in which air is condenſed upon the water to make it ſpout, you play a ſmall jet, of about the fortieth part of an inch diameter, upwards or downwards; the rubbed tube being brought near, the jet will bend towards the tube at the diſtance of a foot; and if the tube be brought nearer, the jet being wholly drawn away by the tube, is changed into a dew upon the tube, ſo that it adheres to the tube in little drops, provided the jet be not made to ſpout with too much force.

12. If a packthread or hempen ſtring be ſtretched horizontally to the length of about twelve hundred feet, at the end of which is ſuſpended an ivory ball of about an inch and an half in diameter; this ball will draw and repel leaf-braſs, or leaf-gold, when the rubbed tube is brought near the other end of the ſtring, and the thread of trial being brought near to the ball, is attracted by it.

In this experiment the ſupporters of the ſtring muſt be *electrics per ſe*, whether they be hair-ropes, fiddle-ſtrings, or cat-guts, ribbons, ſtrings of ſilk, glaſs tubes, long bodies of ſulphur or of reſin, *&c.* and all theſe bodies muſt be very dry. If the ſtring be wet, the experiment will ſucceed the better.

This experiment was, we believe, firſt made by the late Mr. Stephen Gray; and it might be improved, by employing an iron wire inſtead of a packthread or hempen ſtring. When an iron wire is uſed, its ſupporters might be wooden ſticks, being *non-electrics* in a ſlighter degree, as before obſerved; but *electrics* are beſt.

The conductor of *electricity*, in theſe and the like caſes, need not be ſtretched at length, but may be carried backwards and forwards in parallel or other lines, provided they be not placed too near to each other, but at a proper diſtance, as, for inſtance, three feet.

13. If two or three iron bars be ſuſpended in the ſame horizontal line, at the diſtance of ſix inches from one another, the *electricity* communicated by the rubbed tube to the end of one of the bars will go on from the one to the other quite to the end of the laſt bar, where a pricking will be felt, a noiſe heard, and a flaſh of fire ſeen. If the air is dry, the *electricity* will jump from one bar to another at a greater diſtance; but in moiſt weather, the bars muſt not hang at above an inch diſtance from each other.

Theſe experiments may be made with a glaſs tube, about three foot and an half long, an inch and an half in diameter, and about $\frac{1}{12}$ of an inch thick, open at both ends, but ſometimes hermetically ſealed at the end fartheſt from the hand. Theſe proportions are not neceſſary, but only convenient for the hand; and the glaſs of the tube ought not to be leſs than $\frac{1}{12}$ of an inch in thickneſs; for when thinner, the *electricity* is indeed ſooner excited by friction, but it does not laſt ſo long as when the tube is thicker. See *Deſaguliers's* Diſſertation concerning *Electricity*, in his Experim. Philoſ. Vol. II. p. 316. ſeq.

The Doctor obſerves with Monſieur du Fay, that there are two ſorts of *electricity*, a reſinous, and a vitreous kind. One of the experiments, upon which this difference is eſtabliſhed, is as follows.

14. If a down feather be ſuſpended by a ſilken thread, as in the experiment N° 5, ſealing-wax, well rubbed, will produce the ſame effect as the tube, but more weakly, drawing the feather; and when once it is ſeparated from the wax, the wax repels it continually, till the feather has touched ſome other body. But the difference here is, that when the feather is in a ſtate of repulſion, in reſpect of the wax, the rubbed tube attracts it; and when the tube has given the feather its repulſive ſtate, then the rubbed wax attracts it: which ſhews, according to theſe gentlemen, that the *electricity* of glaſs is different from the *electricity* of ſealing-wax; and the like may be obſerved of other reſinous ſubſtances.

But, perhaps, this phænomenon may be accounted for, by ſuppoſing, as the truth is, that the *electrical* power of excited glaſs is ſtronger than that of ſealing-wax, and then from Mr. Ellicott's hypotheſis, hereafter mentioned, the phænomenon follows.

Doctor Deſaguliers has deduced from his experiments, that bodies which are *electric per ſe*, being excited to *electricity*, repel all other bodies that have *electricity*, but attract them as ſoon as they have loſt their *electricity*; and ſo *vice verſa*. Theſe deductions agree very well with Mr. Ellicott's mentioned below.

The Doctor conjectures alſo, that the particles of pure air are *electric* bodies, always in a ſtate of *electricity*, and that vitreous *electricity*, and from this *electricity* of the air, he conjectures, ingeniouſly, that the riſe of vapours may depend upon *electricity*. See the Diſſertation before cited.

To theſe experiments related, among others, by Dr. Deſaguliers, we muſt add from Mr. Ellicott [a], that when the tube, N° 1, is ſtrongly excited, ſparks will not only iſſue from it in ſtreams while it is rubbing, but will continue to dart out from it for a conſiderable time after the rubbing has ceaſed, and a very ſtrong offenſive ſmell will be perceived.—[a Several Eſſays towards diſcovering the Laws of *Electricity*, Lond. 1748.]

15. The ſame gentleman obſerves, that if a ball (of cork ſuppoſe, for lightneſs) be hung by a ſilk line, and the excited tube is applied to it, it will not only be attracted, but will have an attractive quality communicated to it from the tube; and if any light bodies are brought near the ball, they will be attracted by it.

16. As the tube, when ſtrongly excited, will not only attract, but afterwards repel any light bodies brought near it, in like manner the cork-ball will be endued with the ſame property; ſo that a ſmaller ball will firſt be attracted towards it, and then repelled from it, in the ſame manner as the leaf-gold in the beforementioned experiments; and on touching any other body, it will be again attracted; and this may be repeated ſeveral times, provided the ſmaller ball is much leſs than the larger one. But the effect will conſtantly grow weaker and weaker; becauſe every time the leſſer ball is attracted, it carries off with it ſome of the *electric* virtue, and is likewiſe endued with the ſame properties as the larger ball.

Mr. Gray, Monſieur du Fay, and others have obſerved, that this *electrical* quality is not only to be excited in glaſs, but in moſt ſolid bodies capable of friction, metals excepted; though in ſome it will ſcarce be ſenſible. And this *electrical* power is found to be ſtrongeſt in wax, reſins, gums and glaſs. And as glaſs is the eaſieſt procured of a proper form, it has generally been uſed in making theſe experiments. It has been further obſerved, that thoſe bodies, in which the *electrical* quality is capable of being excited the ſtrongeſt by friction, will receive the leaſt quantity of it from any other excited body, and therefore are properly made uſe of, to ſupport any body deſigned to receive the *electrical* virtue. The truth of this will ſufficiently appear from the following experiments.

17. Two lines, one of ſilk, and the other of thread, being hung up, (as in the experiment, N° 5.) that of thread will be attracted by the tube at a much greater diſtance than the ſilk. If a feather, or other light body, be faſtened to each ſtring, and if the tube be brought to the feather faſtened to the ſilk, it will not only be firſt attracted and then repelled, as has been ſaid N° 5, but by the virtue communicated to the feather from the tube, the ſeveral fibres of the feather will ſtrongly repel each other. On the contrary, the feather faſtened to the thread will be ſtrongly attracted by the excited tube, and not repelled, the virtue paſſing off by the thread it is hung to. If a glaſs ball is hung to the ſilk line, it will be but weakly attracted by the tube; but one of cork or metal will be ſo much more ſtrongly.

18. Let a rod of iron be ſuſtained by ſilk lines, and by means of a glaſs ſphere (which can be more regularly and conſtantly excited than a tube) be made *electrical*, it will be found to have all the properties of the excited tube firſt mentioned. A ſtream of light will come from the end of it, if it is pointed. It will attract, repel, and communicate this virtue to any other *non-electric* body. On the approach of a *non-electric*, a ſpark of fire, with a ſnap attending it, will come from it; which ſpark will be greater or leſs, as the bodies approaching it have more or leſs of the *electrical* quality reſiding in them; and there will likewiſe be the ſame offenſive ſmell as was obſerved of the glaſs tube.

19. Let a rod of iron, pointed at one end, be ſuſpended on ſilk lines, as in the laſt experiment, and by the ſphere be made *electrical*. When the rod is ſtrongly *electrified*, a ſtream of light in diverging rays will be ſeen to iſſue from its point; and if any *non-electric* body is held a few inches from the point, the light will become viſible to a greater diſtance; and if the *non-electric* body is likewiſe pointed, a light will ſeem to iſſue from that in diverging rays, in the ſame manner as from the *electrified* rod. But if the *non-electrical* body is flat, and held at the ſame diſtance from the rod as the pointed one was, no light will be ſeen to come from it. It is alſo to be obſerved, that the effluvia from the end of the *electrified* rod ſtrike againſt the hand or face, brought near to that end, like a blaſt of wind.

20. If the *non-electric* body, whether flat or pointed, be brought nearer to the end of the rod than in the laſt experiment, there will be a ſmall ſtream of light produced, reaching quite from the *electric* to the *non-electric* body; and if brought ſtill nearer, there will iſſue a ſpark, attended with a ſmall ſnapping noiſe, which will be ſucceeded by others at equal intervals; and if the *non-electric* is held at ſome diſtance from the ſide of the rod, the point of it will frequently appear luminous, but no part of the *electrified* rod will be ſo. If it is brought nearer, there will likewiſe be ſparks

ſparks produced, at nearly equal intervals from each other, which will ſometimes appear as iſſuing from the ſide of the *electrified* rod, at others, as coming from the *non-electric*.

21. Take two plates of metal, very clean and dry, whoſe ſurfaces are nearly equal; hang one of them horizontally to the *electrified* rod, and bring under it, upon the other, any thin, light body, as leaf-ſilver, *&c.* when the upper plate is made *electrical*, the ſilver will be attracted by it; and if the under plate is held at a proper diſtance, will be perfectly ſuſpended at right angles to the plates, without touching either of them; but if they are either brought nearer together, or carried farther aſunder, the leaf-ſilver will ceaſe to be ſuſpended, and will jump up and down between them. The ſame effect will be produced, if you reverſe the experiment, by *electrifying* the bottom plate, and ſuſpending the other over it. See Mr. *Ellicott*'s Eſſays before mentioned.

22. By the experiments made in Germany, and repeated in England by Mr. Watſon, it appears, that ſpirit of wine may be ſet on fire by the power of *electricity*. This will ſucceed not only with the etherial liquor, or phlogiſton of Frobenius, and rectified ſpirit of wine, but even with common proof ſpirit. But all theſe muſt be warmed a little, ſo as to emit an inflammable vapour.

And the experiment ſucceeds equally well, whether an *electrified* perſon, or other *electrified* body, be brought near the not *electrified* ſpirit; or whether the *electrified* ſpirit be brought near a *non-electric* body.

This laſt method of firing the ſpirit is ſaid, by Mr. Watſon, to be done by the repulſive power of *electricity*. And the former, where the not *electrified* ſpirit is fired by its being brought near to a man ſtanding upon a cake of wax, or to a ſword, or bar of metal, ſuſpended by ſilk lines, is ſaid to be performed by the attractive power of *electricity*. Of theſe two kinds, the repulſive power has generally been found the ſtrongeſt.

23. Not only ſpirits of wine, but alſo ſal volatile oleoſum, dulcified ſpirit of nitre, Peony water, Daffy's elixir, Helvetius's ſtyptic, and ſome other mixtures, where the ſpirit has been very conſiderably diluted, may be fired by the power of *electricity*; and ſo may diſtilled vegetable oils, as that of turpentine, lemon, orange peels, juniper, and even thoſe which are ſpecifically heavier than water, as oil of ſaſſafras; alſo reſinous ſubſtances, ſuch as balſam capivi and turpentine; all which ſend forth, when warmed, an inflammable vapour. The inflammable vapour, produced by putting an ounce of filings of iron, an ounce of oil of vitriol, and four ounces of water into a Florence flaſk, may be fired by the ſame means; as may alſo gunpowder, if ground with a little camphor, or with a few drops of ſome inflammable chemical oil. To increaſe the ſurpriſe, theſe ſubſtances may be fired by ice, or by a drop of water, only thickened a little with the ſeeds of fleawort.

All theſe experiments have ſucceeded, though not always in damp weather, with a glaſs tube rubbed by the hand merely; but if a greater *electrical* force be excited, by means of a globe, theſe experiments will ſucceed in any weather, though not with equal eaſe.

24. If ſome oil of turpentine is ſet on fire in any veſſel, held in the hand of an *electrified* man, the thick ſmoke that ariſes therefrom, received againſt any *non-electric* of a large ſurface, held in the hand of a ſecond man ſtanding upon an *electrical* cake; this ſmoke will, at a foot diſtance from the flame, carry with it a ſufficient quantity of *electricity*, for the ſecond man to fire any inflammable vapour. The *electrical* ſtrokes have been likewiſe perceptible upon the touching the ſecond man, when the *non-electric* held in his hand has been in the ſmoke of the oil of turpentine between ſeven and eight feet above the flame. Here we find the ſmoke of an original *electric*, a conductor of *electricity*.

25. Likewiſe, if burning ſpirit of wine be ſubſtituted in the place of the oil of turpentine, and if the end of an iron rod, in the hand of the ſecond man, be held at the top of the flame, this ſecond man will kindle other warm ſpirits held near his finger. Here we find, that flame conducts the *electricity*, and does not perceptibly diminiſh its force. The like is to be obſerved of red-hot iron; and of the coldeſt mixtures that art can produce.

26. Of all the ſurpriſing phænomena of *electricity*, none ſeems to be more ſo, than the extraordinary accumulation of the *electrical* power in a phial of water, firſt diſcovered by Profeſſor Muſchenbroek of Leyden. The experiment is this: a phial of water is ſuſpended to a gun-barrel by a wire let down a few inches into the water through the cork; and this gun-barrel, ſuſpended in ſilk lines, is applied ſo near an excited glaſs globe, that ſome metallic fringes, inſerted into the gun-barrel, touch the globe in motion. Under theſe circumſtances a man graſps the phial with one hand, and touches the gun-barrel with a finger of the other; upon which he receives a violent ſhock through both his arms, eſpecially at his elbows and wriſts, and acroſs his breaſt. The experiment ſucceeds beſt *cæteris paribus*, 1°. when the air is dry. 2°. When the phial, containing the water, is of the thinneſt glaſs. 3°. When the outſide of the phial is perfectly dry. 4°. In proportion to the number of points of *non-electric* contact. Thus if you hold the phial only with your thumb and finger, the ſnap is ſmall; larger when you apply another finger, and increaſes in proportion to the graſp of your whole hand. 5°. When the water in the phial is heated, which being then warmer than the circumambient air, prevents the condenſation of the floating vapours therein upon the ſurface of the glaſs.

A gun-barrel is not neceſſary in theſe experiments; a ſword, or any other ſolid piece, or tube of metal, is equally uſeful. Mr. Watſon has given us many curious obſerva ions relating to this experiment, and has varied it a great many ways. Among other things he obſerves, that the phial may be *electrified* by applying the wire therein to the globe in motion; after which, if it is graſped in one hand, and the wire touched with a finger of the other, the ſtroke is as great as from the gun-barrel. And if you graſp the phial with your hand, and do not at the ſame time touch the wire, the acquired *electricity* of the water is not diminiſhed. So that, unleſs by accident or otherwiſe the wire is touched, the *electrified* water will retain its force many hours, may be conveyed ſeveral miles, and afterwards exert its force upon touching the wire.

To prove Mr. Watſon's aſſertion that the ſtroke is *cæteris paribus*, as the points of contact of *non-electrics* to the glaſs, Dr. Bevis wrapped up two large round bellied phials in very thin lead ſo cloſe as to touch the glaſſes every where, except their necks. Theſe were filled with water, and corked, with a ſtaple of ſmall wire running through each cork into the water. A piece of ſtrong wire about five inches long, with an eye at each end, was provided, and at each end of this, hung one of the phials of water by the ſmall ſtaple running through the cork. A ſmall wire loop was then faſtened into the lead at the bottom of each phial, and into theſe loops was inſerted a piece of ſtrong wire like the former. If then theſe phials were hung acroſs the gun-barrel and *electrified*, and a perſon ſtanding upon the floor touched the bottom wire with one hand, and the gun-barrel with the other, he received a moſt violent ſhock through both his arms and acroſs his breaſt. The *electrical* exploſion has been ſince vaſtly increaſed. But Mr. Watſon is of opinion, that the violence of the exploſion of the *electric* force accumulated in the glaſs, is not ſo much owing to the quantity of *non-electrical* matters contained in the glaſs, as to the number of points of *non-electrical* contact within the glaſs, and the denſity of the matter conſtituting thoſe points, provided this matter be in its own nature a ready conductor of *electricity*. For a cylindrical glaſs jar blown very thin, of ſixteen inches in height, and eighteen inches in circumference, having been covered both within and without with leaf-ſilver to within an inch of its top, the exploſion from this jar was equal to that from three glaſſes, each about ſeventeen inches in height, and four in diameter, and filled with fifty pounds of leaden ſhot each. The exploſion in theſe caſes is ſo violent as to become dangerous; and has been found mortal not only to ſmall birds, but even to a rat; and Mr. Franklin killed a well-grown turkey with it.

27. A very conſiderable *electrical* exploſion may be made from a plate of glaſs thus: Let a thin plate of glaſs of about a foot ſquare, be covered on both ſides with leaf-ſilver; and make this adhere to the glaſs by a very thin paſte. A margin of an inch muſt be left on both ſides; otherwiſe, upon *electrifying* this plate, the *electricity* would be prevented from being accumulated upon one of its ſurfaces, by being propagated from the ſilver on one ſide to that of the other. When the glaſs plate is thus prepared, if it be placed upon a table in ſuch a manner, that when fully *electrified* by a wire or ſuch like from the prime conductor, a perſon touches the under ſurface with a finger of one of his hands, and brings one of the fingers of the other near the upper ſurface, or near the prime conductor, he will be ſhocked in both his arms and croſs his breaſt. The ſame effect happens, if when this plate is *electrified* as before, a perſon holds it in his hand by the margin, and without touching the ſilver, preſents it, even ſome time after it has been taken from the prime conductor, to another perſon, who touches the under ſurface with his finger, and holds it there till he touches the upper ſurface with a finger of his other hand. This is an experiment contrived by Dr. Bevis, who obſerves, that though the exploſion from the glaſs plate ſilvered was occaſioned by about ſix grains of ſilver, upon which the *electricity* was accumulated, yet the exploſion was equal if not ſuperior to that from half a pint of water contained in a thin glaſs as uſual.

28. The commotion ariſing from the diſcharge of the accumulated *electricity* in the phial, may be felt by a great number of men at once. Monſieur le Monnier, at Paris, is ſaid to have communicated this ſhock through a line of men, and other *non-electrics*, meaſuring nine hundred toiſes, which is more than an Engliſh mile; and the Abbé Nollet [a] made the experiment upon 200 perſons, ranged in two parallel lines.—[[a] Lettres ſur l'*Electricité*, p. 207.]

29. This *electrical* commotion has been made very ſenſible quite acroſs the river Thames, by the communication of no other medium than the water of that river; and ſpirit of wine has been fired at that diſtance.

30. The commotion has alſo been perceptible to two or more

more obfervers at confiderable diftances from each other, even as far as two miles.

In thefe laft experiments, and in many others of the like nature, Mr. Watfon obferves, that the *electrical* power, accumulated in any *non-electric* matter contained in a glafs phial, defcribes upon its explofion a circuit through any line of fubftances *non-electrical* in a confiderable degree; if one end thereof is in contact with the external furface of this phial, and the other end upon the explofion touches either the *electrified* gun-barrel, to which the phial in charging is ufually connected, or the iron hook always fitted therein. Thus if a perfon ftands upon a dry wooden floor with a coated phial ever fo highly charged in one of his hands, and if another perfon, without touching the firft, ftands but fix inches from him, and touches the iron hook of the phial, neither of them are fhocked; becaufe the floor between them, though the diftance is fo fhort, will not conduct the *electricity* fufficiently quick. But if thefe two perfons tread upon a piece of wire laid between them, they each of them feel the *electrical* commotion in that arm which touches the phial and hook, and in that foot which treads upon the wire; the wire here conducting the *electricity* quick enough, which the dry floor would not. The circuit is here formed by the coated phial, its hook, fo much of the bodies of thefe two perfons as form a curve line between the wire, the phial, and hook, and the wire between thefe perfons. If thefe perfons ftand upon, or touch with any part of their bodies any *non-electrics*, which readily conduct *electricity*, the circuit is completed, and the effect is the fame. Hence Mr. Watfon infers, that when the obfervers have been fhocked at the end of two miles of wire, the *electrical* circuit is four miles; *viz.* two miles of wire, and the fpace of two miles of the *non-electric* matter between the obfervers, whether it be water, earth, or both. So in the experiments made near Weftminfter bridge, where the river is above 400 yards over, the circuit muft have been above 800 yards, *viz.* above 400 yards of conducting wire laid upon the Portland ftones of the bridge, and fomething more than 400 yards of water. That the water made part of the circuit, and that the fhock was not communicated from the Surry fhore to the other fide merely by the conducting wire, is evident from this, that if the obferver on the Weftminfter fhore did not communicate with the river, either by dipping his hand, or an iron rod held therein into the river, the fhock arifing from the difcharge of the phial was not at all felt by him, although the obferver on the Surry fide felt it as before. This circuit of the *electrical* matter has been farther confirmed by feveral other ingenious experiments by the fame gentleman.

It is to be obferved, that the commotion is equally ftrong, whether the *electricity* is conducted by water, or dry ground. And that if the wires, between the *electrifying* machine and the obfervers, are conducted upon dry fticks, or other fubftances *non-electric*, in a flight degree only, the effects of the *electrical* power are much greater, than when the wires in their progrefs touch the ground, moift vegetables, or other fubftances in a great degree *non-electric*.

31. It is remarkable, that if the *electrical* machine, and the man who turns the wheel thereof, be mounted upon *electrical* cakes, the *electrical* power is fo far from being increafed hereby, as fome might expect, that it is, on the contrary, much diminifhed, and fometimes is not at all perceptible.

It was this experiment which induced Mr. Watfon to conceive, that the *electrical* power was not inherent in the glafs, but came from the floor of the room. And, he fays, he was confirmed in this opinion when he found, that if he touched the frame of the machine with one hand, while he ftood upon the floor, and with a finger of the other hand touched the gun-barrel, the fire would iffue, and the fnapping would continue as long as he held his hand upon the machine, but would ceafe upon his taking it off. In like manner, if the man, who turned the wheel, put one of his feet upon the floor, the other remaining upon the wax, the *electricity* at the gun-barrel would fnap, and ceafe upon his replacing his foot. But of this hypothefis more hereafter.

32. The accumulation of *electricity* may be meafured to great exactnefs by the following method, difcovered by Mr. Canton. When the phial is fufficiently *electrified*, by applying the wire thereof to the glafs globe, which is known by the appearance of a brufh of flame at the end of the wire, hang a flender piece of wire to the fufpended gun-barrel, detached for this purpofe from the globes. Upon your applying the wire of the *electrified* phial to that hanging to the gun-barrel, you perceive a fmall fnap; this you difcharge by touching the gun-barrel with your finger, which likewife fnaps: and thus alternately *electrifying* and difcharging, you proceed until the whole *electricity* of the water is diffipated, which is, fometimes, not done under an hundred difcharges. If you do not difcharge the *electricity* every time, the fnaps from the wire of the *electrified* phial to the gun-barrel, are fcarcely perceptible. The acquired *electricity* of the water is eftimated in proportion to the number of ftrokes.

This accumulation of *electricity* may perhaps be thought to deferve a farther explanation, and may be thus illuftrated. As we take it for granted, that there is always a determinate quantity of atmofphere furrounding the terraqueous globe, we conceive, when we fee the mercury in the barometer very low, that there then is a lefs accumulated column of this atmofphere impending over us, than when we fee the mercury high. In like manner, when we obferve that the *electrified* gun-barrel attracts or repels only very light fubftances, at a very fmall diftance, or that the fnap and fire therefrom are fcarce perceptible, we conceive then a much lefs quantity of *electrical* atmofphere furrounding the gun-barrel. This power being more or lefs, is called the greater or lefs degree of the accumulation of *electricity*. And this is only attainable to a certain point, if you *electrify* ever fo long; after which, unlefs otherwife directed, the diffipation thereof is general. In the phial filled with water, in Mufchenbroek's experiment, or filled with any other *non-electric*, as filings of iron, if the wire be held to the globe in motion, when the accumulation is complete, the furcharge runs off from the point of the wire, as a brufh of blue flame. That by ftopping the current of *electricity*, *non-electrics* might be excited; and that by accumulating their power, they might be made to exert more force than *electrics per fe* would at any point of time, is that capital difcovery of the late Mr. Gray; which is to be regarded as the bafis upon which all the prefent improvements of our knowledge in *electricity* are founded.

33. By comparing the refpective velocities of *electricity* and found, that of *electricity*, in any diftance yet experienced, appears inftantaneous.

For the detail of thefe curious experiments, and of feveral others, we muft refer to Mr. Watfon's experiments and obfervations, tending to illuftrate the nature and properties of *electricity*, Lond. 1745; and the fequel to the experiments, &c. Lond. 1746; as alfo to his account of the experiments made by fome gentlemen of the Royal Society, Lond. 1748.

34. Mr. Franklin of Philadelphia, in his experiments and obfervations on *electricity*, has obferved, that granulated lead is better than water for filling the phial or glafs jar to be *electrified*; and he has been able to excite the *electrical* force to fuch a degree, as not only to fire gunpowder [a], and to kill a turkey of ten pound weight [b], but to produce a fufion of metals [c].—[[a] Phil. Tranf. Vol. XLVII. p. 291. [b] Ibid. p. 209. [c] Ibid. p. 290.]

This ingenious author's method of firing gunpowder by the *electric* flame has fomething particular, as it does not require any inflammable vapour to be previoufly raifed. The powder may be fired thus: a fmall cartridge is filled with dry powder, hard rammed, fo as to bruife fome of the grains. Two pointed wires are then thruft in, one at each end, the points approaching each other in the middle of the cartridge, till within the diftance of half an inch: then the cartridge being placed in the circle, when four *electrified* glafs jars are difcharged, the *electric* flame leaping from the point of one wire to the point of the other, within the cartridge among the powder, fires it, and the explofion of the powder is at the fame inftant with the crack of the *electrical* difcharge.

35. As to metals, this gentleman obferves, that he has been able by *electricity* frequently to give polarity to needles, and to reverfe it. A fhock from four large glafs jars fent thro' a fine fewing needle, gives it polarity; and it will traverfe, when laid on water. The polarity is given ftrongeft, when the needle is ftruck lying north and fouth; and weakeft, when lying eaft and weft. In this cafe, the end entred by the *electric* blaft points north: but when the needle lies north and fouth, the end that lies towards the north will continue to point north, whether the fire entred at that end, or the contrary end.

36. In thefe experiments, the ends of the needles are fometimes finely blued, like a watch-fpring, by the *electric* flame. This colour, given by the flafh from two glafs jars only, will wipe off; but four will fix it, and frequently melt the needles. Sometimes the furface on the body of the needles is alfo run, and appears bliftered, when examined by a magnifying glafs. The jars Mr. Franklin made ufe of hold feven or eight gallons, and are coated and lined with tinfoil. Each of them takes a thoufand turns of a globe of nine inches diameter to charge it. Tin-foil has been melted between glafs by the force of two jars only. Phil. Tranf. loc. cit.

37. The effects of lightning and thofe of *electricity* appear very fimilar. Lightning has been known to ftrike people blind, the *electrical* fhock has had the fame effect on animals. Animals have been killed by both. The mariners compafs has fometimes loft its virtue by lightning; and by Mr. Franklin's experiments it appears, that polarity may be given and reverfed by *electricity*. The late Mr. Stephen Gray obferved feveral years ago [d], that the *electric* fire feemed to be of the fame nature with that of thunder and lightning. Others have fince fallen into the fame opinion. Indeed many experiments fhew, that the flame of *electricity* has been juftly called by Mr. Franklin a mimic lightning [e], fince it blinds and kills animals, and melts metals, &c. like

like natural lightning.—[d Phil. Transf. Vol. cit. p. 536. e Ibid. p. 290.]

38. This analogy is now farther confirmed by the difcovery made in France, in confequence of Mr. Franklin's hypothefis, of being able, by a proper apparatus, to collect the *electricity* from the atmofphere during a thunder ftorm. For a pointed bar of iron, 40 feet high, having been placed upon an *electrical* body, and a ftormy cloud having paffed over the place where the bar ftood, thofe that were appointed to obferve it drew near, and attracted from it fparks of fire, perceiving the fame kind of commotions as in the common *electrical* experiments. The like effect followed, when a bar of iron 99 feet high was placed upon a cake of refin, two feet fquare and two inches thick. For a ftormy cloud having paffed over the bar, where it remained half an hour, fparks were drawn from the bar. Thefe were the firft experiments made in France, and they have been fufficiently varied and verified fince; fo that it feems now certain, 1°. that a bar of iron, pointed or not, is *electrifed* during a ftorm. 2°. That a vertical or horizontal fituation is equally fitting for thefe experiments. 3°. That even wood is *electrifed*. 4°. That by thefe means a man may be fufficiently *electrifed* to fet fire to fpirit of wine with his finger, and repeat almoft all the ufual experiments of artificial *electricity*; for fuch may that which is excited by friction be denominated.

It is, however, to be remarked, that thefe phænomena are attended with irregularities, and do not always fucceed perfectly. Sometimes fimple clouds, without thunder or lightning, produce more *electricity*, than when there is loud thunder. Sometimes the *electricity* does not fhew itfelf but where there is lightning: in other cafes, the *electricity* which feemed diffipated during the rain, began again as foon as the rain ceafed, altho' the thunder was very diftant. See the Phil. Tranf. Vol. XLVII. p. 534, feq.

39. Mr. Franklin has contrived a very ingenious and eafy way of trying experiments of this kind by means of an *electrical* kite, made of a large thin filk handkerchief, extended and faftened at the four corners to two flight ftrips of cedar, of fufficient length for this purpofe. This kite being accommodated with a tail, loop, and ftring, will rife in the air like thofe of paper. To the top of the upright ftick of the crofs is to be fixed a very fharp-pointed wire, rifing a foot or more above the wood. To the end of the twine, next the hand, is to be tied a filk ribband; and where the twine and filk join, a key may be faftened. The kite is to be raifed when a thunder guft appears to be coming on, and as foon as the thunder-clouds come over the kite, the pointed wire will draw the *electric* fire from them, and the kite with all the twine will be *electrified*; and the loofe filaments of the twine will ftand out every way, and be attracted by an approaching finger. When the rain has wet the kite and twine, fo that it can conduct the *electric* fire freely, it will ftream out plentifully from the key, on the approach of a man's knuckle. At this key the phial may be charged; and from *electric* fire thus obtained fpirits may be kindled, and all the other *electrical* experiments be performed, which are ufually done by the help of a rubbed glafs globe or tube, and the famenefs of the *electric* matter with that of lightning may thereby be completely demonftrated. Phil. Tranf. Vol. cit. p. 565, feq.

From this identity, fome have conceived hopes of depriving the clouds of all their thunder, and thereby rendering thunder ftorms harmlefs. See Philof. Tranf. Vol. cit. p. 289, 535.

40. It has been pretended, that odours would pervade *electrified* globes and tubes of glafs, and that the medicinal effects of drugs might likewife be tranfmitted this way; as alfo, that if perfons were to hold in their hands, or place under their naked feet, odoriferous, or purging fubftances, and were then to be *electrifed*, they would be fenfible of the effects of thefe fubftances. But it feems now certain, that all thefe pretences have been impofitions on the credulity of the world, and that when proper experiments have been tried, no fuch effects have been perceived, nor have the moft poifonous fubftances manifefted any influence in this way. See Dr. Bianchini's experiment, mentioned in the Philof. Tranf. Vol. XLVII. p. 399, feq.

41. However, though thefe pretended wonders, tranfmitted to the reft of Europe from Italy and Leipfic [f], have no foundation in fact, yet it does not follow, that medicinal advantages are not to be gained from *electricity* itfelf. So fubtle and fo elaftic a fluid admitted in a large quantity into our bodies, as, from undoubted experience, it greatly heats the flefh, and quickens the pulfe, may, more efpecially when affifted with the expectation of fuccefs in the patient, in particular cafes be attended with very great advantages [g]. —[f Phil. Tranf. Vol. cit. p. 231, feq. g Mr. Watfon in Phil. Tranf. Vol. cit. p. 406.]

In effect, we meet with fome cures performed in paralytic cafes by the force of *electricity*. See Hiftoire generale et particuliere de l'*Electrité*, Paris, 1752, part. 3. p. 36, feq. And we meet with accounts of feveral other diforders cured by the fame means, in that treatife; but we fear not all equally well attefted.

42. The *electrical* virtue having, in fome cafes, accelerated and facilitated the motion of liquids through capillary tubes, the Abbé Nollet was led to fuppofe, that the *electrical* effluvia might alfo contribute to accelerate the growth of vegetables, and to increafe the perfpiration of animals, and the experiments made by that gentleman feem to fupport his opinion; though objections have arifen, as to what he has advanced with refpect to the acceleration of the motion of fluids through capillary tubes or fyphons: for Mr. Ellicott feems to have proved, that this acceleration is not barely owing to the fluids being *electrified*, but that other circumftances are neceffary, in order to produce this effect. Mr. Ellicott obferves, that if a veffel of water is hung to the prime conductor, having a fyphon in it of fo fmall a bore that the water will be difcharged from it only in drops, on the water's becoming *electrical* by means of the machine, it will immediately run in a ftream, and continue to do fo, till the water is all difcharged, provided the fphere is continued in motion. And the true reafon of the water's running in a ftream in this cafe feems to be, that fo long as the machine is in motion, there is a conftant fucceffion of the *electric* effluvia excited, which vifibly run off from the end of the prime conductor in a ftream; and as they are in like manner carried off from all bodies hung to it, thofe effluvia which run off from the end of the fyphon, being ftrongly attracted by the water, carry fo much of it along with them, as to make it run in a conftant ftream. See Mr. *Ellicott's* Effays before mentioned, p. 11, 12, &c.

The fame author obferves farther, that if the veffel of water, with the fyphon in it, is fufpended by any *non-electric* body over another ftrongly *electrified*, the water will immediately run from the fyphon in a ftream; but if fupported by a piece of filk, or any other *electrical* body, the water will immediately ceafe running, and only be difcharged in drops. And he accounts for this phænomenon from the principles of attraction between *non-electrics* and *electrical* effluvia, and of non-attraction between the fame effluvia and original *electrics*. See page 15 of the Effays before cited.

43. Mr. Watfon has given us a particular account of feveral curious phænomena of *electricity* in vacuo in the Philofophical Tranfactions, Vol. XLVII. p. 362, feq. The *electrical* effluvia, in their paffage through an exhaufted glafs tube, of almoft three inches in diameter, afford a moft agreeable fpectacle in a darkened room. We may obferve, not as in the open air, brufhes or pencils of rays an inch or two in length, but corufcations extending the whole length of the tube, that is, in his experiment, thirty-two inches, and of a bright filver hue. Thefe did not immediately diverge, as in the open air, but frequently, from a bafe apparently flat, divided themfelves into lefs and lefs ramifications, and refembled very much the moft lively corrufcations of the aurora borealis. At other times, when the tube has been exhaufted in the moft perfect manner, the *electricity* has been feen to pafs between two brafs plates, contrived fo, that they might be placed at different diftances from each other, in one continued ftream, of the fame dimenfions throughout its whole length.

If the exhaufted tube be made part of the circuit before mentioned in Mufchenbroek's experiment, at the inftant of explofion, a mafs of very bright embodied fire may be feen jumping from one of the brafs plates in the tube to the other. But this is obferved not to take place, when one of the plates is farther diftant from the other than ten inches. If the diftance be greater, the fire begins to diverge, and lofe part of its force; and this force diminifhes in proportion to its divergency, which is nearly as the diftance of the two plates.

But though the vacuum here employed greatly exceeded that which is ufually made by common air-pumps, yet it was far from being perfect. Thefe experiments were therefore tried with a torricellian vacuum, very ingenioufly contrived by Lord Charles Cavendifh. The apparatus confifted of a cylindrical glafs tube of about three-tenths of an inch in diameter, and of feven feet and an half in length, bent in fuch a manner, that thirty inches of each of its extremities were nearly ftraight, and parallel to each other, from which an arch fprung, which was likewife of thirty inches. This tube was carefully filled with mercury; and each of its extremities being put into its bafon of mercury, fo much of the mercury ran out, until, as in the common barometrical tubes, it was in equilibrio with the atmofphere. Each of the bafons containing the mercury was of wood, and was fupported by a cylindrical glafs of about four inches in diameter, and fix inches in length; and thefe glaffes were faftened to the bottom of a fquare wooden frame, fo contrived, as that to its top was fufpended, by filk lines, the tube filled with mercury before mentioned; fo that the whole of this apparatus, without inconvenience, might be moved together. The torricellian vacuum then occupied a fpace of about thirty inches. In making the experiment, when the room was darkened, a wire from the prime conductor of the common *electrical* machine, communicated with one of the bafons of mercury, and any *non-electric* touching the other bafon, while the machine was in motion,

 the

the *electricity* pervaded the vacuum in a continued arch of lambent flame, and as far as the eye could follow it, without the leaft divergency.

It is to be obferved, that upon admitting a very fmall quantity of air into the exhaufted tube, the phænomena difappear; not fo much from the fmall quantity of air admitted, as from the vapours which infinuated themfelves therewith. For thefe phænomena have been vifible, though in a lefs perfect degree, when a much larger quantity of air was left in the receiver, by omitting to exhauft it as much as poffible.

If the *electrifying* machine, and the man who turns the wheel thereof, are fupported by *electrics per fe*; and if a piece of wire be connected with the brafs cap covering the upper extremity of the exhaufted tube, or to the end of the long brafs rod, by the fliding of which through a box of oiled leather, the upper brafs plate may be moved in the tube; and if the other end of the wire be faftened to any part of the frame of the *electrifying* machine, when this is put in motion, the *electrical* corufcations may be feen to pafs, as before, from one of the brafs plates contained in the tube to the other, and to continue, unlefs the air infinuates itfelf, as long as the machine is in motion. If, under thefe circumftances, the hand of a perfon ftanding on the floor is brought near the fides of the glafs, the corufcations will direct themfelves that way in a great variety of curious forms.

This experiment, in which the *electricity* is feen pufhing itfelf on through the vacuum by its own elafticity, is confidered by Mr. Watfon as an *experimentum crucis* of the truth of his doctrine hereafter mentioned.

It may be obferved in all thefe experiments, that a vacuum does not conduct *electricity* fo perfectly as metals or water. For, in the laft experiment, a perfon ftanding upon the floor, and applying his finger to the upper brafs cap of the tube, receives a fmart ftroke; and in the former, fnaps of fire may be drawn from the prime conductor. Thefe are arguments of fome degree of accumulation, while the *electricity* is paffing through the vacuum; fince nothing of this kind happens when metals, ftanding upon the ground, touch the prime conductor.

Such are the principal phænomena of *electricity* hitherto difcovered; but the chief queftion remains: What are the general laws of thefe phænomena, and what are their caufes?

Mr. Ellicott thinks that the following conclufions, or general laws, may be juftly deduced from the phænomena.

1°. That thefe remarkable phænomena are produced by means of effluvia; which, in exciting the *electrical* body, are put into motion, and feparated from it.

2°. That the particles compofing thefe effluvia ftrongly repel each other.

3°. That there is a mutual attraction between thefe particles and all other bodies whatfoever.

That there are effluvia emitted from the tube when rubbed, and which furround it as an atmofphere, is evident from that offenfive fmell arifing from them, from that fenfation on the hands or face, when the tube is brought near either of them, and from thofe fparks of light, on a ftill nearer approach of the finger to it.

That the particles of thefe effluvia repel each other, is proved by the cork balls, and the fibres of the feather repelling each other, when impregnated with them; and by the leaf-gold being repelled by the tube, and not returning to it again, until by coming near, or touching fome *non-electric* body, the effluvia are drawn off from it. From this property it is, that thefe effluvia expand themfelves with fo great a velocity whenever they are feparated from the *electric* body; and as they are likewife capable of being greatly condenfed, may we not from hence juftly conclude they are *elaftic*?

That there is a mutual attraction between thefe effluvia and moft other bodies, appears from their collecting from the tube fuch quantities thereof, as to endue them with the fame properties with the tube itfelf, as is proved from feveral of the experiments above mentioned.

Thefe principles being admitted, it will follow, that the greater difference there is in the quantity of *electrical* effluvia in any two bodies, the ftronger will be their attraction. For, if the effluvia in each are equal, inftead of attracting, they will repel each other; and in proportion as the quantity of *electric* matter is drawn from one of the bodies, will the attraction between them increafe, and confequently be ftrongeft, when any one of them has all the *electrical* matter drawn from it.

The particles of thefe effluvia are fo exceeding fmall, as eafily to pervade the pores of glafs, as is evident, in that a feather, or any light bodies inclofed in a glafs ball hermetically fealed, will be put in motion on the excited tube being brought near the outfide of it: and it has been generally thought that they pafs thro' the pores of the denfeft bodies, and feveral experiments render this fuppofition not improbable, tho' none of them are quite conclufive.

Mr. Ellicott then proceeds to fhew, in a very ingenious manner, how, from thefe principles, the phænomena of fome of the more remarkable experiments of *electricity* may be accounted for. But as what he fays cannot, with juftice to his reafonings, be abridged, we muft refer the curious to his effays before quoted; only adding, that we have feen a manufcript of his, where he endeavours to account for the experiment of Mufchenbroek on thefe principles, in a manner that makes us wifh to fee the reft of his experiments, obfervations, and reafonings on this fubject publifhed.

Mr. Watfon has endeavoured to prove, that *electricity* is not furnifhed from the glaffes employed in the experiments, nor from the circumambient air. He thinks that *electricity* is the effect of a very fubtile and elaftic fluid, occupying all bodies in contact with the terraqueous globe, and that every where in its natural ftate it is of the fame degree of denfity; and that glafs, and other bodies, which are called *electrics per fe*, have the power of taking this fluid from one body, and conveying it to another, in a quantity fufficient to be obvious to all our fenfes; and that under certain circumftances, it is poffible to render the *electricity* in fome bodies more rare than it naturally is, and, by communicating this to other bodies, to give them an additional quantity, and make their *electricity* more denfe; and that thefe bodies will thus continue until their natural quantity is reftored to each; that is, by thofe which have loft part of theirs, acquiring what they have loft, and by thofe, to which more has been communicated, parting with their additional quantity. Both one and the other of thefe is, from the elafticity of the *electric* matter, attempted to be done from the neareft *non-electric*; and when the air is moift, this is foon accomplifhed by the circumambient vapours, which here may be confidered as preventing, in a very great degree, our attempts to infulate *non-electric* bodies.

This fhort fketch of Mr. Watfon's fyftem is taken from his own words in the Philofophical Tranfactions, Vol. XLVII. p. 371, 372. For the detail of his illuftrations and proofs, his treatife before quoted, or the Phil. Tranfact. Vol. XLIV and XLV, muft be confulted, and particularly Vol. XLVII, p. 372, & feq. where, after giving the *experimentum crucis* before mentioned, he endeavours to fhew that it amounts to a full proof of the truth of his doctrine, that *electricity* is furnifhed by thofe bodies, hitherto called *non-electrics*, and not by the *electrics per fe*; and that we are able to add to, or take from, that quantity of *electricity* naturally adherent to bodies.

Mr. Watfon's fyftem naturally leads him to afk, by what denomination fhall we call this extraordinary power? From its effects in thefe operations fhall we call it *electricity*? From its being a principle neither generated nor deftroyed; from its being every where and always prefent, and in readinefs to fhew itfelf in its effects, tho' latent and unobferved, till by fome procefs it is produced into action, and rendered vifible; from its penetrating the denfeft and hardeft bodies, and its uniting itfelf to them; and from its immenfe velocity; fhall we, with Theophraftus, Boerhaave, Niewentiit, 'sGravefande, and other philofophers, call it elementary fire? Or fhall we, from its containing the fubftance of light and fire, and from the extreme fmallnefs of its parts, as paffing thro' moft bodies we are acquainted with, denominate it, with Homberg and the chemifts, the chemical fulphureous principle, which, according to the doctrines of thefe gentlemen, is univerfally diffeminated? Whatever we call it, it feems certain, that this power has many furprifing properties, and cannot but be of great moment in the fyftem of the univerfe.

To conclude, we muft obferve that the ingenious Mr. Wilfon has, in a treatife exprefs, endeavoured to account for the phænomena of *electricity*, from Sir Ifaac Newton's æther.

As to other hypothefes, we refer to the *Hiftoire generale et particuliere de l'Electricité* before mentioned.

SOUND (*Suppl.*)—The fpace through which *found* is propagated in a given time, has been very differently eftimated by authors who have written concerning this fubject. Roberval gives it at the rate of 560 feet in a fecond; Gaffendus, at 1473; Merfenne, at 1474; Du Hamel, in the Hiftory of the Academy of Sciences at Paris, at 1172; the Academy del Cimento, at 1185; Boyle, at 1200; Roberts, at 1300; Walker, at 1338; Sir Ifaac Newton, at 968; Dr. Derham, in whofe meafure Mr. Flamfteed and Dr. Halley acquiefced, at 1142. But by the accounts fince publifhed by M. Caffini de Thury, in the Memoirs of the Royal Academy of Sciences at Paris for the year 1738, where cannon were fired at various, as well as great diftances, under great variety of weather, wind, and other circumftances, and where the meafures of the different places had been fettled with the utmoft exactnefs, *found* was propagated at a medium at the rate only of 1038 French feet in a fecond. The French foot exceeds the Englifh by nearly feven lines and a half, or is as 107 to 114: And confequently, 1038 French feet are equal to 1106 Englifh feet. The difference therefore of

of the meaſures of Mr. Derham and M. Caſſini is 34 French, or 36 Engliſh feet in a ſecond. According to this laſt meaſure, the velocity of *ſound*, when the wind is ſtill, is ſettled at the rate of a mile, or 5280 Engliſh feet, in $4\frac{77}{100}''$.

UNDULATION, or BEAT, in muſic, is uſed for that rattling, or jarring of ſounds, which is obſerved, chiefly, when diſcordant notes are ſounded together.

The phænomenon is more fully deſcribed thus, by Dr. Smith [a]: In tuning muſical inſtruments, eſpecially organs, it is a known thing, that while a conſonance is imperfect, it is not ſmooth and uniform, as when perfect, but interrupted with very ſenſible *undulations* or *beats*; which, while the two ſounds continue at the ſame pitch, ſucceed one another in equal times, and in longer and longer times, while either of the ſounds approaches gradually to a perfect conſonance with the other, till at laſt the *undulations* vaniſh, and leave a ſmooth, uniform conſonance.—[[a] Harmonics, p. 107.]

This learned author obſerves farther, that quicker *undulations* are *beats*, and are remarkably diſagreeable in a concert of ſtrong, treble voices, when ſome of them are out of tune; or in a ring of bells ill tuned, the hearer being near the ſteeple; or in a full organ badly tuned. Nor can the beſt tuning wholly prevent that diſagreeable battering of the ears with a conſtant rattling noiſe of *beats*, quite different from all muſical ſounds, and deſtructive of them, and chiefly cauſed by the compound ſtops called the cornet and ſeſquialter, and by all other loud ſtops of a high pitch, when mixed with the reſt. But if we be content with compoſitions of uniſons and octaves to the diapaſon, whatever be the quality of their ſounds, the beſt manner of tuning will render the noiſe of their *beats* inoffenſive, if not imperceptible.

The Doctor has with great ingenuity deduced the theory of theſe *undulations* from his principles, and has applied his doctrine to the tuning of inſtruments; by which he has ſhewn, that a perſon of no ear at all for muſic may ſoon learn to tune an organ, according to any propoſed temperament of the ſcale, and to any deſired degree of exactneſs, far beyond what the fineſt ear, unaſſiſted by theory, can poſſibly attain to. This may be done by counting the number of *undulations* in a certain time, ſuch as 15 ſeconds. See the treatiſe before cited, Prop. xx. p. 215. and the table, p. 244. Plate 20.

From this ingenious theory the learned author has demonſtrated ſeveral errors in what Monſieur Sauveur has delivered concerning theſe *undulations* or *beats*. See Harmonics, Scholium 2. p. 115.

In the ſame treatiſe we find ſome curious obſervations relating to the analogy of audible and viſible *undulations*. See p. 128, 273.

Aster. Tussilago. Asteriscus. Xeranthemum. Carlina.
Clas. 15. Plants with Apetalous or Stamineous Flowers.
Bistorta. Millium. Cyperus. Ricinus. Equisetum.
Clas. 16. Plants which have Seeds but seem to have no Flowers.
Lonchitis. Trichomanes. Ruta Muraria. Adiantum.
Clas 17. Plants which seem to have Neither Flowers nor Seeds.
Fungus. Fucus. Acetabulum. Corallina. Corallium. Madrepora. Lithophyton.
Clas.18. Trees & Shrubs with Apetalous Flowers.
Buxus. Terebinthus. Fraxinus.
Clas.19. Trees and Shrubs with Amentaceous Flowers.
Ilex. Fagus. Cupressus. Platanus. Salix. Populus.
Clas 20. Trees and Shrubs with Monopetalous Flowers.
Jasminum. Styrax. Nerion. Opulus. Xylosteon.
Clas.21. Trees and Shrubs with Rosaceous Flowers.
Hippocastanum. Rubus. Staphylodendron. Sena. Mespilus.
Clas.22. Trees and Shrubs with Papilionaceous Flowers.
Genista. Siliquastrum. Anagyris. Pseudoacacia. Cytisus.

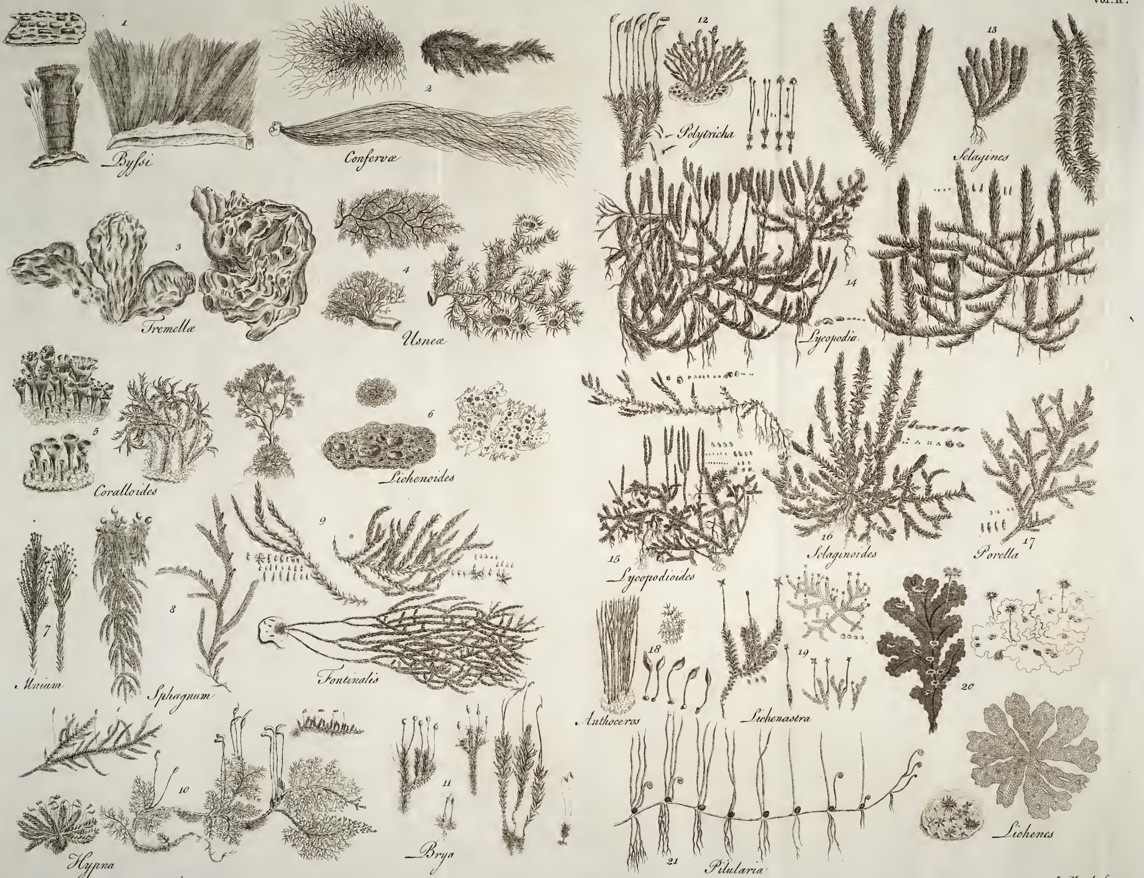
BOTANY Tab. 2.

DISTINCTIONS OF THE LEAVES, FLOWERS, AND CUPS OF PLANTS.

BOTANY Tab. 3.
THE GENERA OF MOSSES



J. Mynde sc.

QUADRUPEDS and SERPENTS

THE MORE SCARCE AND CURIOUS BIRDS.

J. Mynde fc.

THE MOST SCARCE and REMARKABLE FISHES.

INSECTS.

Larger Insects.
1 Libella, The Dragon-fly
2 The Lanthorn-Fly
3 The Common Locust
4 Mantis, The Praying Locust
5 Cicada
6 The Stag-horn'd Beetle
7 Gryllotalpa
8 Scorpion
9 Caterpillars
Butter-flies and their Chrysalises
10
11 Chrysalises
Smaller Insects
Mineurs de Feuilles; or Leaf Insects in their Cells and Separate.
12
Trefoil Leaf
Sowthistle Leaf & the Fly
Ranunculus Leaf
Honeysuckle Leaf
Oak Leaf
all with the Path of the Insects
Tæniæ of various kinds.
13
Tæniæ of Cloaths, the Cases, Worms, and Flies
Tæniæ of Leaves their Cases Worms and Flies
Elm Leaf
14
Tænia of the Oak Leaf
Tænia of the Hornbeam Leaf
15
16
Tæniæ Aquaticæ, or Cadworms in their various Cases and naked
17
Papilionaceous Flies of the Tæniæ Aquaticæ
18
Tænia of the Lilly Leaf with the Beetle produced from it
19
Tænia of y Artichoak with its Chrysalis
Pucerons of various kinds.
20
Tæniæ of Honey-Combs, with their long Pipes or Cases
21
The winged Rose Puceron magnified
The naked Rose Pucerons magnified
Pucerons of the Elder
Pucerons on Branches of Trees in the natural Size & magnified
Pucerons on vitiated Branches of the Lime Tree
Pucerons in the Suberdes of the Gooseberry Tree
Pucerons of the Peach Tree magnified
22
Cottony Pucerons of the Beech-Tree
Bastard-Pucerons of various Speices with the Flies they are chang'd to
23
Bastard-Pucerons of the Fig Tree & Box
Puceron-eaters, or Worms that destroy the Pucerons
24
The Fly of y Puceron-Eater
A Puceron-Eater on a Branch loaded with Pucerons
Crysalis of the Puceron-Eater on a Stick
Leaf-Galls & Insects which occasion them
25
Flies of the Oak-leaf Galls
Oak leaf Galls
26
The Punaise of y Chamadrys Galls
Chamadrys flower Galls
27
Leaf Galls of the Lime
The Worm & Fly of y Galls of y Carduus
28
Hemorhoidalis natural and magnified
Gallinsects of various Species
29
Gallinsects of the Peach Tree
30
Kermes Gallinsect
31
The Boat Gallinsects
32
Gallinsects of the Vine
33
Nymph & Case of the Boat-Gallinsect
34
Flies of the Gallinsects
35
The Shell Gallinsect of y Elm
Gallinsects in Copulation
The Case of y Gallinsects Fly with the Nymph all Magnified
Progallinsects of various Species
36
Progallinsects of the Elm natural size & magnified
with the Cotton and without the Cotton
37
The Cochineal Progallinsect magnified
38
Young Progallinsects of the Elme magnified
39
The Swallows nest Fly in its natural Size
The Swallows nest Fly Magnified
Worms of the Water &c with their Flies
40
The Pencill-tail'd water Worm
41
The red-Water Worm
The Shining Canada Worm
44
42
The Formica-leo
The Hexapode Worm of the Libella
45
46
The Hexapode Water Worm with Oars
43
The Fly of the brown jointed waterworm coming out of its Case in its natural size & Magnified
Tipulæ & their Worms.
47
Tipulæ in Copulation
48
The Worm and Nymph of the Tipulæ
49
The Rat-tail'd Water Worms and their Flies
Flies of the Rat tail'd Water Worms
50
51
Bastard-Caterpillar of the Bramble with its Chrysalis and Flies.
52
The Stalk of the Rose Tree wounded for receiving the Eggs
The Bastard-Caterpillar of the Rose with its Flies
Prickly-Caterpillars
53
Of the Oak
54
Of the Plumb-Tree

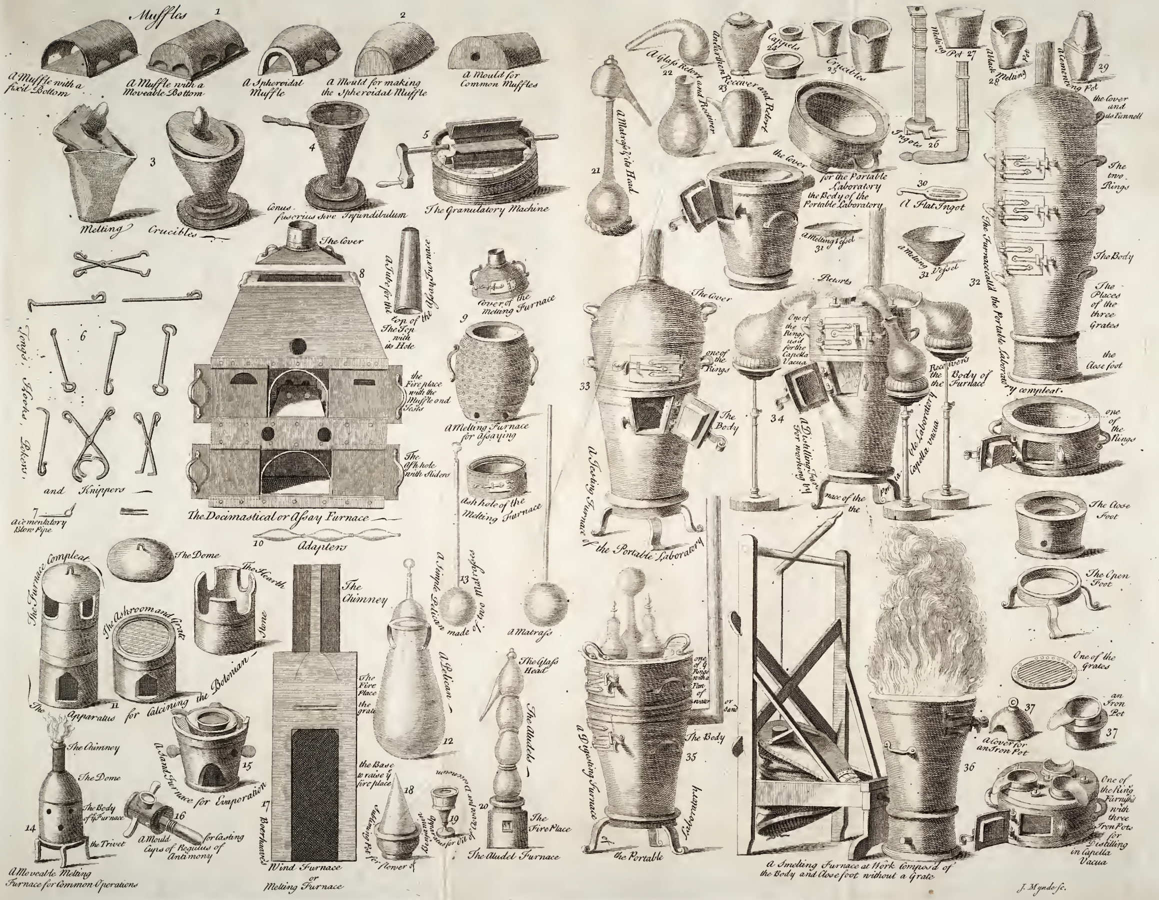
A General Table of Shells

J. Mynde sc.

MICROSCOPICAL OBJECTS and DISCOVERIES



Muffles
A Muffle with a fixed Bottom
A Muffle with a Moveable Bottom
A Spheroidal Muffle
A Mould for making the Spheroidal Muffle
A Mould for Common Muffles
Melting Crucibles
Conus fusorius sive Infundibulum
The Granulatory Machine
The Cover
The Docimastical or Assay Furnace
A Tube for the top of the Assay Furnace
The Top with its Hole
the Fire place with the Muffle and Tests
The Ash hole with Sliders
Cover of the Melting Furnace
A Melting Furnace for assaying
Ash hole of the Melting Furnace
Tongs, Hooks, Pokers, and Knippers
A Cementatory Blow Pipe
Adapters
The Furnace Compleat
The Dome
The Hearth
The Ashroom and Grate
The Apparatus for calcining the Bolonian Stone
The Chimney
The Fire Place
the grate
the Base to raise ye fire place
Boerhaave's Wind Furnace or Melting Furnace
A Simple Pelican made of two Matrasses
A Matrass
A Pelican
A Sand Furnace for Evaporation
The Chimney
The Dome
The Body of ye Furnace
the Trivet
A Moveable Melting Furnace for Common Operations
A Mould for casting Cups of Regulus of Antimony
Subliming Pot for Flower of
The Glass Head
The Aludels
The Fire Place
The Aludel Furnace
A Glass Retort
An earthen Receiver and Retort
Cappels
Crucibles
Melting Pot
A black Melting Pot
A Cementing Pot
Ingots
A Flat Ingot
A Matrass with its Head
the Cover for the Portable Laboratory
the Body of the Portable Laboratory
A Melting Vessel
A Melting Vessel
Retorts
The Cover
one of the Rings
The Body
A Testing Furnace of the Portable Laboratory
One of the Rings used for the Capella Vacua
Receivers
the Body of the Furnace
A Distilling Furnace for working by
The Furnace call'd the Portable Laboratory compleat
the Cover and its Funnell
The two Rings
The Body
The Places of the three Grates
the Close foot
one of the Rings
The Close Foot
The Open Foot
One of the Grates
an Iron Pot
A Cover for an Iron Pot
One of the Rings Furnish'd with three Iron Pots for Distilling in Capella Vacua
A Digesting Furnace of the Portable Laboratory
The Body
A Smelting Furnace at Work compos'd of the Body and Close foot without a Grate
